OpenShift Container Platform 4.10

Installing

Installing and configuring OpenShift Container Platform clusters
Installing and configuring OpenShift Container Platform clusters
Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.
Table of Contents

CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW .......................... 64
1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW .......................... 64
   1.1.1. Installation process ................................................................. 64
   1.1.2. The installation process with installer-provisioned infrastructure ................. 65
   1.1.3. The installation process with user-provisioned infrastructure ..................... 66
   1.1.4. Installation process details ...................................................... 67
   1.1.5. Installation scope ..................................................................... 68
1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS .......... 69

CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS .... 71
2.1. SELECTING A CLUSTER INSTALLATION TYPE .............................................. 71
   2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself? 71
   2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4? 72
   2.1.3. Do you want to use existing components in your cluster? .............................. 72
   2.1.4. Do you need extra security for your cluster? ........................................... 73
2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION ...................... 73
2.3. PREPARING YOUR CLUSTER FOR WORKLOADS ......................................... 73
2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS ............. 74

CHAPTER 3. DISCONNECTED INSTALLATION MIRRORING ............................................. 78
3.1. ABOUT DISCONNECTED INSTALLATION MIRRORING ..................................... 78
   3.1.1. Creating a mirror registry .................................................................... 78
   3.1.2. Mirroring images for a disconnected installation ................................. 78
3.2. CREATING A MIRROR REGISTRY ............................................................. 78
   3.2.1. Prerequisites .................................................................................. 78
   3.2.2. Mirror registry for Red Hat OpenShift introduction ............................. 79
   3.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift ............. 79
   3.2.4. Mirroring on a remote host with mirror registry for Red Hat OpenShift .......... 80
   3.2.5. Upgrading the mirror registry for Red Hat OpenShift .......................... 82
   3.2.6. Uninstalling the mirror registry for Red Hat OpenShift .......................... 82
   3.2.7. Mirror registry for Red Hat OpenShift flags ....................................... 82
3.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION ...................... 84
   3.3.1. Prerequisites .................................................................................. 84
   3.3.2. About the mirror registry .................................................................... 84
   3.3.3. Preparing your mirror host ............................................................... 85
       3.3.3.1. Installing the OpenShift CLI by downloading the binary ................... 85
               Installing the OpenShift CLI on Linux ........................................... 86
               Installing the OpenShift CLI on Windows ..................................... 86
               Installing the OpenShift CLI on macOS ...................................... 86
   3.3.4. Configuring credentials that allow images to be mirrored ...................... 87
   3.3.5. Mirroring the OpenShift Container Platform image repository .................. 89
   3.3.6. The Cluster Samples Operator in a disconnected environment .................. 92
       3.3.6.1. Cluster Samples Operator assistance for mirroring ........................ 92
   3.3.7. Mirroring Operator catalogs for use with disconnected clusters ............... 93
       3.3.7.1. Prerequisites .......................................................................... 93
       3.3.7.2. Extracting and mirroring catalog contents .................................. 94
               3.3.7.2.1. Mirroring catalog contents to registries on the same network .. 94
               3.3.7.2.2. Mirroring catalog contents to airgapped registries ............... 96
       3.3.7.3. Generated manifests .................................................................. 98
       3.3.7.4. Post-installation requirements .................................................... 99
   3.3.8. Next steps ...................................................................................... 99
3.3.9. Additional resources

3.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUG-IN

3.4.1. About the oc-mirror plug-in

3.4.2. About the mirror registry

3.4.3. Prerequisites

3.4.4. Preparing your mirror hosts

3.4.4.1. Installing the oc-mirror OpenShift CLI plug-in

3.4.4.2. Configuring credentials that allow images to be mirrored

3.4.5. Creating the image set configuration

3.4.6. Mirroring an image set to a mirror registry

3.4.6.1. Mirroring an image set in a partially disconnected environment

3.4.6.1.1. Mirroring from mirror to mirror

3.4.6.2. Mirroring an image set in a fully disconnected environment

3.4.6.2.1. Mirroring from mirror to disk

3.4.6.2.2. Mirroring from disk to mirror

3.4.7. Installing the ImageContentSourcePolicy and CatalogSource resources into the cluster

3.4.8. Updating your mirror registry

3.4.9. Image set configuration parameters

3.4.10. Image set configuration examples

Use case: Including arbitrary images and helm charts

Use case: Including specific Operator versions

CHAPTER 4. INSTALLING ON ALIBABA

4.1. PREPARING TO INSTALL ON ALIBABA CLOUD

4.1.1. Prerequisites

4.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud

4.1.3. Registering and Configuring Alibaba Cloud Domain

4.1.4. Supported Alibaba regions

4.1.5. Next steps

4.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES

4.2.1. Creating the required RAM user

4.2.2. Configuring the Cloud Credential Operator utility

4.2.3. Next steps

4.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD

4.3.1. Prerequisites

4.3.2. Internet access for OpenShift Container Platform

4.3.3. Generating a key pair for cluster node SSH access

4.3.4. Obtaining the installation program

4.3.5. Creating the installation configuration file

4.3.6. Generating the required installation manifests

4.3.7. Creating credentials for OpenShift Container Platform components with the ccoctl tool

4.3.8. Deploying the cluster

4.3.9. Installing the OpenShift CLI by downloading the binary

Installing the OpenShift CLI on Linux

Installing the OpenShift CLI on Windows

Installing the OpenShift CLI on macOS

4.3.10. Logging in to the cluster by using the CLI

4.3.11. Logging in to the cluster by using the web console

4.3.12. Telemetry access for OpenShift Container Platform

4.3.13. Next steps

4.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS

4.4.1. Prerequisites

4.4.2. Internet access for OpenShift Container Platform
4.4.3. Generating a key pair for cluster node SSH access

4.4.4. Obtaining the installation program

4.4.4.1. Creating the installation configuration file

4.4.4.2. Generating the required installation manifests

4.4.4.3. Creating credentials for OpenShift Container Platform components with the ccoctl tool

4.4.4.4. Installation configuration parameters

4.4.4.4.1. Required configuration parameters

4.4.4.4.2. Network configuration parameters

4.4.4.4.3. Optional configuration parameters

4.4.4.4.4. Additional Alibaba Cloud configuration parameters

4.4.4.5. Sample customized install-config.yaml file for Alibaba Cloud

4.4.4.6. Configuring the cluster-wide proxy during installation

4.4.5. Deploying the cluster

4.4.6. Installing the OpenShift CLI by downloading the binary

4.4.7. Logging in to the cluster by using the CLI

4.4.8. Logging in to the cluster by using the web console

4.4.9. Telemetry access for OpenShift Container Platform

4.4.10. Next steps

4.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS

4.5.1. Prerequisites

4.5.2. Internet access for OpenShift Container Platform

4.5.3. Generating a key pair for cluster node SSH access

4.5.4. Obtaining the installation program

4.5.5. Network configuration phases

4.5.5.1. Creating the installation configuration file

4.5.5.2. Generating the required installation manifests

4.5.5.3. Installation configuration parameters

4.5.5.3.1. Required configuration parameters

4.5.5.3.2. Network configuration parameters

4.5.5.3.3. Optional configuration parameters

4.5.5.4. Sample customized install-config.yaml file for Alibaba Cloud

4.5.5.5. Configuring the cluster-wide proxy during installation

4.5.6. Cluster Network Operator configuration

4.5.6.1. Cluster Network Operator configuration object

4.5.7. Specifying advanced network configuration

4.5.8. Configuring hybrid networking with OVN-Kubernetes

4.5.9. Deploying the cluster

4.5.10. Installing the OpenShift CLI by downloading the binary

4.5.11. Logging in to the cluster by using the CLI

4.5.12. Logging in to the cluster by using the web console

4.5.13. Telemetry access for OpenShift Container Platform

4.5.14. Next steps

4.6. UNINSTALLING A CLUSTER ON ALIBABA CLOUD
CHAPTER 5. INSTALLING ON AWS

5.1. PREPARING TO INSTALL ON AWS
  5.1.1. Prerequisites
  5.1.2. Requirements for installing OpenShift Container Platform on AWS
  5.1.3. Choosing a method to install OpenShift Container Platform on AWS
    5.1.3.1. Installing a cluster on installer-provisioned infrastructure
    5.1.3.2. Installing a cluster on user-provisioned infrastructure
  5.1.4. Next steps

5.2. CONFIGURING AN AWS ACCOUNT
  5.2.1. Configuring Route 53
    5.2.1.1. Ingress Operator endpoint configuration for AWS Route 53
  5.2.2. AWS account limits
  5.2.3. Required AWS permissions for the IAM user
  5.2.4. Creating an IAM user
  5.2.5. Required AWS permissions for IAM roles
  5.2.6. Supported AWS regions
    5.2.6.1. AWS public regions
    5.2.6.2. AWS GovCloud regions
    5.2.6.3. AWS C2S Secret region
    5.2.6.4. AWS China regions
  5.2.7. Next steps

5.3. MANUALLY CREATING IAM FOR AWS
  5.3.1. Alternatives to storing administrator-level secrets in the kube-system project
  5.3.2. Manually create IAM
  5.3.3. Admin credentials root secret format
  5.3.4. Mint mode
  5.3.5. Mint mode with removal or rotation of the administrator-level credential
  5.3.6. Next steps

5.4. INSTALLING A CLUSTER QUICKLY ON AWS
  5.4.1. Prerequisites
  5.4.2. Internet access for OpenShift Container Platform
  5.4.3. Generating a key pair for cluster node SSH access
  5.4.4. Obtaining the installation program
  5.4.5. Deploying the cluster
  5.4.6. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
  5.4.7. Logging in to the cluster by using the CLI
  5.4.8. Logging in to the cluster by using the web console
  5.4.9. Telemetry access for OpenShift Container Platform
  5.4.10. Next steps

5.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS
  5.5.1. Prerequisites
  5.5.2. Internet access for OpenShift Container Platform
  5.5.3. Generating a key pair for cluster node SSH access
  5.5.4. Obtaining the installation program
  5.5.5. Creating the installation configuration file
    5.5.5.1. Installation configuration parameters
    5.5.5.1.1. Required configuration parameters
    5.5.5.1.2. Network configuration parameters

5.7.3. About using a custom VPC
  5.7.3.1. Requirements for using your VPC
  5.7.3.2. VPC validation
  5.7.3.3. Division of permissions
  5.7.3.4. Isolation between clusters
5.7.4. Internet access for OpenShift Container Platform
5.7.5. Generating a key pair for cluster node SSH access
5.7.6. Creating the installation configuration file
  5.7.6.1. Installation configuration parameters
    5.7.6.1.1. Required configuration parameters
    5.7.6.1.2. Network configuration parameters
    5.7.6.1.3. Optional configuration parameters
    5.7.6.1.4. Optional AWS configuration parameters
  5.7.6.2. Minimum resource requirements for cluster installation
  5.7.6.3. Sample customized install-config.yaml file for AWS
  5.7.6.4. Configuring the cluster-wide proxy during installation
5.7.7. Deploying the cluster
5.7.8. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
5.7.9. Logging in to the cluster by using the CLI
5.7.10. Disabling the default OperatorHub sources
5.7.11. Telemetry access for OpenShift Container Platform
5.7.12. Next steps
5.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC
  5.8.1. Prerequisites
  5.8.2. About using a custom VPC
    5.8.2.1. Requirements for using your VPC
    5.8.2.2. VPC validation
    5.8.2.3. Division of permissions
    5.8.2.4. Isolation between clusters
  5.8.3. Internet access for OpenShift Container Platform
  5.8.4. Generating a key pair for cluster node SSH access
  5.8.5. Obtaining the installation program
  5.8.6. Creating the installation configuration file
    5.8.6.1. Installation configuration parameters
      5.8.6.1.1. Required configuration parameters
      5.8.6.1.2. Network configuration parameters
      5.8.6.1.3. Optional configuration parameters
      5.8.6.1.4. Optional AWS configuration parameters
    5.8.6.2. Minimum resource requirements for cluster installation
    5.8.6.3. Supported AWS machine types
    5.8.6.4. Sample customized install-config.yaml file for AWS
    5.8.6.5. Configuring the cluster-wide proxy during installation
  5.8.7. Deploying the cluster
  5.8.8. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
  5.8.9. Logging in to the cluster by using the CLI
  5.8.10. Logging in to the cluster by using the web console
  5.8.11. Telemetry access for OpenShift Container Platform
5.8.12. Next steps

5.9. INSTALLING A PRIVATE CLUSTER ON AWS
5.9.1. Prerequisites
5.9.2. Private clusters
  5.9.2.1. Private clusters in AWS
  5.9.2.1.1. Limitations
5.9.3. About using a custom VPC
  5.9.3.1. Requirements for using your VPC
  5.9.3.2. VPC validation
  5.9.3.3. Division of permissions
  5.9.3.4. Isolation between clusters
5.9.4. Internet access for OpenShift Container Platform
5.9.5. Generating a key pair for cluster node SSH access
5.9.6. Obtaining the installation program
5.9.7. Manually creating the installation configuration file
  5.9.7.1. Installation configuration parameters
    5.9.7.1.1. Required configuration parameters
    5.9.7.1.2. Network configuration parameters
    5.9.7.1.3. Optional configuration parameters
    5.9.7.1.4. Optional AWS configuration parameters
  5.9.7.2. Minimum resource requirements for cluster installation
  5.9.7.3. Supported AWS machine types
  5.9.7.4. Sample customized install-config.yaml file for AWS
  5.9.7.5. Configuring the cluster-wide proxy during installation
5.9.8. Deploying the cluster
5.9.9. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
5.9.10. Logging in to the cluster by using the CLI
5.9.11. Logging in to the cluster by using the web console
5.9.12. Telemetry access for OpenShift Container Platform
5.9.13. Next steps

5.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION
5.10.1. Prerequisites
5.10.2. AWS government regions
5.10.3. Installation requirements
5.10.4. Private clusters
  5.10.4.1. Private clusters in AWS
  5.10.4.1.1. Limitations
5.10.5. About using a custom VPC
  5.10.5.1. Requirements for using your VPC
  5.10.5.2. VPC validation
  5.10.5.3. Division of permissions
  5.10.5.4. Isolation between clusters
5.10.6. Internet access for OpenShift Container Platform
5.10.7. Generating a key pair for cluster node SSH access
5.10.8. Obtaining the installation program
5.10.9. Manually creating the installation configuration file
  5.10.9.1. Installation configuration parameters
    5.10.9.1.1. Required configuration parameters
    5.10.9.1.2. Network configuration parameters
    5.10.9.1.3. Optional configuration parameters
5.10.9.1.4. Optional AWS configuration parameters
5.10.9.2. Minimum resource requirements for cluster installation
5.10.9.3. Supported AWS machine types
5.10.9.4. Sample customized install-config.yaml file for AWS
5.10.9.5. Configuring the cluster-wide proxy during installation
5.10.10. Deploying the cluster
5.10.11. Installing the OpenShift CLI by downloading the binary
5.10.12. Logging in to the cluster by using the CLI
5.10.13. Logging in to the cluster by using the web console
5.10.14. Telemetry access for OpenShift Container Platform
5.10.15. Next steps

5.11. INSTALLING A CLUSTER ON AWS INTO A TOP SECRET REGION
5.11.1. Prerequisites
5.11.2. AWS Top Secret Region
5.11.3. Installation requirements
5.11.4. Private clusters
5.11.4.1. Private clusters in AWS
5.11.4.1.1. Limitations
5.11.5. About using a custom VPC
5.11.5.1. Requirements for using your VPC
5.11.5.2. VPC validation
5.11.5.3. Division of permissions
5.11.5.4. Isolation between clusters
5.11.6. Internet access for OpenShift Container Platform
5.11.7. Uploading a custom RHCOS AMI in AWS
5.11.8. Generating a key pair for cluster node SSH access
5.11.9. Obtaining the installation program
5.11.10. Manually creating the installation configuration file
5.11.10.1. Installation configuration parameters
5.11.10.1.1. Required configuration parameters
5.11.10.1.2. Network configuration parameters
5.11.10.1.3. Optional configuration parameters
5.11.10.1.4. Optional AWS configuration parameters
5.11.10.2. Supported AWS machine types
5.11.10.3. Sample customized install-config.yaml file for AWS
5.11.10.4. Configuring the cluster-wide proxy during installation
5.11.11. Deploying the cluster
5.11.12. Installing the OpenShift CLI by downloading the binary
5.11.13. Logging in to the cluster by using the CLI
5.11.14. Logging in to the cluster by using the web console
5.11.15. Telemetry access for OpenShift Container Platform
5.11.16. Next steps

5.12. INSTALLING A CLUSTER ON AWS CHINA
5.12.1. Prerequisites
5.12.2. Installation requirements
5.12.3. Internet access for OpenShift Container Platform
5.12.4. Private clusters
5.12.4.1. Private clusters in AWS
  5.12.4.1.1. Limitations
5.12.5. About using a custom VPC
  5.12.5.1. Requirements for using your VPC
  5.12.5.2. VPC validation
  5.12.5.3. Division of permissions
  5.12.5.4. Isolation between clusters
5.12.6. Generating a key pair for cluster node SSH access
5.12.7. Uploading a custom RH COS AMI in AWS
5.12.8. Obtaining the installation program
5.12.9. Manually creating the installation configuration file
  5.12.9.1. Installation configuration parameters
    5.12.9.1.1. Required configuration parameters
    5.12.9.1.2. Network configuration parameters
    5.12.9.1.3. Optional configuration parameters
  5.12.9.2. Sample customized install-config.yaml file for AWS
  5.12.9.3. Minimum resource requirements for cluster installation
  5.12.9.4. Supported AWS machine types
  5.12.9.5. Configuring the cluster-wide proxy during installation
5.12.10. Deploying the cluster
5.12.11. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
5.12.12. Logging in to the cluster by using the CLI
5.12.13. Logging in to the cluster by using the web console
5.12.14. Telemetry access for OpenShift Container Platform
5.12.15. Next steps
5.13. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
  5.13.1. Prerequisites
  5.13.2. About installations in restricted networks
    5.13.2.1. Additional limits
  5.13.3. Internet access for OpenShift Container Platform
  5.13.4. Requirements for a cluster with user-provisioned infrastructure
    5.13.4.1. Required machines for cluster installation
    5.13.4.2. Minimum resource requirements for cluster installation
    5.13.4.3. Certificate signing requests management
    5.13.4.4. Supported AWS machine types
  5.13.5. Required AWS infrastructure components
    5.13.5.1. Other infrastructure components
    5.13.5.2. Cluster machines
    5.13.5.3. Required AWS permissions for the IAM user
  5.13.6. Generating a key pair for cluster node SSH access
  5.13.7. Creating the installation files for AWS
    5.13.7.1. Optional: Creating a separate /var partition
    5.13.7.2. Creating the installation configuration file
    5.13.7.3. Configuring the cluster-wide proxy during installation
    5.13.7.4. Creating the Kubernetes manifest and Ignition config files
  5.13.8. Extracting the infrastructure name
  5.13.9. Creating a VPC in AWS
    5.13.9.1. CloudFormation template for the VPC
  5.13.10. Creating networking and load balancing components in AWS
5.13.10.1. CloudFormation template for the network and load balancers
5.13.11. Creating security group and roles in AWS
5.13.11.1. CloudFormation template for security objects
5.13.12. Accessing RHCOS AMIs with stream metadata
5.13.13. RHCOS AMIs for the AWS infrastructure
5.13.14. Creating the bootstrap node in AWS
5.13.15. Creating the control plane machines in AWS
5.13.16. Creating the worker nodes in AWS
5.13.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure
5.13.18. Logging in to the cluster by using the CLI
5.13.19. Approving the certificate signing requests for your machines
5.13.20. Initial Operator configuration
5.13.20.1. Disabling the default OperatorHub sources
5.13.20.2. Image registry storage configuration
5.13.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure
5.13.20.2.2. Configuring storage for the image registry in non-production clusters
5.13.21. Deleting the bootstrap resources
5.13.22. Creating the Ingress DNS Records
5.13.23. Completing an AWS installation on user-provisioned infrastructure
5.13.24. Logging in to the cluster by using the web console
5.13.25. Telemetry access for OpenShift Container Platform
5.13.26. Additional resources
5.13.27. Next steps

5.14. UNINSTALLING A CLUSTER ON AWS
5.14.1. Removing a cluster that uses installer-provisioned infrastructure
5.14.2. Deleting AWS resources with the Cloud Credential Operator utility

CHAPTER 6. INSTALLING ON AZURE
6.1. PREPARING TO INSTALL ON AZURE
6.1.1. Prerequisites
6.1.2. Requirements for installing OpenShift Container Platform on Azure
6.1.3. Choosing a method to install OpenShift Container Platform on Azure
   6.1.3.1. Installing a cluster on installer-provisioned infrastructure
   6.1.3.2. Installing a cluster on user-provisioned infrastructure
6.1.4. Next steps

6.2. CONFIGURING AN AZURE ACCOUNT
6.2.1. Azure account limits
6.2.2. Configuring a public DNS zone in Azure
6.2.3. Increasing Azure account limits
6.2.4. Required Azure roles
6.2.5. Creating a service principal
6.2.6. Supported Azure regions
   Supported Azure public regions
   Supported Azure Government regions
6.2.7. Next steps

6.3. MANUALLY CREATING IAM FOR AZURE
6.3.1. Alternatives to storing administrator-level secrets in the kube-system project
6.3.2. Manually create IAM
6.3.3. Admin credentials root secret format
6.3.4. Next steps

6.4. INSTALLING A CLUSTER QUICKLY ON AZURE
6.4.1. Prerequisites
6.4.2. Internet access for OpenShift Container Platform
6.4.3. Generating a key pair for cluster node SSH access
6.4.4. Obtaining the installation program
6.4.5. Deploying the cluster
6.4.6. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.4.7. Logging in to the cluster by using the CLI
6.4.8. Telemetry access for OpenShift Container Platform
6.4.9. Next steps

6.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS
6.5.1. Prerequisites
6.5.2. Internet access for OpenShift Container Platform
6.5.3. Generating a key pair for cluster node SSH access
6.5.4. Obtaining the installation program
6.5.5. Creating the installation configuration file
   6.5.5.1. Installation configuration parameters
      6.5.5.1.1. Required configuration parameters
      6.5.5.1.2. Network configuration parameters
      6.5.5.1.3. Optional configuration parameters
      6.5.5.1.4. Additional Azure configuration parameters
   6.5.5.2. Minimum resource requirements for cluster installation
   6.5.5.3. Sample customized install-config.yaml file for Azure
   6.5.5.4. Configuring the cluster-wide proxy during installation
   6.5.6. Enabling Accelerated Networking during installation
6.5.7. Deploying the cluster
6.5.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.5.9. Logging in to the cluster by using the CLI
6.5.10. Telemetry access for OpenShift Container Platform
6.5.11. Next steps

6.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS
6.6.1. Prerequisites
6.6.2. Internet access for OpenShift Container Platform
6.6.3. Generating a key pair for cluster node SSH access
6.6.4. Obtaining the installation program
6.6.5. Creating the installation configuration file
   6.6.5.1. Installation configuration parameters
      6.6.5.1.1. Required configuration parameters
      6.6.5.1.2. Network configuration parameters
      6.6.5.1.3. Optional configuration parameters
      6.6.5.1.4. Additional Azure configuration parameters
   6.6.5.2. Minimum resource requirements for cluster installation
   6.6.5.3. Sample customized install-config.yaml file for Azure
   6.6.5.4. Configuring the cluster-wide proxy during installation
6.6.6. Network configuration phases
6.6.7. Specifying advanced network configuration
6.6.8. Cluster Network Operator configuration
   6.6.8.1. Cluster Network Operator configuration object
defaultNetwork object configuration
Configuration for the OpenShift SDN CNI cluster network provider 667
Configuration for the OVN–Kubernetes CNI cluster network provider 668
kubeProxyConfig object configuration 670
6.6.9. Configuring hybrid networking with OVN–Kubernetes 671
6.6.10. Enabling Accelerated Networking during installation 673
6.6.11. Deploying the cluster 674
6.6.12. Installing the OpenShift CLI by downloading the binary 675
Installing the OpenShift CLI on Linux 675
Installing the OpenShift CLI on Windows 676
Installing the OpenShift CLI on macOS 676
6.6.13. Logging in to the cluster by using the CLI 677
6.6.14. Telemetry access for OpenShift Container Platform 677
6.6.15. Next steps 678
6.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET 678
6.7.1. Prerequisites 678
6.7.2. About reusing a VNet for your OpenShift Container Platform cluster 678
6.7.2.1. Requirements for using your VNet 678
6.7.2.1.1. Network security group requirements 679
6.7.2.2. Division of permissions 680
6.7.2.3. Isolation between clusters 680
6.7.3. Internet access for OpenShift Container Platform 680
6.7.4. Generating a key pair for cluster node SSH access 681
6.7.5. Obtaining the installation program 682
6.7.6. Creating the installation configuration file 683
6.7.6.1. Installation configuration parameters 685
6.7.6.1.1. Required configuration parameters 685
6.7.6.1.2. Network configuration parameters 687
6.7.6.1.3. Optional configuration parameters 688
6.7.6.1.4. Additional Azure configuration parameters 692
6.7.6.2. Minimum resource requirements for cluster installation 694
6.7.6.3. Sample customized install–config.yaml file for Azure 695
6.7.6.4. Configuring the cluster–wide proxy during installation 697
6.7.7. Enabling Accelerated Networking during installation 699
6.7.8. Deploying the cluster 699
6.7.9. Installing the OpenShift CLI by downloading the binary 701
Installing the OpenShift CLI on Linux 701
Installing the OpenShift CLI on Windows 702
Installing the OpenShift CLI on macOS 702
6.7.10. Logging in to the cluster by using the CLI 702
6.7.11. Telemetry access for OpenShift Container Platform 703
6.7.12. Next steps 703
6.8. INSTALLING A PRIVATE CLUSTER ON AZURE 703
6.8.1. Prerequisites 704
6.8.2. Private clusters 704
6.8.2.1. Private clusters in Azure 704
6.8.2.1.1. Limitations 705
6.8.2.2. User–defined outbound routing 705
Private cluster with network address translation 706
Private cluster with Azure Firewall 706
Private cluster with a proxy configuration 706
Private cluster with no internet access 706
6.8.3. About reusing a VNet for your OpenShift Container Platform cluster 706
6.8.3.1. Requirements for using your VNet 706
6.8.3.1. Network security group requirements
6.8.3.2. Division of permissions
6.8.3.3. Isolation between clusters
6.8.4. Internet access for OpenShift Container Platform
6.8.5. Generating a key pair for cluster node SSH access
6.8.6. Obtaining the installation program
6.8.7. Manually creating the installation configuration file
   6.8.7.1. Installation configuration parameters
      6.8.7.1.1. Required configuration parameters
      6.8.7.1.2. Network configuration parameters
      6.8.7.1.3. Optional configuration parameters
      6.8.7.1.4. Additional Azure configuration parameters
   6.8.7.2. Minimum resource requirements for cluster installation
   6.8.7.3. Sample customized install-config.yaml file for Azure
   6.8.7.4. Configuring the cluster-wide proxy during installation
6.8.8. Enabling Accelerated Networking during installation
6.8.9. Deploying the cluster
6.8.10. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.8.11. Logging in to the cluster by using the CLI
6.8.12. Telemetry access for OpenShift Container Platform
6.8.13. Next steps

6.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION
6.9.1. Prerequisites
6.9.2. Azure government regions
6.9.3. Private clusters
   6.9.3.1. Private clusters in Azure
      6.9.3.1.1. Limitations
   6.9.3.2. User-defined outbound routing
      Private cluster with network address translation
      Private cluster with Azure Firewall
      Private cluster with a proxy configuration
      Private cluster with no internet access
6.9.4. About reusing a VNet for your OpenShift Container Platform cluster
   6.9.4.1. Requirements for using your VNet
      6.9.4.1.1. Network security group requirements
   6.9.4.2. Division of permissions
   6.9.4.3. Isolation between clusters
6.9.5. Internet access for OpenShift Container Platform
6.9.6. Generating a key pair for cluster node SSH access
6.9.7. Obtaining the installation program
6.9.8. Manually creating the installation configuration file
   6.9.8.1. Installation configuration parameters
      6.9.8.1.1. Required configuration parameters
      6.9.8.1.2. Network configuration parameters
      6.9.8.1.3. Optional configuration parameters
      6.9.8.1.4. Additional Azure configuration parameters
   6.9.8.2. Minimum resource requirements for cluster installation
   6.9.8.3. Sample customized install-config.yaml file for Azure
   6.9.8.4. Configuring the cluster-wide proxy during installation
6.9.9. Enabling Accelerated Networking during installation
6.9.10. Deploying the cluster
6.9.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.9.12. Logging into the cluster by using the CLI
6.9.13. Telemetry access for OpenShift Container Platform
6.9.14. Next steps

6.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES
6.10.1. Prerequisites
6.10.2. Internet access for OpenShift Container Platform
6.10.3. Configuring your Azure project
   6.10.3.1. Azure account limits
   6.10.3.2. Configuring a public DNS zone in Azure
   6.10.3.3. Increasing Azure account limits
   6.10.3.4. Certificate signing requests management
   6.10.3.5. Required Azure roles
   6.10.3.6. Creating a service principal
   6.10.3.7. Supported Azure regions
      Supported Azure public regions
      Supported Azure Government regions
6.10.4. Requirements for a cluster with user-provisioned infrastructure
   6.10.4.1. Required machines for cluster installation
   6.10.4.2. Minimum resource requirements for cluster installation
6.10.5. Obtaining the installation program
6.10.6. Generating a key pair for cluster node SSH access
6.10.7. Creating the installation files for Azure
   6.10.7.1. Optional: Creating a separate /var partition
   6.10.7.2. Creating the installation configuration file
   6.10.7.3. Configuring the cluster-wide proxy during installation
   6.10.7.4. Exporting common variables for ARM templates
   6.10.7.5. Creating the Kubernetes manifest and Ignition config files
6.10.8. Creating the Azure resource group
6.10.9. Uploading the RHCOS cluster image and bootstrap Ignition config file
6.10.10. Example for creating DNS zones
6.10.11. Creating a VNet in Azure
   6.10.11.1. ARM template for the VNet
6.10.12. Deploying the RHCOS cluster image for the Azure infrastructure
   6.10.12.1. ARM template for image storage
6.10.13. Networking requirements for user-provisioned infrastructure
   6.10.13.1. Network connectivity requirements
   6.10.14.1. ARM template for the network and load balancers
6.10.15. Creating the bootstrap machine in Azure
   6.10.15.1. ARM template for the bootstrap machine
6.10.16. Creating the control plane machines in Azure
   6.10.16.1. ARM template for control plane machines
6.10.17. Wait for bootstrap completion and remove bootstrap resources in Azure
6.10.18. Creating additional worker machines in Azure
   6.10.18.1. ARM template for worker machines
6.10.19. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
6.10.20. Logging in to the cluster by using the CLI
6.10.21. Approving the certificate signing requests for your machines
6.10.22. Adding the Ingress DNS records
6.10.23. Completing an Azure installation on user-provisioned infrastructure
6.10.24. Telemetry access for OpenShift Container Platform
6.11. UNINSTALLING A CLUSTER ON AZURE
6.11.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 7. INSTALLING ON AZURE STACK HUB ............................................. 821
7.1. PREPARING TO INSTALL ON AZURE STACK HUB 821
7.1.1. Prerequisites 821
7.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub 821
7.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub 821
7.1.3.1. Installing a cluster on installer-provisioned infrastructure 821
7.1.3.2. Installing a cluster on user-provisioned infrastructure 821
7.1.4. Next steps 821
7.2. CONFIGURING AN AZURE STACK HUB ACCOUNT 822
7.2.1. Azure Stack Hub account limits 822
7.2.2. Configuring a DNS zone in Azure Stack Hub 823
7.2.3. Required Azure Stack Hub roles 823
7.2.4. Creating a service principal 824
7.2.5. Next steps 826
7.3. INSTALLING A CLUSTER ON AZURE STACK HUB WITH AN INSTALLER-PROVISIONED INFRASTRUCTURE 826
7.3.1. Prerequisites 827
7.3.2. Internet access for OpenShift Container Platform 827
7.3.3. Generating a key pair for cluster node SSH access 827
7.3.4. Uploading the RHCOS cluster image 829
7.3.5. Obtaining the installation program 830
7.3.6. Manually creating the installation configuration file 831
7.3.6.1. Installation configuration parameters 832
7.3.6.1.1. Required configuration parameters 832
7.3.6.1.2. Network configuration parameters 833
7.3.6.1.3. Optional configuration parameters 835
7.3.6.1.4. Additional Azure Stack Hub configuration parameters 840
7.3.6.2. Sample customized install-config.yaml file for Azure Stack Hub 841
7.3.7. Manually manage cloud credentials 843
7.3.8. Configuring the cluster to use an internal CA 845
7.3.9. Deploying the cluster 845
7.3.10. Installing the OpenShift CLI by downloading the binary 847
    Installing the OpenShift CLI on Linux 847
    Installing the OpenShift CLI on Windows 847
    Installing the OpenShift CLI on macOS 848
7.3.11. Logging in to the cluster by using the CLI 848
7.3.12. Logging in to the cluster by using the web console 849
7.3.13. Telemetry access for OpenShift Container Platform 850
7.3.14. Next steps 850
7.4. INSTALLING A CLUSTER ON AZURE STACK HUB WITH NETWORK CUSTOMIZATIONS 850
7.4.1. Prerequisites 850
7.4.2. Internet access for OpenShift Container Platform 851
7.4.3. Generating a key pair for cluster node SSH access 851
7.4.4. Uploading the RHCOS cluster image 853
7.4.5. Obtaining the installation program
7.4.6. Manually creating the installation configuration file
  7.4.6.1. Installation configuration parameters
    7.4.6.1.1. Required configuration parameters
    7.4.6.1.2. Network configuration parameters
    7.4.6.1.3. Optional configuration parameters
    7.4.6.1.4. Additional Azure Stack Hub configuration parameters
  7.4.6.2. Sample customized install-config.yaml file for Azure Stack Hub
7.4.7. Manually manage cloud credentials
7.4.8. Configuring the cluster to use an internal CA
7.4.9. Network configuration phases
7.4.10. Specifying advanced network configuration
7.4.11. Cluster Network Operator configuration
  7.4.11.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
7.4.12. Configuring hybrid networking with OVN-Kubernetes
7.4.13. Deploying the cluster
7.4.14. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
7.4.15. Logging in to the cluster by using the CLI
7.4.16. Logging in to the cluster by using the web console
7.4.17. Telemetry access for OpenShift Container Platform
7.4.18. Next steps

7.5. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES
7.5.1. Prerequisites
7.5.2. Internet access for OpenShift Container Platform
7.5.3. Configuring your Azure Stack Hub project
  7.5.3.1. Azure Stack Hub account limits
  7.5.3.2. Configuring a DNS zone in Azure Stack Hub
  7.5.3.3. Certificate signing requests management
  7.5.3.4. Required Azure Stack Hub roles
  7.5.3.5. Creating a service principal
7.5.4. Obtaining the installation program
7.5.5. Generating a key pair for cluster node SSH access
7.5.6. Creating the installation files for Azure Stack Hub
  7.5.6.1. Manually creating the installation configuration file
    7.5.6.2. Sample customized install-config.yaml file for Azure Stack Hub
    7.5.6.3. Configuring the cluster-wide proxy during installation
    7.5.6.4. Exporting common variables for ARM templates
    7.5.6.5. Creating the Kubernetes manifest and Ignition config files
    7.5.6.6. Optional: Creating a separate /var partition
7.5.7. Creating the Azure resource group
7.5.8. Uploading the RHCOS cluster image and bootstrap Ignition config file
7.5.9. Example for creating DNS zones
7.5.10. Creating a VNet in Azure Stack Hub
  7.5.10.1. ARM template for the VNet
7.5.11. Deploying the RHCOS cluster image for the Azure Stack Hub infrastructure
  7.5.11.1. ARM template for image storage
7.5.12. Networking requirements for user-provisioned infrastructure
7.5.12.1. Network connectivity requirements
7.5.13. Creating networking and load balancing components in Azure Stack Hub
7.5.13.1. ARM template for the network and load balancers
7.5.14. Creating the bootstrap machine in Azure Stack Hub
7.5.14.1. ARM template for the bootstrap machine
7.5.15. Creating the control plane machines in Azure Stack Hub
7.5.15.1. ARM template for control plane machines
7.5.16. Wait for bootstrap completion and remove bootstrap resources in Azure Stack Hub
7.5.17. Creating additional worker machines in Azure Stack Hub
7.5.17.1. ARM template for worker machines
7.5.18. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
7.5.19. Logging in to the cluster by using the CLI
7.5.20. Approving the certificate signing requests for your machines
7.5.21. Adding the Ingress DNS records
7.5.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure
7.6. UNINSTALLING A CLUSTER ON AZURE STACK HUB
    Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 8. INSTALLING ON GCP ............................................................... 924
8.1. PREPARING TO INSTALL ON GCP ............................................. 924
    8.1.1. Prerequisites ................................................................. 924
    8.1.2. Requirements for installing OpenShift Container Platform on GCP
    8.1.3. Choosing a method to install OpenShift Container Platform on GCP
        8.1.3.1. Installing a cluster on installer-provisioned infrastructure
        8.1.3.2. Installing a cluster on user-provisioned infrastructure
    8.1.4. Next steps ................................................................. 925
8.2. CONFIGURING A GCP PROJECT .................................................. 926
    8.2.1. Creating a GCP project .................................................. 926
    8.2.2. Enabling API services in GCP .......................................... 927
    8.2.3. Configuring DNS for GCP .............................................. 927
    8.2.4. GCP account limits ...................................................... 927
    8.2.5. Creating a service account in GCP ................................... 927
        8.2.5.1. Required GCP permissions .................................... 928
        8.2.6. Supported GCP regions ............................................. 930
    8.2.7. Next steps ................................................................. 931
8.3. MANUALLY CREATING IAM FOR GCP .................................... 932
    8.3.1. Alternatives to storing administrator-level secrets in the kube-system project
    8.3.2. Manually create IAM .................................................. 932
    8.3.3. Admin credentials root secret format ................................ 933
    8.3.4. Mint mode ............................................................... 934
    8.3.5. Mint mode with removal or rotation of the administrator-level credential
    8.3.6. Next steps ............................................................... 936
8.4. INSTALLING A CLUSTER QUICKLY ON GCP .......................... 937
    8.4.1. Prerequisites ............................................................. 937
    8.4.2. Internet access for OpenShift Container Platform ............... 937
    8.4.3. Generating a key pair for cluster node SSH access ............ 938
    8.4.4. Obtaining the installation program ................................ 938
    8.4.5. Deploying the cluster ................................................ 939
    8.4.6. Installing the OpenShift CLI by downloading the binary .... 940
8.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS

8.5.1. Prerequisites
8.5.2. Internet access for OpenShift Container Platform
8.5.3. Generating a key pair for cluster node SSH access
8.5.4. Obtaining the installation program
8.5.5. Creating the installation configuration file
   8.5.5.1. Installation configuration parameters
      8.5.5.1.1. Required configuration parameters
      8.5.5.1.2. Network configuration parameters
      8.5.5.1.3. Optional configuration parameters
      8.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.5.5.2. Minimum resource requirements for cluster installation
8.5.5.3. Sample customized install-config.yaml file for GCP
8.5.6. Additional resources
   8.5.6.1. Configuring the cluster-wide proxy during installation
8.5.7. Deploying the cluster
8.5.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
8.5.9. Logging in to the cluster by using the CLI
8.5.10. Telemetry access for OpenShift Container Platform
8.5.11. Next steps

8.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS

8.6.1. Prerequisites
8.6.2. Internet access for OpenShift Container Platform
8.6.3. Generating a key pair for cluster node SSH access
8.6.4. Obtaining the installation program
8.6.5. Creating the installation configuration file
   8.6.5.1. Installation configuration parameters
      8.6.5.1.1. Required configuration parameters
      8.6.5.1.2. Network configuration parameters
      8.6.5.1.3. Optional configuration parameters
      8.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.6.5.2. Minimum resource requirements for cluster installation
8.6.5.3. Sample customized install-config.yaml file for GCP
8.6.6. Additional resources
   8.6.6.1. Configuring the cluster-wide proxy during installation
8.6.7. Network configuration phases
8.6.8. Specifying advanced network configuration
8.6.9. Cluster Network Operator configuration
   8.6.9.1. Cluster Network Operator configuration object
      defaultNetwork object configuration
      Configuration for the OpenShift SDN CNI cluster network provider
      Configuration for the OVN-Kubernetes CNI cluster network provider
      kubeProxyConfig object configuration
8.6.10. Deploying the cluster
8.6.11. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS

8.6.12. Logging in to the cluster by using the CLI

8.6.13. Telemetry access for OpenShift Container Platform

8.6.14. Next steps

8.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK

8.7.1. Prerequisites
8.7.2. About installations in restricted networks
8.7.2.1. Additional limits
8.7.3. Internet access for OpenShift Container Platform
8.7.4. Generating a key pair for cluster node SSH access
8.7.5. Creating the installation configuration file
8.7.5.1. Installation configuration parameters
8.7.5.1.1. Required configuration parameters
8.7.5.1.2. Network configuration parameters
8.7.5.1.3. Optional configuration parameters
8.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.7.5.2. Minimum resource requirements for cluster installation
8.7.5.3. Sample customized install-config.yaml file for GCP
8.7.5.4. Create an Ingress Controller with global access on GCP
8.7.5.5. Configuring the cluster-wide proxy during installation
8.7.6. Deploying the cluster
8.7.7. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
8.7.8. Logging in to the cluster by using the CLI
8.7.9. Disabling the default OperatorHub sources
8.7.10. Telemetry access for OpenShift Container Platform
8.7.11. Next steps

8.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC

8.8.1. Prerequisites
8.8.2. About using a custom VPC
8.8.2.1. Requirements for using your VPC
8.8.2.2. VPC validation
8.8.2.3. Division of permissions
8.8.2.4. Isolation between clusters
8.8.3. Internet access for OpenShift Container Platform
8.8.4. Generating a key pair for cluster node SSH access
8.8.5. Obtaining the installation program
8.8.6. Creating the installation configuration file
8.8.6.1. Installation configuration parameters
8.8.6.1.1. Required configuration parameters
8.8.6.1.2. Network configuration parameters
8.8.6.1.3. Optional configuration parameters
8.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.8.6.2. Minimum resource requirements for cluster installation
8.8.6.3. Sample customized install-config.yaml file for GCP
8.8.6.4. Create an Ingress Controller with global access on GCP
8.8.7. Additional resources
8.8.7.1. Configuring the cluster-wide proxy during installation
8.8.8. Deploying the cluster
8.8.9. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
8.8.10. Logging in to the cluster by using the CLI
8.8.11. Telemetry access for OpenShift Container Platform
8.8.12. Next steps

8.9. INSTALLING A PRIVATE CLUSTER ON GCP
8.9.1. Prerequisites
8.9.2. Private clusters
  8.9.2.1. Private clusters in GCP
  8.9.2.1.1. Limitations
8.9.3. About using a custom VPC
  8.9.3.1. Requirements for using your VPC
  8.9.3.2. Division of permissions
  8.9.3.3. Isolation between clusters
8.9.4. Internet access for OpenShift Container Platform
8.9.5. Generating a key pair for cluster node SSH access
8.9.6. Obtaining the installation program
8.9.7. Manually creating the installation configuration file
  8.9.7.1. Installation configuration parameters
    8.9.7.1.1. Required configuration parameters
    8.9.7.1.2. Network configuration parameters
    8.9.7.1.3. Optional configuration parameters
    8.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters
  8.9.7.2. Minimum resource requirements for cluster installation
  8.9.7.3. Sample customized install-config.yaml file for GCP
  8.9.7.4. Create an Ingress Controller with global access on GCP
8.9.8. Additional resources
  8.9.8.1. Configuring the cluster-wide proxy during installation
8.9.9. Deploying the cluster
8.9.10. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
8.9.11. Logging in to the cluster by using the CLI
8.9.12. Telemetry access for OpenShift Container Platform
8.9.13. Next steps

