Abstract

These release notes provide high-level coverage of the improvements and additions that have been implemented in Container-Native Storage for OpenShift Container Platform 3.9.

CHAPTER 1. WHAT'S NEW IN THIS RELEASE?

This section describes the key features and enhancements in the Container-Native Storage 3.9 release.

- **Expanding the Persistent Volume Size:** With this release, the persistent volume size for dynamically provisioned volumes on file storage can be increased by increasing the persistent volume claim. The parameter `allowVolumeExpansion` has to be set to "true" in the storage class file to enable this feature. For more information, refer https://access.redhat.com/documentation/en-us/container-native_storage/3.9/html/container-native_storage_for_openshift_container_platform/chap-Documentation-Red_Hat_Gluster_Storage_Container_Native_with_OpenShift_Platform-OpenShift_Creating_Persistent_Volumes#sect_expanding_pv.
- **Providing a Custom Volume Name Prefix for a Persistent Volume:** You can provide a custom volume name prefix to the persistent volume that is created in both file and block storage. By providing a custom volume name prefix, users can now easily search/filter the volumes based on:
 - Any string that was provided as the field value of "volnameprefix" in the storageclass file.
 - Persistent volume claim name.
 - Project/Namespace name.

The parameter `volumenameprefix` has to be included in the storage class file to enable this feature. For more information to enable this for block storage, refer

https://access.redhat.com/documentation/en-us/container-native_storage/3.9/html/container-native_storage_for_openshift_container_platform/Block_Storage#sect_block-custom-volname-prefix. For more information to enable this for file storage, refer,
https://access.redhat.com/documentation/en-us/container-native_storage/3.9/html/container-native_storage_for_openshift_container_platform/chap-Documentation-Red_Hat_Gluster_Storage_Container_Native_with_OpenShift_Platform-OpenShift_Creating_Persistent_Volumes#sect_file-custom-volname-prefix.

- **Viewing Volume Metrics:** With this release you can view the details and various metrics that show the persistent volume consumption in addition to the allocated persistent volume size for dynamically provisioned volumes on file storage. The different metrics that can be viewed on Prometheus are:
 - `kubelet_volume_stats_available_bytes`: Number of available bytes in the volume.
 - `kubelet_volume_stats_capacity_bytes`: Capacity in bytes of the volume.
 - `kubelet_volume_stats_inodes`: Maximum number of inodes in the volume.
 - `kubelet_volume_stats_inodes_free`: Number of free inodes in the volume.
 - `kubelet_volume_stats_inodes_used`: Number of used inodes in the volume.
 - `kubelet_volume_stats_used_bytes`: Number of used bytes in the volume.

For more information about Volume metrics, refer https://access.redhat.com/documentation/en-us/container-native_storage/3.9/html/container-native_storage_for_openshift_container_platform/chap-documentation-red_hat_gluster_storage_container_native_with_openshift_platform-openshift_creating_persistent_volumes#enable_vol_metrics.

CHAPTER 2. NOTABLE BUG FIXES

This chapter describes bugs fixed in this release of Container-Native Storage for OpenShift Container Platform that have significant impact on users.

This release addresses many customers reported issues related to Heketi and Gluster database going out of synchronization leaving the system with stale metadata about a number of PV's, old deleted PV's, and failed transaction metadata. Container-Native Storage 3.9 handles Heketi and underlying Gluster subsystem more robustly.

This release also addresses some of the issues reported by customers on Block backed PV's specifically under failure scenario and after recovery from such failures.

heketi

[BZ#1415750](#)

Previously, deleting an heketi pod while some heketi operation was in progress would result in incomplete entries in the database. With this fix, such entries are marked "pending" until the operation is completed, thus leading to a consistent database view.

[BZ#1434668](#)

Earlier, the 'device info' output displayed the state of the device as 'failed' after a device remove operation was completed. With this fix, the state of the device is changed to 'removed' which matches with the operation performed.

[BZ#1437798](#)

Earlier, it was possible to run multiple device remove operations in parallel on the same device. This led to race conditions and database inconsistencies. With this fix, an error is returned while another device remove operation on the same device is already in progress.

kubernetes

[BZ#1505290](#)

Previously, the gluster-block provisioner did not identify the storage units correctly in the PVC. For example, it would identify 1 as 1GiB by default and the provisioner would fail on 1Gi. With this enhancement, gluster-block provisioner identifies the storage units correctly, ie, 1 will be treated as 1 byte, 1Gi will be treated as 1 GibiByte, and 1Ki will be treated as 1KibiByte.

CHAPTER 3. KNOWN ISSUES

This chapter provides a list of known issues at the time of release.

- [BZ#1560840](#)

In a gluster cluster with more than three nodes, if one or more nodes are down, but at least three nodes are up, heketi intermittently fails to create new replica 3 volumes, even if the healthy nodes have sufficient space available.

To workaround this issue, execute the following command on the unavailable nodes, which makes heketi volume creation 100% reliable:

```
# heketi-cli node disable <node-id>
```

After the nodes are available again, execute the following command to let heketi take this node into account again when creating volumes:

```
heketi-cli node enable <node-id>
```

- [BZ#1461131](#)

Volumes that were created using Container-Native Storage 3.5 or previous do not have the GID stored in heketi database. Hence, when a volume expansion is performed, new bricks do not get the group ID set on them which might lead to I/O errors.

- [BZ#1409848](#)

The following two lines might be repeatedly logged in the rhgs-server-docker container/gluster container logs.

```
[MSGID: 106006] [glusterd-svc-mgmt.c:323:glusterd_svc_common_rpc_notify] 0-management: nfs has disconnected from glusterd.  
[socket.c:701:__socket_rwv] 0-nfs: readv on /var/run/gluster/1ab7d02f7e575c09b793c68ec2a478a5.socket failed (Invalid argument)
```

These logs are added as glusterd is unable to start the NFS service. There is no functional impact as NFS export is not supported in Containerized Red Hat Gluster Storage.

APPENDIX A. REVISION HISTORY

Revision 1.0-4	Thu Apr 05 2018	Bhavana Mohan
Publishing for CNS 3.9 release.		
Revision 1.0-3	Wed Apr 04 2018	Bhavana Mohan
Included a known issue and incorporated review comments.		
Revision 1.0-2	Tue Mar 27 2018	Bhavana Mohan
Updated the What's New chapter and the Notable Bug Fixes chapter.		
Revision 1.0-1	Wed Mar 14 2018	Bhavana Mohan
Initial creation by publican