8.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES
8.10.1. Prerequisites
8.10.2. Certificate signing requests management
8.10.3. Internet access for OpenShift Container Platform
8.10.4. Configuring your GCP project
  8.10.4.1. Creating a GCP project
  8.10.4.2. Enabling API services in GCP
  8.10.4.3. Configuring DNS for GCP
  8.10.4.4. GCP account limits
  8.10.4.5. Creating a service account in GCP
    8.10.4.5.1. Required GCP permissions
    8.10.4.6. Supported GCP regions
  8.10.4.7. Installing and configuring CLI tools for GCP
8.10.13. Next steps
8.10.5. Requirements for a cluster with user-provisioned infrastructure
8.10.5.1. Required machines for cluster installation
8.10.5.2. Minimum resource requirements for cluster installation
8.10.6. Creating the installation files for GCP
8.10.6.1. Optional: Creating a separate /var partition
8.10.6.2. Creating the installation configuration file
8.10.6.3. Configuring the cluster-wide proxy during installation
8.10.6.4. Creating the Kubernetes manifest and Ignition config files
8.10.7. Exporting common variables
8.10.7.1. Extracting the infrastructure name
8.10.7.2. Exporting common variables for Deployment Manager templates
8.10.8. Creating a VPC in GCP
8.10.8.1. Deployment Manager template for the VPC
8.10.9. Networking requirements for user-provisioned infrastructure
8.10.9.1. Setting the cluster node hostnames through DHCP
8.10.9.2. Network connectivity requirements
8.10.10. Creating load balancers in GCP
8.10.10.1. Deployment Manager template for the external load balancer
8.10.10.2. Deployment Manager template for the internal load balancer
8.10.11. Creating a private DNS zone in GCP
8.10.11.1. Deployment Manager template for the private DNS
8.10.12. Creating firewall rules in GCP
8.10.12.1. Deployment Manager template for firewall rules
8.10.13. Creating IAM roles in GCP
8.10.13.1. Deployment Manager template for IAM roles
8.10.14. Creating the RHCOS cluster image for the GCP infrastructure
8.10.15. Creating the bootstrap machine in GCP
8.10.15.1. Deployment Manager template for the bootstrap machine
8.10.16. Creating the control plane machines in GCP
8.10.16.1. Deployment Manager template for control plane machines
8.10.17. Wait for bootstrap completion and remove bootstrap resources in GCP
8.10.18. Creating additional worker machines in GCP
8.10.18.1. Deployment Manager template for worker machines
8.10.19. Installing the OpenShift CLI by downloading the binary
8.10.20. Logging in to the cluster by using the CLI
8.10.21. Approving the certificate signing requests for your machines
8.10.22. Optional: Adding the ingress DNS records
8.10.23. Completing a GCP installation on user-provisioned infrastructure
8.10.24. Telemetry access for OpenShift Container Platform
8.10.25. Next steps
8.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES
8.11.1. Prerequisites
8.11.2. Certificate signing requests management
8.11.3. Internet access for OpenShift Container Platform
8.11.4. Configuring the GCP project that hosts your cluster
8.11.4.1. Creating a GCP project
8.11.4.2. Enabling API services in GCP
8.11.4.3. GCP account limits
8.11.4.4. Creating a service account in GCP
8.11.4.4.1. Required GCP permissions
8.11.4.5. Supported GCP regions
8.11.4.6. Installing and configuring CLI tools for GCP
8.11.5. Requirements for a cluster with user-provisioned infrastructure
8.11.5.1. Required machines for cluster installation
8.11.5.2. Minimum resource requirements for cluster installation
8.11.6. Configuring the GCP project that hosts your shared VPC network
8.11.6.1. Configuring DNS for GCP
8.11.6.2. Creating a VPC in GCP
8.11.6.2.1. Deployment Manager template for the VPC
8.11.7. Creating the installation files for GCP
8.11.7.1. Manually creating the installation configuration file
8.11.7.2. Sample customized install-config.yaml file for GCP
8.11.7.3. Configuring the cluster-wide proxy during installation
8.11.7.4. Creating the Kubernetes manifest and Ignition config files
8.11.8. Exporting common variables
8.11.8.1. Extracting the infrastructure name
8.11.8.2. Exporting common variables for Deployment Manager templates
8.11.9. Networking requirements for user-provisioned infrastructure
8.11.9.1. Setting the cluster node hostnames through DHCP
8.11.9.2. Network connectivity requirements
8.11.10. Creating load balancers in GCP
8.11.10.1. Deployment Manager template for the external load balancer
8.11.10.2. Deployment Manager template for the internal load balancer
8.11.11. Creating a private DNS zone in GCP
8.11.11.1. Deployment Manager template for the private DNS
8.11.12. Creating firewall rules in GCP
8.11.12.1. Deployment Manager template for firewall rules
8.11.13. Creating IAM roles in GCP
8.11.13.1. Deployment Manager template for IAM roles
8.11.14. Creating the RHOS cluster image for the GCP infrastructure
8.11.15. Creating the bootstrap machine in GCP
8.11.15.1. Deployment Manager template for the bootstrap machine
8.11.16. Creating the control plane machines in GCP
8.11.16.1. Deployment Manager template for control plane machines
8.11.17. Wait for bootstrap completion and remove bootstrap resources in GCP
8.11.18. Creating additional worker machines in GCP
8.11.18.1. Deployment Manager template for worker machines
8.11.19. Installing the OpenShift CLI by downloading the binary
8.11.20. Logging in to the cluster by using the CLI
8.11.21. Approving the certificate signing requests for your machines
8.11.22. Adding the ingress DNS records
8.11.23. Adding ingress firewall rules
8.11.23.1. Creating cluster-wide firewall rules for a shared VPC in GCP
8.11.24. Completing a GCP installation on user-provisioned infrastructure
8.11.25. Telemetry access for OpenShift Container Platform
8.11.26. Next steps
8.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
8.12.1. Prerequisites
8.12.2. About installations in restricted networks
8.12.2.1. Additional limits
8.12.3. Internet access for OpenShift Container Platform
8.12.4. Configuring your GCP project
8.12.4.1. Creating a GCP project
8.12.4.2. Enabling API services in GCP
8.12.4.3. Configuring DNS for GCP
8.12.4.4. GCP account limits
8.12.4.5. Creating a service account in GCP
8.12.4.5.1. Required GCP permissions
8.12.4.6. Supported GCP regions
8.12.4.7. Installing and configuring CLI tools for GCP
8.12.5. Requirements for a cluster with user-provisioned infrastructure
8.12.5.1. Required machines for cluster installation
8.12.5.2. Minimum resource requirements for cluster installation
8.12.6. Creating the installation files for GCP
8.12.6.1. Optional: Creating a separate /var partition
8.12.6.2. Creating the installation configuration file
8.12.6.3. Configuring the cluster-wide proxy during installation
8.12.6.4. Creating the Kubernetes manifest and Ignition config files
8.12.7. Exporting common variables
8.12.7.1. Extracting the infrastructure name
8.12.7.2. Exporting common variables for Deployment Manager templates
8.12.8. Creating a VPC in GCP
8.12.8.1. Deployment Manager template for the VPC
8.12.9. Networking requirements for user-provisioned infrastructure
8.12.9.1. Setting the cluster node hostnames through DHCP
8.12.9.2. Network connectivity requirements
8.12.10. Creating load balancers in GCP
8.12.10.1. Deployment Manager template for the external load balancer
8.12.10.2. Deployment Manager template for the internal load balancer
8.12.11. Creating a private DNS zone in GCP
8.12.11.1. Deployment Manager template for the private DNS
8.12.12.1. Deployment Manager template for firewall rules
8.12.13. Creating IAM roles in GCP
8.12.13.1. Deployment Manager template for IAM roles
8.12.14. Creating the RHCOS cluster image for the GCP infrastructure
8.12.15. Creating the bootstrap machine in GCP
8.12.15.1. Deployment Manager template for the bootstrap machine
8.12.16. Creating the control plane machines in GCP
8.12.16.1. Deployment Manager template for control plane machines
8.12.17. Wait for bootstrap completion and remove bootstrap resources in GCP
8.12.18. Creating additional worker machines in GCP
8.12.18.1. Deployment Manager template for worker machines
8.12.19. Logging in to the cluster by using the CLI
8.12.20. Disabling the default OperatorHub sources
8.12.21. Approving the certificate signing requests for your machines
8.12.22. Optional: Adding the ingress DNS records
8.12.23. Completing a GCP installation on user-provisioned infrastructure
8.12.24. Telemetry access for OpenShift Container Platform
8.12.25. Next steps
8.13. UNINSTALLING A CLUSTER ON GCP
8.13.1. Removing a cluster that uses installer-provisioned infrastructure
8.13.2. Deleting GCP resources with the Cloud Credential Operator utility

CHAPTER 9. INSTALLING ON IBM CLOUD

9.1. PREPARING TO INSTALL ON IBM CLOUD
9.1.1. Prerequisites
9.1.2. Requirements for installing OpenShift Container Platform on IBM Cloud
9.1.3. Choosing a method to install OpenShift Container Platform on IBM Cloud
  9.1.3.1. Installing a cluster on installer-provisioned infrastructure
9.1.4. Next steps

9.2. CONFIGURING AN IBM CLOUD ACCOUNT
9.2.1. Prerequisites
9.2.2. Quotas and limits on IBM Cloud
  Virtual Private Cloud (VPC)
  Application load balancer
  Floating IP address
  Virtual Server Instances (VSI)
  Block Storage Volumes
9.2.3. Configuring DNS resolution using Cloud Internet Services
9.2.4. IBM Cloud IAM Policies and API Key
  9.2.4.1. Required access policies
  9.2.4.2. Access policy assignment
  9.2.4.3. Creating an API key
9.2.5. Supported IBM Cloud regions
9.2.6. Next steps

9.3. CONFIGURING IAM FOR IBM CLOUD
9.3.1. Alternatives to storing administrator-level secrets in the kube-system project
9.3.2. Configuring the Cloud Credential Operator utility
9.3.3. Next steps

9.4. INSTALLING A CLUSTER ON IBM CLOUD WITH CUSTOMIZATIONS
9.4.1. Prerequisites
9.4.2. Internet access for OpenShift Container Platform
9.4.3. Generating a key pair for cluster node SSH access
9.4.4. Obtaining the installation program
9.4.5. Exporting the IBM Cloud API key
9.4.6. Creating the installation configuration file
  9.4.6.1. Installation configuration parameters
    9.4.6.1.1. Required configuration parameters
    9.4.6.1.2. Network configuration parameters
    9.4.6.1.3. Optional configuration parameters
    9.4.6.1.4. Additional IBM Cloud configuration parameters
  9.4.6.2. Sample customized install-config.yaml file for IBM Cloud
  9.4.6.3. Configuring the cluster-wide proxy during installation
9.4.7. Manually creating IAM for IBM Cloud
9.4.8. Deploying the cluster
9.4.9. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
9.4.10. Logging in to the cluster by using the CLI
9.4.11. Telemetry access for OpenShift Container Platform
9.4.12. Next steps

9.5. INSTALLING A CLUSTER ON IBM CLOUD WITH NETWORK CUSTOMIZATIONS
9.5.1. Prerequisites
9.5.2. Internet access for OpenShift Container Platform
9.5.3. Generating a key pair for cluster node SSH access
9.5.4. Obtaining the installation program
9.5.5. Exporting the IBM Cloud API key
9.5.6. Creating the installation configuration file
  9.5.6.1. Installation configuration parameters
    9.5.6.1.1. Required configuration parameters
    9.5.6.1.2. Network configuration parameters
    9.5.6.1.3. Optional configuration parameters
    9.5.6.1.4. Additional IBM Cloud configuration parameters
  9.5.6.2. Sample customized install-config.yaml file for IBM Cloud
  9.5.6.3. Configuring the cluster-wide proxy during installation
9.5.7. Manually creating IAM for IBM Cloud
9.5.8. Network configuration phases
9.5.9. Specifying advanced network configuration
9.5.10. Cluster Network Operator configuration
  9.5.10.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
9.5.11. Deploying the cluster
9.5.12. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
9.5.13. Logging in to the cluster by using the CLI
9.5.14. Telemetry access for OpenShift Container Platform
9.5.15. Next steps
9.6. UNINSTALLING A CLUSTER ON IBM CLOUD
  9.6.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 10. INSTALLING ON BARE METAL

10.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION
  10.1.1. Prerequisites
  10.1.2. Choosing a method to install OpenShift Container Platform on bare metal
    10.1.2.1. Installing a cluster on installer-provisioned infrastructure
    10.1.2.2. Installing a cluster on user-provisioned infrastructure
10.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL
  10.2.1. Prerequisites
  10.2.2. Internet access for OpenShift Container Platform
  10.2.3. Requirements for a cluster with user-provisioned infrastructure
    10.2.3.1. Required machines for cluster installation
    10.2.3.2. Minimum resource requirements for cluster installation
    10.2.3.3. Certificate signing requests management
    10.2.3.4. Networking requirements for user-provisioned infrastructure
      10.2.3.4.1. Setting the cluster node hostnames through DHCP
      10.2.3.4.2. Network connectivity requirements
      NTP configuration for user-provisioned infrastructure
    10.2.3.5. User-provisioned DNS requirements
    10.2.3.5.1. Example DNS configuration for user-provisioned clusters
    10.2.3.6. Load balancing requirements for user-provisioned infrastructure
10.2.3.6.1. Example load balancer configuration for user-provisioned clusters
10.2.4. Preparing the user-provisioned infrastructure
10.2.5. Validating DNS resolution for user-provisioned infrastructure
10.2.6. Generating a key pair for cluster node SSH access
10.2.7. Obtaining the installation program
10.2.8. Installing the OpenShift CLI by downloading the binary
10.2.9. Manually creating the installation configuration file
10.2.9.1. Installation configuration parameters
10.2.9.1.1. Required configuration parameters
10.2.9.1.2. Network configuration parameters
10.2.9.1.3. Optional configuration parameters
10.2.9.2. Sample install-config.yaml file for bare metal
10.2.9.3. Configuring the cluster-wide proxy during installation
10.2.9.4. Configuring a three-node cluster
10.2.10. Creating the Kubernetes manifest and Ignition config files
10.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
10.2.11.1. Installing RHCOS by using an ISO image
10.2.11.2. Installing RHCOS by using PXE or iPXE booting
10.2.11.3. Advanced RHCOS installation configuration
10.2.11.3.1. Using advanced networking options for PXE and ISO installations
10.2.11.3.2. Disk partitioning
10.2.11.3.2.1. Creating a separate /var partition
10.2.11.3.2.2. Retaining existing partitions
10.2.11.3.3. Identifying Ignition configs
10.2.11.3.3.1. Customizing a live RHCOS ISO or PXE install
10.2.11.3.3.2. Customizing a live RHCOS ISO image
10.2.11.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority
10.2.11.3.3.2.2. Modifying a live install ISO image with customized network settings
10.2.11.3.3.3. Customizing a live RHCOS PXE environment
10.2.11.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority
10.2.11.3.3.3.2. Modifying a live install PXE environment with customized network settings
10.2.11.3.4. Advanced RHCOS installation reference
10.2.11.3.4.1. Networking and bonding options for ISO installations
10.2.11.3.4.2. coreos-installer options for ISO and PXE installations
10.2.11.3.4.3. coreos.inst boot options for ISO or PXE installations
10.2.11.4. Enabling multipathing with kernel arguments on RHCOS
10.2.11.5. Updating the bootloader using bootupd
10.2.12. Waiting for the bootstrap process to complete
10.2.13. Logging into the cluster by using the CLI
10.2.14. Approving the certificate signing requests for your machines
10.2.15. Initial Operator configuration
10.2.15.1. Image registry removed during installation
10.2.15.2. Image registry storage configuration
10.2.15.2.1. Configuring registry storage for bare metal and other manual installations
10.2.15.2.2. Configuring storage for the image registry in non-production clusters
10.2.15.2.3. Configuring block registry storage
10.2.16. Completing installation on user-provisioned infrastructure
10.2.17. Telemetry access for OpenShift Container Platform
10.2.18. Next steps

10.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS
10.3.1. Prerequisites
10.3.2. Internet access for OpenShift Container Platform
10.3.3. Requirements for a cluster with user-provisioned infrastructure
  10.3.3.1. Required machines for cluster installation
  10.3.3.2. Minimum resource requirements for cluster installation
  10.3.3.3. Certificate signing requests management
  10.3.3.4. Networking requirements for user-provisioned infrastructure
    10.3.3.4.1. Setting the cluster node hostnames through DHCP
    10.3.3.4.2. Network connectivity requirements
      NTP configuration for user-provisioned infrastructure
  10.3.3.5. User-provisioned DNS requirements
  10.3.3.6. Load balancing requirements for user-provisioned infrastructure
    10.3.3.6.1. Example load balancer configuration for user-provisioned clusters
10.3.4. Preparing the user-provisioned infrastructure
10.3.5. Validating DNS resolution for user-provisioned infrastructure
10.3.6. Generating a key pair for cluster node SSH access
10.3.7. Obtaining the installation program
10.3.8. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
10.3.9. Manually creating the installation configuration file
  10.3.9.1. Installation configuration parameters
    10.3.9.1.1. Required configuration parameters
    10.3.9.1.2. Network configuration parameters
    10.3.9.1.3. Optional configuration parameters
  10.3.9.2. Sample install-config.yaml file for bare metal
10.3.10. Network configuration phases
10.3.11. Specifying advanced network configuration
10.3.12. Cluster Network Operator configuration
  10.3.12.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
10.3.13. Creating the Ignition config files
10.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  10.3.14.1. Installing RHCOS by using an ISO image
  10.3.14.2. Installing RHCOS by using PXE or iPXE booting
  10.3.14.3. Advanced RHCOS installation configuration
    10.3.14.3.1. Using advanced networking options for PXE and ISO installations
    10.3.14.3.2. Disk partitioning
      10.3.14.3.2.1. Creating a separate /var partition
      10.3.14.3.2.2. Retaining existing partitions
    10.3.14.3.3. Identifying Ignition configs
      10.3.14.3.3.1. Customizing a live RHCOS ISO or PXE install
      10.3.14.3.3.2. Customizing a live RHCOS ISO image
      10.3.14.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority
      10.3.14.3.3.2.2. Modifying a live install ISO image with customized network settings
      10.3.14.3.3.3. Customizing a live RHCOS PXE environment
      10.3.14.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority
      10.3.14.3.3.3.2. Modifying a live install PXE environment with customized network settings
10.3.14.3. Advanced RHCOS installation reference
10.3.14.3.4. Networking and bonding options for ISO installations
10.3.14.3.4.2. coreos-installer options for ISO and PXE installations
10.3.14.3.4.3. coreos.inst boot options for ISO or PXE installations

10.3.14.4. Enabling multipathing with kernel arguments on RHCOS

10.3.14.5. Updating the bootloader using bootupd

10.3.15. Waiting for the bootstrap process to complete

10.3.16. Logging in to the cluster by using the CLI

10.3.17. Approving the certificate signing requests for your machines

10.3.18. Initial Operator configuration
10.3.18.1. Image registry removed during installation
10.3.18.2. Image registry storage configuration
10.3.18.3. Configuring block registry storage
10.3.19. Completing installation on user-provisioned infrastructure

10.3.20. Telemetry access for OpenShift Container Platform

10.3.21. Next steps

10.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK

10.4.1. Prerequisites

10.4.2. About installations in restricted networks
10.4.2.1. Additional limits

10.4.3. Internet access for OpenShift Container Platform

10.4.4. Requirements for a cluster with user-provisioned infrastructure
10.4.4.1. Required machines for cluster installation
10.4.4.2. Minimum resource requirements for cluster installation
10.4.4.3. Certificate signing requests management
10.4.4.4. Networking requirements for user-provisioned infrastructure
10.4.4.4.1. Setting the cluster node hostnames through DHCP
10.4.4.4.2. Network connectivity requirements
10.4.4.5. User-provisioned DNS requirements
10.4.4.5.1. Example DNS configuration for user-provisioned clusters
10.4.4.6. Load balancing requirements for user-provisioned infrastructure
10.4.4.6.1. Example load balancer configuration for user-provisioned clusters

10.4.5. Preparing the user-provisioned infrastructure

10.4.6. Validating DNS resolution for user-provisioned infrastructure

10.4.7. Generating a key pair for cluster node SSH access

10.4.8. Manually creating the installation configuration file

10.4.8.1. Installation configuration parameters
10.4.8.1.1. Required configuration parameters
10.4.8.1.2. Network configuration parameters
10.4.8.1.3. Optional configuration parameters
10.4.8.2. Sample install-config.yaml file for bare metal
10.4.8.3. Configuring the cluster-wide proxy during installation
10.4.8.4. Configuring a three-node cluster

10.4.9. Creating the Kubernetes manifest and Ignition config files

10.4.10. Configuring chrony time service

10.4.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
10.4.11.1. Installing RHCOS by using an ISO image
10.4.11.2. Installing RHCOS by using PXE or iPXE booting
10.4.11.3. Advanced RHCOS installation configuration
10.4.11.3.1. Using advanced networking options for PXE and ISO installations
10.4.11.3.2. Disk partitioning
10.4.11.3.2.1. Creating a separate /var partition
10.4.11.3.2.2. Retaining existing partitions
10.4.11.3.3. Identifying Ignition configs
10.4.11.3.3.1. Customizing a live RHCOS ISO or PXE install
10.4.11.3.3.2. Customizing a live RHCOS ISO image
10.4.11.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority
10.4.11.3.3.2.2. Modifying a live install ISO image with customized network settings
10.4.11.3.3.3. Customizing a live RHCOS PXE environment
10.4.11.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority
10.4.11.3.3.3.2. Modifying a live install PXE environment with customized network settings
10.4.11.3.4. Advanced RHCOS installation reference
10.4.11.3.4.1. Networking and bonding options for ISO installations
10.4.11.3.4.2. coreos-installer options for ISO and PXE installations
10.4.11.3.4.3. coreos.inst boot options for ISO or PXE installations
10.4.11.4. Enabling multipathing with kernel arguments on RHCOS
10.4.11.5. Updating the bootloader using bootupd
10.4.12. Waiting for the bootstrap process to complete
10.4.13. Logging in to the cluster by using the CLI
10.4.14. Approving the certificate signing requests for your machines
10.4.15. Initial Operator configuration
10.4.15.1. Disabling the default OperatorHub sources
10.4.15.2. Image registry storage configuration
10.4.15.2.1. Changing the image registry’s management state
10.4.15.2.2. Configuring registry storage for bare metal and other manual installations
10.4.15.2.3. Configuring storage for the image registry in non-production clusters
10.4.15.2.4. Configuring block registry storage
10.4.16. Completing installation on user-provisioned infrastructure
10.4.17. Telemetry access for OpenShift Container Platform
10.4.18. Next steps

CHAPTER 11. INSTALLING ON A SINGLE NODE
11.1. PREPARING TO INSTALL ON A SINGLE NODE
11.1.1. Prerequisites
11.1.2. About OpenShift on a single node
11.1.3. Requirements for installing OpenShift on a single node
11.2. INSTALLING OPENSHEET ON A SINGLE NODE
11.2.1. Generating the discovery ISO with the Assisted Installer
11.2.2. Generating the discovery ISO manually
11.2.3. Installing with USB media
11.2.4. Monitoring the installation with the Assisted Installer
11.2.5. Monitoring the installation manually

CHAPTER 12. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL
12.1. OVERVIEW
12.2. PREREQUISITES
12.2.1. Node requirements
12.2.2. Firmware requirements for installing with virtual media
12.2.3. Network requirements
12.2.3.1. Increase the network MTU
12.2.3.2. Configuring NICs
12.2.3.3. DNS requirements
12.2.3.4. Dynamic Host Configuration Protocol (DHCP) requirements
12.2.3.5. Reserving IP addresses for nodes with the DHCP server
12.2.3.6. Network Time Protocol (NTP)
12.2.3.7. Port access for the out-of-band management IP address
12.2.4. Configuring nodes
   Configuring nodes when using the provisioning network
   Configuring nodes without the provisioning network
   Configuring nodes for Secure Boot manually
12.2.5. Out-of-band management
12.2.6. Required data for installation
12.2.7. Validation checklist for nodes

12.3. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT INSTALLATION
12.3.1. Installing RHEL on the provisioner node
12.3.2. Preparing the provisioner node for OpenShift Container Platform installation
12.3.3. Retrieving the OpenShift Container Platform installer
12.3.4. Extracting the OpenShift Container Platform installer
12.3.5. (Optional) Creating an RHCOS images cache
12.3.6. Configuration files
   12.3.6.1. Configuring the install-config.yaml file
   12.3.6.2. (Optional) Setting proxy settings within the install-config.yaml file
   12.3.6.3. (Optional) Modifying the install-config.yaml file for no provisioning network
   12.3.6.4. (Optional) Modifying the install-config.yaml file for dual-stack network
   12.3.6.5. (Optional) Configuring host network interfaces in the install-config.yaml file
   12.3.6.6. (Optional) Configuring managed Secure Boot in the install-config.yaml file
   12.3.6.7. Additional install-config parameters
      Hosts
   12.3.6.8. BMC addressing
      IPMI
      Redfish network boot
   12.3.6.9. BMC addressing for Dell iDRAC
      BMC address formats for Dell iDRAC
      Redfish virtual media for Dell iDRAC
      Redfish network boot for iDRAC
   12.3.6.10. BMC addressing for HPE iLO
      Redfish virtual media for HPE iLO
      Redfish network boot for HPE iLO
   12.3.6.11. BMC addressing for Fujitsu iRMC
   12.3.6.12. Root device hints
   12.3.6.13. Creating the OpenShift Container Platform manifests
   12.3.6.14. (Optional) Configuring NTP for disconnected clusters
   12.3.6.15. (Optional) Configure network components to run on the control plane
   12.3.6.16. Configuring the BIOS for worker nodes
   12.3.6.17. Configuring RAID for worker nodes
   12.3.7. (Optional) Creating a disconnected registry
      12.3.7.1. Preparing the registry node to host the mirrored registry (optional)
      12.3.7.2. Generating the self-signed certificate (optional)
      12.3.7.3. Creating the registry podman container (optional)
      12.3.7.4. Copy and update the pull-secret (optional)
      12.3.7.5. Mirroring the repository (optional)
      12.3.7.6. Modify the install-config.yaml file to use the disconnected registry (optional)
   12.3.8. Deploying routers on worker nodes
   12.3.9. Validation checklist for installation
   12.3.10. Deploying the cluster via the OpenShift Container Platform installer
   12.3.11. Following the installation
   12.3.12. Verifying static IP address configuration

12.4. INSTALLER-PROVISIONED POST-INSTALLATION CONFIGURATION
12.4.1. (Optional) Configuring NTP for disconnected clusters 1620
12.4.2. Enabling a provisioning network after installation 1623
12.4.3. Configuring an external load balancer 1624

12.5. EXPANDING THE CLUSTER 1627
12.5.1. Preparing the bare metal node 1627
12.5.2. Preparing to deploy with Virtual Media on the baremetal network 1629
12.5.3. Diagnosing a duplicate MAC address when provisioning a new host in the cluster 1631
12.5.4. Provisioning the bare metal node 1632

12.6. TROUBLESHOOTING 1634
12.6.1. Troubleshooting the installer workflow 1634
12.6.2. Troubleshooting install-config.yaml 1636
12.6.3. Bootstrap VM issues 1637
12.6.3.1. Bootstrap VM cannot boot up the cluster nodes 1638
12.6.3.2. Inspecting logs 1639
12.6.4. Cluster nodes will not PXE boot 1640
12.6.5. The API is not accessible 1641
12.6.6. Cleaning up previous installations 1641
12.6.7. Issues with creating the registry 1642
12.6.8. Miscellaneous issues 1643
12.6.8.1. Addressing the runtime network not ready error 1643
12.6.8.2. Cluster nodes not getting the correct IPv6 address over DHCP 1644
12.6.8.3. Cluster nodes not getting the correct hostname over DHCP 1644
12.6.8.4. Routes do not reach endpoints 1646
12.6.8.5. Failed Ignition during Firstboot 1647
12.6.8.6. NTP out of sync 1647
12.6.9. Reviewing the installation 1649

CHAPTER 13. INSTALLING BARE METAL CLUSTERS ON IBM CLOUD 1650

13.1. PREREQUISITES 1650
13.1.1. Setting up IBM Cloud infrastructure 1650
Use one data center per cluster 1650
Create public and private VLANs 1650
Ensure subnets have sufficient IP addresses 1650
Configuring NICs 1651
Configuring canonical names 1652
Creating DNS entries 1652
Network Time Protocol (NTP) 1653
Configure a DHCP server 1653
Ensure BMC access privileges 1653
Create bare metal servers 1654

13.2. SETTING UP THE ENVIRONMENT FOR AN OPENSOURCE CONTAINER PLATFORM INSTALLATION 1654
13.2.1. Preparing the provisioner node for OpenShift Container Platform installation on IBM Cloud 1654
13.2.2. Configuring the public subnet 1658
13.2.3. Retrieving the OpenShift Container Platform installer 1660
13.2.4. Extracting the OpenShift Container Platform installer 1660
13.2.5. Configuring the install-config.yaml file 1661
13.2.6. Additional install-config parameters 1663
Hosts 1667
13.2.7. Root device hints 1668
13.2.8. Creating the OpenShift Container Platform manifests 1669
13.2.9. Deploying the cluster via the OpenShift Container Platform installer 1670
13.2.10. Following the installation 1670
CHAPTER 14. INSTALLING WITH Z/VM ON IBM Z AND LINUXONE

14.1. PREPARING TO INSTALL WITH Z/VM ON IBM Z AND LINUXONE

14.1.1. Prerequisites

14.1.2. Choosing a method to install OpenShift Container Platform with z/VM on IBM Z or LinuxONE

14.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE

14.2.1. Prerequisites

14.2.2. Internet access for OpenShift Container Platform

14.2.3. Requirements for a cluster with user-provisioned infrastructure

14.2.3.1. Required machines for cluster installation

14.2.3.2. Minimum resource requirements for cluster installation

14.2.3.3. Minimum IBM Z system environment

Hardware requirements
Operating system requirements
IBM Z network connectivity requirements
Disk storage for the z/VM guest virtual machines
Storage / Main Memory

14.2.3.4. Preferred IBM Z system environment

Hardware requirements
Operating system requirements
IBM Z network connectivity requirements
Disk storage for the z/VM guest virtual machines
Storage / Main Memory

14.2.3.5. Certificate signing requests management

14.2.3.6. Networking requirements for user-provisioned infrastructure

14.2.3.6.1. Network connectivity requirements

NTP configuration for user-provisioned infrastructure

14.2.3.7. User-provisioned DNS requirements

14.2.3.7.1. Example DNS configuration for user-provisioned clusters

14.2.3.8. Load balancing requirements for user-provisioned infrastructure

14.2.3.8.1. Example load balancer configuration for user-provisioned clusters

14.2.4. Preparing the user-provisioned infrastructure

14.2.5. Validating DNS resolution for user-provisioned infrastructure

14.2.6. Generating a key pair for cluster node SSH access

14.2.7. Obtaining the installation program

14.2.8. Installing the OpenShift CLI by downloading the binary

Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS

14.2.9. Manually creating the installation configuration file

14.2.9.1. Installation configuration parameters

14.2.9.1.1. Required configuration parameters

14.2.9.1.2. Network configuration parameters

14.2.9.1.3. Optional configuration parameters

14.2.9.2. Sample install-config.yaml file for IBM Z

14.2.9.3. Configuring the cluster-wide proxy during installation

14.2.9.4. Configuring a three-node cluster

14.2.10. Cluster Network Operator configuration

14.2.10.1. Cluster Network Operator configuration object

defaultNetwork object configuration
Configuration for the OpenShift SDN CNI cluster network provider
Configuration for the OVN-Kubernetes CNI cluster network provider
kubeProxyConfig object configuration

14.2.11. Creating the Kubernetes manifest and Ignition config files
14.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process

14.2.12.1. Advanced RHCOS installation reference

14.2.12.1.1. Networking and bonding options for ISO installations

14.2.13. Waiting for the bootstrap process to complete

14.2.14. Logging in to the cluster by using the CLI

14.2.15. Approving the certificate signing requests for your machines

14.2.16. Initial Operator configuration

14.2.16.1. Image registry storage configuration

14.2.16.1.1. Configuring registry storage for IBM Z

14.2.16.1.2. Configuring storage for the image registry in non-production clusters

14.2.17. Completing installation on user-provisioned infrastructure

14.2.18. Telemetry access for OpenShift Container Platform

14.2.19. Next steps

14.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK

14.3.1. Prerequisites

14.3.2. About installations in restricted networks

14.3.2.1. Additional limits

14.3.3. Internet access for OpenShift Container Platform

14.3.4. Requirements for a cluster with user-provisioned infrastructure

14.3.4.1. Required machines for cluster installation

14.3.4.2. Minimum resource requirements for cluster installation

14.3.4.3. Minimum IBM Z system environment

14.3.4.4. Preferred IBM Z system environment

14.3.4.5. Certificate signing requests management

14.3.4.6. Networking requirements for user-provisioned infrastructure

14.3.4.6.1. Setting the cluster node hostnames through DHCP

14.3.4.6.2. Network connectivity requirements

14.3.4.7. NTP configuration for user-provisioned infrastructure

14.3.4.8. Load balancing requirements for user-provisioned infrastructure

14.3.4.8.1. Example load balancer configuration for user-provisioned clusters

14.3.5. Preparing the user-provisioned infrastructure

14.3.6. Validating DNS resolution for user-provisioned infrastructure

14.3.7. Generating a key pair for cluster node SSH access

14.3.8. Manually creating the installation configuration file

14.3.8.1. Installation configuration parameters

14.3.8.1.1. Required configuration parameters

14.3.8.1.2. Network configuration parameters

14.3.8.1.3. Optional configuration parameters

14.3.8.2. Sample install-config.yaml file for IBM Z

14.3.8.3. Configuring the cluster-wide proxy during installation

14.3.8.4. Configuring a three-node cluster
14.3.9. Cluster Network Operator configuration
  14.3.9.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
14.3.10. Creating the Kubernetes manifest and Ignition config files
14.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  14.3.11.1. Advanced RHCOS installation reference
    14.3.11.1.1. Networking and bonding options for ISO installations
14.3.12. Waiting for the bootstrap process to complete
14.3.13. Logging in to the cluster by using the CLI
14.3.14. Approving the certificate signing requests for your machines
14.3.15. Initial Operator configuration
  14.3.15.1. Disabling the default OperatorHub sources
  14.3.15.2. Image registry storage configuration
    14.3.15.2.1. Configuring registry storage for IBM Z
    14.3.15.2.2. Configuring storage for the image registry in non-production clusters
14.3.16. Completing installation on user-provisioned infrastructure
14.3.17. Next steps

CHAPTER 15. INSTALLING WITH RHEL KVM ON IBM Z AND LINUXONE

15.1. PREPARING TO INSTALL WITH RHEL KVM ON IBM Z AND LINUXONE
  15.1.1. Prerequisites
  15.1.2. Choosing a method to install OpenShift Container Platform with RHEL KVM on IBM Z or LinuxONE

15.2. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE
  15.2.1. Prerequisites
  15.2.2. Internet access for OpenShift Container Platform
  15.2.3. Machine requirements for a cluster with user-provisioned infrastructure
    15.2.3.1. Required machines
    15.2.3.2. Network connectivity requirements
    15.2.3.3. IBM Z network connectivity requirements
    15.2.3.4. Host machine resource requirements
    15.2.3.5. Minimum IBM Z system environment
      Hardware requirements
      Operating system requirements
    15.2.3.6. Minimum resource requirements
    15.2.3.7. Preferred IBM Z system environment
      Hardware requirements
      Operating system requirements
    15.2.3.8. Preferred resource requirements
    15.2.3.9. Certificate signing requests management
    15.2.3.10. Networking requirements for user-provisioned infrastructure
      15.2.3.10.1. Setting the cluster node hostnames through DHCP
      15.2.3.10.2. Network connectivity requirements
        NTP configuration for user-provisioned infrastructure
    15.2.3.11. User-provisioned DNS requirements
      15.2.3.11.1. Example DNS configuration for user-provisioned clusters
    15.2.3.12. Load balancing requirements for user-provisioned infrastructure
      15.2.3.12.1. Example load balancer configuration for user-provisioned clusters
    15.2.4. Preparing the user-provisioned infrastructure
    15.2.5. Validating DNS resolution for user-provisioned infrastructure
15.2.6. Generating a key pair for cluster node SSH access
15.2.7. Obtaining the installation program
15.2.8. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
15.2.9. Manually creating the installation configuration file
  15.2.9.1. Installation configuration parameters
    15.2.9.1.1. Required configuration parameters
    15.2.9.1.2. Network configuration parameters
    15.2.9.1.3. Optional configuration parameters
  15.2.9.2. Sample install-config.yaml file for IBM Z
  15.2.9.3. Configuring the cluster-wide proxy during installation
  15.2.9.4. Configuring a three-node cluster
15.2.10. Cluster Network Operator configuration
  15.2.10.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
  15.2.10.2. Configuration for the OpenShift SDN CNI cluster network provider
  15.2.10.3. Configuration for the OVN-Kubernetes CNI cluster network provider
  15.2.10.4. kubeProxyConfig object configuration
15.2.11. Creating the Kubernetes manifest and Ignition config files
15.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  15.2.12.1. Fast-track installation by using a prepackaged QCOW2 disk image
  15.2.12.2. Full installation on a new QCOW2 disk image
  15.2.12.3. Advanced RHCOS installation reference
    15.2.12.3.1. Networking options for ISO installations
15.2.13. Waiting for the bootstrap process to complete
15.2.14. Logging in to the cluster by using the CLI
15.2.15. Approving the certificate signing requests for your machines
15.2.16. Initial Operator configuration
  15.2.16.1. Image registry storage configuration
    15.2.16.1.1. Configuring registry storage for IBM Z
    15.2.16.1.2. Configuring storage for the image registry in non-production clusters
  15.2.17. Completing installation on user-provisioned infrastructure
15.2.18. Telemetry access for OpenShift Container Platform
15.2.19. Next steps

15.3. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK

15.3.1. Prerequisites
15.3.2. About installations in restricted networks
  15.3.2.1. Additional limits
15.3.3. Internet access for OpenShift Container Platform
15.3.4. Machine requirements for a cluster with user-provisioned infrastructure
  15.3.4.1. Required machines
  15.3.4.2. Network connectivity requirements
  15.3.4.3. IBM Z network connectivity requirements
  15.3.4.4. Host machine resource requirements
  15.3.4.5. Minimum IBM Z system environment
    Hardware requirements
    Operating system requirements
  15.3.4.6. Minimum resource requirements
  15.3.4.7. Preferred IBM Z system environment
    Hardware requirements
Operating system requirements
15.3.4.8. Preferred resource requirements
15.3.4.9. Certificate signing requests management
15.3.4.10. Networking requirements for user-provisioned infrastructure
  15.3.4.10.1. Network connectivity requirements
    NTP configuration for user-provisioned infrastructure
15.3.4.11. User-provisioned DNS requirements
  15.3.4.11.1. Example DNS configuration for user-provisioned clusters
15.3.4.12. Load balancing requirements for user-provisioned infrastructure
  15.3.4.12.1. Example load balancer configuration for user-provisioned clusters
15.3.5. Preparing the user-provisioned infrastructure
15.3.6. Validating DNS resolution for user-provisioned infrastructure
15.3.7. Generating a key pair for cluster node SSH access
15.3.8. Manually creating the installation configuration file
  15.3.8.1. Installation configuration parameters
    15.3.8.1.1. Required configuration parameters
    15.3.8.1.2. Network configuration parameters
    15.3.8.1.3. Optional configuration parameters
  15.3.8.2. Sample install-config.yaml file for IBM Z
  15.3.8.3. Configuring the cluster-wide proxy during installation
  15.3.8.4. Configuring a three-node cluster
15.3.9. Cluster Network Operator configuration
  15.3.9.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
15.3.10. Creating the Kubernetes manifest and Ignition config files
15.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  15.3.11.1. Fast-track installation by using a prepackaged QCOW2 disk image
  15.3.11.2. Full installation on a new QCOW2 disk image
  15.3.11.3. Advanced RHCOS installation reference
  15.3.11.3.1. Networking options for ISO installations
15.3.12. Waiting for the bootstrap process to complete
15.3.13. Logging in to the cluster by using the CLI
15.3.14. Approving the certificate signing requests for your machines
15.3.15. Initial Operator configuration
  15.3.15.1. Disabling the default OperatorHub sources
  15.3.15.2. Image registry storage configuration
    15.3.15.2.1. Configuring registry storage for IBM Z
    15.3.15.2.2. Configuring storage for the image registry in non-production clusters
15.3.16. Completing installation on user-provisioned infrastructure
15.3.17. Next steps

CHAPTER 16. INSTALLING ON IBM POWER ................................................. 1915
16.1. PREPARING TO INSTALL ON IBM POWER ................................. 1915
  16.1.1. Prerequisites .................................................................. 1915
  16.1.2. Choosing a method to install OpenShift Container Platform on IBM Power 1915
16.2. INSTALLING A CLUSTER ON IBM POWER ................................. 1915
  16.2.1. Prerequisites ................................................................. 1915
  16.2.2. Internet access for OpenShift Container Platform .................. 1916
  16.2.3. Requirements for a cluster with user-provisioned infrastructure 1916
    16.2.3.1. Required machines for cluster installation .................. 1916
16.2.3.2. Minimum resource requirements for cluster installation

16.2.3.3. Minimum IBM Power requirements
   Hardware requirements
   Operating system requirements
   Disk storage for the IBM Power guest virtual machines
   Network for the PowerVM guest virtual machines
   Storage / main memory

16.2.3.4. Recommended IBM Power system requirements
   Hardware requirements
   Operating system requirements
   Disk storage for the IBM Power guest virtual machines
   Network for the PowerVM guest virtual machines
   Storage / main memory

16.2.3.5. Certificate signing requests management

16.2.3.6. Networking requirements for user-provisioned infrastructure
   16.2.3.6.1. Network connectivity requirements
      NTP configuration for user-provisioned infrastructure
   16.2.3.7. User-provisioned DNS requirements
   16.2.3.8. Load balancing requirements for user-provisioned infrastructure
      16.2.3.8.1. Example load balancer configuration for user-provisioned clusters

16.2.4. Preparing the user-provisioned infrastructure

16.2.5. Validating DNS resolution for user-provisioned infrastructure

16.2.6. Generating a key pair for cluster node SSH access

16.2.7. Obtaining the installation program

16.2.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS

16.2.9. Manually creating the installation configuration file
   16.2.9.1. Installation configuration parameters
      16.2.9.1.1. Required configuration parameters
      16.2.9.1.2. Network configuration parameters
      16.2.9.1.3. Optional configuration parameters
   16.2.9.2. Sample install-config.yaml file for IBM Z
   16.2.9.3. Sample install-config.yaml file for IBM Power
   16.2.9.4. Configuring the cluster-wide proxy during installation
   16.2.9.5. Configuring a three-node cluster

16.2.10. Cluster Network Operator configuration
   16.2.10.1. Cluster Network Operator configuration object
      defaultNetwork object configuration
      Configuration for the OpenShift SDN CNI cluster network provider
      Configuration for the OVN-Kubernetes CNI cluster network provider
      kubeProxyConfig object configuration

16.2.11. Creating the Kubernetes manifest and Ignition config files

16.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
   16.2.12.1. Installing RHCOS by using an ISO image
   16.2.12.1.1. Advanced RHCOS installation reference
      16.2.12.1.1.1. Networking and bonding options for ISO installations
   16.2.12.2. Installing RHCOS by using PXE booting
   16.2.12.3. Enabling multipathing with kernel arguments on RHCOS
   16.2.13. Waiting for the bootstrap process to complete
   16.2.14. Logging in to the cluster by using the CLI
16.2.15. Approving the certificate signing requests for your machines
16.2.16. Initial Operator configuration
16.2.16.1. Image registry storage configuration
  16.2.16.1.1. Configuring registry storage for IBM Z
  16.2.16.1.2. Configuring registry storage for IBM Power
  16.2.16.1.3. Configuring storage for the image registry in non-production clusters
16.2.17. Completing installation on user-provisioned infrastructure
16.2.18. Telemetry access for OpenShift Container Platform
16.2.19. Next steps

16.3. INSTALLING A CLUSTER ON IBM POWER IN A RESTRICTED NETWORK
16.3.1. Prerequisites
16.3.2. About installations in restricted networks
  16.3.2.1. Additional limits
16.3.3. Internet access for OpenShift Container Platform
16.3.4. Requirements for a cluster with user-provisioned infrastructure
  16.3.4.1. Required machines for cluster installation
  16.3.4.2. Minimum resource requirements for cluster installation
  16.3.4.3. Minimum IBM Power requirements
    Hardware requirements
    Operating system requirements
    Disk storage for the IBM Power guest virtual machines
    Network for the PowerVM guest virtual machines
    Storage / main memory
  16.3.4.4. Recommended IBM Power system requirements
    Hardware requirements
    Operating system requirements
    Disk storage for the IBM Power guest virtual machines
    Network for the PowerVM guest virtual machines
    Storage / main memory
  16.3.4.5. Certificate signing requests management
  16.3.4.6. Networking requirements for user-provisioned infrastructure
    16.3.4.6.1. Network connectivity requirements
      NTP configuration for user-provisioned infrastructure
  16.3.4.7. User-provisioned DNS requirements
    16.3.4.7.1. Example DNS configuration for user-provisioned clusters
  16.3.4.8. Load balancing requirements for user-provisioned infrastructure
    16.3.4.8.1. Example load balancer configuration for user-provisioned clusters
16.3.5. Preparing the user-provisioned infrastructure
16.3.6. Validating DNS resolution for user-provisioned infrastructure
16.3.7. Generating a key pair for cluster node SSH access
16.3.8. Manually creating the installation configuration file
  16.3.8.1. Installation configuration parameters
    16.3.8.1.1. Required configuration parameters
    16.3.8.1.2. Network configuration parameters
    16.3.8.1.3. Optional configuration parameters
  16.3.8.2. Sample install-config.yaml file for IBM Z
  16.3.8.3. Sample install-config.yaml file for IBM Power
  16.3.8.4. Configuring the cluster-wide proxy during installation
  16.3.8.5. Configuring a three-node cluster
16.3.9. Cluster Network Operator configuration
  16.3.9.1. Cluster Network Operator configuration object
defaultNetwork object configuration
Configuration for the OpenShift SDN CNI cluster network provider
Configuration for the OVN-Kubernetes CNI cluster network provider
  kubeProxyConfig object configuration  2017
16.3.10. Creating the Kubernetes manifest and Ignition config files  2019
16.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process  2020
  16.3.11.1. Installing RHCOS by using an ISO image  2022
  16.3.11.1.1. Advanced RHCOS installation reference  2025
  16.3.11.1.2. Networking and bonding options for ISO installations  2026
  16.3.11.2. Installing RHCOS by using PXE booting  2030
  16.3.11.3. Enabling multipathing with kernel arguments on RHCOS  2033
16.3.12. Waiting for the bootstrap process to complete  2034
16.3.13. Logging in to the cluster by using the CLI  2035
16.3.14. Approving the certificate signing requests for your machines  2036
16.3.15. Initial Operator configuration  2038
  16.3.15.1. Disabling the default OperatorHub sources  2039
  16.3.15.2. Image registry storage configuration  2040
  16.3.15.2.1. Changing the image registry’s management state  2040
  16.3.15.2.2. Configuring registry storage for IBM Z  2040
  16.3.15.2.3. Configuring registry storage for IBM Power  2040
  16.3.15.2.4. Configuring storage for the image registry in non-production clusters  2042
16.3.16. Completing installation on user-provisioned infrastructure  2042
16.3.17. Next steps  2045

CHAPTER 17. INSTALLING ON OPENSTACK .......................................................... 2046
17.1. PREPARING TO INSTALL ON OPENSTACK  2046
  17.1.1. Prerequisites  2046
  17.1.2. Choosing a method to install OpenShift Container Platform on OpenStack  2046
  17.1.2.1. Installing a cluster on installer-provisioned infrastructure  2046
  17.1.2.2. Installing a cluster on user-provisioned infrastructure  2046
  17.1.3. Scanning RHOSP endpoints for legacy HTTPS certificates  2047
17.2. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS  2049
  17.2.1. Prerequisites  2049
  17.2.2. Resource guidelines for installing OpenShift Container Platform on RHOSP  2049
  17.2.2.1. Control plane and compute machines  2050
  17.2.2.2. Bootstrap machine  2051
  17.2.3. Internet access for OpenShift Container Platform  2051
  17.2.4. Enabling Swift on RHOSP  2051
  17.2.5. Verifying external network access  2052
  17.2.6. Defining parameters for the installation program  2053
  17.2.7. Setting cloud provider options  2054
  17.2.8. Obtaining the installation program  2056
  17.2.9. Creating the installation configuration file  2056
  17.2.9.1. Configuring the cluster-wide proxy during installation  2059
  17.2.10. Installation configuration parameters  2060
  17.2.10.1. Required configuration parameters  2060
  17.2.10.2. Network configuration parameters  2062
  17.2.10.3. Optional configuration parameters  2063
  17.2.10.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters  2068
  17.2.10.5. Optional RHOSP configuration parameters  2069
  17.2.10.6. Custom subnets in RHOSP deployments  2074
  17.2.10.7. Deploying a cluster with bare metal machines  2075
  17.2.10.8. Cluster deployment on RHOSP provider networks  2076
  17.2.10.8.1. RHOSP provider network requirements for cluster installation  2077
  17.2.10.8.2. Deploying a cluster that has a primary interface on a provider network  2079
17.2.10.9. Sample customized install-config.yaml file for RHOSP
17.2.11. Generating a key pair for cluster node SSH access
17.2.12. Enabling access to the environment
  17.2.12.1. Enabling access with floating IP addresses
  17.2.12.2. Completing installation without floating IP addresses
17.2.13. Deploying the cluster
17.2.14. Verifying cluster status
17.2.15. Logging in to the cluster by using the CLI
17.2.16. Telemetry access for OpenShift Container Platform
17.2.17. Next steps

17.3. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR
17.3.1. Prerequisites
17.3.2. About Kuryr SDN
17.3.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr
  17.3.3.1. Increasing quota
  17.3.3.2. Configuring Neutron
  17.3.3.3. Configuring Octavia
    17.3.3.3.1. The Octavia OVN Driver
  17.3.3.4. Known limitations of installing with Kuryr
    RHOSP general limitations
    RHOSP version limitations
    RHOSP environment limitations
    RHOSP upgrade limitations
  17.3.3.5. Control plane and compute machines
  17.3.3.6. Bootstrap machine
  17.3.4. Internet access for OpenShift Container Platform
  17.3.5. Enabling Swift on RHOSP
  17.3.6. Verifying external network access
  17.3.7. Defining parameters for the installation program
  17.3.8. Setting cloud provider options
  17.3.9. Obtaining the installation program
  17.3.10. Creating the installation configuration file
    17.3.10.1. Configuring the cluster-wide proxy during installation
  17.3.11. Installation configuration parameters
    17.3.11.1. Required configuration parameters
    17.3.11.2. Network configuration parameters
    17.3.11.3. Optional configuration parameters
    17.3.11.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
    17.3.11.5. Optional RHOSP configuration parameters
    17.3.11.6. Custom subnets in RHOSP deployments
    17.3.11.7. Sample customized install-config.yaml file for RHOSP with Kuryr
  17.3.11.8. Cluster deployment on RHOSP provider networks
    17.3.11.8.1. RHOSP provider network requirements for cluster installation
    17.3.11.8.2. Deploying a cluster that has a primary interface on a provider network
  17.3.11.9. Kuryr ports pools
  17.3.11.10. Adjusting Kuryr ports pools during installation
  17.3.12. Generating a key pair for cluster node SSH access
  17.3.13. Enabling access to the environment
    17.3.13.1. Enabling access with floating IP addresses
    17.3.13.2. Completing installation without floating IP addresses
  17.3.14. Deploying the cluster
  17.3.15. Verifying cluster status
  17.3.16. Logging in to the cluster by using the CLI
17.4. INSTALLING A CLUSTER ON OPENSTACK THAT SUPPORTS SR-IOV-CONNECTED COMPUTE MACHINES

17.4.1. Prerequisites

17.4.2. Resource guidelines for installing OpenShift Container Platform on RHOSP
  17.4.2.1. Control plane and compute machines
  17.4.2.2. Bootstrap machine

17.4.3. Internet access for OpenShift Container Platform

17.4.4. Enabling Swift on RHOSP

17.4.5. Verifying external network access

17.4.6. Defining parameters for the installation program

17.4.7. Obtaining the installation program

17.4.8. Creating the installation configuration file
  17.4.8.1. Configuring the cluster-wide proxy during installation

17.4.9. Installation configuration parameters
  17.4.9.1. Required configuration parameters
  17.4.9.2. Network configuration parameters
  17.4.9.3. Optional configuration parameters
  17.4.9.4. Custom subnets in RHOSP deployments
  17.4.9.5. Deploying a cluster with bare metal machines
  17.4.9.6. Sample customized install-config.yaml file for RHOSP

17.4.10. Generating a key pair for cluster node SSH access

17.4.11. Enabling access to the environment
  17.4.11.1. Enabling access with floating IP addresses
  17.4.11.2. Completing installation without floating IP addresses

17.4.12. Creating SR-IOV networks for compute machines

17.4.13. Deploying the cluster

17.4.14. Verifying cluster status

17.4.15. Logging in to the cluster by using the CLI

17.4.16. Preparing a cluster that runs on RHOSP for SR-IOV
  17.4.16.1. Enabling the RHOSP metadata service as a mountable drive
  17.4.16.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver

17.4.17. Telemetry access for OpenShift Container Platform

17.4.18. Next steps
17.5.9.5. Deploying a cluster with bare metal machines
17.5.9.6. Sample customized install-config.yaml file for RHOSP
17.5.10. Generating a key pair for cluster node SSH access
17.5.11. Enabling access to the environment
  17.5.11.1. Enabling access with floating IP addresses
  17.5.11.2. Completing installation without floating IP addresses
17.5.12. Creating SR-IOV networks for compute machines
17.5.13. Deploying the cluster
17.5.14. Verifying cluster status
17.5.15. Logging in to the cluster by using the CLI
17.5.16. Enabling the RHOSP metadata service as a mountable drive
17.5.17. Enabling the No-IOMMU feature for the RHOSP VFIO driver
17.5.18. Binding thevfio-pci kernel driver to NICs
17.5.19. Exposing the host-device interface to the pod
17.5.20. Telemetry access for OpenShift Container Platform
17.5.21. Additional resources
17.5.22. Next steps

17.6. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN INFRASTRUCTURE
17.6.1. Prerequisites
17.6.2. Internet access for OpenShift Container Platform
17.6.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
  17.6.3.1. Control plane and compute machines
  17.6.3.2. Bootstrap machine
17.6.4. Downloading playbook dependencies
17.6.5. Downloading the installation playbooks
17.6.6. Obtaining the installation program
17.6.7. Generating a key pair for cluster node SSH access
17.6.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
17.6.9. Verifying external network access
17.6.10. Enabling access to the environment
  17.6.10.1. Enabling access with floating IP addresses
  17.6.10.2. Completing installation without floating IP addresses
17.6.11. Defining parameters for the installation program
17.6.12. Creating the installation configuration file
17.6.13. Installation configuration parameters
  17.6.13.1. Required configuration parameters
  17.6.13.2. Network configuration parameters
  17.6.13.3. Optional configuration parameters
  17.6.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
  17.6.13.5. Optional RHOSP configuration parameters
  17.6.13.6. Custom subnets in RHOSP deployments
17.6.13.7. Sample customized install-config.yaml file for RHOSP
17.6.13.8. Setting a custom subnet for machines
17.6.13.9. Emptying compute machine pools
17.6.13.10. Cluster deployment on RHOSP provider networks
  17.6.13.10.1. RHOSP provider network requirements for cluster installation
  17.6.13.10.2. Deploying a cluster that has a primary interface on a provider network
17.6.14. Creating the Kubernetes manifest and Ignition config files
17.6.15. Preparing the bootstrap Ignition files
17.6.16. Creating control plane Ignition config files on RHOSP
17.6.17. Creating network resources on RHOSP
  17.6.17.1. Deploying a cluster with bare metal machines
  17.6.17.2. Creating SR-IOV networks for compute machines
17.6.18. Creating the bootstrap machine on RHOSP
17.6.19. Creating the control plane machines on RHOSP
17.6.20. Logging in to the cluster by using the CLI
17.6.21. Deleting bootstrap resources from RHOSP
17.6.22. Creating compute machines on RHOSP
17.6.23. Approving the certificate signing requests for your machines
17.6.24. Verifying a successful installation
17.6.25. Telemetry access for OpenShift Container Platform
17.6.26. Next steps

17.7. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR ON YOUR OWN INFRASTRUCTURE

17.7.1. Prerequisites
17.7.2. About Kuryr SDN
17.7.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr
17.7.3.1. Increasing quota
17.7.3.2. Configuring Neutron
17.7.3.3. Configuring Octavia
17.7.3.3.1. The Octavia OVN Driver
17.7.3.4. Known limitations of installing with Kuryr
17.7.3.5. Control plane and compute machines
17.7.3.6. Bootstrap machine
17.7.4. Internet access for OpenShift Container Platform
17.7.5. Downloading playbook dependencies
17.7.6. Downloading the installation playbooks
17.7.7. Obtaining the installation program
17.7.8. Generating a key pair for cluster node SSH access
17.7.9. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
17.7.10. Verifying external network access
17.7.11. Enabling access to the environment
17.7.11.1. Enabling access with floating IP addresses
17.7.11.2. Completing installation without floating IP addresses
17.7.12. Defining parameters for the installation program
17.7.13. Creating the installation configuration file
17.7.14. Installation configuration parameters
17.7.14.1. Required configuration parameters
17.7.14.2. Network configuration parameters
17.7.14.3. Optional configuration parameters
17.7.14.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
17.7.14.5. Optional RHOSP configuration parameters
17.7.14.6. Custom subnets in RHOSP deployments
17.7.14.7. Sample customized install-config.yaml file for RHOSP with Kuryr
17.7.14.8. Cluster deployment on RHOSP provider networks
17.7.14.8.1. RHOSP provider network requirements for cluster installation
17.7.14.8.2. Deploying a cluster that has a primary interface on a provider network
17.7.14.9. Kuryr ports pools
17.7.14.10. Adjusting Kuryr ports pools during installation
17.7.14.11. Setting a custom subnet for machines
17.7.14.12. Emptying compute machine pools
17.7.14.13. Modifying the network type
17.7.15. Creating the Kubernetes manifest and Ignition config files
17.7.16. Preparing the bootstrap Ignition files
17.7.17. Creating control plane Ignition config files on RHOSP
17.7.18. Creating network resources on RHOSP
17.7.19. Creating the bootstrap machine on RHOSP
17.7.20. Creating the control plane machines on RHOSP
17.7.21. Logging in to the cluster by using the CLI
17.7.22. Deleting bootstrap resources from RHOSP
17.7.23. Creating compute machines on RHOSP
17.7.24. Approving the certificate signing requests for your machines
17.7.25. Verifying a successful installation
17.7.26. Telemetry access for OpenShift Container Platform
17.7.27. Next steps

17.8. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN SR-IOV INFRASTRUCTURE
17.8.1. Prerequisites
17.8.2. Internet access for OpenShift Container Platform
17.8.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
  17.8.3.1. Control plane and compute machines
  17.8.3.2. Bootstrap machine
17.8.4. Downloading playbook dependencies
17.8.5. Downloading the installation playbooks
17.8.6. Obtaining the installation program
17.8.7. Generating a key pair for cluster node SSH access
17.8.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
17.8.9. Verifying external network access
17.8.10. Enabling access to the environment
  17.8.10.1. Enabling access with floating IP addresses
  17.8.10.2. Completing installation without floating IP addresses
17.8.11. Defining parameters for the installation program
17.8.12. Creating the installation configuration file
17.8.13. Installation configuration parameters
  17.8.13.1. Required configuration parameters
  17.8.13.2. Network configuration parameters
  17.8.13.3. Optional configuration parameters
  17.8.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
  17.8.13.5. Optional RHOSP configuration parameters
  17.8.13.6. Sample customized install-config.yaml file for RHOSP
  17.8.13.7. Custom subnets in RHOSP deployments
  17.8.13.8. Setting a custom subnet for machines
  17.8.13.9. Emptying compute machine pools
  17.8.14. Creating the Kubernetes manifest and Ignition config files
  17.8.15. Preparing the bootstrap Ignition files
  17.8.16. Creating control plane Ignition config files on RHOSP
17.8.17. Creating network resources on RHOSP
  17.8.17.1. Deploying a cluster with bare metal machines
17.8.18. Creating the bootstrap machine on RHOSP
17.8.19. Creating the control plane machines on RHOSP
17.8.20. Logging in to the cluster by using the CLI
17.8.21. Deleting bootstrap resources from RHOSP
17.8.22. Creating SR-IOV networks for compute machines
17.8.23. Creating compute machines that run on SR-IOV networks
17.8.24. Approving the certificate signing requests for your machines
17.8.25. Verifying a successful installation
17.8.26. Preparing a cluster that runs on RHOSP for SR-IOV
  17.8.26.1. Enabling the RHOSP metadata service as a mountable drive
17.8.26.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver 2355
17.8.27. Telemetry access for OpenShift Container Platform 2356
17.8.28. Additional resources 2356
17.8.29. Next steps 2357

17.9. INSTALLING A CLUSTER ON OPENSTACK IN A RESTRICTED NETWORK 2357
17.9.1. Prerequisites 2357
17.9.2. About installations in restricted networks 2357
  17.9.2.1. Additional limits 2358
17.9.3. Resource guidelines for installing OpenShift Container Platform on RHOSP 2358
  17.9.3.1. Control plane and compute machines 2359
  17.9.3.2. Bootstrap machine 2359
17.9.4. Internet access for OpenShift Container Platform 2360
17.9.5. Enabling Swift on RHOSP 2360
17.9.6. Defining parameters for the installation program 2361
17.9.7. Setting cloud provider options 2362
17.9.8. Creating the RHCOS image for restricted network installations 2363
17.9.9. Creating the installation configuration file 2364
  17.9.9.1. Configuring the cluster-wide proxy during installation 2366
  17.9.9.2. Installation configuration parameters 2368
    17.9.9.2.1. Required configuration parameters 2368
    17.9.9.2.2. Network configuration parameters 2370
    17.9.9.2.3. Optional configuration parameters 2371
    17.9.9.2.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters 2376
    17.9.9.2.5. Optional RHOSP configuration parameters 2377
  17.9.9.3. Sample customized install-config.yaml file for restricted OpenStack installations 2382
17.9.10. Generating a key pair for cluster node SSH access 2383
17.9.11. Enabling access to the environment 2385
  17.9.11.1. Enabling access with floating IP addresses 2385
  17.9.11.2. Completing installation without floating IP addresses 2386
17.9.12. Deploying the cluster 2386
17.9.13. Verifying cluster status 2388
17.9.14. Logging in to the cluster by using the CLI 2389
17.9.15. Disabling the default OperatorHub sources 2389
17.9.16. Telemetry access for OpenShift Container Platform 2390
17.9.17. Next steps 2390

17.10. UNINSTALLING A CLUSTER ON OPENSTACK 2390
  17.10.1. Removing a cluster that uses installer-provisioned infrastructure 2390
17.11. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE 2391
  17.11.1. Downloading playbook dependencies 2391
  17.11.2. Removing a cluster from RHOSP that uses your own infrastructure 2392

CHAPTER 18. INSTALLING ON RHV ................................................................. 2394
18.1. PREPARING TO INSTALL ON RED HAT VIRTUALIZATION (RHV) 2394
  18.1.1. Prerequisites 2394
  18.1.2. Choosing a method to install OpenShift Container Platform on RHV 2394
    18.1.2.1. Installing a cluster on installer-provisioned infrastructure 2394
    18.1.2.2. Installing a cluster on user-provisioned infrastructure 2394
18.2. INSTALLING A CLUSTER QUICKLY ON RHV 2395
  18.2.1. Prerequisites 2395
  18.2.2. Internet access for OpenShift Container Platform 2396
  18.2.3. Requirements for the RHV environment 2396
  18.2.4. Verifying the requirements for the RHV environment 2398
  18.2.5. Preparing the network environment on RHV 2400

45
18.2.6. Installing OpenShift Container Platform on RHV in insecure mode
18.2.7. Generating a key pair for cluster node SSH access
18.2.8. Obtaining the installation program
18.2.9. Deploying the cluster
18.2.10. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
18.2.11. Logging in to the cluster by using the CLI
18.2.12. Verifying cluster status
18.2.13. Accessing the OpenShift Container Platform web console on RHV
18.2.14. Telemetry access for OpenShift Container Platform
18.2.15. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)
   18.2.15.1. CPU load increases and nodes go into a Not Ready state
   18.2.15.2. Trouble connecting the OpenShift Container Platform cluster API
18.2.16. Post-installation tasks

18.3. INSTALLING A CLUSTER ON RHV WITH CUSTOMIZATIONS
18.3.1. Prerequisites
18.3.2. Internet access for OpenShift Container Platform
18.3.3. Requirements for the RHV environment
18.3.4. Verifying the requirements for the RHV environment
18.3.5. Preparing the network environment on RHV
18.3.6. Installing OpenShift Container Platform on RHV in insecure mode
18.3.7. Generating a key pair for cluster node SSH access
18.3.8. Obtaining the installation program
18.3.9. Creating the installation configuration file
   18.3.9.1. Example install-config.yaml files for Red Hat Virtualization (RHV)
      Example default install-config.yaml file
      Example minimal install-config.yaml file
      Example Custom machine pools in an install-config.yaml file
      Example non-enforcing affinity group
      Example removing all affinity groups for a non-production lab setup
   18.3.9.2. Installation configuration parameters
      18.3.9.2.1. Required configuration parameters
      18.3.9.2.2. Network configuration parameters
      18.3.9.2.3. Optional configuration parameters
      18.3.9.2.4. Additional Red Hat Virtualization (RHV) configuration parameters
      18.3.9.2.5. Additional RHV parameters for machine pools
18.3.10. Deploying the cluster
18.3.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
18.3.12. Logging in to the cluster by using the CLI
18.3.13. Verifying cluster status
18.3.14. Accessing the OpenShift Container Platform web console on RHV
18.3.15. Telemetry access for OpenShift Container Platform
18.3.16. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)
   18.3.16.1. CPU load increases and nodes go into a Not Ready state
   18.3.16.2. Trouble connecting the OpenShift Container Platform cluster API
18.3.17. Post-installation tasks
18.3.18. Next steps

18.4. INSTALLING A CLUSTER ON RHV WITH USER-PROVISIONED INFRASTRUCTURE
18.5.20. Building the Ignition files
18.5.21. Creating templates and virtual machines
18.5.22. Creating the bootstrap machine
18.5.23. Creating the control plane nodes
18.5.24. Verifying cluster status
18.5.25. Removing the bootstrap machine
18.5.26. Creating the worker nodes and completing the installation
18.5.27. Telemetry access for OpenShift Container Platform
18.5.28. Disabling the default OperatorHub sources
18.6. UNINSTALLING A CLUSTER ON RHV
18.6.1. Removing a cluster that uses installer-provisioned infrastructure
18.6.2. Removing a cluster that uses user-provisioned infrastructure

CHAPTER 19. INSTALLING ON VSPHERE
19.1. PREPARING TO INSTALL ON VSPHERE
19.1.1. Prerequisites
19.1.2. Choosing a method to install OpenShift Container Platform on vSphere
19.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere
19.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on vSphere
19.1.3. VMware vSphere infrastructure requirements
19.1.4. VMware vSphere CSI Driver Operator requirements
19.1.5. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere
19.2. INSTALLING A CLUSTER ON VSPHERE
19.2.1. Prerequisites
19.2.2. Internet access for OpenShift Container Platform
19.2.3. VMware vSphere infrastructure requirements
19.2.4. VMware vSphere CSI Driver Operator requirements
19.2.5. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
19.2.6. Generating a key pair for cluster node SSH access
19.2.7. Obtaining the installation program
19.2.8. Adding vCenter root CA certificates to your system trust
19.2.9. Deploying the cluster
19.2.10. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
19.2.11. Logging in to the cluster by using the CLI
19.2.12. Creating registry storage
   19.2.12.1. Image registry removed during installation
   19.2.12.2. Image registry storage configuration
   19.2.12.2.1. Configuring registry storage for VMware vSphere
   19.2.12.2.2. Configuring block registry storage for VMware vSphere
19.2.13. Backing up VMware vSphere volumes
19.2.14. Telemetry access for OpenShift Container Platform
19.2.15. Next steps

CHAPTER 25
19.3. INSTALLING A CLUSTER ON VSPHERE WITH CUSTOMIZATIONS
19.3.1. Prerequisites
19.3.2. Internet access for OpenShift Container Platform
19.3.3. VMware vSphere infrastructure requirements
19.3.4. VMware vSphere CSI Driver Operator requirements
19.3.5. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
19.3.6. Generating a key pair for cluster node SSH access
19.3.7. Obtaining the installation program
19.3.8. Adding vCenter root CA certificates to your system trust
19.3.9. Creating the installation configuration file
   19.3.9.1. Installation configuration parameters
      19.3.9.1.1. Required configuration parameters
      19.3.9.1.2. Network configuration parameters
      19.3.9.1.3. Optional configuration parameters
      19.3.9.1.4. Additional VMware vSphere configuration parameters
      19.3.9.1.5. Optional VMware vSphere machine pool configuration parameters
   19.3.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
   19.3.9.3. Configuring the cluster-wide proxy during installation
19.3.10. Deploying the cluster
19.3.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
19.3.12. Logging in to the cluster by using the CLI
19.3.13. Creating registry storage
   19.3.13.1. Image registry removed during installation
   19.3.13.2. Image registry storage configuration
      19.3.13.2.1. Configuring registry storage for VMware vSphere
      19.3.13.2.2. Configuring block registry storage for VMware vSphere
19.3.14. Backing up VMware vSphere volumes
19.3.15. Telemetry access for OpenShift Container Platform
19.3.16. Next steps

19.4. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS
19.4.1. Prerequisites
19.4.2. Internet access for OpenShift Container Platform
19.4.3. VMware vSphere infrastructure requirements
19.4.4. VMware vSphere CSI Driver Operator requirements
19.4.5. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
19.4.6. Generating a key pair for cluster node SSH access
19.4.7. Obtaining the installation program
19.4.8. Adding vCenter root CA certificates to your system trust
19.4.9. Creating the installation configuration file
19.4.9.1. Installation configuration parameters
19.4.9.1.1. Required configuration parameters
19.4.9.1.2. Network configuration parameters
19.4.9.1.3. Optional configuration parameters
19.4.9.1.4. Additional VMware vSphere configuration parameters
19.4.9.1.5. Optional VMware vSphere machine pool configuration parameters
19.4.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
19.4.9.3. Configuring the cluster-wide proxy during installation
19.4.10. Network configuration phases
19.4.11. Specifying advanced network configuration
19.4.12. Cluster Network Operator configuration
19.4.12.1. Cluster Network Operator configuration object
19.4.12.1.1. defaultNetwork object configuration
19.4.12.1.2. Configuration for the OpenShift SDN CNI cluster network provider
19.4.12.1.3. Configuration for the OVN-Kubernetes CNI cluster network provider
19.4.12.1.4. kubeProxyConfig object configuration
19.4.13. Deploying the cluster
19.4.14. Installing the OpenShift CLI by downloading the binary
19.4.14.1. Installing the OpenShift CLI on Linux
19.4.14.2. Installing the OpenShift CLI on Windows
19.4.14.3. Installing the OpenShift CLI on macOS
19.4.15. Logging in to the cluster by using the CLI
19.4.16. Creating registry storage
19.4.16.1. Image registry removed during installation
19.4.16.2. Image registry storage configuration
19.4.16.2.1. Configuring registry storage for VMware vSphere
19.4.16.2.2. Configuring block registry storage for VMware vSphere
19.4.17. Backing up VMware vSphere volumes
19.4.18. Telemetry access for OpenShift Container Platform
19.4.19. Next steps
19.5. INSTALLING A CLUSTER ON VSPHERE WITH USER-PROVISIONED INFRASTRUCTURE
19.5.1. Prerequisites
19.5.2. Internet access for OpenShift Container Platform
19.5.3. VMware vSphere infrastructure requirements
19.5.4. VMware vSphere CSI Driver Operator requirements
19.5.5. Requirements for a cluster with user-provisioned infrastructure
19.5.5.1. Required machines for cluster installation
19.5.5.2. Minimum resource requirements for cluster installation
19.5.5.3. Certificate signing requests management
19.5.5.4. Networking requirements for user-provisioned infrastructure
19.5.5.4.1. Network connectivity requirements
19.5.5.4.2. Ethernet adaptor hardware address requirements
19.5.5.5. User-provisioned DNS requirements
19.5.5.5.1. Example DNS configuration for user-provisioned clusters
19.5.5.6. Load balancing requirements for user-provisioned infrastructure
19.5.5.6.1. Example load balancer configuration for user-provisioned clusters
19.5.6. Preparing the user-provisioned infrastructure
19.5.7. Validating DNS resolution for user-provisioned infrastructure
19.5.8. Generating a key pair for cluster node SSH access
19.5.9. Obtaining the installation program
19.5.10. Manually creating the installation configuration file
  19.5.10.1. Sample install-config.yaml file for VMware vSphere
  19.5.10.2. Configuring the cluster-wide proxy during installation
19.5.11. Creating the Kubernetes manifest and Ignition config files
19.5.12. Extracting the infrastructure name
19.5.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
19.5.14. Adding more compute machines to a cluster in vSphere
19.5.15. Disk partitioning
  Creating a separate /var partition
19.5.16. Updating the bootloader using bootupd
19.5.17. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
19.5.18. Waiting for the bootstrap process to complete
19.5.19. Logging in to the cluster by using the CLI
19.5.20. Approving the certificate signing requests for your machines
19.5.21. Initial Operator configuration
  19.5.21.1. Image registry removed during installation
  19.5.21.2. Image registry storage configuration
    19.5.21.2.1. Configuring registry storage for VMware vSphere
    19.5.21.2.2. Configuring storage for the image registry in non-production clusters
    19.5.21.2.3. Configuring block registry storage for VMware vSphere
  19.5.22. Completing installation on user-provisioned infrastructure
19.5.23. Backing up VMware vSphere volumes
19.5.24. Telemetry access for OpenShift Container Platform
19.5.25. Next steps

19.6. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS
19.6.1. Prerequisites
19.6.2. Internet access for OpenShift Container Platform
19.6.3. VMware vSphere infrastructure requirements
19.6.4. VMware vSphere CSI Driver Operator requirements
19.6.5. Requirements for a cluster with user-provisioned infrastructure
  19.6.5.1. Required machines for cluster installation
  19.6.5.2. Minimum resource requirements for cluster installation
  19.6.5.3. Certificate signing requests management
  19.6.5.4. Networking requirements for user-provisioned infrastructure
    19.6.5.4.1. Network connectivity requirements
    Ethernet adaptor hardware address requirements
    NTP configuration for user-provisioned infrastructure
  19.6.5.5. User-provisioned DNS requirements
    19.6.5.5.1. Example DNS configuration for user-provisioned clusters
  19.6.5.6. Load balancing requirements for user-provisioned infrastructure
    19.6.5.6.1. Example load balancer configuration for user-provisioned clusters
  19.6.6. Preparing the user-provisioned infrastructure
19.6.7. Validating DNS resolution for user-provisioned infrastructure
19.6.8. Generating a key pair for cluster node SSH access
19.6.9. Obtaining the installation program
19.6.10. Manually creating the installation configuration file
  19.6.10.1. Sample install-config.yaml file for VMware vSphere
  19.6.10.2. Configuring the cluster-wide proxy during installation
19.6.11. Network configuration phases
19.6.12. Specifying advanced network configuration
19.6.13. Cluster Network Operator configuration
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
19.6.15. Extracting the infrastructure name
19.6.16. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
19.6.17. Adding more compute machines to a cluster in vSphere
19.6.18. Disk partitioning
  Creating a separate /var partition
19.6.19. Updating the bootloader using bootupd
19.6.20. Waiting for the bootstrap process to complete
19.6.21. Logging in to the cluster by using the CLI
19.6.22. Approving the certificate signing requests for your machines
  19.6.22.1. Initial Operator configuration
  19.6.22.2. Image registry removed during installation
  19.6.22.3. Image registry storage configuration
    19.6.22.3.1. Configuring block registry storage for VMware vSphere
19.6.23. Completing installation on user-provisioned infrastructure
19.6.24. Backing up VMware vSphere volumes
19.6.25. Telemetry access for OpenShift Container Platform
19.6.26. Next steps

19.7. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK

19.7.1. Prerequisites
19.7.2. About installations in restricted networks
  19.7.2.1. Additional limits
19.7.3. Internet access for OpenShift Container Platform
19.7.4. VMware vSphere infrastructure requirements
19.7.5. VMware vSphere CSI Driver Operator requirements
19.7.6. vCenter requirements
  Required vCenter account privileges
  Using OpenShift Container Platform with vMotion
  Cluster resources
  Cluster limits
  Networking requirements
    Required IP Addresses
    DNS records
19.7.7. Generating a key pair for cluster node SSH access
19.7.8. Adding vCenter root CA certificates to your system trust
19.7.9. Creating the RHCOS image for restricted network installations
19.7.10. Creating the installation configuration file
  19.7.10.1. Installation configuration parameters
    19.7.10.1.1. Required configuration parameters
    19.7.10.1.2. Network configuration parameters
    19.7.10.1.3. Optional configuration parameters
    19.7.10.1.4. Additional VMware vSphere configuration parameters
    19.7.10.1.5. Optional VMware vSphere machine pool configuration parameters
19.7.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
19.7.10.3. Configuring the cluster-wide proxy during installation
19.7.11. Deploying the cluster
19.7.12. Installing the OpenShift CLI by downloading the binary
19.7.12.1. Installing the OpenShift CLI on Linux
19.7.12.2. Installing the OpenShift CLI on Windows
19.7.12.3. Installing the OpenShift CLI on macOS
19.7.13. Logging in to the cluster by using the CLI
19.7.14. Disabling the default OperatorHub sources
19.7.15. Creating registry storage
19.7.15.1. Image registry removed during installation
19.7.15.2. Image registry storage configuration
19.7.15.2.1. Configuring registry storage for VMware vSphere
19.7.16. Telemetry access for OpenShift Container Platform
19.7.17. Next steps

19.8. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
19.8.1. Prerequisites
19.8.2. About installations in restricted networks
19.8.2.1. Additional limits
19.8.3. Internet access for OpenShift Container Platform
19.8.4. VMware vSphere infrastructure requirements
19.8.5. VMware vSphere CSI Driver Operator requirements
19.8.6. Requirements for a cluster with user-provisioned infrastructure
19.8.6.1. Required machines for cluster installation
19.8.6.2. Minimum resource requirements for cluster installation
19.8.6.3. Certificate signing requests management
19.8.6.4. Networking requirements for user-provisioned infrastructure
19.8.6.4.1. Network connectivity requirements
   Ethernet adaptor hardware address requirements
   NTP configuration for user-provisioned infrastructure
19.8.6.5. User-provisioned DNS requirements
19.8.6.5.1. Example DNS configuration for user-provisioned clusters
19.8.6.6. Load balancing requirements for user-provisioned infrastructure
19.8.6.6.1. Example load balancer configuration for user-provisioned clusters
19.8.7. Preparing the user-provisioned infrastructure
19.8.8. Validating DNS resolution for user-provisioned infrastructure
19.8.9. Generating a key pair for cluster node SSH access
19.8.10. Manually creating the installation configuration file
19.8.10.1. Sample install-config.yaml file for VMware vSphere
19.8.10.2. Configuring the cluster-wide proxy during installation
19.8.11. Creating the Kubernetes manifest and Ignition config files
19.8.12. Configuring chrony time service
19.8.13. Extracting the infrastructure name
19.8.15. Adding more compute machines to a cluster in vSphere
19.8.16. Disk partitioning
   Creating a separate /var partition
19.8.17. Updating the bootloader using bootupd
19.8.18. Waiting for the bootstrap process to complete
19.8.19. Logging in to the cluster by using the CLI
19.8.20. Approving the certificate signing requests for your machines
19.8.21. Initial Operator configuration
19.8.21.1. Disabling the default OperatorHub sources
19.8.21.2. Image registry storage configuration
   19.8.21.2.1. Configuring registry storage for VMware vSphere
19.8.21.2. Configuring storage for the image registry in non-production clusters
19.8.21.3. Configuring block registry storage for VMware vSphere
19.8.22. Completing installation on user-provisioned infrastructure
19.8.23. Backing up VMware vSphere volumes
19.8.24. Telemetry access for OpenShift Container Platform
19.8.25. Next steps

19.9. UNINSTALLING A CLUSTER ON VSPHERE THAT USES INSTALLER-PROVISIONED INFRASTRUCTURE
19.9.1. Removing a cluster that uses installer-provisioned infrastructure

19.10. USING THE VSPHERE PROBLEM DETECTOR OPERATOR
19.10.1. About the vSphere Problem Detector Operator
19.10.2. Running the vSphere Problem Detector Operator checks
19.10.3. Viewing the events from the vSphere Problem Detector Operator
19.10.4. Viewing the logs from the vSphere Problem Detector Operator
19.10.5. Configuration checks run by the vSphere Problem Detector Operator
19.10.6. About the storage class configuration check
19.10.7. Metrics for the vSphere Problem Detector Operator
19.10.8. Additional resources

CHAPTER 20. INSTALLING ON VMC

20.1. PREPARING TO INSTALL ON VMC
20.1.1. Prerequisites
20.1.2. Choosing a method to install OpenShift Container Platform on VMC
   20.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on VMC
   20.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on VMC
20.1.3. VMware vSphere infrastructure requirements
20.1.4. VMware vSphere CSI Driver Operator requirements
20.1.5. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on VMC

20.2. INSTALLING A CLUSTER ON VMC
20.2.1. Setting up VMC for vSphere
   20.2.1.1. VMC Sizer tool
20.2.2. vSphere prerequisites
20.2.3. Internet access for OpenShift Container Platform
20.2.4. VMware vSphere infrastructure requirements
20.2.5. VMware vSphere CSI Driver Operator requirements
20.2.6. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
20.2.7. Generating a key pair for cluster node SSH access
20.2.8. Obtaining the installation program
20.2.9. Adding vCenter root CA certificates to your system trust
20.2.10. Deploying the cluster
20.2.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
20.2.12. Logging in to the cluster by using the CLI
20.2.13. Creating registry storage
20.2.13.1. Image registry removed during installation
20.2.13.2. Image registry storage configuration
20.2.13.2.1. Configuring registry storage for VMware vSphere
20.2.13.2.2. Configuring block registry storage for VMware vSphere
20.2.14. Backing up VMware vSphere volumes
20.2.15. Telemetry access for OpenShift Container Platform
20.2.16. Next steps

20.3. INSTALLING A CLUSTER ON VMC WITH CUSTOMIZATIONS
20.3.1. Setting up VMC for vSphere
20.3.11. VMC Sizer tool
20.3.2. vSphere prerequisites
20.3.3. Internet access for OpenShift Container Platform
20.3.4. VMware vSphere infrastructure requirements
20.3.5. VMware vSphere CSI Driver Operator requirements
20.3.6. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
20.3.7. Generating a key pair for cluster node SSH access
20.3.8. Obtaining the installation program
20.3.9. Adding vCenter root CA certificates to your system trust
20.3.10. Creating the installation configuration file
   20.3.10.1. Installation configuration parameters
      20.3.10.1.1. Required configuration parameters
      20.3.10.1.2. Network configuration parameters
      20.3.10.1.3. Optional configuration parameters
      20.3.10.1.4. Additional VMware vSphere configuration parameters
      20.3.10.1.5. Optional VMware vSphere machine pool configuration parameters
   20.3.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
   20.3.10.3. Configuring the cluster-wide proxy during installation
20.3.11. Deploying the cluster
20.3.12. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
20.3.13. Logging in to the cluster by using the CLI
20.3.14. Creating registry storage
   20.3.14.1. Image registry removed during installation
   20.3.14.2. Image registry storage configuration
      20.3.14.2.1. Configuring registry storage for VMware vSphere
      20.3.14.2.2. Configuring block registry storage for VMware vSphere
   20.3.15. Backing up VMware vSphere volumes
20.3.16. Telemetry access for OpenShift Container Platform
20.3.17. Next steps

20.4. INSTALLING A CLUSTER ON VMC WITH NETWORK CUSTOMIZATIONS
20.4.1. Setting up VMC for vSphere
20.4.11. VMC Sizer tool
20.4.2. vSphere prerequisites
20.4.3. Internet access for OpenShift Container Platform
20.4.4. VMware vSphere infrastructure requirements
20.4.5. VMware vSphere CSI Driver Operator requirements
20.4.6. vCenter requirements
  Required vCenter account privileges
  Using OpenShift Container Platform with vMotion
  Cluster resources
  Cluster limits
  Networking requirements
    Required IP Addresses
    DNS records
20.4.7. Generating a key pair for cluster node SSH access
20.4.8. Obtaining the installation program
20.4.9. Adding vCenter root CA certificates to your system trust
20.4.10. Creating the installation configuration file
  20.4.10.1. Installation configuration parameters
    20.4.10.1.1. Required configuration parameters
    20.4.10.1.2. Network configuration parameters
    20.4.10.1.3. Optional configuration parameters
    20.4.10.1.4. Additional VMware vSphere configuration parameters
    20.4.10.1.5. Optional VMware vSphere machine pool configuration parameters
  20.4.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
  20.4.10.3. Configuring the cluster-wide proxy during installation
  20.4.11. Network configuration phases
20.4.12. Specifying advanced network configuration
20.4.13. Cluster Network Operator configuration
  20.4.13.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
20.4.14. Deploying the cluster
20.4.15. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
20.4.16. Logging in to the cluster by using the CLI
20.4.17. Creating registry storage
  20.4.17.1. Image registry removed during installation
  20.4.17.2. Image registry storage configuration
    20.4.17.2.1. Configuring registry storage for VMware vSphere
    20.4.17.2.2. Configuring block registry storage for VMware vSphere
20.4.18. Backing up VMware vSphere volumes
20.4.19. Telemetry access for OpenShift Container Platform
20.4.20. Next steps

20.5. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK
20.5.1. Setting up VMC for vSphere
  20.5.1.1. VMC Sizer tool
20.5.2. vSphere prerequisites
20.5.3. About installations in restricted networks
  20.5.3.1. Additional limits
20.5.4. Internet access for OpenShift Container Platform
20.5.5. VMware vSphere infrastructure requirements
20.5.6. VMware vSphere CSI Driver Operator requirements
20.5.7. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
20.5.8. Generating a key pair for cluster node SSH access
20.5.9. Adding vCenter root CA certificates to your system trust
20.5.10. Creating the RH COS image for restricted network installations
20.5.11. Creating the installation configuration file
   20.5.11.1. Installation configuration parameters
      20.5.11.1.1. Required configuration parameters
      20.5.11.1.2. Network configuration parameters
      20.5.11.1.3. Optional configuration parameters
      20.5.11.1.4. Additional VMware vSphere configuration parameters
      20.5.11.1.5. Optional VMware vSphere machine pool configuration parameters
20.5.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
20.5.11.3. Configuring the cluster-wide proxy during installation
20.5.12. Deploying the cluster
20.5.13. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
20.5.14. Logging in to the cluster by using the CLI
20.5.15. Disabling the default OperatorHub sources
20.5.16. Creating registry storage
   20.5.16.1. Image registry removed during installation
   20.5.16.2. Image registry storage configuration
   20.5.16.2.1. Configuring registry storage for VMware vSphere
20.5.17. Telemetry access for OpenShift Container Platform
20.5.18. Next steps
20.6. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE
20.6.1. Setting up VMC for vSphere
   20.6.1.1. VMC Sizer tool
20.6.2. vSphere prerequisites
20.6.3. Internet access for OpenShift Container Platform
20.6.4. VMware vSphere infrastructure requirements
20.6.5. VMware vSphere CSI Driver Operator requirements
20.6.6. Requirements for a cluster with user-provisioned infrastructure
   20.6.6.1. Required machines for cluster installation
   20.6.6.2. Minimum resource requirements for cluster installation
   20.6.6.3. Certificate signing requests management
   20.6.6.4. Networking requirements for user-provisioned infrastructure
   20.6.6.4.1. Network connectivity requirements
   NTP configuration for user-provisioned infrastructure
   20.6.6.5. User-provisioned DNS requirements
   20.6.6.5.1. Example DNS configuration for user-provisioned clusters
   20.6.6.6. Load balancing requirements for user-provisioned infrastructure
   20.6.6.6.1. Example load balancer configuration for user-provisioned clusters
20.6.7. Preparing the user-provisioned infrastructure
20.6.8. Validating DNS resolution for user-provisioned infrastructure
20.6.9. Generating a key pair for cluster node SSH access
20.6.10. Obtaining the installation program
20.6.11. Manually creating the installation configuration file
  20.6.11.1. Sample install-config.yaml file for VMware vSphere
  20.6.11.2. Configuring the cluster-wide proxy during installation
20.6.12. Creating the Kubernetes manifest and Ignition config files
20.6.13. Extracting the infrastructure name
20.6.15. Adding more compute machines to a cluster in vSphere
20.6.16. Disk partitioning
  Creating a separate /var partition
20.6.17. Updating the bootloader using bootupd
20.6.18. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
20.6.19. Waiting for the bootstrap process to complete
20.6.20. Logging in to the cluster by using the CLI
20.6.21. Approving the certificate signing requests for your machines
20.6.22. Initial Operator configuration
  20.6.22.1. Image registry removed during installation
  20.6.22.2. Image registry storage configuration
  20.6.22.2.1. Configuring registry storage for VMware vSphere
  20.6.22.2.2. Configuring storage for the image registry in non-production clusters
  20.6.22.2.3. Configuring block registry storage for VMware vSphere
20.6.23. Completing installation on user-provisioned infrastructure
20.6.24. Backing up VMware vSphere volumes
20.6.25. Telemetry access for OpenShift Container Platform
20.6.26. Next steps

20.7. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE AND NETWORK CUSTOMIZATIONS
20.7.1. Setting up VMC for vSphere
  20.7.1.1. VMC Sizer tool
20.7.2. vSphere prerequisites
20.7.3. Internet access for OpenShift Container Platform
20.7.4. VMware vSphere infrastructure requirements
20.7.5. VMware vSphere CSI Driver Operator requirements
20.7.6. Requirements for a cluster with user-provisioned infrastructure
  20.7.6.1. Required machines for cluster installation
  20.7.6.2. Minimum resource requirements for cluster installation
  20.7.6.3. Certificate signing requests management
  20.7.6.4. Networking requirements for user-provisioned infrastructure
    20.7.6.4.1. Network connectivity requirements
    NTP configuration for user-provisioned infrastructure
  20.7.6.5. User-provisioned DNS requirements
    20.7.6.5.1. Example DNS configuration for user-provisioned clusters
  20.7.6.6. Load balancing requirements for user-provisioned infrastructure
    20.7.6.6.1. Example load balancer configuration for user-provisioned clusters
20.7.7. Preparing the user-provisioned infrastructure
20.7.8. Validating DNS resolution for user-provisioned infrastructure
20.7.9. Generating a key pair for cluster node SSH access
20.7.10. Obtaining the installation program
20.7.11. Manually creating the installation configuration file
20.7.11.1. Sample install-config.yaml file for VMware vSphere
20.7.12. Specifying advanced network configuration
20.7.13. Cluster Network Operator configuration
20.7.13.1. Cluster Network Operator configuration object
   defaultNetwork object configuration
   Configuration for the OpenShift SDN CNI cluster network provider
   Configuration for the OVN-Kubernetes CNI cluster network provider
   kubeProxyConfig object configuration
20.7.14. Creating the Ignition config files
20.7.15. Extracting the infrastructure name
20.7.16. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
20.7.17. Adding more compute machines to a cluster in vSphere
20.7.18. Disk partitioning
   Creating a separate /var partition
20.7.19. Updating the bootloader using bootupd
20.7.20. Waiting for the bootstrap process to complete
20.7.21. Logging in to the cluster by using the CLI
20.7.22. Approving the certificate signing requests for your machines
20.7.23. Initial Operator configuration
   20.7.23.1. Image registry removed during installation
   20.7.23.2. Image registry storage configuration
   20.7.23.2.1. Configuring block registry storage for VMware vSphere
   20.7.24. Completing installation on user-provisioned infrastructure
   20.7.25. Backing up VMware vSphere volumes
   20.7.26. Telemetry access for OpenShift Container Platform
   20.7.27. Next steps

20.8. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
20.8.1. Setting up VMC for vSphere
   20.8.1.1. VMC Sizer tool
20.8.2. vSphere prerequisites
20.8.3. About installations in restricted networks
   20.8.3.1. Additional limits
20.8.4. Internet access for OpenShift Container Platform
20.8.5. VMware vSphere infrastructure requirements
20.8.6. VMware vSphere CSI Driver Operator requirements
20.8.7. Requirements for a cluster with user-provisioned infrastructure
   20.8.7.1. Required machines for cluster installation
   20.8.7.2. Minimum resource requirements for cluster installation
   20.8.7.3. Certificate signing requests management
   20.8.7.4. Networking requirements for user-provisioned infrastructure
   20.8.7.4.1. Network connectivity requirements
   NTP configuration for user-provisioned infrastructure
   20.8.7.5. User-provisioned DNS requirements
   20.8.7.5.1. Example DNS configuration for user-provisioned clusters
20.8.8. Preparing the user-provisioned infrastructure
20.8.9. Validating DNS resolution for user-provisioned infrastructure
20.8.10. Generating a key pair for cluster node SSH access
20.8.11. Manually creating the installation configuration file
20.8.11. Sample install-config.yaml file for VMware vSphere
20.8.12. Configuring the cluster-wide proxy during installation
20.8.13. Extracting the infrastructure name
20.8.15. Adding more compute machines to a cluster in vSphere
20.8.16. Disk partitioning

Creating a separate /var partition
20.8.17. Updating the bootloader using bootupd
20.8.18. Waiting for the bootstrap process to complete
20.8.19. Logging in to the cluster by using the CLI
20.8.20. Approving the certificate signing requests for your machines
20.8.21. Initial Operator configuration
20.8.21.1. Disabling the default OperatorHub sources
20.8.21.2. Image registry storage configuration
20.8.21.2.1. Configuring registry storage for VMware vSphere
20.8.21.2.2. Configuring storage for the image registry in non-production clusters
20.8.21.2.3. Configuring block registry storage for VMware vSphere
20.8.22. Completing installation on user-provisioned infrastructure
20.8.23. Backing up VMware vSphere volumes
20.8.24. Telemetry access for OpenShift Container Platform
20.8.25. Next steps

20.9. UNINSTALLING A CLUSTER ON VMC

21.1. INSTALLING A CLUSTER ON ANY PLATFORM

21.1.1. Prerequisites
21.1.2. Internet access for OpenShift Container Platform
21.1.3. Requirements for a cluster with user-provisioned infrastructure
21.1.3.1. Required machines for cluster installation
21.1.3.2. Minimum resource requirements for cluster installation
21.1.3.3. Certificate signing requests management
21.1.3.4. Networking requirements for user-provisioned infrastructure
21.1.3.4.1. Network connectivity requirements
21.1.3.5. User-provisioned DNS requirements
21.1.3.5.1. Example DNS configuration for user-provisioned clusters
21.1.3.6. Load balancing requirements for user-provisioned infrastructure
21.1.3.6.1. Example load balancer configuration for user-provisioned clusters
21.1.4. Preparing the user-provisioned infrastructure
21.1.5. Validating DNS resolution for user-provisioned infrastructure
21.1.6. Generating a key pair for cluster node SSH access
21.1.7. Obtaining the installation program
21.1.8. Installing the OpenShift CLI by downloading the binary
21.1.9. Manually creating the installation configuration file
21.1.9.1. Sample install-config.yaml file for IBM Z
21.1.9.2. Sample install-config.yaml file for other platforms
21.1.9.3. Configuring the cluster-wide proxy during installation
21.1.9.4. Configuring a three-node cluster

CHAPTER 21. INSTALLING ON ANY PLATFORM

21.1. INSTALLING A CLUSTER ON ANY PLATFORM

21.1. Prerequisites
21.1.2. Internet access for OpenShift Container Platform
21.1.3. Requirements for a cluster with user-provisioned infrastructure
21.1.3.1. Required machines for cluster installation
21.1.3.2. Minimum resource requirements for cluster installation
21.1.3.3. Certificate signing requests management
21.1.3.4. Networking requirements for user-provisioned infrastructure
21.1.3.4.1. Network connectivity requirements
21.1.3.5. User-provisioned DNS requirements
21.1.3.5.1. Example DNS configuration for user-provisioned clusters
21.1.3.6. Load balancing requirements for user-provisioned infrastructure
21.1.3.6.1. Example load balancer configuration for user-provisioned clusters
21.1.4. Preparing the user-provisioned infrastructure
21.1.5. Validating DNS resolution for user-provisioned infrastructure
21.1.6. Generating a key pair for cluster node SSH access
21.1.7. Obtaining the installation program
21.1.8. Installing the OpenShift CLI by downloading the binary
21.1.9. Manually creating the installation configuration file
21.1.10. Creating the Kubernetes manifest and Ignition config files
21.1.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
21.1.11.1. Installing RHCOS by using an ISO image
21.1.11.2. Installing RHCOS by using PXE or iPXE booting
21.1.11.3. Advanced RHCOS installation configuration
  21.1.11.3.1. Using advanced networking options for PXE and ISO installations
  21.1.11.3.2. Disk partitioning
    21.1.11.3.2.1. Creating a separate /var partition
    21.1.11.3.2.2. Retaining existing partitions
    21.1.11.3.3. Identifying Ignition configs
  21.1.11.3.4. Advanced RHCOS installation reference
    21.1.11.3.4.1. Networking and bonding options for ISO installations
  21.1.11.4. Updating the bootloader using bootupd
21.1.12. Waiting for the bootstrap process to complete
21.1.13. Logging in to the cluster by using the CLI
21.1.14. Approving the certificate signing requests for your machines
21.1.15. Initial Operator configuration
  21.1.15.1. Disabling the default OperatorHub sources
  21.1.15.2. Image registry removed during installation
  21.1.15.3. Image registry storage configuration
    21.1.15.3.1. Configuring registry storage for IBM Z
    21.1.15.3.2. Configuring storage for the image registry in non-production clusters
  21.1.15.3.3. Configuring block registry storage
21.1.16. Completing installation on user-provisioned infrastructure
21.1.17. Telemetry access for OpenShift Container Platform
21.1.18. Next steps

CHAPTER 22. INSTALLATION CONFIGURATION .................................................. 3163
22.1. CUSTOMIZING NODES ................................................................. 3163
  22.1.1. Creating machine configs with Butane
    22.1.1.1. About Butane
    22.1.1.2. Installing Butane
    22.1.1.3. Creating a MachineConfig object by using Butane
  22.1.2. Adding day-1 kernel arguments
  22.1.3. Adding kernel modules to nodes
    22.1.3.1. Building and testing the kernel module container
    22.1.3.2. Provisioning a kernel module to OpenShift Container Platform
      22.1.3.2.1. Provision kernel modules via a MachineConfig object
  22.1.4. Encrypting and mirroring disks during installation
    22.1.4.1. About disk encryption
      22.1.4.1.1. Configuring an encryption threshold
    22.1.4.2. About disk mirroring
    22.1.4.3. Configuring disk encryption and mirroring
    22.1.4.4. Configuring a RAID-enabled data volume
  22.1.5. Configuring chrony time service
  22.1.6. Additional resources
22.2. CONFIGURING YOUR FIREWALL .................................................. 3185
  22.2.1. Configuring your firewall for OpenShift Container Platform

CHAPTER 23. VALIDATING AN INSTALLATION ............................................. 3189
23.1. REVIEWING THE INSTALLATION LOG ........................................... 3189
23.2. VIEWING THE IMAGE PULL SOURCE ............................................. 3189
23.3. GETTING CLUSTER VERSION, STATUS, AND UPDATE DETAILS .............. 3190
23.4. QUERYING THE STATUS OF THE CLUSTER NODES BY USING THE CLI 3192
23.5. REVIEWING THE CLUSTER STATUS FROM THE OPENSShift CONTAINER PLATFORM WEB CONSOLE 3192
23.6. REVIEWING THE CLUSTER STATUS FROM RED HAT OPENSShift CLUSTER MANAGER 3193
23.7. CHECKING CLUSTER RESOURCE AVAILABILITY AND UTILIZATION 3194
23.8. LISTING ALERTS THAT ARE FIRING 3196
23.9. NEXT STEPS 3196

CHAPTER 24. TROUBLESHOOTING INSTALLATION ISSUES 3197
24.1. PREREQUISITES 3197
24.2. GATHERING LOGS FROM A FAILED INSTALLATION 3197
24.3. MANUALLY GATHERING LOGS WITH SSH ACCESS TO YOUR HOST(S) 3198
24.4. MANUALLY GATHERING LOGS WITHOUT SSH ACCESS TO YOUR HOST(S) 3199
24.5. GETTING DEBUG INFORMATION FROM THE INSTALLATION PROGRAM 3199
24.6. REINSTALLING THE OPENSShift CONTAINER PLATFORM CLUSTER 3200

CHAPTER 25. SUPPORT FOR FIPS CRYPTOGRAPHY 3201
25.1. FIPS VALIDATION IN OPENSShift CONTAINER PLATFORM 3201
25.2. FIPS SUPPORT IN COMPONENTS THAT THE CLUSTER USES 3201
   25.2.1. etcd 3202
   25.2.2. Storage 3202
   25.2.3. Runtimes 3202
25.3. INSTALLING A CLUSTER IN FIPS MODE 3202
CHAPTER 1. OPENSHIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

1.1. OPENSHIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

The OpenShift Container Platform installation program offers you flexibility. You can use the installation program to deploy a cluster on infrastructure that the installation program provisions and the cluster maintains or deploy a cluster on infrastructure that you prepare and maintain.

These two basic types of OpenShift Container Platform clusters are frequently called installer-provisioned infrastructure clusters and user-provisioned infrastructure clusters.

Both types of clusters have the following characteristics:

- Highly available infrastructure with no single points of failure is available by default
- Administrators maintain control over what updates are applied and when

You use the same installation program to deploy both types of clusters. The main assets generated by the installation program are the Ignition config files for the bootstrap, master, and worker machines. With these three configurations and correctly configured infrastructure, you can start an OpenShift Container Platform cluster.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installation. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel. The ultimate target is a running cluster. By meeting dependencies instead of running commands, the installation program is able to recognize and use existing components instead of running the commands to create them again.

The following diagram shows a subset of the installation targets and dependencies:
After installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. It includes the kubelet, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.10 cluster must use RHCOS, which includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure the machines. Operating system updates are delivered as an Atomic OSTree repository that is embedded in a container image that is rolled out across the cluster by an Operator. Actual operating system changes are made in-place on each machine as an atomic operation by using rpm-ostree. Together, these technologies enable OpenShift Container Platform to manage the operating system like it manages any other application on the cluster, via in-place upgrades that keep the entire platform up-to-date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its components and machines, including the operating system. Because of this, only the installation program and the Machine Config Operator can change machines. The installation program uses Ignition config files to set the exact state of each machine, and the Machine Config Operator completes more changes to the machines, such as the application of new certificates or keys, after installation.

1.1.1. Installation process

When you install an OpenShift Container Platform cluster, you download the installation program from the appropriate Infrastructure Provider page on the OpenShift Cluster Manager site. This site manages:

- REST API for accounts
- Registry tokens, which are the pull secrets that you use to obtain the required components
Cluster registration, which associates the cluster identity to your Red Hat account to facilitate the gathering of usage metrics

In OpenShift Container Platform 4.10, the installation program is a Go binary file that performs a series of file transformations on a set of assets. The way you interact with the installation program differs depending on your installation type.

- For clusters with installer-provisioned infrastructure, you delegate the infrastructure bootstrapping and provisioning to the installation program instead of doing it yourself. The installation program creates all of the networking, machines, and operating systems that are required to support the cluster.
- If you provision and manage the infrastructure for your cluster, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.

You use three sets of files during installation: an installation configuration file that is named `install-config.yaml`, Kubernetes manifests, and Ignition config files for your machine types.

**IMPORTANT**

It is possible to modify Kubernetes and the Ignition config files that control the underlying RHCOS operating system during installation. However, no validation is available to confirm the suitability of any modifications that you make to these objects. If you modify these objects, you might render your cluster non-functional. Because of this risk, modifying Kubernetes and Ignition config files is not supported unless you are following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are wrapped into Ignition config files. The installation program uses these Ignition config files to create the cluster.

The installation configuration files are all pruned when you run the installation program, so be sure to back up all configuration files that you want to use again.

**IMPORTANT**

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

The installation process with installer-provisioned infrastructure

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.

If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.
With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

The installation process with user-provisioned infrastructure
You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself, including:

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL compute machines to your cluster.

Installation process details
Because each machine in the cluster requires information about the cluster when it is provisioned, OpenShift Container Platform uses a temporary bootstrap machine during initial configuration to provide the required information to the permanent control plane. It boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:

Figure 1.2. Creating the bootstrap, control plane, and compute machines
After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. (Requires manual intervention if you provision the infrastructure)

2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.

3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. (Requires manual intervention if you provision the infrastructure)

4. The temporary control plane schedules the production control plane to the production control plane machines.

5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.

6. The temporary control plane shuts down and passes control to the production control plane.

7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.

8. The installation program shuts down the bootstrap machine. (Requires manual intervention if you provision the infrastructure)

9. The control plane sets up the compute nodes.

10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a fully running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operation, including the creation of compute machines in supported environments.

**Installation scope**
The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

Additional resources

- See Available cluster customizations for details about OpenShift Container Platform configuration resources.

1.2. SUPPORTED PLATFORMS FOR OPENSHIFT CONTAINER PLATFORM CLUSTERS

In OpenShift Container Platform 4.10, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Amazon Web Services (AWS)
- Google Cloud Platform (GCP)
- Microsoft Azure
- Microsoft Azure Stack Hub
- Red Hat OpenStack Platform (RHOSP) versions 16.1 and 16.2
  - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the OpenShift Container Platform on RHOSP support matrix.
- IBM Cloud
- Red Hat Virtualization (RHV)
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Alibaba Cloud
- Bare metal

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

**IMPORTANT**

After installation, the following changes are not supported:

- Mixing cloud provider platforms
- Mixing cloud provider components, such as using a persistent storage framework from a differing platform than what the cluster is installed on

In OpenShift Container Platform 4.10, you can install a cluster that uses user-provisioned infrastructure on the following platforms:
- AWS
- Azure
- Azure Stack Hub
- GCP
- RHOSP versions 16.1 and 16.2
- RHV
- VMware vSphere
- VMware Cloud on AWS
- Bare metal
- IBM Z or LinuxONE
- IBM Power

Depending on the supported cases for the platform, installations on user-provisioned infrastructure allow you to run machines with full internet access, place your cluster behind a proxy, or perform a restricted network installation. In a restricted network installation, you can download the images that are required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a restricted network installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The OpenShift Container Platform 4.x Tested Integrations page contains details about integration testing for different platforms.

Additional resources

- See Supported installation methods for different platforms for more information about the types of installations that are available for each supported platform.

- See Selecting a cluster installation method and preparing it for users for information about choosing an installation method and preparing the required resources.
CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and make sure you that you have all of the required resources to prepare the cluster for users.

2.1. SELECTING A CLUSTER INSTALLATION TYPE

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Alibaba Cloud
- Amazon Web Services (AWS) on x86_64 instances
- Amazon Web Services (AWS) on arm64 instances
- Microsoft Azure
- Microsoft Azure Stack Hub
- Google Cloud Platform (GCP)
- Red Hat OpenStack Platform (RHOSP)
- Red Hat Virtualization (RHV)
- IBM Cloud
- IBM Z and LinuxONE
- IBM Z and LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same datacenter or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use OpenShift Dedicated or OpenShift Online. You can also use OpenShift as a managed service on Azure,
AWS, IBM Cloud, or Google Cloud. For more information about managed services, see the OpenShift Products page.

2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves the Operators that package, deploy, and manage Kubernetes applications and the operating system that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines as part of the installation process for OpenShift Container Platform. See Comparing OpenShift Container Platform 3 and OpenShift Container Platform 4.

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see OpenShift Migration Best Practices. Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called installer provisioned infrastructure installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to Alibaba Cloud, AWS, Azure, Azure Stack Hub, GCP, or VMC on AWS. These installation methods are the fastest way to deploy a production-capable OpenShift Container Platform cluster.

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for Alibaba Cloud, AWS, Azure, GCP, or VMC on AWS.

For installer-provisioned infrastructure installations, you can use an existing VPC in AWS, vNet in Azure, or VPC in GCP. You can also reuse part of your networking infrastructure so that your cluster in AWS, Azure, GCP, or VMC on AWS can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for RHOSP, RHOSP with Kuryr, RHOSP on SR-IOV, RHV, vSphere, and bare metal. Additionally, for vSphere, VMC on AWS, you can also customize additional network parameters during installation.

If you want to reuse extensive cloud infrastructure, you can complete a user-provisioned infrastructure installation. With these installations, you manually deploy the machines that your cluster requires during the installation process. If you perform a user-provisioned infrastructure installation on AWS, Azure,
Azure Stack Hub, GCP, or VMC on AWS, you can use the provided templates to help you stand up all of
the required components. You can also reuse a shared VPC on GCP. Otherwise, you can use the
provider-agnostic installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you
use RHOSP, RHOSP on SR-IOV, RHV, IBM Z or LinuxONE, IBM Z or LinuxONE with RHEL KVM, IBM
Power, or vSphere, use the specific installation instructions to deploy your cluster. If you use other
supported hardware, follow the bare metal installation procedure. For some of these platforms, such as
RHOSP, vSphere, VMC on AWS, and bare metal, you can also customize additional network parameters
during installation.

2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The
instructions are included in each installation procedure.

If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy
a private cluster with installer-provisioned infrastructure on AWS, Azure, or GCP.

If you need to install your cluster that has limited access to the internet, such as a disconnected or
restricted network cluster, you can mirror the installation packages and install the cluster from them.
Follow detailed instructions for user provisioned infrastructure installations into restricted networks for
AWS, GCP, IBM Z or LinuxONE, IBM Z or LinuxONE with RHEL KVM, IBM Power, vSphere, VMC on
AWS, or bare metal. You can also install a cluster into a restricted network using installer-provisioned
infrastructure by following detailed instructions for AWS, GCP, VMC on AWS, RHOSP, RHV, and
vSphere.

If you need to deploy your cluster to an AWS GovCloud region, AWS China region, or Azure government
region, you can configure those custom regions during an installer-provisioned infrastructure
installation.

You can also configure the cluster machines to use FIPS Validated / Modules in Process cryptographic
libraries during installation.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported
on OpenShift Container Platform deployments on the x86_64 architecture.

2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION

Some configuration is not required to install the cluster but recommended before your users access the
cluster. You can customize the cluster itself by customizing the Operators that make up your cluster and
integrate you cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- Persistent storage
- An identity provider
- Monitoring core OpenShift Container Platform components

2.3. PREPARING YOUR CLUSTER FOR WORKLOADS
Depending on your workload needs, you might need to take extra steps before you begin deploying applications. For example, after you prepare infrastructure to support your application build strategy, you might need to make provisions for low-latency workloads or to protect sensitive workloads. You can also configure monitoring for application workloads.

2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS

You can perform different types of installations on different platforms.

**NOTE**

Not all installation options are supported for all platforms, as shown in the following tables.

CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

| Shared VPC hosted outside of cluster project | X |
CHAPTER 3. DISCONNECTED INSTALLATION MIRRORING

3.1. ABOUT DISCONNECTED INSTALLATION MIRRORING

You can use a mirror registry to ensure that your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

3.1.1. Creating a mirror registry

If you already have a container image registry, such as Red Hat Quay, you can use it as your mirror registry. If you do not already have a registry, you can create a mirror registry using the mirror registry for Red Hat OpenShift.

3.1.2. Mirroring images for a disconnected installation

You can use one of the following procedures to mirror your OpenShift Container Platform image repository to your mirror registry:

- Mirroring images for a disconnected installation
- Mirroring images for a disconnected installation using the oc-mirror plug-in (Technology Preview)

3.2. CREATING A MIRROR REGISTRY

The mirror registry for Red Hat OpenShift is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

If you already have a container image registry, such as Red Hat Quay, you can skip this section and go straight to Mirroring the OpenShift Container Platform image repository.

3.2.1. Prerequisites

- An OpenShift Container Platform subscription.
- Red Hat Enterprise Linux (RHEL) 8 with Podman 3.3 and OpenSSL installed.
- Fully qualified domain name for the Red Hat Quay service, which must resolve through a DNS server.
- Passwordless sudo access on the target host.
- Key-based SSH connectivity on the target host. SSH keys are automatically generated for local installs. For remote hosts, you must generate your own SSH keys.
- 2 or more vCPUs.
- 8 GB of RAM.
About 12 GB for OpenShift Container Platform 4.10 release images, or about 358 GB for OpenShift Container Platform 4.10 release images and OpenShift Container Platform 4.10 Red Hat Operator images. Up to 1 TB per stream or more is suggested.

**IMPORTANT**

These requirements are based on local testing results with only release images and Operator images. Storage requirements can vary based on your organization’s needs. You might require more space, for example, when you mirror multiple z-streams. You can use standard Red Hat Quay functionality to remove unnecessary images and free up space.

### 3.2.2. Mirror registry for Red Hat OpenShift introduction

For disconnected deployments of OpenShift Container Platform, a container registry is required to carry out the installation of the clusters. To run a production-grade registry service on such a cluster, you must create a separate registry deployment to install the first cluster. The mirror registry for Red Hat OpenShift addresses this need and is included in every OpenShift subscription. It is available for download on the OpenShift console Downloads page.

The mirror registry for Red Hat OpenShift allows users to install a small-scale version of Red Hat Quay and its required components using the mirror-registry command line interface (CLI) tool. The mirror registry for Red Hat OpenShift is deployed automatically with pre-configured local storage and a local database. It also includes auto-generated user credentials and access permissions with a single set of inputs and no additional configuration choices to get started.

The mirror registry for Red Hat OpenShift provides a pre-determined network configuration and reports deployed component credentials and access URLs upon success. A limited set of optional configuration inputs like fully qualified domain name (FQDN) services, superuser name and password, and custom TLS certificates are also provided. This provides users with a container registry so that they can easily create an offline mirror of all OpenShift Container Platform release content when running OpenShift Container Platform in restricted network environments.

The mirror registry for Red Hat OpenShift is limited to hosting images that are required to install a disconnected OpenShift Container Platform cluster, such as Release images or Red Hat Operator images. It uses local storage on your Red Hat Enterprise Linux (RHEL) machine, and storage supported by RHEL is supported by the mirror registry for Red Hat OpenShift. Content built by customers should not be hosted by the mirror registry for Red Hat OpenShift.

Unlike Red Hat Quay, the mirror registry for Red Hat OpenShift is not a highly-available registry and only local file system storage is supported. Using the mirror registry for Red Hat OpenShift with more than one cluster is discouraged, because multiple clusters can create a single point of failure when updating your cluster fleet. It is advised to leverage the mirror registry for Red Hat OpenShift to install a cluster that can host a production-grade, highly-available registry such as Red Hat Quay, which can serve OpenShift Container Platform content to other clusters.

Use of the mirror registry for Red Hat OpenShift is optional if another container registry is already available in the install environment.

### 3.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift

This procedure explains how to install the mirror registry for Red Hat OpenShift on a local host using the mirror-registry installer tool. By doing so, users can create a local host registry running on port 443 for the purpose of storing a mirror of OpenShift Container Platform images.
Installing the mirror registry for Red Hat OpenShift using the mirror-registry CLI tool makes several changes to your machine. After installation, a /etc/quay-install directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named init is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure

1. Download the mirror-registry.tar.gz package for the latest version of the mirror registry for Red Hat OpenShift found on the OpenShift console Downloads page.

2. Install the mirror registry for Red Hat OpenShift on your local host with your current user account by using the mirror-registry tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

   $ sudo ./mirror-registry install \  --quayHostname <host_example_com> \  --quayRoot <example_directory_name>

3. Use the user name and password generated during installation to log into the registry by running the following command:

   $ podman login --authfile pull-secret.txt \  -u init \  -p <password> \  <host_example_com>:8443 \  --tls-verify=false

   You can avoid running --tls-verify=false by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

   NOTE

   You can also log in by accessing the UI at https://<host.example.com>:8443 after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

   NOTE

   If there are issues with images stored by the mirror registry for Red Hat OpenShift due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

3.2.4. Mirroring on a remote host with mirror registry for Red Hat OpenShift
This procedure explains how to install the mirror registry for Red Hat OpenShift on a remote host using the mirror-registry tool. By doing so, users can create a registry to hold a mirror of OpenShift Container Platform images.

NOTE
Installing the mirror registry for Red Hat OpenShift using the mirror-registry CLI tool makes several changes to your machine. After installation, a /etc/quay-install directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named init is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure

1. Download the mirror-registry.tar.gz package for the latest version of the mirror registry for Red Hat OpenShift found on the OpenShift console Downloads page.

2. Install the mirror registry for Red Hat OpenShift on your local host with your current user account by using the mirror-registry tool. For a full list of available flags, see “mirror registry for Red Hat OpenShift flags”.

```
$ sudo ./mirror-registry install -v \
 --targetHostname <host_example_com> \
 --targetUsername <example_user> \
 -k ~/.ssh/my_ssh_key \
 --quayHostname <host_example_com> \
 --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the mirror registry by running the following command:

```
$ podman login --authfile pull-secret.txt \
 -u init \
 -p <password> \
 <host_example_com>:8443> \
 --tls-verify=false
```

You can avoid running --tls-verify=false by configuring your system to trust the generated rootCA certificates. See “Using SSL to protect connections to Red Hat Quay” and “Configuring the system to trust the certificate authority” for more information.

NOTE
You can also log in by accessing the UI at https://<host.example.com>:8443 after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.
NOTE

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

3.2.5. Upgrading the mirror registry for Red Hat OpenShift

- You can upgrade the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

  $ sudo ./mirror-registry upgrade

NOTE

- Users who upgrade the *mirror registry for Red Hat OpenShift* with the `./mirror-registry upgrade` flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with `--quayHostname <host_example_com>` and `--quayRoot <example_directory_name>`, you must include that string to properly upgrade the mirror registry.

3.2.6. Uninstalling the mirror registry for Red Hat OpenShift

- You can uninstall the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

  $ sudo ./mirror-registry uninstall -v \
  --quayRoot <example_directory_name>

NOTE

- Deleting the *mirror registry for Red Hat OpenShift* will prompt the user before deletion. You can use `--autoApprove` to skip this prompt.

- Users who install the *mirror registry for Red Hat OpenShift* with the `--quayRoot` flag must include the `--quayRoot` flag when uninstalling. For example, if you installed the *mirror registry for Red Hat OpenShift* with `--quayRoot example_directory_name`, you must include that string to properly uninstall the mirror registry.

3.2.7. Mirror registry for Red Hat OpenShift flags

The following flags are available for the *mirror registry for Red Hat OpenShift*:

<table>
<thead>
<tr>
<th>Flags</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--autoApprove</code></td>
<td>A boolean value that disables interactive prompts. If set to <code>true</code>, the quayRoot directory is automatically deleted when uninstalling the mirror registry. Defaults to <code>false</code> if left unspecified.</td>
</tr>
</tbody>
</table>
The password of the init user created during Quay installation. Must be at least eight characters and contain no whitespace.

Shows the username of the initial user. Defaults to init if left unspecified.

The fully-qualified domain name of the mirror registry that clients will use to contact the registry. Equivalent to SERVER_HOSTNAME in the Quay config.yaml. Must resolve by DNS. Defaults to <targetHostname>:8443 if left unspecified. [1]

The directory where container image layer and configuration data is saved, including rootCA.key, rootCA.pem, and rootCA.srl certificates. Requires about 12 GB for OpenShift Container Platform 4.10 Release images, or about 358 GB for OpenShift Container Platform 4.10 Release images and OpenShift Container Platform 4.10 Red Hat Operator images. Defaults to /etc/quay-install if left unspecified.

The path of your SSH identity key. Defaults to ~/.ssh/quay_installer if left unspecified.

The path to the SSL/TLS public key / certificate. Defaults to {quayRoot}/quay-config and is auto-generated if left unspecified.

Skips the check for the certificate hostname against the SERVER_HOSTNAME in the config.yaml file. [2]

The path to the SSL/TLS private key used for HTTPS communication. Defaults to {quayRoot}/quay-config and is auto-generated if left unspecified.

The hostname of the target you want to install Quay to. Defaults to $HOST, for example, a local host, if left unspecified.

The user on the target host which will be used for SSH. Defaults to $USER, for example, the current user if left unspecified.

Shows debug logs and Ansible playbook outputs.

Shows the version for the mirror registry for Red Hat OpenShift

---

1. **--quayHostname** must be modified if the public DNS name of your system is different from the local hostname.

2. **--sslCheckSkip** is used in cases when the mirror registry is set behind a proxy and the exposed hostname is different from the internal Quay hostname. It can also be used when users do not want the certificates to be validated against the provided Quay hostname during installation.
3.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

You can ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

**IMPORTANT**

You must have access to the internet to obtain the necessary container images. In this procedure, you place your mirror registry on a mirror host that has access to both your network and the internet. If you do not have access to a mirror host, use the Mirroring Operator catalogs for use with disconnected clusters procedure to copy images to a device you can move across network boundaries with.

### 3.3.1. Prerequisites

- You must have a container image registry that supports Docker v2-2 in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
  - Red Hat Quay
  - JFrog Artifactory
  - Sonatype Nexus Repository
  - Harbor

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay for proof-of-concept purposes or by using the Quay Operator. If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat support.

- If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a mirror registry for Red Hat OpenShift. The mirror registry for Red Hat OpenShift is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

### 3.3.2. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry such as Red Hat Quay, JFrog Artifactory, Sonatype Nexus Repository, or Harbor. If you do not have access to a large-scale container registry, you can use the mirror registry for Red Hat OpenShift, a small-scale container registry included with OpenShift Container Platform subscriptions.
You can use any container registry that supports Docker v2-2, such as Red Hat Quay, the mirror registry for Red Hat OpenShift, Artifactory, Sonatype Nexus Repository, or Harbor. Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

**IMPORTANT**

The internal registry of the OpenShift Container Platform cluster cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the mirror registry for Red Hat OpenShift, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as **connected mirroring**. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as **disconnected mirroring**.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the **crictl images** command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

**NOTE**

Red Hat does not test third party registries with OpenShift Container Platform.

**Additional information**

For information about viewing the CRI-O logs to view the image source, see **Viewing the image pull source**.

**3.3.3. Preparing your mirror host**

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.

**3.3.3.1. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.
Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

$ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.

   To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the OpenShift CLI, it is available using the oc command:

C:\> oc <command>

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 macOS Client entry and save the file.

4. Open the .dmg file and drag the file to the Applications folder.

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, open the terminal and execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

$ oc <command>

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   ```

### 3.3.4. Configuring credentials that allow images to be mirrored

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

**WARNING**

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

**WARNING**

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

**Prerequisites**

- You configured a mirror registry to use in your restricted network.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

**Procedure**
Complete the following steps on the installation host:

1. Download your `registry.redhat.io` pull secret from the Red Hat OpenShift Cluster Manager.

2. Make a copy of your pull secret in JSON format:

   ```bash
   $ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json>
   ```

   Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

   The contents of the file resemble the following example:

   ```json
   {
     "auths": {
       "cloud.openshift.com": {
         "auth": "b3BlbnNo...",
         "email": "you@example.com"
       },
       "quay.io": {
         "auth": "b3BlbnNo...",
         "email": "you@example.com"
       },
       "registry.connect.redhat.com": {
         "auth": "NTE3Njg5Nj...",
         "email": "you@example.com"
       },
       "registry.redhat.io": {
         "auth": "NTE3Njg5Nj...",
         "email": "you@example.com"
       }
     }
   }
   ```

3. Generate the base64-encoded user name and password or token for your mirror registry:

   ```bash
   $ echo -n '<user_name>:<password>' | base64 -w0
   BGVtbYk3ZHAtqXs=
   ```

   For `<user_name>` and `<password>`, specify the user name and password that you configured for your registry.

4. Edit the JSON file and add a section that describes your registry to it:

   ```json
   "auths": {
     "<mirror_registry>": {  
       "auth": "<credentials>",  
       "email": "you@example.com"
     },
   }
   ```

   For `<mirror_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:5000`
For `<credentials>`, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```json
{
    "auths": {
        "registry.example.com": {
            "auth": "BGVtbYk3ZHAtqXs=",
            "email": "you@example.com"
        },
        "cloud.openshift.com": {
            "auth": "b3BlbnNo...",
            "email": "you@example.com"
        },
        "quay.io": {
            "auth": "b3BlbnNo...",
            "email": "you@example.com"
        },
        "registry.connect.redhat.com": {
            "auth": "NTE3Njg5Nj...",
            "email": "you@example.com"
        },
        "registry.redhat.io": {
            "auth": "NTE3Njg5Nj...",
            "email": "you@example.com"
        }
    }
}
```

### 3.3.5. Mirroring the OpenShift Container Platform image repository

Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

**Prerequisites**

- Your mirror host has access to the internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the pull secret from the Red Hat OpenShift Cluster Manager and modified it to include authentication to your mirror repository.
- If you use self-signed certificates, you have specified a Subject Alternative Name in the certificates.

**Procedure**

Complete the following steps on the mirror host:

1. Review the OpenShift Container Platform downloads page to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the Repository Tags page.
2. Set the required environment variables:
   a. Export the release version:
      $$\text{	exttt{OCP\_RELEASE}}=<\text{release\_version}>$$
      For $<\text{release\_version}>$, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as 4.5.4.
   b. Export the local registry name and host port:
      $$\text{	exttt{LOCAL\_REGISTRY}}='<\text{local\_registry\_host\_name}>:<\text{local\_registry\_host\_port}>'$$
      For $<\text{local\_registry\_host\_name}>$, specify the registry domain name for your mirror repository, and for $<\text{local\_registry\_host\_port}>$, specify the port that it serves content on.
   c. Export the local repository name:
      $$\text{	exttt{LOCAL\_REPOSITORY}}='<\text{local\_repository\_name}>'$$
      For $<\text{local\_repository\_name}>$, specify the name of the repository to create in your registry, such as ocp4/openshift4.
   d. Export the name of the repository to mirror:
      $$\text{	exttt{PRODUCT\_REPO}}='\text{openshift\_release\_dev}'$$
      For a production release, you must specify openshift-release-dev.
   e. Export the path to your registry pull secret:
      $$\text{	exttt{LOCAL\_SECRET\_JSON}}='<\text{path\_to\_pull\_secret}>'$$
      For $<\text{path\_to\_pull\_secret}>$, specify the absolute path to and file name of the pull secret for your mirror registry that you created.
   f. Export the release mirror:
      $$\text{	exttt{RELEASE\_NAME}}='\text{ocp\_release}'$$
      For a production release, you must specify ocp-release.
   g. Export the type of architecture for your server, such as x86_64:
      $$\text{	exttt{ARCHITECTURE}}=<\text{server\_architecture}>$$
   h. Export the path to the directory to host the mirrored images:
      $$\text{	exttt{REMOVABLE\_MEDIA\_PATH}}=<\text{path}> \hspace{1em} 1$$
      1 Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the mirror registry:
   $$\text{OpenShift Container Platform 4.10 Installing}$$
If your mirror host does not have internet access, take the following actions:

i. Connect the removable media to a system that is connected to the internet.

ii. Review the images and configuration manifests to mirror:

   ```
   $ oc adm release mirror -a ${LOCAL_SECRET_JSON} \ 
     --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE} \ 
     --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \ 
     --to-release=image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE} --dry-run
   ```

iii. Record the entire `imageContentSources` section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the `imageContentSources` section to the `install-config.yaml` file during installation.

iv. Mirror the images to a directory on the removable media:

   ```
   $ oc adm release mirror -a ${LOCAL_SECRET_JSON} --to-dir=${REMOVABLE_MEDIA_PATH}/mirror quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE}
   ```

v. Take the media to the restricted network environment and upload the images to the local container registry.

   ```
   $ oc image mirror -a ${LOCAL_SECRET_JSON} --from-dir=${REMOVABLE_MEDIA_PATH}/mirror "file://openshift/release:${OCP_RELEASE}/*" 
   ${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}
   ```

   **For REMOVABLE_MEDIA_PATH, you must use the same path that you specified when you mirrored the images.**

If the local container registry is connected to the mirror host, take the following actions:

i. Directly push the release images to the local registry by using following command:

   ```
   $ oc adm release mirror -a ${LOCAL_SECRET_JSON} \ 
     --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE} \ 
     --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \ 
     --to-release=image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE}
   ```

   This command pulls the release information as a digest, and its output includes the `imageContentSources` data that you require when you install your cluster.

ii. Record the entire `imageContentSources` section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and
you must add the `imageContentSources` section to the `install-config.yaml` file during installation.

**NOTE**

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.

4. To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:

- If your mirror host does not have internet access, run the following command:

  ```bash
  $ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install "${LOCAL.Registry}/${LOCAL.Repository}:${OCP.Release}"
  ``

- If the local container registry is connected to the mirror host, run the following command:

  ```bash
  $ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install "${LOCAL.Registry}/${LOCAL.Repository}:${OCP.Release}-${ARCHITECTURE}"
  ``

**IMPORTANT**

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active internet connection.

If you are in a disconnected environment, use the `--image` flag as part of must-gather and point to the payload image.

5. For clusters using installer-provisioned infrastructure, run the following command:

   ```bash
   $ openshift-install
   ```

3.3.6. The Cluster Samples Operator in a disconnected environment

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

3.3.6.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named `imagestreamtag-to-image` in the `openshift-cluster-samples-operator` namespace. The `imagestreamtag-to-image` config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is `<image_stream_name>_imagestream_tag_name>`. 

92
During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to **Removed**. If you choose to change it to **Managed**, it installs samples.

**NOTE**

The use of samples in a network-restricted or discontinued environment may require access to services external to your network. Some example services include: Github, Maven Central, npm, RubyGems, PyPi and others. There might be additional steps to take that allow the cluster samples operators’s objects to reach the services they require.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to **Removed**, you can create your mirrored registry, or determine which existing mirrored registry you want to use.

- Mirror the samples you want to the mirrored registry using the new config map as your guide.

- Add any of the image streams you did not mirror to the `skippedImagestreams` list of the Cluster Samples Operator configuration object.

- Set `samplesRegistry` of the Cluster Samples Operator configuration object to the mirrored registry.

- Then set the Cluster Samples Operator to **Managed** to install the image streams you have mirrored.

### 3.3.7. Mirroring Operator catalogs for use with disconnected clusters

You can mirror the Operator contents of a Red Hat-provided catalog, or a custom catalog, into a container image registry using the `oc adm catalog mirror` command. The target registry must support Docker v2-2. For a cluster on a restricted network, this registry can be one that the cluster has network access to, such as a mirror registry created during a restricted network cluster installation.

The `oc adm catalog mirror` command also automatically mirrors the index image that is specified during the mirroring process, whether it be a Red Hat-provided index image or your own custom-built index image, to the target registry. You can then use the mirrored index image to create a catalog source that allows Operator Lifecycle Manager (OLM) to load the mirrored catalog onto your OpenShift Container Platform cluster.

**Additional resources**

- [Using Operator Lifecycle Manager on restricted networks](#)

### 3.3.7.1. Prerequisites

Mirroring Operator catalogs for use with disconnected clusters has the following prerequisites:

- Workstation with unrestricted network access.

- `podman` version 1.9.3 or later.

- If you want to filter, or `prune`, the default catalog and selectively mirror only a subset of Operators, see the following sections:

  - [Installing the opm CLI](#)
Filtering a SQLite-based index image

- If you want to mirror a Red Hat-provided catalog, run the following command on your workstation with unrestricted network access to authenticate with registry.redhat.io:

  ```
  $ podman login registry.redhat.io
  ```

- Access to a mirror registry that supports Docker v2-2.

- On your mirror registry, decide which namespace to use for storing mirrored Operator content. For example, you might create an `olm-mirror` namespace.

- If your mirror registry does not have internet access, connect removable media to your workstation with unrestricted network access.

- If you are working with private registries, including registry.redhat.io, set the `REG_CREDS` environment variable to the file path of your registry credentials for use in later steps. For example, for the podman CLI:

  ```
  $ REG_CREDS=${XDG_RUNTIME_DIR}/containers/auth.json
  ```

3.3.7.2. Extracting and mirroring catalog contents

The `oc adm catalog mirror` command extracts the contents of an index image to generate the manifests required for mirroring. The default behavior of the command generates manifests, then automatically mirrors all of the image content from the index image, as well as the index image itself, to your mirror registry.

Alternatively, if your mirror registry is on a completely disconnected, or airgapped, host, you can first mirror the content to removable media, move the media to the disconnected environment, then mirror the content from the media to the registry.

3.3.7.2.1. Mirroring catalog contents to registries on the same network

If your mirror registry is co-located on the same network as your workstation with unrestricted network access, take the following actions on your workstation.

Procedure

1. If your mirror registry requires authentication, run the following command to log in to the registry:

   ```
   $ podman login <mirror_registry>
   ```

2. Run the following command to extract and mirror the content to the mirror registry:

   ```
   $ oc adm catalog mirror \
   <index_image> \ <.> \
   <mirror_registry>:<port>/<namespace> \ <.> \
   [-a ${REG_CREDS}] \ <.> \
   [--insecure] \ <.> \
   [--index-filter-by-os='<platform>/<arch>'] \ <.> \
   [--manifests-only] <.>
   ```
Specify the index image for the catalog that you want to mirror. For example, this might be a pruned index image that you created previously, or one of the source index images for the default catalogs, such as `registry.redhat.io/redhat/redhat-operator-index:v4.10`.

Specify the fully qualified domain name (FQDN) for the target registry and namespace to mirror the Operator contents to, where `<namespace>` is any existing namespace on the registry. For example, you might create an `olm-mirror` namespace to push all mirrored content to.

Optional: If required, specify the location of your registry credentials file. `{REG_CREDS}` is required for `registry.redhat.io`.

Optional: If you do not want to configure trust for the target registry, add the `--insecure` flag.

Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are passed as `<platform>/<arch>[/<variant>]`. This does not apply to images referenced by the index. Valid values are `linux/amd64`, `linux/ppc64le`, `linux/s390x`, and `.*`.

Optional: Generate only the manifests required for mirroring, and do not actually mirror the image content to a registry. This option can be useful for reviewing what will be mirrored, and it allows you to make any changes to the mapping list if you require only a subset of packages. You can then use the `mapping.txt` file with the `oc image mirror` command to mirror the modified list of images in a later step. This flag is intended for only advanced selective mirroring of content from the catalog; the `opm index prune` command, if you used it previously to prune the index image, is suitable for most catalog management use cases.

### Example output

```
src image has index label for database path: /database/index.db
using database path mapping: /database/index.db:/tmp/153048078
wrote database to /tmp/153048078
...  1
wrote mirroring manifests to manifests-redhat-operator-index-1614211642  2
```

1. Directory for the temporary `index.db` database generated by the command.
2. Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.

### NOTE

Red Hat Quay does not support nested repositories. As a result, running the `oc adm catalog mirror` command will fail with a 401 unauthorized error. As a workaround, you can use the `--max-components=2` option when running the `oc adm catalog mirror` command to disable the creation of nested repositories. For more information on this workaround, see the Unauthorized error thrown while using catalog mirror command with Quay registry Knowledgebase Solution.
3.3.7.2.2. Mirroring catalog contents to airgapped registries

If your mirror registry is on a completely disconnected, or airgapped, host, take the following actions.

Procedure

1. Run the following command on your workstation with unrestricted network access to mirror the content to local files:

   ```
   $ oc adm catalog mirror \
   <index_image> <.> \
   file://local/index \ <.> \
   -a ${REG_CREDS} \ <.> \
   --insecure \ <.> \
   --index-filter-by-os='<platform>/<arch>' <.
   ```

   <> Specify the index image for the catalog that you want to mirror. For example, this might be a pruned index image that you created previously, or one of the source index images for the default catalogs, such as `registry.redhat.io/redhat/redhat-operator-index:v4.10`. <> Specify the content to mirror to local files in your current directory. <> Optional: If required, specify the location of your registry credentials file. <> Optional: If you do not want to configure trust for the target registry, add the `--insecure` flag. <> Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as `<platform>/<arch>[/<variant>]`. This does not apply to images referenced by the index. Valid values are `linux/amd64`, `linux/ppc64le`, `linux/s390x`, and `.*`.

2. Copy the `v2/` directory to removable media.

3. Physically remove the media and attach it to a host in the disconnected environment that has access to the mirror registry.

4. If your mirror registry requires authentication, run the following command on your host in the disconnected environment to log in to the registry:

   ```
   $ oc adm catalog mirror \
   <index_image> <.> \
   file:///local/index \ <.> \
   -a ${REG_CREDS} \ <.> \
   --insecure \ <.> \
   --index-filter-by-os='<platform>/<arch>' <.
   ```

Example output

```
info: Mirroring completed in 5.93s (5.915MB/s)
1 wrote mirroring manifests to manifests-my-index-1614985528

To upload local images to a registry, run:

   oc adm catalog mirror file:///local/index/myrepo/my-index:v1 REGISTRY/REPOSITORY

1 Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.

2 Record the expanded `file://` path that is based on your provided index image. This path is referenced in a subsequent step.

This command creates a `v2/` directory in your current directory.

2. Copy the `v2/` directory to removable media.

3. Physically remove the media and attach it to a host in the disconnected environment that has access to the mirror registry.

4. If your mirror registry requires authentication, run the following command on your host in the disconnected environment to log in to the registry:
$ podman login <mirror_registry>

5. Run the following command from the parent directory containing the v2/ directory to upload the images from local files to the mirror registry:

$ oc adm catalog mirror \
  file://local/index/<repo>/<index_image>:<tag> \<.> \
  <mirror_registry>:<port>/<namespace> \<.> \
  -a ${REG_CREDS} \<.> \
  --insecure \<.> \
  --index-filter-by-os='<platform>/<arch>' <.>

<.> Specify the file:// path from the previous command output. <.> Specify the fully qualified domain name (FQDN) for the target registry and namespace to mirror the Operator contents to, where <namespace> is any existing namespace on the registry. For example, you might create an olm-mirror namespace to push all mirrored content to. <.> Optional: If required, specify the location of your registry credentials file. <.> Optional: If you do not want to configure trust for the target registry, add the --insecure flag. <.> Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '<platform>/<arch>[/<variant>]'. This does not apply to images referenced by the index. Valid values are linux/amd64, linux/ppc64le, linux/s390x, and .*

NOTE

Red Hat Quay does not support nested repositories. As a result, running the oc adm catalog mirror command will fail with a 401 unauthorized error. As a workaround, you can use the --max-components=2 option when running the oc adm catalog mirror command to disable the creation of nested repositories. For more information on this workaround, see the Unauthorized error thrown while using catalog mirror command with Quay registry Knowledgebase Solution.

6. Run the oc adm catalog mirror command again. Use the newly mirrored index image as the source and the same mirror registry namespace used in the previous step as the target:

$ oc adm catalog mirror \
  <mirror_registry>:<port>/<index_image> \
  <mirror_registry>:<port>/<namespace> \
  --manifests-only \
  [-a ${REG_CREDS}] \
  [--insecure]

The --manifests-only flag is required for this step so that the command does not copy all of the mirrored content again.

IMPORTANT

This step is required because the image mappings in the imageContentSourcePolicy.yaml file generated during the previous step must be updated from local paths to valid mirror locations. Failure to do so will cause errors when you create the ImageContentSourcePolicy object in a later step.

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your
cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the `ImageContentSourcePolicy` and `CatalogSource` objects. These objects are required to enable installation of Operators from OperatorHub.

**Additional resources**

- Architecture and operating system support for Operators

### 3.3.7.3. Generated manifests

After mirroring Operator catalog content to your mirror registry, a manifests directory is generated in your current directory.

If you mirrored content to a registry on the same network, the directory name takes the following pattern:

```
manifests-<index_image_name>-<random_number>
```

If you mirrored content to a registry on a disconnected host in the previous section, the directory name takes the following pattern:

```
manifests-index/<namespace>/<index_image_name>-<random_number>
```

**NOTE**

The manifests directory name is referenced in subsequent procedures.

The manifests directory contains the following files, some of which might require further modification:

- The `catalogSource.yaml` file is a basic definition for a `CatalogSource` object that is pre-populated with your index image tag and other relevant metadata. This file can be used as is or modified to add the catalog source to your cluster.

  **IMPORTANT**

  If you mirrored the content to local files, you must modify your `catalogSource.yaml` file to remove any backslash (`/`) characters from the `metadata.name` field. Otherwise, when you attempt to create the object, it fails with an "invalid resource name" error.

- The `imageContentSourcePolicy.yaml` file defines an `ImageContentSourcePolicy` object that can configure nodes to translate between the image references stored in Operator manifests and the mirrored registry.

  **NOTE**

  If your cluster uses an `ImageContentSourcePolicy` object to configure repository mirroring, you can use only global pull secrets for mirrored registries. You cannot add a pull secret to a project.
The `mapping.txt` file contains all of the source images and where to map them in the target registry. This file is compatible with the `oc image mirror` command and can be used to further customize the mirroring configuration.

**IMPORTANT**

If you used the `--manifests-only` flag during the mirroring process and want to further trim the subset of packages to mirror, see the steps in the Mirroring a package manifest format catalog image procedure of the OpenShift Container Platform 4.7 documentation about modifying your `mapping.txt` file and using the file with the `oc image mirror` command.

### 3.3.7.4. Post-installation requirements

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the `ImageContentSourcePolicy` and `CatalogSource` objects. These objects are required to populate and enable installation of Operators from OperatorHub.

**Additional resources**

- Populating OperatorHub from mirrored Operator catalogs

### 3.3.8. Next steps

- Install a cluster on infrastructure that you provision in your restricted network, such as on VMware vSphere, bare metal, or Amazon Web Services.

### 3.3.9. Additional resources

- See Gathering data about specific features for more information about using must-gather.

### 3.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUG-IN

You can ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

You can use the oc-mirror OpenShift CLI (`oc`) plug-in to mirror images to a mirror registry in your fully or partially disconnected environments.
**IMPORTANT**

Mirroring images for disconnected environments using the oc-mirror plug-in is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [https://access.redhat.com/support/offerings/techpreview/](https://access.redhat.com/support/offerings/techpreview/).

The following steps outline the high-level workflow on how to use the oc-mirror plug-in to mirror images to a mirror registry:

1. Create an image set configuration file.
2. Mirror the image set to the mirror registry.
3. Install the `ImageContentSourcePolicy` and `CatalogSource` resources that were generated by oc-mirror into the cluster.
4. Repeat these steps to update your mirror registry as necessary.

### 3.4.1. About the oc-mirror plug-in

You can use the oc-mirror OpenShift CLI (`oc`) plug-in to mirror all required OpenShift Container Platform content and other images to your mirror registry by using a single tool. It provides the following features:

- Provides a centralized method to mirror OpenShift Container Platform releases, Operators, helm charts, and other images.
- Maintains update paths for OpenShift Container Platform and Operators.
- Uses a declarative image set configuration file to include only the OpenShift Container Platform releases, Operators, and images that your cluster needs.
- Performs incremental mirroring, which reduces the size of future image sets.

When using the oc-mirror plug-in, you specify which content to mirror in an image set configuration file. In this YAML file, you can fine-tune the configuration to only include the OpenShift Container Platform releases and Operators that your cluster needs. This reduces the amount of data that you need to download and transfer. The oc-mirror plug-in can also mirror arbitrary helm charts and additional container images to assist users in seamlessly synchronizing their workloads onto mirror registries.

The first time you run the oc-mirror plug-in, it populates your mirror registry with the required content to perform your disconnected cluster installation. In order for your disconnected cluster to continue receiving updates, you must keep your mirror registry updated. To update your mirror registry, you run the oc-mirror plug-in using the same configuration as the first time you ran it. The oc-mirror plug-in references the metadata from the storage backend and only downloads what has been released since the last time you ran the tool. This provides update paths for OpenShift Container Platform and Operators and performs dependency resolution as required.
When using the oc-mirror CLI plug-in to populate a mirror registry, any further updates to the mirror registry must be made using the oc-mirror tool.

3.4.2. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry that supports Docker v2-2, such as Red Hat Quay. If you do not have access to a large-scale container registry, you can use the mirror registry for Red Hat OpenShift, which is a small-scale container registry included with OpenShift Container Platform subscriptions.

Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

The internal registry of the OpenShift Container Platform cluster cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the mirror registry for Red Hat OpenShift, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as connected mirroring. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as disconnected mirroring.

For mirrored registries, to view the source of pulled images, you must review the Trying to access log entry in the CRI-O logs. Other methods to view the image pull source, such as using the crictl images command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

Red Hat does not test third party registries with OpenShift Container Platform.

3.4.3. Prerequisites

- You must have a container image registry that supports Docker v2-2 in the location that will host the OpenShift Container Platform cluster, such as Red Hat Quay.
NOTE
If you use Red Hat Quay, you must use version 3.6 or later with the oc-mirror plug-in. If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay for proof-of-concept purposes or by using the Quay Operator. If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat Support.

If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a mirror registry for Red Hat OpenShift. The mirror registry for Red Hat OpenShift is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

3.4.4. Preparing your mirror hosts
Before you can use the oc-mirror plug-in to mirror images, you must install the plug-in and create a container image registry credentials file to allow the mirroring from Red Hat to your mirror.

3.4.4.1. Installing the oc-mirror OpenShift CLI plug-in
To use the oc-mirror OpenShift CLI plug-in to mirror registry images, you must install the plug-in. If you are mirroring image sets in a fully disconnected environment, ensure that you install the oc-mirror plug-in on the host with internet access and the host in the disconnected environment with access to the mirror registry.

Prerequisites
- You have installed the OpenShift CLI (oc).

Procedure
1. Download the oc-mirror CLI plug-in.
   a. Navigate to the Downloads page of the OpenShift Cluster Manager.
   b. Under the OpenShift disconnected installation tools section, click Download for OpenShift Client (oc) mirror plugin and save the file.
2. Extract the archive:
   ```
   $ tar xvzf oc-mirror.tar.gz
   ```
3. If necessary, update the plug-in file to be executable:
   ```
   $ chmod +x oc-mirror
   ```

4. Install the oc-mirror CLI plug-in by placing the file in your PATH, for example, /usr/local/bin:
Verification

- Run `oc mirror help` to verify that the plug-in was successfully installed:

```
$ oc mirror help
```

Additional resources

- Installing and using CLI plug-ins

### 3.4.4.2. Configuring credentials that allow images to be mirrored

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

**WARNING**

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

**WARNING**

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

**Prerequisites**

- You configured a mirror registry to use in your restricted network.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

**Procedure**

Complete the following steps on the installation host:

1. Download your `registry.redhat.io` pull secret from the Red Hat OpenShift Cluster Manager.
2. Make a copy of your pull secret in JSON format:
Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

Save the file either as `~/.docker/config.json` or `$XDG_RUNTIME_DIR/containers/auth.json`. The contents of the file resemble the following example:

```

```

Generate the base64-encoded user name and password or token for your mirror registry:

```
$ echo -n '<user_name>:<password>' | base64 -w0
```

For `<user_name>` and `<password>`, specify the user name and password that you configured for your registry.

Edit the JSON file and add a section that describes your registry to it:

```
"auths": {
  "<mirror_registry>": {  
    "auth": "<credentials>",  
    "email": "you@example.com"
  }
}
```

For `<mirror_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:5000`

For `<credentials>`, specify the base64-encoded user name and password for the mirror registry.
3.4.5. Creating the image set configuration

Before you can use the oc-mirror plug-in to mirror image sets, you must create an image set configuration file. This image set configuration file defines which OpenShift Container Platform releases, Operators, and other images to mirror, along with other configuration settings for the oc-mirror plug-in.

You must specify a storage backend in the image set configuration file. This storage backend can be a local directory or a registry that supports Docker v2-2. The oc-mirror plug-in stores metadata in this storage backend during image set creation.

IMPORTANT

Do not delete or modify the metadata that is generated by the oc-mirror plug-in. You must use the same storage backend every time you run the oc-mirror plug-in for the same mirror registry.

Procedure

1. Create an ImageSetConfiguration resource that specifies the necessary configuration details:

   Example ImageSetConfiguration file

   ```yaml
   apiVersion: mirror.openshift.io/v1alpha1
   kind: ImageSetConfiguration
   archiveSize: 4
   
mirror:
   ```
The maximum size, in GiB, of each file within the image set.

The channel to retrieve the OpenShift Container Platform images from.

The Operator catalog to retrieve the OpenShift Container Platform images from.

The back-end location to save the image set metadata to. This location can be a registry or local directory. It is required to specify `storageConfig` values.

The registry URL for the storage backend.

This example pulls images from the `stable-4.9` channel for the `registry.redhat.io/redhat/redhat-operator-index:v4.9` operator catalog and saves the image set metadata to the `example.com/example/oc-mirror` registry.

2. Save the file as `imageset-config.yaml`. This file is required by the `oc mirror` command when mirroring content.

Additional resources

- Image set configuration parameters
- Image set configuration examples

3.4.6. Mirroring an image set to a mirror registry

You can use the `oc-mirror` CLI plug-in to mirror images to a mirror registry in a partially disconnected environment or in a fully disconnected environment.

These procedures assume that you already have your mirror registry set up.

3.4.6.1. Mirroring an image set in a partially disconnected environment

In a partially disconnected environment, you can mirror an image set directly to the target mirror registry.

3.4.6.1.1. Mirroring from mirror to mirror

You can use the `oc-mirror` plug-in to mirror an image set directly to a target mirror registry that is accessible during image set creation.
### IMPORTANT

Depending on the configuration specified in the image set configuration file, using oc-mirror to mirror images might download several hundreds of gigabytes of data to disk before mirroring to the destination mirror registry.

The initial image set download when you populate the mirror registry is often the largest. Because you only download the images that changed since the last time you ran the command, when you run the oc-mirror plug-in again, the generated image set is often smaller.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a Docker v2 registry. The oc-mirror plug-in stores metadata in this storage backend during image set creation.

### IMPORTANT

Do not delete or modify the metadata that is generated by the oc-mirror plug-in. You must use the same storage backend every time you run the oc-mirror plug-in for the same mirror registry.

### Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (oc).
- You have installed the oc-mirror CLI plug-in.
- You have created the image set configuration file.

### Procedure

- Run the oc mirror command to mirror the images from the specified image set configuration to a specified registry:

```
$ oc mirror --config=./imageset-config.yaml \  
docker://registry.example:5000
```

1. Pass in the image set configuration file that was created. This procedure assumes that it is named `imageset-config.yaml`.
2. Specify the registry to mirror the image set file to. The registry must start with `docker://`. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

### Verification

1. Navigate into the oc-mirror-workspace/ directory that was generated.
2. Navigate into the results directory, for example, `results-1639608409/`.
3. Verify that YAML files are present for the ImageContentSourcePolicy and CatalogSource resources.
Next steps

- Install the ImageContentSourcePolicy and CatalogSource resources into the cluster.

### 3.4.6.2. Mirroring an image set in a fully disconnected environment

To mirror an image set in a fully disconnected environment, you must first mirror the image set to disk, then mirror the image set file on disk to a mirror.

#### 3.4.6.2.1. Mirroring from mirror to disk

You can use the oc-mirror plug-in to generate an image set and save the contents to disk. The generated image set can then be transferred to the disconnected environment and mirrored to the target registry.

**IMPORTANT**

Depending on the configuration specified in the image set configuration file, using oc-mirror to mirror images might download several hundreds of gigabytes of data to disk.

The initial image set download when you populate the mirror registry is often the largest. Because you only download the images that changed since the last time you ran the command, when you run the oc-mirror plug-in again, the generated image set is often smaller.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a docker v2 registry. The oc-mirror plug-in stores metadata in this storage backend during image set creation.

**IMPORTANT**

Do not delete or modify the metadata that is generated by the oc-mirror plug-in. You must use the same storage backend every time you run the oc-mirror plug-in for the same mirror registry.

### Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (`oc`).
- You have installed the oc-mirror CLI plug-in.
- You have created the image set configuration file.

### Procedure

- Run the `oc mirror` command to mirror the images from the specified image set configuration to disk:

  ```sh
  $ oc mirror --config=./imageset-config.yaml \[1
  file://<path_to_output_directory> \[2
  ```
1. Pass in the image set configuration file that was created. This procedure assumes that it is named `imageset-config.yaml`.

2. Specify the target directory where you want to output the image set file. The target directory path must start with `file://`.

### Verification

1. Navigate to your output directory:

   ```bash
   $ cd <path_to_output_directory>
   ``

2. Verify that an image set `.tar` file was created:

   ```bash
   $ ls
   ``

   **Example output**

   ```bash
   mirror_seq1_000000.tar
   ```

### Next steps

- Transfer the image set `.tar` file to the disconnected environment.

### 3.4.6.2.2. Mirroring from disk to mirror

You can use the `oc-mirror` plug-in to mirror the contents of a generated image set to the target mirror registry.

### Prerequisites

- You have installed the OpenShift CLI (`oc`) in the disconnected environment.
- You have installed the `oc-mirror` CLI plug-in in the disconnected environment.
- You have generated the image set file by using the `oc mirror` command.
- You have transferred the image set file to the disconnected environment.

### Procedure

- Run the `oc mirror` command to process the image set file on disk and mirror the contents to a target mirror registry:

  ```bash
  $ oc mirror --from=./mirror_seq1_000000.tar \
  docker://registry.example:5000
  ```

  **1** Pass in the image set `.tar` file to mirror, named `mirror_seq1_000000.tar` in this example. If an `archiveSize` value was specified in the image set configuration file, the image set might be broken up into multiple `.tar` files. In this situation, you can pass in a directory that contains the image set `.tar` files.
Specify the registry to mirror the image set file to. The registry must start with `docker://`. If you specify a top-level namespace for the mirror registry, you must also use this same namespace.

This command updates the mirror registry with the image set and generates the `ImageContentSourcePolicy` and `CatalogSource` resources.

**Verification**

1. Navigate into the `oc-mirror-workspace/` directory that was generated.
2. Navigate into the results directory, for example, `results-1639608409/`.
3. Verify that YAML files are present for the `ImageContentSourcePolicy` and `CatalogSource` resources.

**Next steps**

- Install the `ImageContentSourcePolicy` and `CatalogSource` resources into the cluster.

### 3.4.7. Installing the ImageContentSourcePolicy and CatalogSource resources into the cluster

After you have mirrored your image set to the mirror registry, you must install the generated `ImageContentSourcePolicy` and `CatalogSource` resources into the cluster.

The `ImageContentSourcePolicy` resource associates the mirror registry with the source registry and redirects image pull requests from the online registries to the mirror registry. The `CatalogSource` resource is used by Operator Lifecycle Manager (OLM) to retrieve information about the available Operators in the mirror registry.

**Prerequisites**

- You have mirrored the image set to the registry mirror in the disconnected environment.
- You have access to the cluster as a user with the `cluster-admin` role.

**Procedure**

1. Log in to the OpenShift CLI as a user with the `cluster-admin` role.
2. Apply the YAML files from the results directory to the cluster:

   ```bash
   $ oc apply -f ./oc-mirror-workspace/results-1639608409/
   ```

**Verification**

1. Verify that the `ImageContentSourcePolicy` resources were successfully installed:

   ```bash
   $ oc get imagecontentsourcepolicy --all-namespaces
   ```
2. Verify that the `CatalogSource` resources were successfully installed:

   ```bash
   $ oc get catalogsource --all-namespaces
   ```
### 3.4.8. Updating your mirror registry

After you publish a full image set to the mirror registry, you can use the oc-mirror plug-in to update the mirror registry with updated images.

When you run the oc-mirror plug-in again, it generates an image set that only contains new and updated images since the previous execution.

**NOTE**

You must use the same storage backend as the initial execution of oc-mirror for the same mirror registry. Do not delete or modify the metadata that is generated by the oc-mirror plug-in.

Because it only pulls in the differences since the previous image set was created, the generated image set is often smaller and faster to process than the initial image set.

**IMPORTANT**

Generated image sets are sequential and must be synchronized to the target mirror registry in order.

### Prerequisites

- You have used the oc-mirror plug-in to mirror the initial image set to your mirror registry.
- You have access to the storage backend that was used for the initial execution of the oc-mirror plug-in.

### Procedure

1. Follow the same steps that you used to create the initial image set and mirror it to the mirror registry. For instructions, see *Mirroring an image set in a partially disconnected environment* or *Mirroring an image set in a fully disconnected environment*.

   **IMPORTANT**

   - You must provide the same storage backend so that only a differential image set is created and mirrored.
   - If you specified a top-level namespace for the mirror registry during the initial image set creation, then you must use this same namespace every time you run the oc-mirror plug-in for the same mirror registry.

2. Install the `ImageContentSourcePolicy` and `CatalogSource` resources into the cluster.

### Additional resources

- *Mirroring an image set in a partially disconnected environment*
- *Mirroring an image set in a fully disconnected environment*
- *Installing the ImageContentSourcePolicy and CatalogSource resources into the cluster*
### 3.4.9. Image set configuration parameters

The oc-mirror plug-in requires an image set configuration file that defines what images to mirror. The following table lists the available parameters for the `ImageSetConfiguration` resource.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>ImageSetConfiguration</code> content.</td>
<td>String. For example: <code>mirror.openshift.io/v1alpha1</code></td>
</tr>
<tr>
<td>archiveSize</td>
<td>The maximum size, in GiB, of each archive file within the image set.</td>
<td>Integer. For example: <code>4</code></td>
</tr>
<tr>
<td>mirror</td>
<td>The configuration of the image set.</td>
<td>Object</td>
</tr>
<tr>
<td>mirror.additionallimages</td>
<td>The additional images configuration of the image set.</td>
<td>Array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>additionalImages:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- name: <code>registry.redhat.io/ubi8/ubi:latest</code></td>
</tr>
<tr>
<td>mirror.additionallimages.name</td>
<td>The tag of the image to mirror.</td>
<td>String. For example: <code>registry.redhat.io/ubi8/ubi:latest</code></td>
</tr>
<tr>
<td>mirror.helm</td>
<td>The helm configuration of the image set. Note that the oc-mirror plug-in supports only helm charts that do not require user input when rendered.</td>
<td>Object</td>
</tr>
<tr>
<td>mirror.helm.local</td>
<td>The local helm charts to mirror.</td>
<td>Array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>local:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- name: <code>podinfo</code></td>
</tr>

<tr>
<td><code>storageConfig.registry.imageURL</code></td>
<td>The back-end registry URI. Can optionally include a namespace reference in the URI.</td>
<td>String. For example: <code>quay.io/myuser/imageset:metadata</code>.</td>
</tr>
<tr>
<td><code>storageConfig.registry.skipTLS</code></td>
<td>Optionally skip TLS verification of the referenced back-end registry.</td>
<td>Boolean. The default value is <code>false</code>.</td>
</tr>
</tbody>
</table>

### 3.4.10. Image set configuration examples

The following `ImageSetConfiguration` file examples show the configuration for various mirroring use cases.

**Use case: Including arbitrary images and helm charts**
The following `ImageSetConfiguration` file uses a registry storage backend and includes helm charts and an additional Red Hat Universal Base Image (UBI).

#### Example ImageSetConfiguration file

```yaml
apiVersion: mirror.openshift.io/v1alpha1
class: ImageSetConfiguration
archiveSize: 4
storageConfig:
  registry:
    imageURL: example.com/example/oc-mirror
    skipTLS: false
mirror:
  ocp:
    channels:
      - name: stable-4.9
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.9
helm:
  repos:
    - name: redhat-helm-charts
      url: https://raw.githubusercontent.com/redhat-developer/redhat-helm-charts/master
    - name: ibm-mongodb-enterprise-helm
      version: 0.2.0
additionalImages:
  - name: registry.redhat.io/ubi8/ubi:latest
```
Use case: Including specific Operator versions
The following ImageSetConfiguration file uses a local storage backend and includes only the Red Hat Advanced Cluster Security for Kubernetes Operator, versions starting at 3.67.0 and later.

Example ImageSetConfiguration file

```yaml
apiVersion: mirror.openshift.io/v1alpha1
kind: ImageSetConfiguration
storageConfig:
  local:
    path: /home/user/metadata
mirror:
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.9
      headsOnly: false
      packages:
        - name: rhacs-operator
          channels:
            - name: latest
              startingVersion: 3.67.0
```

CHAPTER 4. INSTALLING ON ALIBABA

4.1. PREPARING TO INSTALL ON ALIBABA CLOUD

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see https://access.redhat.com/support/offerings/techpreview/.

4.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

4.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud

Before installing OpenShift Container Platform on Alibaba Cloud, you must configure and register your domain, create a Resource Access Management (RAM) user for the installation, and review the supported Alibaba Cloud data center regions and zones for the installation.

4.1.3. Registering and Configuring Alibaba Cloud Domain

To install OpenShift Container Platform, the Alibaba Cloud account you use must have a dedicated public hosted zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Alibaba Cloud or another source.

   NOTE

   If you purchase a new domain through Alibaba Cloud, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through Alibaba Cloud, see Alibaba Cloud domains.

2. If you are using an existing domain and registrar, migrate its DNS to Alibaba Cloud. See Domain name transfer in the Alibaba Cloud documentation.

3. Configure DNS for your domain. This includes:
   - Registering a generic domain name.
Completing real-name verification for your domain name.

Applying for an Internet Content Provider (ICP) filing.

Enabling domain name resolution.
Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. If you are using a subdomain, follow the procedures of your company to add its delegation records to the parent domain.

4.1.4. Supported Alibaba regions
You can deploy an OpenShift Container Platform cluster to the regions listed in the Alibaba Regions and zones documentation.

4.1.5. Next steps
- Create the required Alibaba Cloud resources.

4.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES
Before you install OpenShift Container Platform, you must use the Alibaba Cloud console to create a Resource Access Management (RAM) user that has sufficient permissions to install OpenShift Container Platform into your Alibaba Cloud. This user must also have permissions to create new RAM users. You can also configure and use the ccoctl tool to create new credentials for the OpenShift Container Platform components with the permissions that they require.

IMPORTANT
Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see https://access.redhat.com/support/offerings/techpreview/.

4.2.1. Creating the required RAM user
You must have a Alibaba Cloud Resource Access Management (RAM) user for the installation that has sufficient privileges. You can use the Alibaba Cloud Resource Access Management console to create a new user or modify an existing user. Later, you create credentials in OpenShift Container Platform based on this user’s permissions.

When you configure the RAM user, be sure to consider the following requirements:

- The user must have an Alibaba Cloud AccessKey ID and AccessKey secret pair.
  - For a new user, you can select Open API Access for the Access Mode when creating the user. This mode generates the required AccessKey pair.
• For an existing user, you can add an AccessKey pair or you can obtain the AccessKey pair for that user.

**NOTE**

When created, the AccessKey secret is displayed only once. You must immediately save the AccessKey pair because the AccessKey pair is required for API calls.

• Add the AccessKey ID and secret to the `~/.alibabacloud/credentials` file on your local computer. Alibaba Cloud automatically creates this file when you log in to the console. The Cloud Credential Operator (CCO) utility, ccoutil, uses these credentials when processing Credential Request objects.

For example:

```json
[default]                          # Default client
type = access_key                  # Certification type: access_key
access_key_id = LTAI5t8cefXKmt                # Key
access_key_secret = wYx56mszAN4Uunfh            # Secret

1 Add your AccessKeyId and AccessKeySecret here.
```

• The RAM user must have the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the OpenShift Container Platform cluster. This policy grants permissions to manage all Alibaba Cloud resources.

When you attach the **AdministratorAccess** policy to a RAM user, you grant that user full access to all Alibaba Cloud services and resources. If you do not want to create a user with full access, create a custom policy with the following actions that you can add to your RAM user for installation. These actions are sufficient to install OpenShift Container Platform.

**TIP**

You can copy and paste the following JSON code into the Alibaba Cloud console to create a custom policy. For information on creating custom policies, see Create a custom policy in the Alibaba Cloud documentation.

**Example 4.1. Example custom policy JSON file**

```json
{
    "Version": "1",
    "Statement": [
        {
            "Action": [
                "tag:ListTagResources",
                "tag:UntagResources"
            ],
            "Resource": "*",
            "Effect": "Allow"
        },
        {
            "Action": [

4.2.2. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in extract and prepare the CCO utility ($ccoctl) binary.

To assign RAM users and policies that provide long-lived RAM AccessKeys (AKs) for each in-cluster component, extract and prepare the OpenShift Container Platform Cloud Credential Operator (CCO) utility ($ccoctl) binary.

NOTE

The $ccoctl is a Linux binary that must run in a Linux environment.

Procedure

1. Obtain the OpenShift Container Platform release image:

   ```bash
   $ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
   ```

2. Get the CCO container image from the OpenShift Container Platform release image:

   ```bash
   $ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator' $RELEASE_IMAGE)
   ```

   NOTE

   Ensure that the architecture of the $RELEASE_IMAGE matches the architecture of the environment in which you will use the $ccoctl tool.

3. Extract the $ccoctl binary from the CCO container image within the OpenShift Container Platform release image:

   ```bash
   $ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
   ```

4. Change the permissions to make $ccoctl executable:

   ```bash
   $ chmod 775 ccoctl
   ```

Verification
To verify that `ccoctl` is ready to use, display the help file:

```bash
$ ccoctl --help
```

**Output of `ccoctl --help`:**

```
OpenShift credentials provisioning tool

Usage:
ccoctl [command]

Available Commands:
alibabacloud Manage credentials objects for alibaba cloud
aws Manage credentials objects for AWS cloud
gcp Manage credentials objects for Google cloud
help Help about any command
ibmcloud Manage credentials objects for IBM Cloud

Flags:
  -h, --help  help for ccoctl

Use "ccoctl [command] --help" for more information about a command.
```

### 4.2.3. Next steps

- Install a cluster on Alibaba Cloud infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:
  - **Installing a cluster quickly on Alibaba Cloud** You can install a cluster quickly by using the default configuration options.
  - **Installing a customized cluster on Alibaba Cloud** The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

### 4.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD

In OpenShift Container Platform version 4.10, you can install a cluster on Alibaba Cloud that uses the default configuration options.

**IMPORTANT**

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [https://access.redhat.com/support/offerings/techpreview/](https://access.redhat.com/support/offerings/techpreview/).

### 4.3.1. Prerequisites
- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You registered your domain.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- You have created the required Alibaba Cloud resources.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

### 4.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- **Access** OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- **Access** Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.3.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.
**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ``

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ``

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ``

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$($(ssh-agent -s))"
   ``

   **Example output**
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.3.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```bash
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.3.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   **IMPORTANT**
   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Specify `alibabacloud` as the platform to target.

iii. Specify the region to deploy the cluster to.

iv. Specify the base domain to deploy the cluster to. All DNS records will be sub-domains of this base and will also include the cluster name.

v. Specify a descriptive name for your cluster.

vi. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the `install-config.yaml` file to set the `credentialsMode` parameter to `Manual`:

Example install-config.yaml configuration file with credentialsMode set to Manual

```yaml
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual
compute:
  - architecture: amd64
    hyperthreading: Enabled
    ...
```

Add this line to set the `credentialsMode` to `Manual`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.3.6. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:
<installation_directory>
Specifies the directory in which the installation program creates files.

4.3.7. Creating credentials for OpenShift Container Platform components with the ccoctl tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

NOTE
By default, ccoctl creates objects in the directory in which the commands are run. To create the objects in a different directory, use the --output-dir flag. This procedure uses <path_to_ccoctl_output_dir> to refer to this directory.

Prerequisites
You must have:

- Extracted and prepared the ccoctl binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyId (access_key_id) and AccessKeySecret (access_key_secret) of that RAM user into the ~/.alibabacloud/credentials file on your local computer.

Procedure

1. Extract the list of CredentialsRequest objects from the OpenShift Container Platform release image:

   $ oc adm release extract \
   --credentials-requests \
   --cloud=alibabacloud \
   --to=<path_to_directory_with_list_of_credentials_requests>/credrequests \
   quay.io/<path_to>/ocp-release:<version>

   NOTE
   This command can take a few moments to run.

2. Use the ccoctl tool to process all CredentialsRequest objects in the credrequests directory:

   a. Run the following command to use the tool:

   $ ccoctl alibabacloud create-ram-users \
   --name <name> \
   --region=<alibaba_region> \
   --credentials-requests-dir=\n   <path_to_directory_with_list_of_credentials_requests>/credrequests \
   --output-dir=<path_to_ccoctl_output_dir>
where:

- `<name>` is the name used to tag any cloud resources that are created for tracking.
- `<alibaba_region>` is the Alibaba Cloud region in which cloud resources will be created.
- `<path_to_directory_with_list_of_credentials_requests>/credrequests` is the directory containing the files for the component `CredentialsRequest` objects.
- `<path_to_ccoctl_output_dir>` is the directory where the generated component credentials secrets will be placed.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set, you must include the `--enable-tech-preview` parameter.

**Example output**

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...
```

**NOTE**

A RAM user can have up to two AccessKeys at the same time. If you run `ccoctl alibabacloud create-ram-users` more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

**Example output:**

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```
You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

3. Copy the generated credential files to the target manifests directory:

   $ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml ./<path_to_installation>dir>/manifests/

   where:

   <path_to_ccoctl_output_dir>
   Specifies the directory created by the ccoctl alibabacloud create-ram-users command.

   <path_to_installation>dir>
   Specifies the directory in which the installation program creates files.

4.3.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   $ ./openshift-install create cluster --dir <installation_directory>
   --log-level=info

   1 For <installation_directory>, specify the location of your customized ./install-config.yaml file.

   2 To view different installation details, specify warn, debug, or error instead of info.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the kubeadmin user, display in your terminal.
NOTE

The cluster access and credential information also outputs to

<installation_directory>/openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

4.3.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:
   ```
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:
   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```$ echo $PATH```

After you install the OpenShift CLI, it is available using the `oc` command:

```$ oc <command>```

### 4.3.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```$ export KUBECONFIG=<installation_directory>/auth/kubeconfig```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```$ oc whoami```

   **Example output**

   ```system:admin```

### 4.3.11. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.
Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**

   Alternatively, you can obtain the **kubeadmin** password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

4.3.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager**.

After you confirm that your **OpenShift Cluster Manager** inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use **subscription watch** to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See **Accessing the web console** for more details about accessing and understanding the OpenShift Container Platform web console.
- See **About remote health monitoring** for more information about the Telemetry service

4.3.13. Next steps

- **Validating an installation**.
- **Customize your cluster**.
4.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Alibaba Cloud. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

**NOTE**

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

**IMPORTANT**

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see https://access.redhat.com/support/offerings/techpreview/.

4.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You registered your domain.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

4.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `/openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>  
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.
If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   Example output

      Agent pid 31874

   NOTE
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>

   Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

   Example output

      Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps
- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.4.4.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

Prerequisites
Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Specify `alibabacloud` as the platform to target.

   iii. Specify the region to deploy the cluster to.

   iv. Specify the base domain to deploy the cluster to. All DNS records will be sub-domains of this base and will also include the cluster name.

   v. Specify a descriptive name for your cluster.

   vi. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the `install-config.yaml` file to set the `credentialsMode` parameter to `Manual`:

   Example install-config.yaml configuration file with `credentialsMode` set to Manual
3. Set the available parameters in the "Installation configuration parameters" section, as needed.

4. Back up the install-config.yaml file so that you can use it to install multiple clusters.

**IMPORTANT**

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 4.4.4.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

**Procedure**

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```
   $ openshift-install create manifests --dir <installation_directory>
   
   where:

   `<installation_directory>`
   Specifies the directory in which the installation program creates files.
   ```

### 4.4.4.3. Creating credentials for OpenShift Container Platform components with the ccoctl tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

**NOTE**

By default, ccoctl creates objects in the directory in which the commands are run. To create the objects in a different directory, use the --output-dir flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

**Prerequisites**

You must have:
• Extracted and prepared the `ccoctl` binary.

• Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.

• Added the AccessKeyID (**access_key_id**) and AccessKeySecret (**access_key_secret**) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.

Procedure

1. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

   ```bash
   $ oc adm release extract \
   --credentials-requests \
   --cloud=alibabacloud \
   --to=<path_to_directory_with_list_of_credentials_requests>/credrequests \
   quay.io/<path_to>/ocp-release:<version>
   ```

   **NOTE**
   This command can take a few moments to run.

2. Use the `ccoctl` tool to process all **CredentialsRequest** objects in the `credrequests` directory:

   a. Run the following command to use the tool:

   ```bash
   $ ccoctl alibabacloud create-ram-users \
   --name <name> \
   --region=<alibaba_region> \
   --credentials-requests-dir= \
   <path_to_directory_with_list_of_credentials_requests>/credrequests \
   --output-dir=<path_to_ccoctl_output_dir>
   ```

   where:

   • `<name>` is the name used to tag any cloud resources that are created for tracking.

   • `<alibaba_region>` is the Alibaba Cloud region in which cloud resources will be created.

   • `<path_to_directory_with_list_of_credentials_requests>/credrequests` is the directory containing the files for the component **CredentialsRequest** objects.

   • `<path_to_ccoctl_output_dir>` is the directory where the generated component credentials secrets will be placed.

   **NOTE**

   If your cluster uses Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set, you must include the `--enable-tech-preview` parameter.

Example output
NOTE

A RAM user can have up to two AccessKeys at the same time. If you run `ccoctl alibabacloud create-ram-users` more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

**Example output:**

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

3. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml ./<path_to_installation>dir>/manifests/
```

where:

- `<path_to_ccoctl_output_dir>`
  - Specifies the directory created by the `ccoctl alibabacloud create-ram-users` command.
- `<path_to_installation>dir>`
  - Specifies the directory in which the installation program creates files.

### 4.4.4.4. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s
platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 4.4.4.4.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.1. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>apiVersion</strong></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <strong>v1</strong>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><strong>baseDomain</strong></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td><strong>metadata</strong></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>metadata.name</strong></td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **alibabacloud**, **aws**, **baremetal**, **azure**, **ibmcloud**, **openstack**, **ovirt**, **vsphere**, or \{\}. For additional information about **platform.<platform>** parameters, consult the table for your specific platform that follows.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;cloud.openshift.com&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;quay.io&quot;:{</td>
</tr>

### 4.4.4.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.2. Network parameters**
### networking

The configuration for the cluster network.

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example: <code>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</code></td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given cidr. A <code>hostPrefix</code> value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example: <code>networking: serviceNetwork: - 172.30.0.0/16</code></td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example: <code>networking: machineNetwork: - cidr: 10.0.0.0/16</code></td>
</tr>
</tbody>
</table>
networking.machineNetwork.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation. For example, 10.0.0.0/16.

NOTE

Set the networking.machineneNetwork to match the CIDR that the preferred NIC resides in.

4.4.4.4.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.3. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or *hyperthreading*, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <em>hyperthreading</em>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**
Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageContentSources</code></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><code>imageContentSources.mirrors</code></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><code>publish</code></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. The default value is <code>External</code>. Setting this field to <code>Internal</code> is not supported on non-cloud platforms and IBM Cloud. IMPORTANT If the value of the field is set to <code>Internal</code>, the cluster will become non-functional. For more information, refer to <code>BZ#1953035</code>.</td>
</tr>
</tbody>
</table>
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

- sshKey: 
  - <key1>
  - <key2>
  - <key3>

### 4.4.4.4. Additional Alibaba Cloud configuration parameters

Additional Alibaba Cloud configuration parameters are described in the following table. The `alibabacloud` parameters are the configuration used when installing on Alibaba Cloud. The `defaultMachinePlatform` parameters are the default configuration used when installing on Alibaba Cloud for machine pools that do not define their own platform configuration.

**Table 4.4. Optional Alibaba Cloud parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.alibabacloud.region</code></td>
<td>Required. The Alibaba Cloud region where the cluster will be created.</td>
<td>String.</td>
</tr>
<tr>
<td><code>platform.alibabacloud.resource GroupID</code></td>
<td>The ID of an already existing resource group where the cluster will be installed. If empty, the installer will create a new resource group for the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.tags</code></td>
<td>Additional keys and values to apply to all Alibaba Cloud resources created for the cluster.</td>
<td>Object.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.vpcID</code></td>
<td>The ID of an already existing VPC where the cluster should be installed. If empty, the installer will create a new VPC for the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.vswitchIDs</code></td>
<td>The ID list of already existing VSwitches where cluster resources will be created. The existing VSwitches can only be used when also using existing VPC. If empty, the installer will create new VSwitches for the cluster.</td>
<td>String list.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.imageID</code></td>
<td>For compute machines, the image ID that should be used to create ECS instance. If set, the image ID should belong to the same region as the cluster</td>
<td>String.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.instanceType</code></td>
<td>For compute machines, the configuration used when installing on Alibaba Cloud.</td>
<td>String. For example <code>ecs.g6.large</code>.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.systemDiskCategory</code></td>
<td>For compute machines, the category of the system disk.</td>
<td>String, for example <code>&quot;, cloud_efficiency, cloud_essd</code>.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.systemDiskSize</code></td>
<td>For compute machine, the size of the system disk in gibibytes (GiB). The minimum is 120.</td>
<td>Integer.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.zones</code></td>
<td>For compute machine, list of availability zones that can be used.</td>
<td>String.</td>
</tr>
</tbody>
</table>
4.4.4.5. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (install-config.yaml) to specify more details about your cluster's platform or modify the values of the required parameters.

```yaml
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
  - architecture: amd64
    hypethreading: Enabled
    name: worker
    platform: {}
    replicas: 3
controlPlane:
  architecture: amd64
  hypethreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:
  creationTimestamp: null
name: test-cluster

networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: 2
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.alibabacloud.privateZoneID</td>
<td>The ID of an existing private zone into which to add DNS records for the cluster’s internal API. An existing private zone can only be used when also using existing VPC. The private zone must be associated with the VPC containing the subnets. Leave the private zone unset to have the installer create the private zone on your behalf.</td>
<td>String.</td>
</tr>
</tbody>
</table>
systemDiskSize: 200
region: ap-southeast-1
resourceGroupId: rg-acfnw6j3hyai
publish: External
pullSecret: 
"auths": {"cloud.openshift.com": {"auth": ... }}
sshKey: |
ssh-rsa AAAA...

1. Required. The installation program prompts you for a cluster name.
2. Optional. Specify parameters for machine pools that do not define their own platform configuration.
3. Required. The installation program prompts you for the region to deploy the cluster to.
4. Optional. Specify an existing resource group where the cluster should be installed.
5. Required. The installation program prompts you for the pull secret.
6. Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.

4.4.4.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
```
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ①
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ②
  noProxy: example.com ③
  additionalTrustBundle: | ④
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
  ...

① A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

② A proxy URL to use for creating HTTPS connections outside the cluster.

③ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

④ If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

4.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT
You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites
• Configure an account with the cloud platform that hosts your cluster.

• Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \  
   --log-level=info
```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using `oc`, run `export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig`
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

   **NOTE**

   The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending [node-bootstrapper](#) certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 4.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of `oc`.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.

4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the `oc` binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the oc command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

4.4.7. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container
Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the **kubeadmin** credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   system:admin
   ```

Example output

4.4.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**
   Alternatively, you can obtain the **kubeadmin** password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```
4.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.
- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.
- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

4.4.10. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

4.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform 4.10, you can install a cluster on Alibaba Cloud with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only kubeProxy configuration parameters in a running cluster.
IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see https://access.redhat.com/support/offerings/techpreview/.

4.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You registered your domain.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

4.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the
installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH into the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH into your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

```
$ ssh-add <path>/<file_name>
```

1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.5.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

**Phase 1**

You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**Phase 2**
After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

4.5.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Enter a descriptive name for your cluster.

      iii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.
2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

    **IMPORTANT**
    
    The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.5.5.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

**Procedure**

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   
   Specifies the directory in which the installation program creates files.

   **NOTE**

   By default, `ccoctl` creates objects in the directory in which the commands are run. To create the objects in a different directory, use the `--output-dir` flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

**Prerequisites**

You must have:

- Extracted and prepared the `ccoctl` binary.

**Procedure**

1. Extract the list of `CredentialsRequest` objects from the OpenShift Container Platform release image:

   **NOTE**

   This command can take a few moments to run.

4.5.5.3. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for
the required parameters through the command line. If you customize your cluster, you can modify the
install-config.yaml file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the install-config.yaml file.

4.5.5.3.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.5. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the install-config.yaml content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
### Platform
The configuration for the specific platform upon which to perform the installation: **alibabacloud**, **aws**, **baremetal**, **azure**, **ibmcloud**, **openstack**, **ovirt**, **vsphere**, or `{}`. For additional information about `platform.<platform>` parameters, consult the table for your specific platform that follows.

### Pull Secret
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 4.5.5.3.2. Network Configuration Parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.6. Network Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**
You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network.Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>-  networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
### Networking Machine CIDR

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### 4.5.5.3.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

#### Table 4.7. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><code>true</code></td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
## Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. The default value is <strong>External</strong>. Setting this field to <strong>Internal</strong> is not supported on non-cloud platforms and IBM Cloud.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If the value of the field is set to **Internal**, the cluster will become non-functional. For more information, refer to [BZ#1953035](#).
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

### 4.5.5.4. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your cluster’s platform or modify the values of the required parameters.

```yaml
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:  
  - architecture: amd64
    hyperthreading: Enabled
    name: worker
    platform: {}
    replicas: 3
controlPlane:  
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:  
  creationTimestamp: null
  name: test-cluster
networking:  
  clusterNetwork:  
    - cidr: 10.128.0.0/14
```
Required. The installation program prompts you for a cluster name.

Optional. Specify parameters for machine pools that do not define their own platform configuration.

Required. The installation program prompts you for the region to deploy the cluster to.

Optional. Specify an existing resource group where the cluster should be installed.

Required. The installation program prompts you for the pull secret.

Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.

4.5.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
  noProxy: example.com
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
  ...
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.
NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.5.6. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.
- **serviceNetwork**
  - IP address pool for services.
- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

#### 4.5.6.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <strong>cluster</strong>.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
</tbody>
</table>

You can customize this field only in the **install-config.yaml** file before you create the manifests. The value is read-only in the manifest file.
A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:

```yaml
spec:
  serviceNetwork:
    - 172.30.0.0/14
```

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.

**defaultNetwork object configuration**

The values for the `defaultNetwork` object are defined in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>string</td>
<td>Either <code>OpenShiftSDN</code> or <code>OVN Kubernetes</code>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td><code>openshiftSDNConfig</code></td>
<td>object</td>
<td>This object is only valid for the OpenShift SDN cluster network provider.</td>
</tr>
<tr>
<td><code>ovnKubernetesConfig</code></td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

**Configuration for the OpenShift SDN CNI cluster network provider**

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.
Table 4.10. openshiftSDNConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>. The values <strong>Multitenant</strong> and <strong>Subnet</strong> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <strong>9001</strong>, and some have an MTU of <strong>1500</strong>, you must set this value to <strong>1450</strong>. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>vxlanPort</td>
<td>integer</td>
<td>The port to use for all VXLAN packets. The default value is <strong>4789</strong>. This value cannot be changed after cluster installation. If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number. On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <strong>9000</strong> and port <strong>9999</strong>.</td>
</tr>
</tbody>
</table>

**Example OpenShift SDN configuration**

```yaml
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

**Configuration for the OVN-Kubernetes CNI cluster network provider**
The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

### Table 4.11. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</td>
</tr>
<tr>
<td>genevePort</td>
<td>integer</td>
<td>The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>ipsecConfig</td>
<td>object</td>
<td>Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>policyAuditConf</td>
<td>object</td>
<td>Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.</td>
</tr>
<tr>
<td>gatewayConfig</td>
<td>object</td>
<td>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</td>
</tr>
</tbody>
</table>

**NOTE**

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

### Table 4.12. policyAuditConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
</tbody>
</table>
maxFileSize  integer  The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.

destination  string  One of the following additional audit log targets:

- libc
  The libc `syslog()` function of the journald process on the host.
- udp:<host>:<port>
  A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.
- unix:<file>
  A Unix Domain Socket file specified by `<file>`.
- null
  Do not send the audit logs to any additional target.

syslogFacility  string  The syslog facility, such as kern, as defined by RFC5424. The default value is local0.

Table 4.13. gatewayConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to true to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is false. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to true, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

Example OVN-Kubernetes configuration with IPSec enabled

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
  ipsecConfig: {}  

kubeProxyConfig object configuration
The values for the kubeProxyConfig object are defined in the following table:
### Table 4.14. kubeProxyConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iptablesSyncPeriod</td>
<td>string</td>
<td>The refresh period for iptables rules. The default value is <strong>30s</strong>. Valid suffixes include <strong>s</strong>, <strong>m</strong>, and <strong>h</strong> and are described in the Go time package documentation.</td>
</tr>
</tbody>
</table>
| proxyArguments.iptables-min-sync-period | array    | The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include **s**, **m**, and **h** and are described in the Go time package. The default value is:     | **kubeProxyConfig:**  
  **proxyArguments:**  
  **iptables-min-sync-period:**  
  - **0s** |

#### Note

Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the `iptablesSyncPeriod` parameter is no longer necessary.

### 4.5.7. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```
1. `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   ```

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

   **Specify a different VXLAN port for the OpenShift SDN network provider**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       openshiftSDNConfig:
         vxlanPort: 4800
   ```

   **Enable IPsec for the OVN-Kubernetes network provider**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnKubernetesConfig:
         ipsecConfig: {}
   ```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

### 4.5.8. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**
You defined `OVNKubernetes` for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ``

   where:

   `<installation_directory>`

   Specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```bash
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   EOF
   ``

   where:

   `<installation_directory>`

   Specifies the directory name that contains the `manifests/` directory for your cluster.

3. Open the `cluster-network-03-config.yml` file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

   **Specify a hybrid networking configuration**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnkubernetesConfig:
         hybridOverlayConfig:
           hybridClusterNetwork:
             cidr: 10.132.0.0/14
             hostPrefix: 23
           hybridOverlayVXLANPort: 9898
   ``

   **1** Specify the CIDR configuration used for nodes on the additional overlay network. The `hybridClusterNetwork` CIDR cannot overlap with the `clusterNetwork` CIDR.

   **2** Specify a custom VXLAN port for the additional overlay network. This is required for
4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

### 4.5.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \  
   --log-level=info
   ```

   **1** For `<installation_directory>`, specify the

   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```bash
...
```
NOTE

The cluster access and credential information also outputs to `<installation_directory>/.openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

4.5.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:
   
   ```
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:
   
   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH. To check your PATH, execute the following command:
   
   ```
   C:> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
C:> oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.

4. Unpack and unzip the archive.

```
$ tar xvzf <file>
```
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

### 4.5.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

```
$ oc whoami
```

   Example output

```
system:admin
```

### 4.5.12. Logging in to the cluster by using the web console

The kubeadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubeadmin user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**
1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**

   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

### 4.5.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service.
- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console
- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.5.14. Next steps

- Validate an installation.
- Customize your cluster.
• If necessary, you can opt out of remote health reporting.

4.6. UNINSTALLING A CLUSTER ON ALIBABA CLOUD

You can remove a cluster that you deployed to Alibaba Cloud.

4.6.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

**NOTE**

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

**Prerequisites**

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

**Procedure**

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$ ./openshift-install destroy cluster \
--dir <installation_directory> --log-level info
```

   **1** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   **2** To view different details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

1. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.
5.1. PREPARING TO INSTALL ON AWS

5.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

5.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See Configuring an AWS account for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for AWS for other options, including configuring the Cloud Credential Operator (CCO) to use the Amazon Web Services Security Token Service (AWS STS).

5.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on AWS** You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on AWS** You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on AWS with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on AWS in a restricted network** You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the Amazon Virtual Private Cloud (VPC).
installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.

- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.

- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.

- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

5.1.4. Next steps

- Configuring an AWS account

5.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

5.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.
NOTE
If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see Registering Domain Names Using Amazon Route 53 in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See Making Amazon Route 53 the DNS Service for an Existing Domain in the AWS documentation.

3. Create a public hosted zone for your domain or subdomain. See Creating a Public Hosted Zone in the AWS documentation.
   Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. Extract the new authoritative name servers from the hosted zone records. See Getting the Name Servers for a Public Hosted Zone in the AWS documentation.

5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: Adding or Changing Name Servers or Glue Records.

6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain in the AWS documentation for an example high level procedure.

5.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses us-gov-west-1 region for Route53 and tagging API clients.

The Ingress Operator uses https://tagging.us-gov-west-1.amazonaws.com as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the Service Endpoints in the AWS documentation about GovCloud (US).

IMPORTANT
Private, disconnected installations are not supported for AWS GovCloud when you install in the us-gov-east-1 region.

Example Route 53 configuration

```
platform:
  aws:
    region: us-gov-west-1
    serviceEndpoints:
      - name: ec2
        url: https://ec2.us-gov-west-1.amazonaws.com
      - name: elasticloadbalancing
        url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
      - name: route53
```
Route 53 defaults to https://route53.us-gov.amazonaws.com for both AWS GovCloud (US) regions.

Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

5.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default Service Limits affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Limits</td>
<td>Varies</td>
<td>Varies</td>
<td>By default, each cluster creates the following instances:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- One bootstrap machine, which is removed after installation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three control plane nodes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three worker nodes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>These instance type counts are within a new account’s default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>In most regions, the worker machines use an m6i.large instance and the bootstrap and control plane machines use m6i.xlarge instances. In some regions, including all regions that do not support these instance types, m5.large and m5.xlarge instances are used instead.</td>
</tr>
<tr>
<td>Component</td>
<td>Number of clusters available by default</td>
<td>Default AWS limit</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>----------------------------------------</td>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Elastic IPs (EIPs)</td>
<td>0 to 1</td>
<td>5 EIPs per account</td>
<td>To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each availability zone within a region. Each private subnet requires a NAT Gateway, and each NAT gateway requires a separate elastic IP. Review the AWS region map to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit. <strong>IMPORTANT</strong> To use the <strong>us-east-1</strong> region, you must increase the EIP limit for your account.</td>
</tr>
<tr>
<td>Virtual Private Clouds (VPCs)</td>
<td>5</td>
<td>5 VPCs per region</td>
<td>Each cluster creates its own VPC.</td>
</tr>
<tr>
<td>Elastic Load Balancing (ELB/NLB)</td>
<td>3</td>
<td>20 per region</td>
<td>By default, each cluster creates internal and external network load balancers for the master API server and a single classic elastic load balancer for the router. Deploying more Kubernetes Service objects with type LoadBalancer will create additional load balancers.</td>
</tr>
<tr>
<td>NAT Gateways</td>
<td>5</td>
<td>5 per availability zone</td>
<td>The cluster deploys one NAT gateway in each availability zone.</td>
</tr>
<tr>
<td>Elastic Network Interfaces (ENIs)</td>
<td>At least 12</td>
<td>350 per region</td>
<td>The default installation creates 21 ENIs and an ENI for each availability zone in your region. For example, the <strong>us-east-1</strong> region contains six availability zones, so a cluster that is deployed in that zone uses 27 ENIs. Review the AWS region map to determine how many availability zones are in each region. Additional ENIs are created for additional machines and elastic load balancers that are created by cluster usage and deployed workloads.</td>
</tr>
</tbody>
</table>
### 5.2.3. Required AWS permissions for the IAM user

**NOTE**

Your IAM user must have the permission `tag:GetResources` in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 5.1. Required EC2 permissions for installation**

- `ec2:AuthorizeSecurityGroupEgress`
- `ec2:AuthorizeSecurityGroupIngress`
- `ec2:CopyImage`
- `ec2:CreateNetworkInterface`
- `ec2:AttachNetworkInterface`
- `ec2:CreateSecurityGroup`
- `ec2:CreateTags`
- `ec2:CreateVolume`
- `ec2:DeleteSecurityGroup`
- `ec2:DeleteSnapshot`
- `ec2:DeleteTags`
• ec2:DeregisterImage
• ec2:DescribeAccountAttributes
• ec2:DescribeAddresses
• ec2:DescribeAvailabilityZones
• ec2:DescribeDhcpOptions
• ec2:DescribeImages
• ec2:DescribeInstanceAttribute
• ec2:DescribeInstanceCreditSpecifications
• ec2:DescribeInstances
• ec2:DescribeInstanceTypes
• ec2:DescribeInternetGateways
• ec2:DescribeKeyPairs
• ec2:DescribeNatGateways
• ec2:DescribeNetworkAcls
• ec2:DescribeNetworkInterfaces
• ec2:DescribePrefixLists
• ec2:DescribeRegions
• ec2:DescribeRouteTables
• ec2:DescribeSecurityGroups
• ec2:DescribeSubnets
• ec2:DescribeTags
• ec2:DescribeVolumes
• ec2:DescribeVpcAttribute
• ec2:DescribeVpcClassicLink
• ec2:DescribeVpcClassicLinkDnsSupport
• ec2:DescribeVpcEndpoints
• ec2:DescribeVpcs
• ec2:GetEbsDefaultKmsKeyId
• ec2:ModifyInstanceAttribute
- `ec2:ModifyNetworkInterfaceAttribute`
- `ec2:RevokeSecurityGroupEgress`
- `ec2:RevokeSecurityGroupIngress`
- `ec2:RunInstances`
- `ec2:TerminateInstances`

Example 5.2. Required permissions for creating network resources during installation

- `ec2:AllocateAddress`
- `ec2:AssociateAddress`
- `ec2:AssociateDhcpOptions`
- `ec2:AssociateRouteTable`
- `ec2:AttachInternetGateway`
- `ec2:CreateDhcpOptions`
- `ec2:CreateInternetGateway`
- `ec2:CreateNatGateway`
- `ec2:CreateRoute`
- `ec2:CreateRouteTable`
- `ec2:CreateSubnet`
- `ec2:CreateVpc`
- `ec2:CreateVpcEndpoint`
- `ec2:ModifySubnetAttribute`
- `ec2:ModifyVpcAttribute`

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 5.3. Required Elastic Load Balancing permissions (ELB) for installation

- `elasticloadbalancing:AddTags`
- `elasticloadbalancing:ApplySecurityGroupsToLoadBalancer`
- `elasticloadbalancing:AttachLoadBalancerToSubnets`
Example 5.4. Required Elastic Load Balancing permissions (ELBv2) for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:DescribeListeners
- elasticloadbalancing:DescribeLoadBalancerAttributes
- elasticloadbalancing:DescribeLoadBalancers
- elasticloadbalancing:DescribeTargetGroupAttributes
- elasticloadbalancing:DescribeTargetHealth
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
- elasticloadbalancing:RegisterTargets
Example 5.5. Required IAM permissions for installation

- `iam:AddRoleToInstanceProfile`
- `iam:CreateInstanceProfile`
- `iam:CreateRole`
- `iam:DeleteInstanceProfile`
- `iam:DeleteRole`
- `iam:DeleteRolePolicy`
- `iam:GetInstanceProfile`
- `iam:GetRole`
- `iam:GetRolePolicy`
- `iam:GetUser`
- `iam:ListInstanceProfilesForRole`
- `iam:ListRoles`
- `iam:ListUsers`
- `iam:PassRole`
- `iam:PutRolePolicy`
- `iam:RemoveRoleFromInstanceProfile`
- `iam:SimulatePrincipalPolicy`
- `iam:TagRole`

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

Example 5.6. Required Route 53 permissions for installation

- `route53:ChangeResourceRecordSets`
- `route53:ChangeTagsForResource`
- `route53:CreateHostedZone`
- `route53:DeleteHostedZone`
- `route53:GetChange`
- route53:GetHostedZone
- route53:ListHostedZones
- route53:ListHostedZonesByName
- route53:ListResourceRecordSets
- route53:ListTagsForResource
- route53:UpdateHostedZoneComment

Example 5.7. Required S3 permissions for installation

- s3:CreateBucket
- s3:DeleteBucket
- s3:GetAccelerateConfiguration
- s3:GetBucketAcl
- s3:GetBucketCors
- s3:GetBucketLocation
- s3:GetBucketLogging
- s3:GetBucketObjectLockConfiguration
- s3:GetBucketReplication
- s3:GetBucketRequestPayment
- s3:GetBucketTagging
- s3:GetBucketVersioning
- s3:GetBucketWebsite
- s3:GetEncryptionConfiguration
- s3:GetLifecycleConfiguration
- s3:GetReplicationConfiguration
- s3:ListBucket
- s3:PutBucketAcl
- s3:PutBucketTagging
- s3:PutEncryptionConfiguration

Example 5.8. S3 permissions that cluster Operators require
- s3:DeleteObject
- s3:GetObject
- s3:GetObjectAcl
- s3:GetObjectTagging
- s3:GetObjectVersion
- s3:PutObject
- s3:PutObjectAcl
- s3:PutObjectTagging

Example 5.9. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
- ec2:DeleteNetworkInterface
- ec2:DeleteVolume
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DescribeTargetGroups
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:ListAttachedRolePolicies
- iam:ListInstanceProfiles
- iam:ListRolePolicies
- iam:ListUserPolicies
- s3:DeleteObject
- s3:ListBucketVersions
- tag:GetResources

Example 5.10. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
• ec2:DeleteRouteTable
• ec2:DeleteSubnet
• ec2:DeleteVpc
• ec2:DeleteVpcEndpoints
• ec2:DetachInternetGateway
• ec2:DisassociateRouteTable
• ec2:ReleaseAddress
• ec2:ReplaceRouteTableAssociation

**NOTE**

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the `tag:UntagResources` permission to delete network resources.

Example 5.11. Required permissions to delete a cluster with shared instance roles

• iam:UntagRole

Example 5.12. Additional IAM and S3 permissions that are required to create manifests

• iam:DeleteAccessKey
• iam:DeleteUser
• iam:DeleteUserPolicy
• iam:GetUserPolicy
• iam:ListAccessKeys
• iam:PutUserPolicy
• iam:TagUser
• iam:GetUserPolicy
• iam:ListAccessKeys
• s3:PutBucketPublicAccessBlock
• s3:GetBucketPublicAccessBlock
• s3:PutLifecycleConfiguration
• s3:HeadBucket
- `s3:ListBucketMultipartUploads`
- `s3:AbortMultipartUpload`

**NOTE**
If you are managing your cloud provider credentials with mint mode, the IAM user also requires the `iam:CreateAccessKey` and `iam:CreateUser` permissions.

Example 5.13. Optional permissions for instance and quota checks for installation
- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

### 5.2.4. Creating an IAM user

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the Creating an IAM User in Your AWS Account procedure in the AWS documentation, set the following options:

**Procedure**

1. Specify the IAM user name and select **Programmatic access**.

2. Attach the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

   **NOTE**
   While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.

4. Confirm that the user name that you specified is granted the **AdministratorAccess** policy.

5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.
IMPORTANT

You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials.

Additional resources

- See Manually creating IAM for AWS for steps to set the Cloud Credential Operator (CCO) to manual mode prior to installation. Use this mode in environments where the cloud identity and access management (IAM) APIs are not reachable, or if you prefer not to store an administrator-level credential secret in the cluster kube-system project.

5.2.5. Required AWS permissions for IAM roles

You have the option of defining your own IAM roles that are applied to the instance profiles of your machines created by the installation program. You can specify existing IAM roles by defining the controlPlane.platform.aws.iamRole and compute.platform.aws.iamRoleThis fields in the install-config.yaml file. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles.

The control plane and compute machines require the following IAM role permissions:

Example 5.14. Required IAM role permissions for control plane instance profiles

- sts:AssumeRole
- ec2:AttachVolume
- ec2:AuthorizeSecurityGroupIngress
- ec2:CreateSecurityGroup
- ec2:CreateTags
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteVolume
- ec2:Describe*
- ec2:DetachVolume
- ec2:ModifyInstanceAttribute
- ec2:ModifyVolume
- ec2:RevokeSecurityGroupIngress
- elasticloadbalancing:AddTags
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateLoadBalancerPolicy
- elasticloadbalancing:CreateLoadBalancerListeners
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:ConfigureHealthCheck
- elasticloadbalancing:DeleteListener
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeleteLoadBalancerListeners
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DeregisterInstancesFromLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:Describe*
- elasticloadbalancing:DetachLoadBalancerFromSubnets
- elasticloadbalancing:ModifyListener
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
- elasticloadbalancing:RegisterInstancesWithLoadBalancer
- elasticloadbalancing:RegisterTargets
- elasticloadbalancing:SetLoadBalancerPoliciesForBackendServer
- elasticloadbalancing:SetLoadBalancerPoliciesOfListener
- kms:DescribeKey

Example 5.15. Required IAM role permissions for compute instance profiles

- sts:AssumeRole
- ec2:DescribeInstances
- ec2:DescribeRegions
5.2.6. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following regions.

NOTE

Your IAM user must have the permission tag:GetResources in the region us-east-1 to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

5.2.6.1. AWS public regions

The following AWS public regions are supported:

- af-south-1 (Cape Town)
- ap-east-1 (Hong Kong)
- ap-northeast-1 (Tokyo)
- ap-northeast-2 (Seoul)
- ap-northeast-3 (Osaka)
- ap-south-1 (Mumbai)
- ap-southeast-1 (Singapore)
- ap-southeast-2 (Sydney)
- ca-central-1 (Central)
- eu-central-1 (Frankfurt)
- eu-north-1 (Stockholm)
- eu-south-1 (Milan)
- eu-west-1 (Ireland)
- eu-west-2 (London)
- eu-west-3 (Paris)
- me-south-1 (Bahrain)
- sa-east-1 (São Paulo)
- us-east-1 (N. Virginia)
- us-east-2 (Ohio)
- us-west-1 (N. California)
- us-west-2 (Oregon)

5.2.6.2. AWS GovCloud regions
The following AWS GovCloud regions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

### 5.2.6.3. AWS C2S Secret region

The **us-iso-east-1** region is supported.

### 5.2.6.4. AWS China regions

The following AWS China regions are supported:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

### 5.2.7. Next steps

- Install an OpenShift Container Platform cluster:
  - Quickly install a cluster with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure
  - Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates

### 5.3. MANUALLY CREATING IAM FOR AWS

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

#### 5.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use the Amazon Web Services Security Token Service**
  You can use the CCO utility (**ccoctl**) to configure the cluster to use the Amazon Web Services Security Token Service (AWS STS). When the CCO utility is used to configure the cluster for STS, it assigns IAM roles that provide short-term, limited-privilege security credentials to components.
NOTE

This credentials strategy is supported for only new OpenShift Container Platform clusters and must be configured during installation. You cannot reconfigure an existing cluster that uses a different credentials strategy to use this feature.

- **Manage cloud credentials manually**
  You can set the `credentialsMode` parameter for the CCO to `Manual` to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**
  If you are using the CCO with the `credentialsMode` parameter set to `Mint`, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

  **NOTE**

  Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

**Additional resources**

- To learn how to use the CCO utility (`ccoctl`) to configure the CCO to use the AWS STS, see [Using manual mode with STS](#).

- To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see [Rotating or removing cloud provider credentials](#).

- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

### 5.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster `kube-system` namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the `install-config.yaml` file:

   ```bash
   $ openshift-install create install-config --dir <installation_directory>
   ```
where `<installation_directory>` is the directory in which the installation program creates files.

2. Edit the `install-config.yaml` configuration file so that it contains the `credentialsMode` parameter set to `Manual`.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
   - architecture: amd64
     hyperthreading: Enabled
   ...
   ```

   This line is added to set the `credentialsMode` parameter to `Manual`.

3. Generate the manifests by running the following command from the directory that contains the installation program:

   ```
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   Specifies the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   ```
   $ openshift-install version
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ```

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on:

   ```
   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=aws
   ```

   This command creates a YAML file for each `CredentialsRequest` object.

   **Sample CredentialsRequest object**

   ```yaml
   apiVersion: cloudcredential.openshift.io/v1
   kind: CredentialsRequest
   metadata:
   name: cloud-credential-operator-iam-ro
   namespace: openshift-cloud-credential-operator
   spec:
   ```
secretRef:
  name: cloud-credential-operator-iam-ro-creds
  namespace: openshift-cloud-credential-operator
providerSpec:
  apiVersion: cloudcredential.openshift.io/v1
  kind: AWSProviderSpec
  statementEntries:
    - effect: Allow
      action:
        - iam:GetUser
        - iam:GetUserPolicy
        - iam:ListAccessKeys
      resource: "**"
• Updating a cluster using the web console
• Updating a cluster using the CLI

5.3.3. Admin credentials root secret format

Each cloud provider uses a credentials root secret in the kube-system namespace by convention, which is then used to satisfy all credentials requests and create their respective secrets. This is done either by minting new credentials with mint mode, or by copying the credentials root secret with passthrough mode.

The format for the secret varies by cloud, and is also used for each CredentialsRequest secret.

Amazon Web Services (AWS) secret format

```yaml
apiVersion: v1
kind: Secret
metadata:
  namespace: kube-system
  name: aws-creds
stringData:
  aws_access_key_id: <AccessKeyID>
  aws_secret_access_key: <SecretAccessKey>
```

5.3.4. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform on platforms that support it. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the admin credential is stored in the kube-system namespace and then used by the CCO to process the CredentialsRequest objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

• Each cluster component has only the permissions it requires
• Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires admin credential storage in a cluster kube-system secret.

5.3.5. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all CredentialsRequest objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.
NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

5.3.6. Next steps

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on AWS with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure
  - Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates

5.4. INSTALLING A CLUSTER QUICKLY ON AWS

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

5.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment,
or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials. Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

5.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
```

Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

```
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>
```
Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform.
5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
   --log-level=info 2
```

   - **1** For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   - **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

a. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

b. Select `aws` as the platform to target.
c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in

`~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

d. Select the AWS region to deploy the cluster to.

e. Select the base domain for the Route 53 service that you configured for your cluster.

f. Enter a descriptive name for your cluster.

g. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to

`<installation_directory>/.openshift_install.log` when an installation succeeds.
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the AdministratorAccess policy are required only during installation.

Additional resources

- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.

4. Unpack the archive:

   ```
   $ tar xzvf <file>
   ```

5. Place the `oc` binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   ```

**Installing the OpenShift CLI on Windows**
You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   C:\> oc <command>
   ```

**Installing the OpenShift CLI on macOS**
You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your **PATH**.
To check your **PATH**, open a terminal and execute the following command:

   ```
   $ tar xvzf <file>
   $ echo $PATH
   $ oc <command>
   ```

C:\> path

C:\> oc <command>
After you install the OpenShift CLI, it is available using the `oc` command:

```
$ echo $PATH
```

## 5.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   `system:admin`

### Example output

```
$ oc whoami
system:admin
```

## 5.4.8. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:
$ cat <installation_directory>/auth/kubeadmin-password

### NOTE

Alternatively, you can obtain the kubeadmin password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.4.10. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can remove cloud provider credentials.
5.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

**NOTE**

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

5.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   $ cat <path>/<file_name>.pub

For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

      **Example output**

      Agent pid 31874

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   $ ssh-add <path>/<file_name>

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

   **Example output**

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.5.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
a. Change to the directory that contains the installation program and run the following command:

```bash
$ ./openshift-install create install-config --dir <installation_directory> 1
```

For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select AWS as the platform to target.

iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.5.5.1. Installation configuration parameters
Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}**. For additional information about *platform.* **<platform>** parameters, consult the table for your specific platform that follows.

### pullSecret
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "b3Blb=",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3Blb=",
      "email": "you@example.com"
    }
  }
}
```

#### 5.5.5.1.2. Network configuration parameters
You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

### Table 5.2. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the **networking** object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
**networking.machineNetwork.cidr**  
Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.  

**NOTE**  
Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### 5.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.3. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
</tbody>
</table>
### Parameter | Description | Values
--- | --- | ---
**compute.architecture** | Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are `amd64` and `arm64`. See Supported installation methods for different platforms in Installing documentation for information about instance availability. | String

**compute.hyperthreading** | Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. **IMPORTANT** If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. | Enabled or Disabled

**compute.name** | Required if you use `compute`. The name of the machine pool. | worker

**compute.platform** | Required if you use `compute`. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the `controlPlane.platform` parameter value. | alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}

**compute.replicas** | The number of compute machines, which are also known as worker machines, to provision. | A positive integer greater than or equal to 2. The default value is 3.

**controlPlane** | The configuration for the machines that comprise the control plane. | Array of `MachinePool` objects.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. See Supported installation methods for different platforms in Installing documentation for information about instance availability.</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>

<td>-------------------------</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example: sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</td>
</tr>
</tbody>
</table>

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 5.5.5.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

**Table 5.4. Optional AWS parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>computePLATFORM.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <strong>4000</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The type of the root volume.</td>
<td>Valid <strong>AWS EBS volume type</strong>, such as <strong>io1</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid <strong>AWS instance type</strong>, such as <strong>m4.2xlarge</strong>. See the <strong>Supported AWS machine types</strong> table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a <strong>YAML sequence</strong>.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid <strong>AWS region</strong>, such as <strong>us-east-1</strong>.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See **Global availability** map in the AWS documentation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platfrom.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <code>RHCOS AMIs for AWS infrastructure</code> for available AMI IDs.</td>
</tr>
<tr>
<td><code>controlPlane.platfrom.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platfrom.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m6i.xlarge</code>. See the <code>Supported AWS machine types</code> table that follows.</td>
</tr>
<tr>
<td><code>controlPlane.platfrom.aws.zone</code></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>controlPlane.aws.region</code></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td><code>platform.aws.amiID</code></td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <code>RHCOS AMIs for AWS infrastructure</code> for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><strong>platform.aws.hostedZone</strong></td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KV.</td>
</tr>
<tr>
<td><strong>platform.aws.serviceEndpoints.name</strong></td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td><strong>platform.aws.serviceEndpoints.url</strong></td>
<td>The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td><strong>platform.aws.userTags</strong></td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the &lt;key&gt;: &lt;value&gt; format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
</tbody>
</table>
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

### 5.5.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: `(threads per core × cores) × sockets = vCPUs`.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 5.5.5.3. Supported AWS machine types
The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

### Example 5.16. Machine types based on x86_64 architecture

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>i3.large</td>
<td>x</td>
<td></td>
<td></td>
</tr>
<tr>
<td>m4.large</td>
<td></td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>m4.xlarge</td>
<td>x</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>m4.2xlarge</td>
<td>x</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>m4.4xlarge</td>
<td>x</td>
<td>x</td>

</table>
### 5.5.5.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
      type: m6i.xlarge
      replicas: 3
  compute:
    - name: worker
      platform:
        aws:
          rootVolume:
            iops: 2000
            size: 500
            type: io1
          type: c5.4xlarge
          zones:
            - us-west-2c
          replicas: 3
      metadata:
        name: test-cluster
  networking:
    clusterNetwork:
      - cidr: 10.128.0.0/14
      hostPrefix: 23
```

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>c6g.16xlarge</td>
<td>x</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>
machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
    userTags:
      adminContact: jdoe
costCenter: 7536
amiID: ami-96c6f8f7
serviceEndpoints:
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
fips: false
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'

1 Required. The installation program prompts you for this value.
2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3 If you do not provide these parameters and values, the installation program provides the default value.
4 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
5 Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.
6 To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.
7 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
8 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.
The endpoint URL must use the **https** protocol and the host must trust the certificate.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

#### 5.5.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

### NOTE

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- You have added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.
Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
noProxy: example.com
additionalTrustBundle:
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
2. A proxy URL to use for creating HTTPS connections outside the cluster.
3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
4. If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE
Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

5.5.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**
   
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

The elevated permissions provided by the AdministratorAccess policy are required only during installation.

5.5.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
5. Place the **oc** binary in a directory that is on your **PATH**.
   To check your **PATH**, execute the following command:

   ```bash
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the **oc** command:

   ```bash
   $ oc <command>
   ```

**Installing the OpenShift CLI on Windows**
You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a **ZIP** program.

5. Move the **oc** binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```cmd
   C:\> path
   ```

   After you install the OpenShift CLI, it is available using the **oc** command:

   ```cmd
   C:\> oc <command>
   ```

**Installing the OpenShift CLI on macOS**
You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your **PATH**.
   To check your **PATH**, open a terminal and execute the following command:

   ```bash
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the **oc** command:

   ```bash
   $ oc <command>
   ```
After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 5.5.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

### 5.5.9. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
NOTE

Alternatively, you can obtain the kubeadmin password from the 
<installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   NOTE

   Alternatively, you can obtain the OpenShift Container Platform route from the 
   <installation_directory>/openshift_install.log log file on the installation host.

   Example output

   console console-openshift-console.apps.<cluster_name>.<base_domain> console
   https   reencrypt/Redirect   None

   3. Navigate to the route detailed in the output of the preceding command in a web browser and 
   log in as the kubeadmin user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the 
  OpenShift Container Platform web console.

5.5.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics 
about cluster health and the success of updates, requires internet access. If your cluster is connected to 
the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained 
automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to 
track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.5.11. Next steps

- Validating an installation.

- Customize your cluster.

- If necessary, you can opt out of remote health reporting.

- If necessary, you can remove cloud provider credentials.
5.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only `kubeProxy` configuration parameters in a running cluster.

5.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT
Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```
   Agent pid 31874
   ```

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   **Example output**

   ```
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.6.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.6.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`
For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**Phase 2**

After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

**5.6.6. Creating the installation configuration file**

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>  
   ``

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

ii. Select AWS as the platform to target.

iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the install-config.yaml file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.

IMPORTANT

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.6.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the install-config.yaml installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the install-config.yaml file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the install-config.yaml file.

5.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.5. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>

262
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the install-config.yaml content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 5.6.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.6. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.networkType</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the networking object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

### 5.6.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.7. Optional parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. See Supported installation methods for different platforms in Installing documentation for information about instance availability.</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. See Supported installation methods for different platforms in Installing documentation for information about instance availability.</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you are using Azure File storage, you cannot enable FIPS mode.</td>
<td></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.</td>
</tr>
</tbody>
</table>
The SSH key or keys to authenticate access your cluster machines.

NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

### 5.6.6.14. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

**Table 5.8. Optional AWS parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <strong>4000</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as \texttt{io1}.</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as \texttt{m4.2xlarge}. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as \texttt{us-east-1c}, in a YAML sequence.</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as \texttt{us-east-1}.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.type</td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as \texttt{m6i.xlarge}. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zone</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid <strong>AWS region</strong>, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <strong>RHCOS AMIs for AWS infrastructure</strong> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KVV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid <strong>AWS service endpoint name</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid <strong>AWS service endpoint URL</strong>.</td>
</tr>
</tbody>
</table>
**platform.aws.userTags**  
A map of keys and values that the installation program adds as tags to all resources that it creates.  
Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

**platform.aws.subnets**  
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.  
Valid subnet IDs.

### 5.6.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

5.6.6.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 5.18. Machine types based on x86_64 architecture

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>i3.large</td>
<td>x</td>

</tbody>
</table>
5.6.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (install-config.yaml) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:  
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
        type: m6i.xlarge
      replicas: 3
compute:  
  - hyperthreading: Enabled
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1
        type: c5.4xlarge
      zones:
        - us-west-2c
      replicas: 3
metadata:
```

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>c6g.8xlarge</td>
<td>x</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>c6g.12xlarge</td>
<td>x</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>c6g.16xlarge</td>
<td>x</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>
name: test-cluster

networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16

platform:
  aws:
    region: us-west-2
    userTags:
      adminContact: jdoe
      costCenter: 7536
      amiID: ami-96c6f8f7
    serviceEndpoints:
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    fips: false
    sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'

1. Required. The installation program prompts you for this value.
2. Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3. If you do not provide these parameters and values, the installation program provides the default value.
4. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
5. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

6. To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.
The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 5.6.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- You have added the `ec2.<region>.amazonaws.com`, `elasticsearchbalancing`. 

---

280
<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ¹
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ²
  noProxy: example.com ³
additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
```

¹ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

² A proxy URL to use for creating HTTPS connections outside the cluster.

³ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

⁴ If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.
NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

5.6.7. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.
- **serviceNetwork**
  - IP address pool for services.
- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

5.6.7.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <strong>cluster</strong>.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
</tbody>
</table>
|                    |          | spec:
|                    |          |   clusterNetwork:
|                    |          |     - cidr: 10.128.0.0/19
|                    |          |       hostPrefix: 23
|                    |          |     - cidr: 10.128.32.0/19
|                    |          |       hostPrefix: 23

You can customize this field only in the **install-config.yaml** file before you create the manifests. The value is read-only in the manifest file.
spec.serviceNetwork array
A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:

```yaml
spec:
  serviceNetwork:
    - 172.30.0.0/14
```

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.

spec.defaultNetwork object
Configures the Container Network Interface (CNI) cluster network provider for the cluster network.

spec.kubeProxyConfig object
The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

defaultNetwork object configuration
The values for the `defaultNetwork` object are defined in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong> OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</td>
</tr>
<tr>
<td>openshiftSDNConfig</td>
<td>object</td>
<td>This object is only valid for the OpenShift SDN cluster network provider.</td>
</tr>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

Configuration for the OpenShift SDN CNI cluster network provider
The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.
Table 5.11. `openshiftSDNConfig` object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <code>NetworkPolicy</code>. The values <code>Multitenant</code> and <code>Subnet</code> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>vxlanPort</td>
<td>integer</td>
<td>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation. If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number. On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</td>
</tr>
</tbody>
</table>

Example OpenShift SDN configuration

```yaml
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider
The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

### Table 5.12. `ovnKubernetesConfig` object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mtu</code></td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</td>
</tr>
<tr>
<td><code>genevePort</code></td>
<td>integer</td>
<td>The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td><code>ipsecConfig</code></td>
<td>object</td>
<td>Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td><code>policyAuditConfig</code></td>
<td>object</td>
<td>Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.</td>
</tr>
<tr>
<td><code>gatewayConfig</code></td>
<td>object</td>
<td>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</td>
</tr>
</tbody>
</table>

**NOTE**

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

### Table 5.13. `policyAuditConfig` object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rateLimit</code></td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
</tbody>
</table>
maxFileSize  integer  The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.

destination  string  One of the following additional audit log targets:

  libc
  - The libc syslog() function of the journald process on the host.

  udp:<host>::<port>
  - A syslog server. Replace <host>::<port> with the host and port of the syslog server.

  unix:<file>
  - A Unix Domain Socket file specified by <file>.

  null
  - Do not send the audit logs to any additional target.

syslogFacility  string  The syslog facility, such as kern, as defined by RFC5424. The default value is local0.

Table 5.14. gatewayConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to true to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is false. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to true, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

Example OVN-Kubernetes configuration with IPSec enabled

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
  ipsecConfig: {}

kubeProxyConfig object configuration
The values for the kubeProxyConfig object are defined in the following table:
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iptablesSyncPeriod</td>
<td>string</td>
<td>The refresh period for iptables rules. The default value is \textbf{30s}. Valid suffixes include \texttt{s, m, and h} and are described in the Go \texttt{time} package documentation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the \texttt{iptablesSyncPeriod} parameter is no longer necessary.</td>
</tr>
<tr>
<td>proxyArguments.iptables-min-sync-period</td>
<td>array</td>
<td>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include \texttt{s, m, and h} and are described in the Go \texttt{time} package. The default value is:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>kubeProxyConfig: \par proxyArguments: \par iptables-min-sync-period: \par - 0s</td>
</tr>
</tbody>
</table>

### 5.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the \texttt{install-config.yaml} file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```
1. `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   ```

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

   **Specify a different VXLAN port for the OpenShift SDN network provider**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       openshiftSDNConfig:
         vxlanPort: 4800
   ```

   **Enable IPsec for the OVN-Kubernetes network provider**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnKubernetesConfig:
         ipsecConfig: {}
   ```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

   **NOTE**

   For more information on using a Network Load Balancer (NLB) on AWS, see Configuring Ingress cluster traffic on AWS using a Network Load Balancer.

5.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

**Prerequisites**

- Create the `install-config.yaml` file and complete any modifications to it.
Procedure

Create an Ingress Controller backed by an AWS NLB on a new cluster.

1. Change to the directory that contains the installation program and create the manifests:

   ```
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a file that is named `cluster-ingress-default-ingresscontroller.yaml` in the `<installation_directory>/manifests/` directory:

   ```
   $ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
   ```

   For `<installation_directory>`, specify the directory name that contains the `manifests/` directory for your cluster.

   After creating the file, several network configuration files are in the `manifests/` directory, as shown:

   ```
   $ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
   ```

   **Example output**

   ```
   cluster-ingress-default-ingresscontroller.yaml
   ```

3. Open the `cluster-ingress-default-ingresscontroller.yaml` file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

   ```
   apiVersion: operator.openshift.io/v1
   kind: IngressController
   metadata:
     creationTimestamp: null
     name: default
     namespace: openshift-ingress-operator
   spec:
     endpointPublishingStrategy:
       loadBalancer:
         scope: External
         providerParameters:
           type: AWS
           aws:
             type: NLB
             type: LoadBalancerService
   ```

4. Save the `cluster-ingress-default-ingresscontroller.yaml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-ingress-default-ingresscontroller.yaml` file. The installation program deletes the `manifests/` directory when creating the cluster.
5.6.10. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

Prerequisites

- You defined OVN_Kubernetes for the networking.networkType parameter in the install-config.yaml file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

Procedure

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   Specifies the name of the directory that contains the install-config.yaml file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named cluster-network-03-config.yml in the `<installation_directory>/manifests/` directory:

   ```bash
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   EOF
   ```

   where:

   `<installation_directory>`
   Specifies the directory name that contains the manifests/ directory for your cluster.

3. Open the cluster-network-03-config.yml file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   ```
Specify the CIDR configuration used for nodes on the additional overlay network. The `hybridClusterNetwork` CIDR cannot overlap with the `clusterNetwork` CIDR.

Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.

4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

NOTE
Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom `hybridOverlayVXLANPort` value because this Windows server version does not support selecting a custom VXLAN port.

### 5.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**
1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \  
     --log-level=info
   ```

   1. For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```
   ... INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
   INFO Time elapsed: 36m22s
   ```

   **NOTE**

   The cluster access and credential information also outputs to `<installation_directory>/.openshift_install.log` when an installation succeeds.

   **IMPORTANT**

   - The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

   - It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.
IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the AdministratorAccess policy are required only during installation.

5.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   C:\> oc <command>
   ```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   ```

### 5.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.
Procedure

1. Export the **kubeadmin** credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

5.6.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**

   Alternatively, you can obtain the **kubeadmin** password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   -
3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.6.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.6.16. Next steps

- Validating an installation.

- Customize your cluster.

- If necessary, you can opt out of remote health reporting.

- If necessary, you can remove cloud provider credentials.

5.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

5.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You mirrored the images for a disconnected installation to your registry and obtained the imageContentSources data for your version of OpenShift Container Platform.
IMPORTANT
Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You configured an AWS account to host the cluster.

IMPORTANT
If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

NOTE
If you are configuring a proxy, be sure to also review this site list.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.7.2. About installations in restricted networks
In OpenShift Container Platform 4.10, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s IAM service, require internet access, so you might still require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods.
that meet your restrictions.

5.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The `ClusterVersion` status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

5.7.3. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.7.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.
Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag. The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::VPC</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::VPC Endpoint</code></td>
<td></td>
</tr>
<tr>
<td>Public subnets</td>
<td></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::Subnet</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::SubnetNetworkAclAssociation</code></td>
<td></td>
</tr>
</tbody>
</table>
## Internet gateway

- AWS::EC2::InternetGateway
- AWS::EC2::VPCGatewayAttachment
- AWS::EC2::RouteTable
- AWS::EC2::Route
- AWS::EC2::SubnetRouteTableAssociation
- AWS::EC2::NatGateway
- AWS::EC2::EIP

You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

## Network access control

- AWS::EC2::NetworkAcl
- AWS::EC2::NetworkAclEntry

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

## Private subnets

- AWS::EC2::Subnet
- AWS::EC2::RouteTable
- AWS::EC2::SubnetRouteTableAssociation

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

### 5.7.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:
• All the subnets that you specify exist.

• You provide private subnets.

• The subnet CIDRs belong to the machine CIDR that you specified.

• You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

• You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/*/shared` tag is removed from the subnets that it used.

### 5.7.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.7.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

• You can install multiple OpenShift Container Platform clusters in the same VPC.

• ICMP ingress is allowed from the entire network.

• TCP 22 ingress (SSH) is allowed to the entire network.

• Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

• Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 5.7.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:
• Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

• Access Quay.io to obtain the packages that are required to install your cluster.

• Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.7.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.
NOTE
If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the \texttt{x86\_64} architecture, do not create a key that uses the \texttt{ed25519} algorithm. Instead, create a key that uses the \texttt{rsa} or \texttt{ecdsa} algorithm.

2. View the public SSH key:

```bash
$ cat <path>/<file_name>.pub
```

For example, run the following to view the \texttt{~/.ssh/id\_rsa.pub} public key:

```bash
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the \texttt{./openshift-install gather} command.

NOTE
On some distributions, default SSH private key identities such as \texttt{~/.ssh/id_rsa} and \texttt{~/.ssh/id_dsa} are managed automatically.

a. If the \texttt{ssh-agent} process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the \texttt{ssh-agent}:

```bash
$ ssh-add <path>/<file_name> ¹
```

¹ Specify the path and file name for your SSH private key, such as \texttt{~/.ssh/id_rsa}

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps
When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the `imageContentSources` values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory> 1
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select AWS as the platform to target.
iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Edit the `install-config.yaml` file to provide the additional information that is required for an installation in a restricted network.

   a. Update the `pullSecret` value to contain the authentication information for your registry:

      ```yaml
      pullSecret: '{"auths":{"<mirror_host_name>:5000": {"auth": "<credentials>"} },"email": "you@example.com"}}
      ```

      For `<mirror_host_name>`, specify the registry domain name that you specified in the certificate for your mirror registry, and for `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

   b. Add the `additionalTrustBundle` parameter and value.

      ```yaml
      additionalTrustBundle: |
      -----BEGIN CERTIFICATE-----
      ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
3. Make any other modifications to the `install-config.yaml` file that you require. You can find more information about the available parameters in the Installation configuration parameters section.

4. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 5.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### 5.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apiVersion</code></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><code>baseDomain</code></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {.metadata.name}. {.baseDomain}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{}</td>
</tr>
</tbody>
</table>

#### 5.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.17. Network parameters**

```json
{  
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
**Parameter** | **Description** | **Values**
---|---|---
`networking.machineNetwork.cidr` | Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`. | An IP network block in CIDR notation. For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

5.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.18. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><code>true</code></td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter Value Table

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (“”).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageContentSources</code></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><code>imageContentSources.mirrors</code></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><code>publish</code></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
<tr>
<td><code>sshKey</code></td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example:</td>
</tr>
<tr>
<td></td>
<td>NOTE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <code>ssh-agent</code> process uses.</td>
<td></td>
</tr>
</tbody>
</table>

### 5.7.6.14. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

**Table 5.19. Optional AWS parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.lops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as <code>io1</code>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <code>m4.2xlarge</code>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See Global availability map in the AWS documentation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <em>RHCOS AMIs for AWS infrastructure</em> for available AMI IDs.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m6i.xlarge</code>. See the <em>Supported AWS machine types</em> table that follows.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>controlPlane.aws.region</code></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td><code>platform.aws.amiID</code></td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <em>RHCOS AMIs for AWS infrastructure</em> for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td>platform.aws.userTags</td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the <code>&lt;key&gt;: &lt;value&gt;</code> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
</tbody>
</table>
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.aws.subnets</code></td>
<td>If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <code>machineNetwork[].cidr</code> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.</td>
<td>Valid subnet IDs.</td>
</tr>
</tbody>
</table>

5.7.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

5.7.6.3. Sample customized install-config.yaml file for AWS
You can customize the installation configuration file (`install-config.yaml`) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
        type: m6i.xlarge
      replicas: 3
  compute:
    - hyperthreading: Enabled
      name: worker
      platform:
        aws:
          rootVolume:
            iops: 2000
            size: 500
            type: io1
            type: c5.4xlarge
          zones:
            - us-west-2c
          replicas: 3
      metadata:
        name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
userTags:
  adminContact: jdoe
```
Required. The installation program prompts you for this value.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.
To configure faster storage for etcd, especially for larger clusters, set the storage type as `io1` and set `iops` to 2000.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the `https` protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

Provide the contents of the certificate file that you used for your mirror registry.

Provide the `imageContentSources` section from the output of the command to mirror the repository.

5.7.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy object’s spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy object status.noProxy** field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy object status.noProxy** field is also populated with the instance metadata endpoint (169.254.169.254).

You have added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ¹
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ²
     noProxy: example.com ³
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
       <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
     ...
   
   ¹ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
   ² A proxy URL to use for creating HTTPS connections outside the cluster.
   ³ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use * to bypass the proxy for all destinations.
   ⁴ If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy object**. The **additionalTrustBundle** field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \ 
   --log-level=info
   ``

   1. For `<installation_directory>`, specify the location of your customized `/install-config.yaml` file.

   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.
When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```bash
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.7.8. Installing the OpenShift CLI by downloading the binary
You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
   
   ```
   $ tar xvzf <file>
   ```
5. Place the oc binary in a directory that is on your PATH.
   
   To check your PATH, execute the following command:
   
   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   
   To check your PATH, open the command prompt and execute the following command:
   
   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:
Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.

To check your PATH, open a terminal and execute the following command:

```bash
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the oc command:

```bash
$ oc <command>
```

### 5.7.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   **1** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**
5.7.10. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:

```
$ oc patch OperatorHub cluster --type json \
  -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

TIP

Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Configuration → OperatorHub page, click the Sources tab, where you can create, delete, disable, and enable individual sources.

5.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.7.12. Next steps

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the `must-gather` tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.

5.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC
In OpenShift Container Platform version 4.10, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

5.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.8.2. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.8.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
VPCs
VPC DHCP options
VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- Create a public and private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet. For an example of this type of configuration, see VPC with public and private subnets (NAT) in the AWS documentation.
  Record each subnet ID. Completing the installation requires that you enter these values in the platform section of the install-config.yaml file. See Finding a subnet ID in the AWS documentation.

- The VPC’s CIDR block must contain the Networking.MachineCIDR range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.

- The VPC must have a public internet gateway attached to it. For each availability zone:
  - The public subnet requires a route to the internet gateway.
  - The public subnet requires a NAT gateway with an EIP address.
  - The private subnet requires a route to the NAT gateway in public subnet.

- The VPC must not use the kubernetes.io/cluster/.*: owned tag.
  The installation program modifies your subnets to add the kubernetes.io/cluster/.*: shared tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.

- You must enable the enableDnsSupport and enableDnsHostnames attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation.
  If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the platform.aws.hostedZone field in the install-config.yaml file.
If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>- AWS::EC2::VPC&lt;br&gt;- AWS::EC2::VPCEndpoint</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td>Public subnets</td>
<td>- AWS::EC2::Subnet&lt;br&gt;- AWS::EC2::SubnetNetworkAclAssociation</td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td>Internet gateway</td>
<td>- AWS::EC2::InternetGateway&lt;br&gt;- AWS::EC2::VPCGatewayAttachment&lt;br&gt;- AWS::EC2::RouteTable&lt;br&gt;- AWS::EC2::Route&lt;br&gt;- AWS::EC2::SubnetRouteTableAssociation&lt;br&gt;- AWS::EC2::NatGateway&lt;br&gt;- AWS::EC2::EIP</td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td>Network access control</td>
<td>- AWS::EC2::NetworkAcl&lt;br&gt;- AWS::EC2::NetworkAclEntry</td>
<td>You must allow the VPC to access the following ports:</td>
</tr>
<tr>
<td></td>
<td><strong>Port</strong>&lt;br&gt;<strong>Reason</strong></td>
<td><strong>80</strong>&lt;br&gt;Inbound HTTP traffic</td>
</tr>
</tbody>
</table>

<td></td>
</tr>
</tbody>
</table>

#### 5.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/*: shared` tag is removed from the subnets that it used.

#### 5.8.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different
resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the core user on each node, which enables password-less authentication.
After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ``

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ``

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ``

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.
a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```bash
$ ssh-add ~/.ssh/id_rsa
```

**Example output**

```
Identity added: /home/<you>/~/.ssh/id_rsa (computer_name)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.8.5. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.
The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

Procedure

1. Create the install-config.yaml file.
   a. Change to the directory that contains the installation program and run the following command:

      $ ./openshift-install create install-config --dir <installation_directory>

      **For `<installation_directory>`**, specify the directory name to store the files that the installation program creates.
Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:
   i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**
   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select **AWS** as the platform to target.

   iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

   iv. Select the AWS region to deploy the cluster to.

   v. Select the base domain for the Route 53 service that you configured for your cluster.

   vi. Enter a descriptive name for your cluster.

   vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 5.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.
### 5.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{.metadata.name}</code>. <code>{.baseDomain}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 5.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 5.21. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.

<table>
<thead>
<tr>
<th>networking.network Type</th>
<th>The cluster network provider Container Network Interface (CNI) plug-in to install.</th>
<th>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</th>
</tr>
</thead>
</table>
| networking.clusterNetwork | The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap. | An array of objects. For example: `networking:

  - cidr: 10.128.0.0/14
  - hostPrefix: 23` |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^{32-23}-2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>An array of objects. For example:</td>
<td>networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td></td>
</tr>
</tbody>
</table>

**5.8.6.1.3. Optional configuration parameters**

Optional installation configuration parameters are described in the following table:

**Table 5.22. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^{32-23}-2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>An array of objects. For example:</td>
<td>networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. See Supported installation methods for different platforms in Installing documentation for information about instance availability.</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. See Supported installation methods for different platforms in Installing documentation for information about instance availability.</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Sources and repositories for the release-image content.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
</tbody>
</table>
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

### 5.8.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sshKey</code></td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example: <code>sshKey:</code> <code>&lt;key1&gt;</code> <code>&lt;key2&gt;</code> <code>&lt;key3&gt;</code></td>
</tr>
</tbody>
</table>

#### Table 5.23. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <code>4000</code>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <code>500</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as <code>io1</code>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <code>m4.2xlarge</code>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>IMPORTANT</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See Global availability map in the AWS documentation.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m6i.xlarge</code>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <em>RHCOS AMIs for AWS infrastructure</em> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KVV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
A map of keys and values that the installation program adds as tags to all resources that it creates. Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

Valid subnet IDs.

5.8.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>

</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

5.8.6.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 5.20. Machine types based on x86_64 architecture

### 5.8.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (*install-config.yaml*) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your *install-config.yaml* file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
      type: m6i.xlarge
  replicas: 3
compute:
  - hyperthreading: Enabled
    name: worker
    platform:
      aws:
        rootVolume:
          iops: 2000
          size: 500
          type: io1
        type: c5.4xlarge
    zones:
      - us-west-2c
    replicas: 3
metadata:
```

CHAPTER 5. INSTALLING ON AWS
name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
    userTags:
      adminContact: jdoe
costCenter: 7536
subnets:
  - subnet-1
  - subnet-2
  - subnet-3
amiID: ami-96c6f8f7
serviceEndpoints:
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KVV
fips: false
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'

1 Required. The installation program prompts you for this value.
2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3 If you do not provide these parameters and values, the installation program provides the default value.
4 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
5 Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as `m4.2xlarge` or `m5.2xlarge`, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as `io1` and set `iops` to `2000`.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the `https` protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

5.8.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to
hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- You have added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ¹
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ²
  noProxy: example.com ³
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
```

¹ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.

² A proxy URL to use for creating HTTPS connections outside the cluster.

³ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.

⁴ If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the Proxy object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.
The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

5.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \1
   --log-level=info 2
   ```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.
Example output

INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wi5AL"
INFO Time elapsed: 36m22s

NOTE
The cluster access and credential information also outputs to <installation_directory>/.openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT
You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

NOTE
The elevated permissions provided by the AdministratorAccess policy are required only during installation.

5.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.
IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
   
   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the OpenShift CLI, it is available using the oc command:

   C:\> oc <command>
Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```

5.8.9. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```
5.8.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   
   **NOTE**
   Alternatively, you can obtain the **kubeadmin** password from the `<installation_directory>/openshift_install.log` log file on the installation host.
   
2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   
   **NOTE**
   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.
   
   **Example output**

   ```bash
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See **Accessing the web console** for more details about accessing and understanding the OpenShift Container Platform web console.

5.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager**.
After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.8.12. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

5.9. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.10, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

5.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.9.2. Private clusters
You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.9.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.9.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

### 5.9.3. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.9.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](https://docs.aws.amazon.com/vpc/latest/wizard.html) and [Work with VPCs and subnets](https://docs.aws.amazon.com/vpc/latest/userguide/VPC_Subnets.html) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-networking-concepts.html) and [Route tables for your VPC](https://docs.aws.amazon.com/vpc/latest/userguide/route-tables.html) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag. The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](https://docs.aws.amazon.com/vpc/latest/userguide/VPC_TagRestrictions.html) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>- <code>AWS::EC2::VPC</code></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::VPC Endpoint</code></td>
<td></td>
</tr>
<tr>
<td>Public subnets</td>
<td>- <code>AWS::EC2::Subnet</code></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::SubnetNetworkAclAssociation</code></td>
<td></td>
</tr>
<tr>
<td>Internet gateway</td>
<td>- <code>AWS::EC2::InternetGateway</code></td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::VPCGatewayAttachment</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::RouteTable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::Route</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::SubnetRouteTableAssociation</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::NatGateway</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- <code>AWS::EC2::EIP</code></td>
<td></td>
</tr>
</tbody>
</table>
### Network access control

- **AWS::EC2::NetworkAcl**
- **AWS::EC2::NetworkAclEntry**

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

### Private subnets

- **AWS::EC2::Subnet**
- **AWS::EC2::RouteTable**
- **AWS::EC2::SubnetRouteTableAssociation**

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

### 5.9.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.
If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the kubernetes.io/cluster/*.: shared tag is removed from the subnets that it used.

5.9.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.9.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.
5.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
   ``

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   
   For example, run the following to view the ~/.ssh/id_rsa.pub public key:
   
   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```
3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.9.6. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   $ mkdir <installation_directory>
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```
You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**
You must name this configuration file `install-config.yaml`.

**NOTE**
For some platform types, you can alternatively run `/openshift-install create install-config --dir <installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**
The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**
After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.24. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}, {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb",
      "email":"you@example.com"
    }
  }
}
```

### 5.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.25. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>networking.network Type</strong></td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
</tbody>
</table>
| **networking.clusterNetwork** | The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap. | An array of objects. For example: networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14 hostPrefix: 23 |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR notation). The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides (2^{(32 - 23)} - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block.</td>
<td>An IP network block in CIDR notation.</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

5.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.26. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. See Supported installation methods for different platforms in Installing documentation for information about instance availability.</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>

<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td>IMPORTANT</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity</td>
<td></td>
</tr>
<tr>
<td></td>
<td>planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (“”).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>

</tbody>
</table>

Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set `publish` to Internal. The default value is External.
The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sshKey</code></td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</code></td>
</tr>
</tbody>
</table>

### 5.9.7.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

**Table 5.27. Optional AWS parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as <code>io1</code>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <code>m4.2xlarge</code>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <code>us-east-1</code>. <strong>IMPORTANT</strong> When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See Global availability map in the AWS documentation.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m6i.xlarge</code>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zone</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.aws.amiId</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KVV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
platform.aws.userTags

A map of keys and values that the installation program adds as tags to all resources that it creates.

Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

platform.aws.subnets

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

Valid subnet IDs.

5.9.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 5.9.7.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 5.22. Machine types based on x86_64 architecture

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>

5.9.7.4. Sample customized `install-config.yaml` file for AWS

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com  # 1
credentialsMode: Mint    # 2
controlPlane:            # 3
  hyperthreading: Enabled # 4
  name: master
  platform:
    aws:
      zones:  # 7
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1  # 6
        type: m6i.xlarge
      replicas: 3
  compute:  # 8
    - hyperthreading: Enabled
    name: worker
    platform:
      aws:
        rootVolume:
          iops: 2000
          size: 500
          type: io1  # 9
          type: c5.4xlarge
        zones:
          - us-west-2c
        replicas: 3
metadata:
```
name: test-cluster 10

networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16

platform:
  aws:
    region: us-west-2 11
    userTags:
      adminContact: jdoe
costCenter: 7536
  subnets: 12
    - subnet-1
    - subnet-2
    - subnet-3
  amiID: ami-96c6f8f7 13
  serviceEndpoints: 14
    - name: ec2
      url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  hostedZone: Z3URY6TWQ91KVY 15

fips: false 16

sshKey: ssh-ed25519 AAAA... 17

publish: Internal 18

pullSecret: '{"auths": ...}' 19

---

1. Required. The installation program prompts you for this value.

2. Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

3. If you do not provide these parameters and values, the installation program provides the default value.

4. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

5. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
IMPORTANT
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as `m4.2xlarge` or `m5.2xlarge`, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as `io1` and set `iops` to `2000`.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the `https` protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the internet. The default value is `External`.

5.9.7.5. Configuring the cluster-wide proxy during installation
Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites
- You have an existing `install-config.yaml` file.
You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

**NOTE**

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

You have added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
noProxy: example.com
additionalTrustBundle:
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

   1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
   2. A proxy URL to use for creating HTTPS connections outside the cluster.
   3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.
   4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

5.9.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT
You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \ 
   --log-level=info  
   ```

1. For <installation_directory>, specify the

   2. To view different installation details, specify warn, debug, or error instead of info.

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> --log-level=info
   ```

   NOTE
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.
When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 5.9.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:
   
   ```
   $ tar xvzf <file>
   ```
5. Place the `oc` binary in a directory that is on your **PATH**.
   To check your **PATH**, execute the following command:
   
   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:
   
   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:
   
   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```bash
   $ echo $PATH
   ``

   After you install the OpenShift CLI, it is available using the oc command:

   ```bash
   $ oc <command>
   ```

5.9.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubadmin credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   **For <installation_directory>, specify the path to the directory that you stored the installation files in.**

2. Verify you can run oc commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ``

   **Example output**

   ```bash
   system:admin
   ```

5.9.11. Logging in to the cluster by using the web console

The kubadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubadmin user by using the OpenShift Container Platform web console.
Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   
   NOTE
   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/.openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   
   NOTE
   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/.openshift_install.log` log file on the installation host.

   Example output

<table>
<thead>
<tr>
<th>console</th>
<th>console-openshift-console.apps.&lt;cluster_name&gt;.&lt;base_domain&gt;</th>
<th>console</th>
</tr>
</thead>
<tbody>
<tr>
<td>https</td>
<td>reencrypt/Redirect</td>
<td>None</td>
</tr>
</tbody>
</table>

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources
• See About remote health monitoring for more information about the Telemetry service.

5.9.13. Next steps

• Validating an installation.

• Customize your cluster.

• If necessary, you can opt out of remote health reporting.

• If necessary, you can remove cloud provider credentials.

5.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) into a government region. To configure the region, modify parameters in the install-config.yaml file before you install the cluster.

5.10.1. Prerequisites

• You reviewed details about the OpenShift Container Platform installation and update processes.

• You read the documentation on selecting a cluster installation method and preparing it for users.

• You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

• If you use a firewall, you configured it to allow the sites that your cluster requires access to.

• If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.10.2. AWS government regions

OpenShift Container Platform supports deploying a cluster to an AWS GovCloud (US) region.

The following AWS GovCloud partitions are supported:

• us-gov-east-1

• us-gov-west-1
5.10.3. Installation requirements

Before you can install the cluster, you must:

- Provide an existing private AWS VPC and subnets to host the cluster. Public zones are not supported in Route 53 in AWS GovCloud. As a result, clusters must be private when you deploy to an AWS government region.

- Manually create the installation configuration file (`install-config.yaml`).

5.10.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

**NOTE**

Public zones are not supported in Route 53 in an AWS GovCloud Region. Therefore, clusters must be private if they are deployed to an AWS GovCloud Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.10.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the `baseDomain` for the cluster

The installation program uses the `baseDomain` that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.10.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

5.10.5. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.10.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.
The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag.
  The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation.
  If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VPC</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::VPC</code></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::VPCEndpoint</code></td>
<td></td>
</tr>
<tr>
<td><strong>Public subnets</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::Subnet</code></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::SubnetNetworkAclAssociation</code></td>
<td></td>
</tr>
</tbody>
</table>
### Internet gateway

- AWS::EC2::InternetGateway
- AWS::EC2::VPCGatewayAttachment
- AWS::EC2::RouteTable
- AWS::EC2::Route
- AWS::EC2::SubnetRouteTableAssociation
- AWS::EC2::NatGateway
- AWS::EC2::EIP

You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

### Network access control

- AWS::EC2::NetworkAcl
- AWS::EC2::NetworkAclEntry

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

### Private subnets

- AWS::EC2::Subnet
- AWS::EC2::RouteTable
- AWS::EC2::SubnetRouteTableAssociation

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

### 5.10.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:
• All the subnets that you specify exist.

• You provide private subnets.

• The subnet CIDRs belong to the machine CIDR that you specified.

• You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

• You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

5.10.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.10.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

• You can install multiple OpenShift Container Platform clusters in the same VPC.

• ICMP ingress is allowed from the entire network.

• TCP 22 ingress (SSH) is allowed to the entire network.

• Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

• Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.10.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:
- Access **OpenShift Cluster Manager** to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access **Quay.io** to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.10.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```sh
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.
NOTE
If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

```bash
$ cat <path>/<file_name>.pub
```
For example, run the following to view the ~/.ssh/id_rsa.pub public key:

```bash
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

NOTE
On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

```bash
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps
5.10.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**
The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**
Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   `$ tar -xvf openshift-install-linux.tar.gz`

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.10.9. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites
• You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

• You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```bash
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.10.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.10.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 5.28. Required parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}. {{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
    {  
        "auths":{  
            "cloud.openshift.com":{  
                "auth":"b3Blb=",
                "email":"you@example.com"
            },  
            "quay.io":{  
                "auth":"b3Blb=",
                "email":"you@example.com"
            }
        }
    }
```

---

#### 5.10.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.29. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NOTE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You cannot modify parameters</td>
</tr>
<tr>
<td></td>
<td></td>
<td>specified by the <code>networking</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>object after installation.</td>
</tr>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network</td>
<td>Either OpenShiftSDN or</td>

</table>

5.10.9.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.30. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</code></td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td><code>Enabled</code> or <code>Disabled</code></td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td><code>master</code></td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmccloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td><code>credentialsMode</code></td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
fips

Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

NOTE

If you are using Azure File storage, you cannot enable FIPS mode.

imageContentSources

Sources and repositories for the release-image content.

Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.

imageContentSources.source

Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.

String

imageContentSources.mirrors

Specify one or more repositories that may also contain the same images.

Array of strings

publish

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.
### 5.10.9.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

#### Table 5.31. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as io1.</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as m4.2xlarge. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="IMPORTANT" /></td>
<td>When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See Global availability map in the AWS documentation.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.type</td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m6i.xlarge. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zone</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <strong>RHCOS AMIs for AWS infrastructure</strong> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KVV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
platform.aws.us

erTags

A map of keys and values that the installation program adds as tags to all resources that it creates.

Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

platform.aws.su

bnets

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

Valid subnet IDs.

5.10.9.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

5.10.9.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 5.24. Machine types based on x86_64 architecture

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>

5.10.9.4. Sample customized `install-config.yaml` file for AWS

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
name: master
platform:
  aws:
    zones:
    - us-gov-west-1a
    - us-gov-west-1b
    rootVolume:
      iops: 4000
      size: 500
      type: io1
    type: m6i.xlarge
replicas: 3
compute: 7
```
- hyperthreading: Enabled

name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1
    type: c5.4xlarge
    zones:
      - us-gov-west-1c
    replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-gov-west-1
  userTags:
    adminContact: jdoe
    costCenter: 7536
subnets:
  - subnet-1
  - subnet-2
  - subnet-3
amiID: ami-96c6f8f7
serviceEndpoints:
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KV

fips: false
sshKey: ssh-ed25519 AAAA...
publish: Internal
pullSecret: '{"auths": ...}'

1. 10. 11. 19. Required.

2. Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

3. 7. If you do not provide these parameters and values, the installation program provides the default value.

4. The controlPlane section is a single mapping, but the compute section is a sequence of mappings.
Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

5.10.9.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.
Prerequisites

- You have an existing `install-config.yaml` file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- You have added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----

1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2 A proxy URL to use for creating HTTPS connections outside the cluster.

3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4...
If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.10.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   ./openshift-install create cluster --dir <installation_directory> \  
   --log-level=info  
   
   1
   For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   
   2
   To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.
   ```
NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wi5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.
NOTE

The elevated permissions provided by the AdministratorAccess policy are required only during installation.

5.10.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your `PATH`.
   To check your `PATH`, open the command prompt and execute the following command:
   
   ```
   C:\> path
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:
   
   ```
   C:\> oc <command>
   ```

   **Installing the OpenShift CLI on macOS**

   You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

   **Procedure**
   
   2. Select the appropriate version in the Version drop-down menu.
   3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
   4. Unpack and unzip the archive.
   5. Move the `oc` binary to a directory on your `PATH`.
      To check your `PATH`, open a terminal and execute the following command:
      
      ```
      $ echo $PATH
      ```

      After you install the OpenShift CLI, it is available using the `oc` command:
      
      ```
      $ oc <command>
      ```

   **5.10.12. Logging in to the cluster by using the CLI**

   You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

   **Prerequisites**
   
   - You deployed an OpenShift Container Platform cluster.
   - You installed the `oc` CLI.

   **Procedure**
   
   1. Export the `kubeadmin` credentials:
      
      ```
      $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
      ```

      For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
2. Verify you can run `oc` commands successfully using the exported configuration:

```bash
$ oc whoami
```

**Example output**

```
system:admin
```

### 5.10.13. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

```bash
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/.openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

```bash
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**Example output**

```
console   console-openshift-console.apps.<cluster_name>.<base_domain>   console
https   reencrypt/Redirect   None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

**Additional resources**
5.10.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.10.15. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

5.11. INSTALLING A CLUSTER ON AWS INTO A TOP SECRET REGION

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) into a Commercial Cloud Services (C2S) Top Secret Region. To configure the region, modify parameters in the install config.yaml file before you install the cluster.

5.11.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multifactor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the *kube-system* namespace, you can manually create and maintain IAM credentials.

### 5.11.2. AWS Top Secret Region

OpenShift Container Platform supports deploying a cluster to an *AWS Commercial Cloud Services (C2S) Top Secret Region*.

The C2S Top Secret Region does not have a published Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Images (AMI) to select, so you must upload a custom AMI that belongs to that region.

The following AWS Top Secret Region partition is supported:

- `us-iso-east-1`

**NOTE**

The maximum supported MTU in an AWS Top Secret Region is not the same as AWS commercial. For more information about configuring MTU during installation, see the *Cluster Network Operator configuration object* section in *Installing a cluster on AWS with network customizations*.

### 5.11.3. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image for the AWS Top Secret Region.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (*install-config.yaml*).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

**IMPORTANT**

You must also define a custom CA certificate in the `additionalTrustBundle` field of the *install-config.yaml* file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the `AWS_CA_BUNDLE` environment variable, or define the CA bundle in the `ca_bundle` field of the AWS config file.

### 5.11.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.
NOTE

Public zones are not supported in Route 53 in an AWS Top Secret Region. Therefore, clusters must be private if they are deployed to an AWS Top Secret Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.11.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the baseDomain for the cluster

The installation program does use the baseDomain that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.11.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

5.11.5. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.11.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag.
  The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See `DNS Support in Your VPC` in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

- A cluster in a Top Secret Region is unable to reach the public IP addresses for the EC2 and ELB endpoints. You must create a VPC endpoint and attach it to the subnet that the clusters are using. Name the endpoints as follows:
  - `elasticloadbalancing.<region>.c2s.ic.gov`
  - `ec2.<region>.c2s.ic.gov`
  - `s3.<region>.c2s.ic.gov`

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td><img src="aws-ec2-vpc.png" alt="VPC" /></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td>Public subnets</td>
<td><img src="aws-ec2-subnet.png" alt="Public subnets" /></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td>Internet gateway</td>
<td><img src="aws-ec2-internet-gateway.png" alt="Internet gateway" /></td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
</tbody>
</table>
Network access control

- **AWS::EC2::NetworkAcl**
- **AWS::EC2::NetworkAclEntry**

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

Private subnets

- **AWS::EC2::Subnet**
- **AWS::EC2::RouteTable**
- **AWS::EC2::SubnetRouteTableAssociation**

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

5.11.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.
If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

5.11.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.11.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.11.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.
5.11.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

Procedure

1. Export your AWS profile as an environment variable:

   ```bash
   $ export AWS_PROFILE=<aws_profile> ①
   ```

2. Export the region to associate with your custom AMI as an environment variable:

   ```bash
   $ export AWS_DEFAULT_REGION=<aws_region> ①
   ```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

   ```bash
   $ export RHCOS_VERSION=<version> ①
   
   ①①① The RHCOS VMDK version, like 4.10.0.
   ```

4. Export the Amazon S3 bucket name as an environment variable:

   ```bash
   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
   ```

5. Create the `containers.json` file and define your RHCOS VMDK file:

   ```bash
   $ cat <<EOF > containers.json
   {
   "Description": "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64",
   "Format": "vmdk",
   "UserBucket": {
   "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
   "S3Key": "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64.vmdk"
   }
   }
   EOF
   ```

6. Import the RHCOS disk as an Amazon EBS snapshot:
The description of your RHCOS disk being imported, like `rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64`.

The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```bash
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

Example output

```json
{
   "ImportSnapshotTasks": [
      {
         "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
         "ImportTaskId": "import-import-snap-fh6i8uil",
         "SnapshotTaskDetail": {
            "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
            "DiskImageSize": 819056640.0,
            "Format": "VMDK",
            "SnapshotId": "snap-06331325870076318",
            "Status": "completed",
            "UserBucket": {
               "S3Bucket": "external-images",
               "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
            }
         }
      }
   ]
}
```

Copy the `SnapshotId` to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```bash
$ aws ec2 register-image
   --region ${AWS_DEFAULT_REGION} \
   --architecture x86_64 \
   --description "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \
   --ena-support \
   --name "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \
   --virtualization-type hvm \
   --root-device-name '/dev/xvda' \
   --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
   {DeleteOnTermination=true,SnapshotId=<snapshot_ID>}
```

The RHCOS VMDK architecture type, like `x86_64`, `s390x`, or `ppc64le`.
The Description from the imported snapshot.

The name of the RHCOS AMI.

The SnapshotID from the imported snapshot.

To learn more about these APIs, see the AWS documentation for importing snapshots and creating EBS-backed AMIs.

5.11.8. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

      **Example output**

      Agent pid 31874

      **NOTE**

      If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   $ ssh-add <path>/<file_name>  

   **Example output**

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.11.9. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.11.10. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites

- You have uploaded a custom RHCOS AMI.

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
Procedure

1. Create an installation directory to store your required installation assets in:

   ```
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**
   
   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**
   
   You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**
   
   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.11.10.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

   **NOTE**
   
   After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.11.10.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Table 5.32. Required parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <strong>v1</strong>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
5.11.10.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.33. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
</tbody>
</table>

**5.11.10.1.3. Optional configuration parameters**

Optional installation configuration parameters are described in the following table:

**Table 5.34. Optional parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td>IMPORTANT</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><strong>controlPlane.hypertreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><strong>controlPlane.name</strong></td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
Enable or disable FIPS mode. The default is **false** (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release–image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><strong>imageContentSources.mirrors</strong></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><strong>publish</strong></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <strong>publish</strong> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>sshKey:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;key1&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;key2&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;key3&gt;</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</td>
</tr>
</tbody>
</table>

### 5.11.10.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

**Table 5.35. Optional AWS parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td>compute.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.iops</td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.size</td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as <strong>io1</strong>.</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <strong>m4.2xlarge</strong>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.plat form.aws.type</td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m6i.xlarge. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zone s</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KV.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints. name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
</tbody>
</table>
### 5.11.10.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

**Example 5.25. Machine types based on x86_64 architecture**

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>

5.11.10.3. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      zones:
        - us-iso-east-1a
        - us-iso-east-1b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
      type: m6i.xlarge
  replicas: 3
compute: 7
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1
      type: c5.4xlarge
      zones:
        - us-iso-east-1a
        - us-iso-east-1b
      replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
```
Required.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.
To configure faster storage for etcd, especially for larger clusters, set the storage type as \texttt{io1} and set \texttt{iops} to \texttt{2000}.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the \texttt{https} protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

\textbf{IMPORTANT}

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the \texttt{x86_64} architecture.

You can optionally provide the \texttt{sshKey} value that you use to access the machines in your cluster.

\textbf{NOTE}

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your \texttt{ssh-agent} process uses.

How to publish the user-facing endpoints of your cluster. Set \texttt{publish} to \texttt{Internal} to deploy a private cluster, which cannot be accessed from the internet. The default value is \texttt{External}.

The custom CA certificate. This is required when deploying to the AWS C2S Top Secret Region because the AWS API requires a custom CA trust bundle.

5.11.10.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the \texttt{install-config.yaml} file.

Prerequisites

- You have an existing \texttt{install-config.yaml} file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the \texttt{Proxy} object's \texttt{spec.noProxy} field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>  
  httpsProxy: https://<username>:<pswd>@<ip>:<port>  
  noProxy: example.com
  additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----

  ...  
```

   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
   2 A proxy URL to use for creating HTTPS connections outside the cluster.
   3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.
   4 If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.
NOTE

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

5.11.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \  
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   NOTE

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
```
NOTE

The cluster access and credential information also outputs to 
<installation_directory>/openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the AdministratorAccess policy are required only during installation.

5.11.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

$ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the OpenShift CLI, it is available using the oc command:

C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

```bash
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

### 5.11.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

```bash
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

### 5.11.14. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.
Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**
   Alternatively, you can obtain the **kubeadmin** password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**
   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain> console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.11.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager**.

After you confirm that your **OpenShift Cluster Manager** inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.11.16. Next steps

- [Validating an installation](#).
Customize your cluster.

* If necessary, you can opt out of remote health reporting.

* If necessary, you can remove cloud provider credentials.

5.12. INSTALLING A CLUSTER ON AWS CHINA

In OpenShift Container Platform version 4.10, you can install a cluster to the following Amazon Web Services (AWS) China regions:

* cn-north-1 (Beijing)
* cn-northwest-1 (Ningxia)

5.12.1. Prerequisites

* You have an Internet Content Provider (ICP) license.

* You reviewed details about the OpenShift Container Platform installation and update processes.

* You read the documentation on selecting a cluster installation method and preparing it for users.

* You configured an AWS account to host the cluster.

* If you use a firewall, you configured it to allow the sites that your cluster requires access to.

* If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

5.12.2. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) for the AWS China regions.

Before you can install the cluster, you must:

* Upload a custom RHCOS AMI.

* Manually create the installation configuration file (`install-config.yaml`).

* Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.
You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

5.12.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.12.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network.
AWS China does not support a VPN connection between the VPC and your network. For more information about the Amazon VPC service in the Beijing and Ningxia regions, see Amazon Virtual Private Cloud in the AWS China documentation.

5.12.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the baseDomain for the cluster

The installation program does use the baseDomain that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.12.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with kubernetes.io/cluster/<cluster-infra-id>: shared so that AWS can use them to create public load balancers.

5.12.5. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.12.5.1. Requirements for using your VPC

The installation program no longer creates the following components:
If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag. The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com.cn`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.
### Component | AWS type | Description
--- | --- | ---
VPC | - AWS::EC2::VPC  
- AWS::EC2::VPCEndpoint | You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.

Public subnets | - AWS::EC2::Subnet  
- AWS::EC2::SubnetNetworkAclAssociation | Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Internet gateway | - AWS::EC2::InternetGateway  
- AWS::EC2::VPCEGatewayAttachment  
- AWS::EC2::RouteTable  
- AWS::EC2::Route  
- AWS::EC2::SubnetRouteTableAssociation  
- AWS::EC2::NatGateway  
- AWS::EC2::EIP | You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

Network access control | - AWS::EC2::NetworkAcl  
- AWS::EC2::NetworkAclEntry | You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>
5.12.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/*: shared` tag is removed from the subnets that it used.

5.12.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.12.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:
You can install multiple OpenShift Container Platform clusters in the same VPC.

- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.12.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

```bash
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

```bash
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```bash
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.12.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.
Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

Procedure

1. Export your AWS profile as an environment variable:
   
   ```
   $ export AWS_PROFILE=<aws_profile>  # The AWS profile name that holds your AWS credentials, like beijingadmin.
   ```

2. Export the region to associate with your custom AMI as an environment variable:
   
   ```
   $ export AWS_DEFAULT_REGION=<aws_region>  # The AWS region, like cn-north-1.
   ```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:
   
   ```
   $ export RHCOS_VERSION=<version>  # The RHCOS VMDK version, like 4.10.0.
   ```

4. Export the Amazon S3 bucket name as an environment variable:
   
   ```
   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
   ```

5. Create the `containers.json` file and define your RHCOS VMDK file:
   
   ```
   $ cat <<EOF > containers.json
   {
     "Description": "rhcos-$RHCOS_VERSION-x86_64-aws.x86_64",
     "Format": "vmdk",
     "UserBucket": {
       "S3Bucket": "$VMIMPORT_BUCKET_NAME",
       "S3Key": "rhcos-$RHCOS_VERSION-x86_64-aws.x86_64.vmdk"
     }
   }
   EOF
   ```

6. Import the RHCOS disk as an Amazon EBS snapshot:
The description of your RHCOS disk being imported, like `rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64`.

The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```bash
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

**Example output**

```json
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the `SnapshotId` to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```bash
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs=' \
    {DeleteOnTermination=true,SnapshotId=<snapshot_ID>}
```

The RHCOS VMDK architecture type, like `x86_64`, `s390x`, or `ppc64le`. 

---

OpenShift Container Platform 4.10 Installing
2. The **Description** from the imported snapshot.

3. The name of the RHCOS AMI.

4. The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for importing snapshots and creating EBS-backed AMIs.

### 5.12.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the *Infrastructure Provider* page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```sh
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.12.9. Manually creating the installation configuration file
Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   ```
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.12.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

   **NOTE**

   After installation, you cannot modify these parameters in the `install-config.yaml` file.
### 5.12.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 5.36. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
   "auths":{
      "cloud.openshift.com":{
         "auth":"b3Blb=",
         "email":"you@example.com"
      },
      "quay.io":{
         "auth":"b3Blb=",
         "email":"you@example.com"
      }
   }
}
```

### 5.12.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 5.37. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: <code>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</code></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 ((2^{32} - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16. NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

5.12.9.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.38. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td>IMPORTANT</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;),</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
<tr>
<td>IMPORTANT</td>
<td>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</td>
<td></td>
</tr>
<tr>
<td>NOTE</td>
<td>If you are using Azure File storage, you cannot enable FIPS mode.</td>
<td></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. The default value is External. Setting this field to Internal is not supported on non-cloud platforms and IBM Cloud. <strong>IMPORTANT</strong> If the value of the field is set to Internal, the cluster will become non-functional. For more information, refer to BZ#1953035.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key or keys to authenticate access your cluster machines. <strong>NOTE</strong> For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</td>
<td>One or more keys. For example: sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</td>
</tr>
</tbody>
</table>

### 5.12.9.2. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (install-config.yaml) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
domain: example.com
credentialsMode: Mint
controlPlane: 3
hyperthreading: Enabled
name: master
platform:
  aws:
```

---

482
zones:
- cn-north-1a
- cn-north-1b
rootVolume:
  iops: 4000
  size: 500
  type: io1 6
replicas: 3
compute: 7
  - hyperthreading: Enabled 8
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
    type: m6i.xlarge
zones:
- cn-north-1a
replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: cn-north-1 11
userTags:
  adminContact: jdoe
  costCenter: 7536
subnets: 12
- subnet-1
- subnet-2
- subnet-3
amiID: ami-96c6f8f7 13 14
serviceEndpoints: 15
  - name: ec2
    url: https://vpce-id.ec2.cn-north-1.vpce.amazonaws.com.cn
hostedZone: Z3URY6TWQ91KVV 16
fips: false 17
sshKey: ssh-ed25519 AAAA... 18
publish: Internal 19
pullSecret: '{"auths": ...}' 20

Required.
Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials.

If you do not provide these parameters and values, the installation program provides the default value.

The `controlPlane` section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, `-`, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as `m4.2xlarge` or `m5.2xlarge`, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as `io1` and set `iops` to `2000`.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the `https` protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

How to publish the user-facing endpoints of your cluster. Set publish to Internal to deploy a private cluster, which cannot be accessed from the internet. The default value is External.

5.12.9.3. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

5.12.9.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 5.26. Machine types based on x86_64 architecture

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>i3.large</td>
<td>x</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Instance type</td>
<td>Bootstrap</td>
<td>Control plane</td>
<td>Compute</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------</td>
<td>---------------</td>
<td>---------</td>
</tr>
<tr>
<td>m4.large</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.xlarge</td>
<td>x</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.2xlarge</td>
<td>x</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.4xlarge</td>
<td>x</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.10xlarge</td>
<td>x</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.16xlarge</td>
<td>x</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.large</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.xlarge</td>
<td>x</td>
<td></td>

</tbody>
</table>
5.12.9.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- You have added the `ec2.<region>.amazonaws.com.cn`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
   ```
1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 5.12.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \[1
   --log-level=info \[2
   ```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```
   ... INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
   INFO Time elapsed: 36m22s
   ```

   **NOTE**

   The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

5.12.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of `oc`.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the [OpenShift v4.10 Linux Client](https://www.redhat.com) entry and save the file.
4. Unpack the archive:
 Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**. To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your **PATH**. To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### $ tar xzvf <file>

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```
After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 5.12.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

### 5.12.13. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
NOTE
Alternatively, you can obtain the kubeadmin password from the
<installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

$ oc get routes -n openshift-console | grep 'console-openshift'

NOTE
Alternatively, you can obtain the OpenShift Container Platform route from the
<installation_directory>/openshift_install.log log file on the installation host.

Example output

<table>
<thead>
<tr>
<th>console</th>
<th>console-openshift-console.apps.&lt;cluster_name&gt;.&lt;base_domain&gt;</th>
<th>console</th>
</tr>
</thead>
<tbody>
<tr>
<td>https</td>
<td>reencrypt/Redirect None</td>
<td></td>
</tr>
</tbody>
</table>

3. Navigate to the route detailed in the output of the preceding command in a web browser and
log in as the kubeadmin user.

5.12.14. Telemetry access for OpenShift Container Platform
In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics
about cluster health and the success of updates, requires internet access. If your cluster is connected to
the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained
automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to
track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See Accessing the web console for more details about accessing and understanding the
  OpenShift Container Platform web console.
- See About remote health monitoring for more information about the Telemetry service.

5.12.15. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

5.13. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

**IMPORTANT**

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company’s policies.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 5.13.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You created a mirror registry on your mirror host and obtained the `imageContentSources` data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 5.13.2. About installations in restricted networks

In OpenShift Container Platform 4.10, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s IAM service, require internet access, so you might still require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

**IMPORTANT**

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

#### 5.13.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The `ClusterVersion` status includes an **Unable to retrieve available updates** error.

- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 5.13.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:
• Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

• Access Quay.io to obtain the packages that are required to install your cluster.

• Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.13.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 5.13.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 5.39. Minimum required hosts**

<table>
<thead>
<tr>
<th>Hosts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One temporary bootstrap machine</td>
<td>The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.</td>
</tr>
<tr>
<td>Three control plane machines</td>
<td>The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.</td>
</tr>
<tr>
<td>At least two compute machines, which are also known as worker machines.</td>
<td>The workloads requested by OpenShift Container Platform users run on the compute machines.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.4, or RHEL 8.5.
Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See Red Hat Enterprise Linux technology capabilities and limits.

5.13.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

5.13.4.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The kube-controller-manager only approves the kubelet client CSRs. The machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

5.13.4.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 5.27. Machine types based on x86_64 architecture
<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>i3.large</td>
<td>x</td>
<td></td>
<td></td>
</tr>
<tr>
<td>m4.large</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.xlarge</td>
<td>x</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m4.2xlarge</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>m4.4xlarge</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>m4.10xlarge</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>m4.16xlarge</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>m5.large</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.2xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.4xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.8xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.12xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5.16xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5a.large</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5a.xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5a.2xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5a.4xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5a.8xlarge</td>
<td></td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>m5a.12xlarge</td>

5.13.5. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the OpenShift Container Platform 4.x Tested Integrations page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

5.13.5.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
A public and a private Route 53 zone
Security groups
IAM roles
S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>AWS::EC2::VPC</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::VPCEndpoint</td>
<td></td>
</tr>
<tr>
<td>Public subnets</td>
<td>AWS::EC2::Subnet</td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::SubnetNetworkAclAssociation</td>
<td></td>
</tr>
<tr>
<td>Internet gateway</td>
<td>AWS::EC2::InternetGateway</td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::VPGC GatewayAttachment</td>
<td></td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::RouteTable</td>

<td>AWS::EC2::SubnetRouteTableAssociation</td>
<td></td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::NatGateway</td>
<td></td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::EIP</td>
<td></td>
</tr>
</tbody>
</table>
## Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster’s infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for `api.<cluster_name>.<domain>` must point to the external load balancer, and an entry for `api-int.<cluster_name>.<domain>` must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

### Component | AWS type | Description
---|---|---
**Network access control** |  | You must allow the VPC to access the following ports:
<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

### Private subnets

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

### Component | AWS type | Description
---|---|---
**DNS** | `AWS::Route53::HostedZone` | The hosted zone for your internal DNS. |
<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>etcd record sets</td>
<td>AWS::Route 53::RecordSet</td>
<td>The registration records for etcd for your control plane machines.</td>
</tr>
<tr>
<td>Public load balancer</td>
<td>AWS::ElasticLoadBalancingV2::LoadBalancer</td>
<td>The load balancer for your public subnets.</td>
</tr>
<tr>
<td>External API server record</td>
<td>AWS::Route 53::RecordSetGroup</td>
<td>Alias records for the external API server.</td>

<td>A listener on port 6443 for the internal load balancer.</td>
</tr>
</tbody>
</table>
Internal target group

**AWS::ElasticLoadBalancingV2::TargetGroup**
The target group for the internal load balancer.

### Security groups

The control plane and worker machines require access to the following ports:

<table>
<thead>
<tr>
<th>Group</th>
<th>Type</th>
<th>IP Protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>6443</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22623</td>
</tr>
<tr>
<td>WorkerSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>

<td>AWS::EC2::SecurityGroup</td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>19531</td>
</tr>
</tbody>
</table>

### Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a `AWS::EC2::SecurityGroupIngress` resource.

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterIngress Etcd</td>
<td>etcd</td>
<td>tcp</td>

</tr>
<tr>
<td><strong>MasterIngress WorkerIngress ServicesUDP</strong></td>
<td>Kubernetes Ingress services</td>
<td>udp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

### Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a AWS::EC2::SecurityGroupIngress resource.

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WorkerIngress Vxlan</strong></td>
<td>Vxlan packets</td>
<td>udp</td>

<td>Kubernetes Ingress services</td>
<td>udp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

Roles and instance profiles
You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

<table>
<thead>
<tr>
<th>Role</th>
<th>Effect</th>
<th>Action</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master</td>
<td>Allow</td>
<td>ec2:*</td>
<td>*</td>
</tr>
<tr>

<td>Allow</td>
<td>elasticloadbalancing:*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>iam:PassRole</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>s3:GetObject</td>
<td>*</td>
</tr>
<tr>
<td>Worker</td>
<td>Allow</td>
<td>ec2:Describe*</td>
<td>*</td>
</tr>
<tr>
<td>Bootstrap</td>
<td>Allow</td>
<td>ec2:Describe*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>ec2:AttachVolume</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>ec2:DetachVolume</td>
<td>*</td>
</tr>
</tbody>
</table>

5.13.5.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

5.13.5.3. Required AWS permissions for the IAM user

**NOTE**

Your IAM user must have the permission `tag:GetResources` in the region `us-east-1` to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 5.28. Required EC2 permissions for installation**
- ec2:AuthorizeSecurityGroupEgress
- ec2:AuthorizeSecurityGroupIngress
- ec2:CopyImage
- ec2:CreateNetworkInterface
- ec2:AttachNetworkInterface
- ec2:CreateSecurityGroup
- ec2:CreateTags
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteSnapshot
- ec2:DeleteTags
- ec2:DeregisterImage
- ec2:DescribeAccountAttributes
- ec2:DescribeAddresses
- ec2:DescribeAvailabilityZones
- ec2:DescribeDhcpOptions
- ec2:DescribeImages
- ec2:DescribeInstanceAttribute
- ec2:DescribeInstanceCreditSpecifications
- ec2:DescribeInstances
- ec2:DescribeInstanceTypes
- ec2:DescribeInternetGateways
- ec2:DescribeKeyPairs
- ec2:DescribeNatGateways
- ec2:DescribeNetworkAcls
- ec2:DescribeNetworkInterfaces
- ec2:DescribePrefixLists
- ec2:DescribeRegions
- ec2:DescribeRouteTables
Example 5.29. Required permissions for creating network resources during installation

- ec2:AllocateAddress
- ec2:AssociateAddress
- ec2:AssociateDhcpOptions
- ec2:AssociateRouteTable
- ec2:AttachInternetGateway
- ec2:CreateDhcpOptions
- ec2:CreateInternetGateway
- ec2:CreateNatGateway
- ec2:CreateRoute
- ec2:CreateRouteTable
- ec2:CreateSubnet
- ec2:CreateVpc
• ec2:CreateVpcEndpoint
• ec2:ModifySubnetAttribute
• ec2:ModifyVpcAttribute

NOTE
If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 5.30. Required Elastic Load Balancing permissions (ELB) for installation

• elasticloadbalancing:AddTags
• elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
• elasticloadbalancing:AttachLoadBalancerToSubnets
• elasticloadbalancing:ConfigureHealthCheck
• elasticloadbalancing:CreateLoadBalancer
• elasticloadbalancing:CreateLoadBalancerListeners
• elasticloadbalancing:DeleteLoadBalancer
• elasticloadbalancing:DeregisterInstancesFromLoadBalancer
• elasticloadbalancing:DescribeInstanceHealth
• elasticloadbalancing:DescribeLoadBalancerAttributes
• elasticloadbalancing:DescribeLoadBalancers
• elasticloadbalancing:DescribeTags
• elasticloadbalancing:ModifyLoadBalancerAttributes
• elasticloadbalancing:RegisterInstancesWithLoadBalancer
• elasticloadbalancing:SetLoadBalancerPoliciesOfListener

Example 5.31. Required Elastic Load Balancing permissions (ELBv2) for installation

• elasticloadbalancing:AddTags
• elasticloadbalancing:CreateListener
• elasticloadbalancing:CreateLoadBalancer
• elasticloadbalancing:CreateTargetGroup
• elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:DescribeListeners
- elasticloadbalancing:DescribeLoadBalancerAttributes
- elasticloadbalancing:DescribeLoadBalancers
- elasticloadbalancing:DescribeTargetGroupAttributes
- elasticloadbalancing:DescribeTargetHealth
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
- elasticloadbalancing:RegisterTargets

Example 5.32. Required IAM permissions for installation

- iam:AddRoleToInstanceProfile
- iam:CreateInstanceProfile
- iam:CreateRole
- iam:DeleteInstanceProfile
- iam:DeleteRole
- iam:DeleteRolePolicy
- iam:GetInstanceProfile
- iam:GetRole
- iam:GetRolePolicy
- iam:GetUser
- iam:ListInstanceProfilesForRole
- iam:ListRoles
- iam:ListUsers
- iam:PassRole
- iam:PutRolePolicy
- iam:RemoveRoleFromInstanceProfile
- iam:SimulatePrincipalPolicy
- iam:TagRole
NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

Example 5.33. Required Route 53 permissions for installation

- `route53:ChangeResourceRecordSets`
- `route53:ChangeTagsForResource`
- `route53:CreateHostedZone`
- `route53:DeleteHostedZone`
- `route53:GetChange`
- `route53:GetHostedZone`
- `route53:GetHostedZoneComment`
- `route53:GetHostedZones`
- `route53:GetHostedZonesByName`
- `route53:GetResourceRecordSets`
- `route53:GetTagsForResource`
- `route53:ListHostedZones`
- `route53:ListResourceRecordSets`
- `route53:ListTagsForResource`
- `route53:UpdateHostedZoneComment`

Example 5.34. Required S3 permissions for installation

- `s3:CreateBucket`
- `s3:DeleteBucket`
- `s3:GetAccelerateConfiguration`
- `s3:GetBucketAcl`
- `s3:GetBucketCors`
- `s3:GetBucketLocation`
- `s3:GetBucketLogging`
- `s3:GetBucketObjectLockConfiguration`
- `s3:GetBucketReplication`
- `s3:GetBucketRequestPayment`
- `s3:GetBucketTagging`
- `s3:GetBucketVersioning`
Example 5.35. S3 permissions that cluster Operators require

- s3:GetBucketWebsite
- s3:GetEncryptionConfiguration
- s3:GetLifecycleConfiguration
- s3:GetReplicationConfiguration
- s3:ListBucket
- s3:PutBucketAcl
- s3:PutBucketTagging
- s3:PutEncryptionConfiguration

Example 5.36. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
- ec2:DeleteNetworkInterface
- ec2:DeleteVolume
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DescribeTargetGroups
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:ListAttachedRolePolicies
- iam:ListInstanceProfiles
- iam:ListRolePolicies
Example 5.37. Required permissions to delete network resources

- `ec2:DeleteDhcpOptions`
- `ec2:DeleteInternetGateway`
- `ec2:DeleteNatGateway`
- `ec2:DeleteRoute`
- `ec2:DeleteRouteTable`
- `ec2:DeleteSubnet`
- `ec2:DeleteVpc`
- `ec2:DeleteVpcEndpoints`
- `ec2:DetachInternetGateway`
- `ec2:DisassociateRouteTable`
- `ec2:ReleaseAddress`
- `ec2:ReplaceRouteTableAssociation`

**NOTE**

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the `tag:UntagResources` permission to delete network resources.

Example 5.38. Required permissions to delete a cluster with shared instance roles

- `iam:UntagRole`

Example 5.39. Additional IAM and S3 permissions that are required to create manifests

- `iam:DeleteAccessKey`
- `iam:DeleteUser`
- `iam:DeleteUserPolicy`
Example 5.40. Optional permissions for instance and quota checks for installation

- ec2:DescribeInstanceTypeOfferings
- servicequotas:ListAWSDefaultServiceQuotas

5.13.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.
IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> ①

   ① Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

Example output
NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

5.13.7. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `/var` partition during the preparation phases of installation.

5.13.7.1. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- `/var/lib/containers`: Holds container-related content that can grow as more images and containers are added to a system.
- `/var/lib/etcd`: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- `/var`: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a `/var` directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.
Because `/var` must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate `/var` partition by creating a machine config manifest that is inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Procedure**

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```bash
   $ mkdir $HOME/clusterconfig
   ```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   ```bash
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ```

   **Example output**

   ```
   ? SSH Public Key ...
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: $HOME/clusterconfig/manifests and
   $HOME/clusterconfig/openshift
   ```

3. Optional: Confirm that the installation program created manifests in the `clusterconfig/openshift` directory:

   ```bash
   $ ls $HOME/clusterconfig/openshift/
   ```

   **Example output**

   ```
   99_kubeadmin-password-secret.yaml
   99_openshift-cluster-api_master-machines-0.yaml
   99_openshift-cluster-api_master-machines-1.yaml
   99_openshift-cluster-api_master-machines-2.yaml
   ...
   ```

4. Create a Butane config that configures the additional partition. For example, name the file `$HOME/clusterconfig/98-var-partition.bu`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This example places the `/var` directory on a separate partition:

   ```yaml
   variant: openshift
   version: 4.10.0
   metadata:
   labels:
   machineconfiguration.openshift.io/role: worker
   ```
The storage device name of the disk that you want to partition.

When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

The size of the data partition in mebibytes.

The `prjquota` mount option must be enabled for filesystems used for container storage.

### NOTE

When creating a separate `/var` partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the `clusterconfig/openshift` directory. For example, run the following command:

```bash
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

```bash
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth  bootstrap.ign  master.ign  metadata.json  worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 5.13.7.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.
Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.

- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the `install-config.yaml` file manually.

Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>  
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select `aws` as the platform to target.

      iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
NOTE

The AWS access key ID and secret access key are stored in ~/.aws/credentials in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Edit the install-config.yaml file to provide the additional information that is required for an installation in a restricted network.

a. Update the pullSecret value to contain the authentication information for your registry:

```
pullSecret: {
  "auths": {
    "<local_registry>": {
      "auth": "<credentials>",
      "email": "you@example.com"
    }
  }
}
```

For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example registry.example.com or registry.example.com:5000. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

b. Add the additionalTrustBundle parameter and value. The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

```
additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
    -----END CERTIFICATE-----
```

c. Add the image content resources:

```
imageContentSources:
  - mirrors:
    - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-release
    - mirrors:
      - <local_registry>/<local_repository_name>/release
        source: quay.io/openshift-release-dev/ocp-v4.0-art-dev
```

Use the imageContentSources section from the output of the command to mirror the repository or the values that you used when you mirrored the content from the media that you brought into your restricted network.

d. Optional: Set the publishing strategy to Internal:
By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Optional: Back up the `install-config.yaml` file.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

5.13.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- You have added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   ```
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

5.13.7.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.
IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.

- You created the `install-config.yaml` installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   **Example output**

   ```
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: install_dir/manifests and install_dir/openshift
   ```

   1 For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.
4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
   
   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
   
   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
     name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone:  
       id: mycluster-100419-private-zone
     publicZone:  
       id: example.openshift.com
   status: {}
   ```

   **1 2 Remove this section completely.**

   If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

   ```bash
   $ ./openshift-install create ignition-configs --dir <installation_directory>  
   ```

   **1 For `<installation_directory>`, specify the same installation directory.**

   Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadm-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

   ```bash
   ├── auth
   │   ├── kubeadm-password
   │   ├── kubeconfig
   │   ├── bootstrap.ign
   │   └── master.ign
   │       └── metadata.json
   └── worker.ign
   ```

5.13.8. Extracting the infrastructure name
The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the `jq` package.

Procedure

To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6
```

The output of this command is your cluster name and a random string.

5.13.9. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`. 
• You generated the Ignition config files for your cluster.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [ 
   { 
   "ParameterKey": "VpcCidr", 1
   "ParameterValue": "10.0.0.0/16" 2
   },
   { 
   "ParameterKey": "AvailabilityZoneCount", 3
   "ParameterValue": "1" 4
   },
   { 
   "ParameterKey": "SubnetBits", 5
   "ParameterValue": "12" 6
   }
   ]
   ```

   1 The CIDR block for the VPC.
   2 Specify a CIDR block in the format `x.x.x.x/16-24`.
   3 The number of availability zones to deploy the VPC in.
   4 Specify an integer between 1 and 3.
   5 The size of each subnet in each availability zone.
   6 Specify an integer between 5 and 13, where 5 is /27 and 13 is /19.

2. Copy the template from the CloudFormation template for the VPC section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

   ```bash
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   ```

   1 `<name>` is the name for the CloudFormation stack, such as `cluster-vpc`. You need the name of this stack if you remove the cluster.
   2 `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.
<parameters> is the relative path to and name of the CloudFormation parameters JSON file.

Example output

arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f

4. Confirm that the template components exist:

$ aws cloudformation describe-stacks --stack-name <name>

After the StackStatus displays CREATE_COMPLETE, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of your VPC.</td>
</tr>
<tr>
<td>PublicSubnetIds</td>
<td>The IDs of the new public subnets.</td>
</tr>
<tr>
<td>PrivateSubnetIds</td>
<td>The IDs of the new private subnets.</td>
</tr>
</tbody>
</table>

5.13.9.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

Example 5.41. CloudFormation template for the VPC

AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
VpcCidr:
   ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
   Default: 10.0.0.0/16
   Description: CIDR block for VPC.
   Type: String
AvailabilityZoneCount:
   ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
   MinValue: 1
   MaxValue: 3
   Default: 1
   Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
   Type: Number
SubnetBits:
   ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
   MinValue: 5
MaxValue: 13
Default: 12
Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
Type: Number

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: "Network Configuration"
  Parameters:
  - VpcCidr
  - SubnetBits
- Label: "Availability Zones"
  Parameters:
  - AvailabilityZoneCount
ParameterLabels:
AvailabilityZoneCount: "Availability Zone Count"
VpcCidr: "VPC CIDR"
SubnetBits: "Bits Per Subnet"

Conditions:
DoAz3: !Equals [3, !Ref AvailabilityZoneCount]
DoAz2: !Or [!Equals [2, !Ref AvailabilityZoneCount], Condition: DoAz3]

5.13.10. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of

```
DestinationCidrBlock: 0.0.0.0/0
NatGatewayId:
  Ref: NAT3
S3Endpoint:
Type: AWS::EC2::VPC Endpoint
Properties:
  PolicyDocument:
    Version: 2012-10-17
    Statement:
      - Effect: Allow
        Principal: '*'
        Action: '*'
        Resource: '*'
    RouteTableIds:
      - !Ref PublicRouteTable
      - !Ref PrivateRouteTable
      - !If [DoAz2, !Ref PrivateRouteTable2, !Ref "AWS::NoValue"]
      - !If [DoAz3, !Ref PrivateRouteTable3, !Ref "AWS::NoValue"]
      ServiceName: !Join
        - 
          - com.amazonaws.
          - !Ref 'AWS::Region'
          - .s3
      VpcId: !Ref VPC

Outputs:
VpcId:
  Description: ID of the new VPC.
  Value: !Ref VPC
PublicSubnetIds:
  Description: Subnet IDs of the public subnets.
  Value:
    !Join [ '', [
      !Ref PublicSubnet,
      !If [DoAz2, !Ref PublicSubnet2, !Ref "AWS::NoValue"],
      !If [DoAz3, !Ref PublicSubnet3, !Ref "AWS::NoValue"]
    ]]
PrivateSubnetIds:
  Description: Subnet IDs of the private subnets.
  Value:
    !Join [ '', [
      !Ref PrivateSubnet,
      !If [DoAz2, !Ref PrivateSubnet2, !Ref "AWS::NoValue"],
      !If [DoAz3, !Ref PrivateSubnet3, !Ref "AWS::NoValue"]
    ]]
```
AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the `install-config.yaml` file for your cluster. You can obtain details about your hosted zone by running the following command:

   ```bash
   $ aws route53 list-hosted-zones-by-name --dns-name <route53_domain>  
   ```

   For the `<route53_domain>`, specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster.

   **Example output**

   ```yaml
   mycluster.example.com. False 100
   HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
   /hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
   ```

   In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
     {
       "ParameterKey": "ClusterName",  
       "ParameterValue": "mycluster"
     },
     {
       "ParameterKey": "InfrastructureName",  
       "ParameterValue": "mycluster-<random_string>"
     }
   ]
   ```
A short, representative cluster name to use for hostnames, etc.

Specify the cluster name that you used when you generated the `install-config.yaml` file for the cluster.

The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

The Route 53 public zone ID to register the targets with.

Specify the Route 53 public zone ID, which as a format similar to `Z21IXYZABCZ2A4`. You can obtain this value from the AWS console.

The Route 53 zone to register the targets with.

Specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

The public subnets that you created for your VPC.

Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.
Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

**IMPORTANT**

If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

**IMPORTANT**

You must enter the command on a single line.

```bash
$ aws cloudformation create-stack --stack-name <name>  
    --template-body file://<template>.yaml  
    --parameters file://<parameters>.json  
    --capabilities CAPABILITY_NAMED_IAM
```

1. `<name>` is the name for the CloudFormation stack, such as `cluster-dns`. You need the name of this stack if you remove the cluster.

2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` resources.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```bash
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrivateHostedZoneId</td>
<td>Hosted zone ID for the private DNS.</td>
</tr>
<tr>
<td>ExternalAPILoadBalancerName</td>
<td>Full name of the external API load balancer.</td>
</tr>
<tr>
<td>InternalAPILoadBalancerName</td>
<td>Full name of the internal API load balancer.</td>
</tr>
<tr>
<td>ApiServerDnsName</td>
<td>Full hostname of the API server.</td>
</tr>
<tr>
<td>RegisterNLblpTargetsWithLambda</td>
<td>Lambda ARN useful to help register/deregister IP targets for these load balancers.</td>
</tr>
<tr>
<td>ExternalAPITargetGroupArn</td>
<td>ARN of external API target group.</td>
</tr>
<tr>
<td>InternalAPITargetGroupArn</td>
<td>ARN of internal API target group.</td>
</tr>
<tr>
<td>InternalServiceTargetGroupArn</td>
<td>ARN of internal service target group.</td>
</tr>
</tbody>
</table>

### 5.13.10.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

**Example 5.42. CloudFormation template for the network and load balancers**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
ClusterName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-]{0,26})$  # Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, representative cluster name to use for host names and other identifying
```
names.
  Type: String
InfrastructureName:
  AllowedPattern: ^\([a-zA-Z][a-zA-Z0-9-]\)[0,26]$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String
HostedZoneId:
  Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZZ2AA4.
  Type: String
HostedZoneName:
  Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.
  Type: String
  Default: "example.com"
PublicSubnets:
  Description: The internet-facing subnets.
  Type: List<AWS::EC2::Subnet::Id>
PrivateSubnets:
  Description: The internal subnets.
  Type: List<AWS::EC2::Subnet::Id>
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
  - Label: default: "Cluster Information"
    Parameters:
      - ClusterName
      - InfrastructureName
  - Label: default: "Network Configuration"
    Parameters:
      - VpcId
      - PublicSubnets
      - PrivateSubnets
  - Label: default: "DNS"
    Parameters:
      - HostedZoneName

Code:
ZipFile:
  import json
  import boto3
  import cfnresponse

  def handler(event, context):
    ec2_client = boto3.client('ec2')
    if event['RequestType'] == 'Delete':
      for subnet_id in event['ResourceProperties']['Subnets']:
        ec2_client.delete_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
          event['ResourceProperties']['InfrastructureName']}]));
    elif event['RequestType'] == 'Create':
      for subnet_id in event['ResourceProperties']['Subnets']:
        ec2_client.create_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
          event['ResourceProperties']['InfrastructureName'], 'Value': 'shared'}]);
    responseData = {}
    cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData,
      event['ResourceProperties']['InfrastructureName']+event['ResourceProperties']['Subnets'][0])

Runtime: "python3.7"
Timeout: 120
```

RegisterPublicSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PublicSubnets

RegisterPrivateSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PrivateSubnets

Outputs:
  PrivateHostedZoneId:
    Description: Hosted zone ID for the private DNS, which is required for private records.
    Value: !Ref IntDns
  ExternalApiLoadBalancerName:
    Description: Full name of the external API load balancer.
    Value: !GetAtt ExtApiElb.LoadBalancerFullName
  InternalApiLoadBalancerName:
    Description: Full name of the internal API load balancer.
    Value: !GetAtt IntApiElb.LoadBalancerFullName

```
IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` to use `CNAME` records. Records of type `ALIAS` are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
  - !GetAtt IntApiElb.DNSName
```

Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

5.13.11. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

Procedure
1. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "InfrastructureName",  
    "ParameterValue": "mycluster-<random_string>"  
  },
  {
    "ParameterKey": "VpcCidr",  
    "ParameterValue": "10.0.0.0/16"  
  },
  {
    "ParameterKey": "PrivateSubnets",  
    "ParameterValue": "subnet-<random_string>"  
  },
  {
    "ParameterKey": "VpcId",  
    "ParameterValue": "vpc-<random_string>"  
  }
]
```

1. The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

2. Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

3. The CIDR block for the VPC.

4. Specify the CIDR block parameter that you used for the VPC that you defined in the form `x.x.x.x/16-24`.

5. The private subnets that you created for your VPC.

6. Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

7. The VPC that you created for the cluster.

8. Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

2. Copy the template from the CloudFormation template for security objects section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

```
$ aws cloudformation create-stack --stack-name <name>  
```

You must enter the command on a single line.
<name> is the name for the CloudFormation stack, such as `cluster-sec`. You need the name of this stack if you remove the cluster.

<template> is the relative path to and name of the CloudFormation template YAML file that you saved.

<parameters> is the relative path to and name of the CloudFormation parameters JSON file.

You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the StackStatus displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroupId</td>
<td>Master Security Group ID</td>
</tr>
<tr>
<td>WorkerSecurityGroupId</td>
<td>Worker Security Group ID</td>
</tr>
<tr>
<td>MasterInstanceProfile</td>
<td>Master IAM Instance Profile</td>
</tr>
<tr>
<td>WorkerInstanceProfile</td>
<td>Worker IAM Instance Profile</td>
</tr>
</tbody>
</table>

5.13.11.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.
Example 5.43. CloudFormation template for security objects

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String
VpcCidr:
  AllowedPattern: ^((\[0-9]([1-9][0-9]?)\[0-9][0-9]?)|\[255\[0-5]\]|\[0-255\]0-4])\[(16-9)?2[0-4]^$ ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
  Default: 10.0.0.0/16
  Description: CIDR block for VPC.
  Type: String
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
PrivateSubnets:
  Description: The internal subnets.
  Type: List<AWS::EC2::Subnet::Id>

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label: default: "Cluster Information"
    Parameters:
    - InfrastructureName
      - Label: default: "Network Configuration"
        Parameters:
        - VpcId
        - VpcCidr
        - PrivateSubnets
  ParameterLabels:
    InfrastructureName: default: "Infrastructure Name"
    VpcId: default: "VPC ID"
    VpcCidr: default: "VPC CIDR"
    PrivateSubnets: default: "Private Subnets"

Resources:
MasterSecurityGroup:
  Type: AWS::EC2::SecurityGroup
  Properties:
GroupDescription: Cluster Master Security Group

MasterIngressEtcd:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: etcd
    FromPort: 2379
    ToPort: 2380
    IpProtocol: tcp

MasterIngressVxlan:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Vxlan packets
    FromPort: 4789
    ToPort: 4789
    IpProtocol: udp

MasterIngressWorkerVxlan:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Vxlan packets
  FromPort: 4789
  ToPort: 4789
  IpProtocol: udp

MasterIngressGeneve:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: Geneve packets
  FromPort: 6081
  ToPort: 6081
  IpProtocol: udp

MasterIngressWorkerGeneve:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Geneve packets
  FromPort: 6081
  ToPort: 6081
  IpProtocol: udp

MasterIngressIpsecIke:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec IKE packets
  FromPort: 500
  ToPort: 500
  IpProtocol: udp

MasterIngressIpsecNat:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec NAT-T packets
  FromPort: 4500
  ToPort: 4500
  IpProtocol: udp

MasterIngressIpsecEsp:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec ESP packets
  IpProtocol: 50
MasterIngressWorkerIpsecIke:
Type: AWS::EC2::SecurityGroupIngress
Properties:

5.13.12. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, stream metadata provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the `coreos print-stream-json` sub-command of `openshift-install` to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.
For user-provisioned installations, the `openshift-install` binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

**Procedure**

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official `stream-metadata-go` library at https://github.com/coreos/stream-metadata-go. You can also view example code in the library.

- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.

- From a command-line utility that handles JSON data, such as `jq`:
  ```bash
  $ openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.images.aws.regions["us-west-1"].image'
  
  Example output
  
  ami-0d3e625f84626bbda
  
  The output of this command is the AWS AMI ID for your designated architecture and the `us-west-1` region. The AMI must belong to the same region as the cluster.

5.13.13. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.

**NOTE**

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

### 5.13.14. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.
NOTE
If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

Procedure

1. Provide a location to serve the `bootstrap.ign` Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster’s region and upload the Ignition config file to it.

   IMPORTANT
   The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

   IMPORTANT
   If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the `s3://` schema.

   NOTE
   The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

   a. Create the bucket:

   ```bash
   $ aws s3 mb s3://<cluster-name>-infra
   ```

   `<cluster-name>-infra` is the bucket name. When creating the `install-config.yaml` file, replace `<cluster-name>` with the name specified for the cluster.
b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

**Example output**

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroupId", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcId", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  }
]```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.

Specify a valid AWS::EC2::Image::Id value.

CIDR block to allow SSH access to the bootstrap node.

Specify a CIDR block in the format `x.x.x.x/16-24`.

The public subnet that is associated with your VPC to launch the bootstrap node into.

Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The master security group ID (for registering temporary rules)

Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The VPC created resources will belong to.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

Location to fetch bootstrap Ignition config file from.

Specify the S3 bucket and file name in the form `s3://<bucket_name>/bootstrap.ign`.

Whether or not to register a network load balancer (NLB).
16. Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.

17. **The ARN for NLB IP target registration lambda group.**

18. Specify the **RegisterNlbIpTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

19. **The ARN for external API load balancer target group.**

20. Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

21. **The ARN for internal API load balancer target group.**

22. Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

23. **The ARN for internal service load balancer target group.**

24. Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

3. Copy the template from the **CloudFormation template for the bootstrap machine** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.

4. **Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:**

   ![IMPORTANT](image)
   
   You must enter the command on a single line.

   ```bash
   $ aws cloudformation create-stack --stack-name <name>  
   --template-body file://<template>.yaml  
   --parameters file://<parameters>.json  
   --capabilities CAPABILITY_NAMED_IAM
   ```

   - `<name>` is the name for the CloudFormation stack, such as `cluster-bootstrap`. You need the name of this stack if you remove the cluster.
   - `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.
   - `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.
   - You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the
Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BootstrapInstanceId</td>
<td>The bootstrap Instance ID.</td>
</tr>
<tr>
<td>BootstrapPublicIp</td>
<td>The bootstrap node public IP address.</td>
</tr>
<tr>
<td>BootstrapPrivateIp</td>
<td>The bootstrap node private IP address.</td>
</tr>
</tbody>
</table>

### 5.13.14.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

**Example 5.44. CloudFormation template for the bootstrap machine**

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String
RhcosAmi:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
  Type: AWS::EC2::Image::Id
AllowedBootstrapSshCidr:
  AllowedPattern: ^((\[0-9]\[1-9]\[0-9]\[1-9]\[0-9]\[2-0-4]\[0-9]\[25\[0-5]\]\[3]\[0-9]\[1-9]\[0-9]\[1-9]\[0-9]\[1-9]\[2]\[2]\[0-4]\[0-9]\[25\[0-5]\]\[3]\[0-9]\[1-9]\[2]\[0-9]\[3]\[0-2]\]$)
  ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
  Default: 0.0.0.0/0
  Description: CIDR block to allow SSH access to the bootstrap node.
  Type: String
```
PublicSubnet:
Description: The public subnet to launch the bootstrap node into.
Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
Description: The master security group ID for registering temporary rules.
Type: AWS::EC2::SecurityGroup::Id
VpcId:
Description: The VPC-scoped resources will belong to this VPC.
Type: AWS::EC2::VPC::Id
BootstrapIgnitionLocation:
Default: s3://my-s3-bucket/bootstrap.ign
Description: Ignition config file location.
Type: String
AutoRegisterELB:
Default: "yes"
AllowedValues:
- "yes"
- "no"
Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
Type: String
RegisterNlbIpTargetsLambdaArn:
Description: ARN for NLB IP target registration lambda.
Type: String
ExternalApiTargetGroupArn:
Description: ARN for external API load balancer target group.
Type: String
InternalApiTargetGroupArn:
Description: ARN for internal API load balancer target group.
Type: String
InternalServiceTargetGroupArn:
Description: ARN for internal service load balancer target group.
Type: String
BootstrapInstanceType:
Description: Instance type for the bootstrap EC2 instance
Default: "i3.large"
Type: String

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: "Cluster Information"
Parameters:
  - InfrastructureName
- Label: "Host Information"
Parameters:
  - RhcosAmi

CHAPTER 5. INSTALLING ON AWS
5.13.15. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

---

**Condition:** DoRegistration
**Type:** Custom::NLBRegister
**Properties:**
- ServiceToken: !Ref RegisterNlbTargetsLambdaArn
- TargetArn: !Ref InternalApiTargetGroupArn
- TargetIp: !GetAtt BootstrapInstance.PrivateIp

**RegisterBootstrapInternalServiceTarget:**
- **Condition:** DoRegistration
- **Type:** Custom::NLBRegister
  **Properties:**
  - ServiceToken: !Ref RegisterNlbTargetsLambdaArn
  - TargetArn: !Ref InternalServiceTargetGroupArn
  - TargetIp: !GetAtt BootstrapInstance.PrivateIp

**Outputs:**
- **BootstrapInstanceId:**
  - **Description:** Bootstrap Instance ID.
  - **Value:** !Ref BootstrapInstance
- **BootstrapPublicIp:**
  - **Description:** The bootstrap node public IP address.
  - **Value:** !GetAtt BootstrapInstance.PublicIp
- **BootstrapPrivateIp:**
  - **Description:** The bootstrap node private IP address.
  - **Value:** !GetAtt BootstrapInstance.PrivateIp

---

Additional resources
You configured an AWS account.

You added your AWS keys and region to your local AWS profile by running `aws configure`.

You generated the Ignition config files for your cluster.

You created and configured a VPC and associated subnets in AWS.

You created and configured DNS, load balancers, and listeners in AWS.

You created the security groups and roles required for your cluster in AWS.

You created the bootstrap machine.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", \n    "ParameterValue": "mycluster-<random_string>"  
  },
  {
    "ParameterKey": "RhcosAmi",
    "ParameterValue": "ami-<random_string>"
  },
  {
    "ParameterKey": "AutoRegisterDNS",
    "ParameterValue": "yes"
  },
  {
    "ParameterKey": "PrivateHostedZoneId",
    "ParameterValue": "<random_string>"
  },
  {
    "ParameterKey": "PrivateHostedZoneName",
    "ParameterValue": "mycluster.example.com"
  },
  {
    "ParameterKey": "Master0Subnet",
    "ParameterValue": "subnet-<random_string>"
  },
  {
    "ParameterKey": "Master1Subnet",
    "ParameterValue": "subnet-<random_string>"
  },
  {
    "ParameterKey": "Master2Subnet",
    "ParameterValue": "subnet-<random_string>"
  },
  {
    "ParameterKey": "MasterSecurityGroupId",
    "ParameterValue": "sg-<random_string>"
  }
]```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
Specify an **AWS::EC2::Image::Id** value.

Whether or not to perform DNS etcd registration.

Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.

The Route 53 private zone ID to register the etcd targets with.

Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.

The Route 53 zone to register the targets with.

Specify `<cluster_name>.-<domain_name>` where `<domain_name>` is the Route 53 base domain that you used when you generated `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

A subnet, preferably private, to launch the control plane machines on.

Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.

The master security group ID to associate with control plane nodes.

Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.

The location to fetch control plane Ignition config file from.

Specify the generated Ignition config file location, `https://api-int.<cluster_name>.<domain_name>:22623/config/master`.

The base64 encoded certificate authority string to use.

Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC...xyz==`.

The IAM profile to associate with control plane nodes.

Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.

The type of AWS instance to use for the control plane machines.

The instance type value corresponds to the minimum resource requirements for control plane machines.

Whether or not to register a network load balancer (NLB).

Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.

The ARN for NLB IP target registration lambda group.

Specify the **RegisterNlbIpTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
The ARN for external API load balancer target group.

Specify the `ExternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal API load balancer target group.

Specify the `InternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal service load balancer target group.

Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

2. Copy the template from the CloudFormation template for control plane machines section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.

3. If you specified an m5 instance type as the value for `MasterInstanceType`, add that instance type to the `MasterInstanceType.AllowedValues` parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

   IMPORTANT
   
   You must enter the command on a single line.

   ```
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   ```

   1. `<name>` is the name for the CloudFormation stack, such as `cluster-control-plane`. You need the name of this stack if you remove the cluster.

   2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   Example output

   ```
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
   ```
The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

   $ aws cloudformation describe-stacks --stack-name <name>

5.13.16. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

**IMPORTANT**

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

**NOTE**

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

**Procedure**

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

   ```json
   {
     "ParameterKey": "InfrastructureName"
   }
   ```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `cluster-name<-random-string>`.  

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.  

Specify an `AWS::EC2::Image::Id` value.  

A subnet, preferably private, to launch the worker nodes on.  

Specify a subnet from the `PrivateSubnets` value from the output of the CloudFormation template for DNS and load balancing.  

The worker security group ID to associate with worker nodes.  

Specify the `WorkerSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.  

The location to fetch bootstrap Ignition config file from.
Specify the generated Ignition config location, \url{https://api-int.<cluster_name>:22623/config/worker}.

Base64 encoded certificate authority string to use.

Specify the value from the worker.ign file that is in the installation directory. This value is the long string with the format \texttt{data:text/plain;charset=utf-8;base64,ABC...xYz==}.

The IAM profile to associate with worker nodes.

Specify the \texttt{WorkerInstanceProfile} parameter value from the output of the CloudFormation template for the security group and roles.

The type of AWS instance to use for the compute machines.

The instance type value corresponds to the minimum resource requirements for compute machines.

1. Copy the template from the CloudFormation template for worker machines section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

2. If you specified an \texttt{m5} instance type as the value for \texttt{WorkerInstanceType}, add that instance type to the \texttt{WorkerInstanceType.AllowedValues} parameter in the CloudFormation template.

3. Launch the CloudFormation template to create a stack of AWS resources that represent a worker node:

   \textbf{IMPORTANT}

   You must enter the command on a single line.

   ```bash
   $ aws cloudformation create-stack --stack-name <name> --template-body file://<template>.yaml --parameters file://<parameters>.json
   ```

   \texttt{<name>} is the name for the CloudFormation stack, such as \texttt{cluster-worker-1}. You need the name of this stack if you remove the cluster.

   \texttt{<template>} is the relative path to and name of the CloudFormation template YAML file that you saved.

   \texttt{<parameters>} is the relative path to and name of the CloudFormation parameters JSON file.

   \textbf{Example output}

   ```
   ```
NOTE
The CloudFormation template creates a stack that represents one worker node.

5. Confirm that the template components exist:

   $ aws cloudformation describe-stacks --stack-name <name>

6. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

IMPORTANT
You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

5.13.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

   $ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \
   --log-level=info

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**Example output**

```
INFO Waiting up to 20m0s for the Kubernetes API at https://api.mycluster.example.com:6443...
INFO API v1.23.0 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

**NOTE**

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

**Additional resources**

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.

### 5.13.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```
5.13.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

Example output

```
NAME      STATUS    ROLES   AGE  VERSION
master-0  Ready     master  63m  v1.23.0
master-1  Ready     master  63m  v1.23.0
master-2  Ready     master  64m  v1.23.0
```

The output lists all of the machines that you created.

**NOTE**

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME        AGE     REQUESTOR                                                                 CONDITION
csr-8b2br   15m     system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
csr-8vnps   15m     system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.
3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the `oc exec`, `oc rsh`, and `oc logs` commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the `system:node` or `system:admin` groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  ```
  $ oc adm certificate approve <csr_name>
  ```

  `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

  ```
  $ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
  ```

  **NOTE**

  Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

  ```
  $ oc get csr
  ```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
</tbody>
</table>
5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

   - To approve them individually, run the following command for each valid CSR:

     ```
     $ oc adm certificate approve <csr_name> 1
     
     1  <csr_name> is the name of a CSR from the list of current CSRs.
     ```

   - To approve all pending CSRs, run the following command:

     ```
     $ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs oc adm certificate approve
     ```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

   ```
   $ oc get nodes
   ```

### Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>74m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.23.0</td>
</tr>
</tbody>
</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 5.13.20. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

**Prerequisites**

- Your control plane has initialized.

**Procedure**
1. Watch the cluster components come online:

   $ watch -n5 oc get clusteroperators

   **Example output**

<table>
<thead>
<tr>
<th>NAME</th>

2. Configure the Operators that are not available.

### 5.13.20.1. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

**Procedure**

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:
Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Configuration → OperatorHub page, click the Sources tab, where you can create, delete, disable, and enable individual sources.

5.13.20.2. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the Recreate rollout strategy during upgrades.

5.13.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - REGISTRY_STORAGE_S3_ACCESSKEY
  - REGISTRY_STORAGE_S3_SECRETKEY

Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a Bucket Lifecycle Policy to abort incomplete multipart uploads that are one day old.

2. Fill in the storage configuration in configs.imageregistry.operator.openshift.io/cluster:

   ```bash
   $ oc edit configs.imageregistry.operator.openshift.io/cluster
   ```

   Example configuration

   ```yaml
   storage:
   s3:
   ```
5.13.20.2.2 Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

Procedure

- To set the image registry storage to an empty directory:

  ```bash
  $ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage": {"emptyDir": {}}}}'
  ```

WARNING

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the `oc patch` command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

5.13.21 Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

Prerequisites

- You completed the initial Operator configuration for your cluster.

Procedure

1. Delete the bootstrap resources. If you used the CloudFormation template, delete its stack:

   ```bash
   bucket: <bucket-name>
   region: <region-name>
   ```

   ```bash
   Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
   ```

   Wait a few minutes and run the command again.
$ aws cloudformation delete-stack --stack-name <name> 1

1 <name> is the name of your bootstrap stack.

- Delete the stack by using the AWS CloudFormation console.

5.13.22. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (oc).
- You installed the jq package.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix).

Procedure

1. Determine the routes to create.

   - To create a wildcard record, use *.apps.<cluster_name>.<domain_name>, where <cluster_name> is your cluster name, and <domain_name> is the Route 53 base domain for your OpenShift Container Platform cluster.

   - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

     ```bash
     $ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
     {"\"n\"}{end}{end}' routes
     ```

     Example output

     ```bash
     oauth-openshift.apps.<cluster_name>.<domain_name>
     console-openshift-console.apps.<cluster_name>.<domain_name>
     downloads-openshift-console.apps.<cluster_name>.<domain_name>
     alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
     grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
     prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
     ```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the EXTERNAL-IP column:

   ```bash
   $ oc -n openshift-ingress get service router-default
   ```

   Example output
3. Locate the hosted zone ID for the load balancer:

```bash
$ aws elb describe-load-balancers | jq -r `.LoadBalancerDescriptions[] | select(.DNSName == 
"<external_ip>").CanonicalHostedZoneNameID`

1 For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster’s domain:

```bash
$ aws route53 list-hosted-zones-by-name \
   --dns-name `<domain_name>` \
   --query 'HostedZones[? Config.PrivateZone != `true` && Name == 
`<domain_name>.`].Id' \
   --output text
```

For `<domain_name>`, specify the Route 53 base domain for your OpenShift Container Platform cluster.

Example output

```
/hostedzone/Z3URY6TWQ91KV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is Z3URY6TWQ91KV.

5. Add the alias records to your private zone:

```bash
$ aws route53 change-resource-record-sets --hosted-zone-id `<private_hosted_zone_id>` --change-batch '{
   "Changes": [
     {
       "Action": "CREATE",
       "ResourceRecordSet": {
         "Name": ".\052.apps.<cluster_domain>",
         "Type": "A",
         "AliasTarget":{
           "HostedZoneId": `<hosted_zone_id>`,
           "DNSName": `<external_ip>.`,
           "EvaluateTargetHealth": false
         }
       }
     }
   ]
}
```

1 For `<private_hosted_zone_id>`, specify the private hosted zone ID.
2 For `<hosted_zone_id>`, specify the hosted zone ID obtained in step 3.
3 For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.
For `<private_hosted_zone_id>`, specify the value from the output of the CloudFormation template for DNS and load balancing.

For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```bash
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --change-batch '{
  "Changes": [
    {
      "Action": "CREATE",
      "ResourceRecordSet": {
        "Name": "\052.apps.<cluster_domain>",
        "Type": "A",
        "AliasTarget": {
          "HostedZoneId": "<hosted_zone_id>",
          "DNSName": "<external_ip>",
          "EvaluateTargetHealth": false
        }
      }
    }
  ]
}'
```

1. For `<public_hosted_zone_id>`, specify the public hosted zone for your domain.

2. For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

3. For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

4. For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

5.13.23. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.
Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the oc CLI.

Procedure

1. From the directory that contains the installation program, complete the cluster installation:

   ```
   $ ./openshift-install --dir <installation_directory> wait-for install-complete
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using `oc`, run `export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig`
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-Wt6NL"
INFO Time elapsed: 1s
```

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Register your cluster on the Cluster registration page.

5.13.24. Logging in to the cluster by using the web console

The kubeadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubeadmin user by using the OpenShift Container Platform web console.
Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the kubeadmin user from the kubeadmin-password file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**
   Alternatively, you can obtain the kubeadmin password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**
   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.13.25. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources
5.13.26. Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.13.27. Next steps

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the must-gather tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

5.14. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

5.14.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

**NOTE**

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

   ```
   $ ./openshift-install destroy cluster \
   --dir <installation_directory> --log-level info
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
To view different details, specify warn, debug, or error instead of info.

NOTE
You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the metadata.json file in this directory to delete the cluster.

1. Optional: Delete the <installation_directory> directory and the OpenShift Container Platform installation program.

5.14.2. Deleting AWS resources with the Cloud Credential Operator utility

To clean up resources after uninstalling an OpenShift Container Platform cluster with the Cloud Credential Operator (CCO) in manual mode with STS, you can use the CCO utility (ccoctl) to remove the AWS resources that ccoctl created during installation.

Prerequisites

- Extract and prepare the ccoctl binary.
- Install an OpenShift Container Platform cluster with the CCO in manual mode with STS.

Procedure

- Delete the AWS resources that ccoctl created:

  $ ccoctl aws delete --name=<name> --region=<aws_region>

  where:
  
  - <name> matches the name used to originally create and tag the cloud resources.
  - <aws_region> is the AWS region in which cloud resources will be deleted.

Example output:

| 2021/04/08 17:50:41 | Identity Provider object .well-known/openid-configuration deleted from the bucket <name>-oidc |
| 2021/04/08 17:50:42 | Identity Provider object keys.json deleted from the bucket <name>-oidc |
| 2021/04/08 17:50:43 | Identity Provider bucket <name>-oidc deleted |
| 2021/04/08 17:51:05 | Policy <name>-openshift-cloud-credential-operator-cloud-credential-o associated with IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o deleted |
| 2021/04/08 17:51:05 | IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o deleted |
| 2021/04/08 17:51:07 | IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials deleted |
| 2021/04/08 17:51:08 | Policy <name>-openshift-image-registry-installer-cloud-credentials deleted |
associated with IAM Role <name>-openshift-image-registry-installer-cloud-credentials deleted
2021/04/08 17:51:08 IAM Role <name>-openshift-image-registry-installer-cloud-credentials deleted
2021/04/08 17:51:10 IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:11 IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted

**Verification**

- To verify that the resources are deleted, query AWS. For more information, refer to AWS documentation.
CHAPTER 6. INSTALLING ON AZURE

6.1. PREPARING TO INSTALL ON AZURE

6.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

6.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See Configuring an Azure account for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for Azure for other options.

6.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

6.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when
creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

### 6.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

### 6.1.4. Next steps

- **Configuring an Azure account**

### 6.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 6.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

**IMPORTANT**

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.
<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vCPU</td>
<td>40</td>
<td>20 per region</td>
<td>A default cluster requires 40 vCPUs, so you must increase the account limit. By default, each cluster creates the following instances:  - One bootstrap machine, which is removed after installation  - Three control plane machines  - Three compute machines Because the bootstrap machine uses <strong>Standard_D4s_v3</strong> machines, which use 4 vCPUs, the control plane machines use <strong>Standard_D8s_v3</strong> virtual machines, which use 8 vCPUs, and the worker machines use <strong>Standard_D4s_v3</strong> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require. By default, the installation program distributes control plane and compute machines across all availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.</td>
</tr>
</tbody>
</table>
### Compounts

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OS Disk</td>
<td>7</td>
<td></td>
<td>VM OS disk must be able to sustain a minimum throughput of 5000 IOPS / 200MBps. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by <strong>Standard_D8s_v3</strong>, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required. Host caching must be set to <strong>ReadOnly</strong> for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</td>
</tr>
<tr>
<td>VNet</td>
<td>1</td>
<td>1000 per region</td>
<td>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</td>
</tr>
<tr>
<td>Network interfaces</td>
<td>7</td>
<td>65,536 per region</td>
<td>Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</td>
</tr>
<tr>
<td>Network security groups</td>
<td>2</td>
<td>5000</td>
<td>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</td>
</tr>
</tbody>
</table>

- **controlplane**
  - Allows the control plane machines to be reached on port 6443 from anywhere

- **node**
  - Allows worker nodes to be reached from the internet on ports 80 and 443
Network load balancers | 3 | 1000 per region | Each cluster creates the following load balancers:

- **default**: Public IP address that load balances requests to ports 80 and 443 across worker machines
- **internal**: Private IP address that load balances requests to ports 6443 and 22623 across control plane machines
- **external**: Public IP address that load balances requests to port 6443 across control plane machines

If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.

Public IP addresses | 3 | | Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.

Private IP addresses | 7 | | The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.

Spot VM vCPUs (optional) | 0 | 20 per region | This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.

### 6.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**
Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

   **NOTE**

   For more information about purchasing domains through Azure, see Buy a custom domain name for Azure App Service in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See Migrate an active DNS name to Azure App Service in the Azure documentation.

3. Configure DNS for your domain. Follow the steps in the Tutorial: Host your domain in Azure DNS in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.

   Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain.

### 6.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

   **NOTE**

   You can increase only one type of quota per support request.

Procedure

1. From the Azure portal, click Help + support in the lower left corner.

2. Click New support request and then select the required values:
   a. From the Issue type list, select Service and subscription limits (quotas)
   b. From the Subscription list, select the subscription to modify.
   c. From the Quota type list, select the quota to increase. For example, select Compute-VM (cores-vCPUs) subscription limit increases to increase the number of vCPUs, which is required to install a cluster.

   d. Click Next: Solutions.

3. On the Problem Details page, provide the required information for your quota increase:
   a. Click Provide details and provide the required details in the Quota details window.
   b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.

4. Click Next: Review + create and then click Create.
6.2.4. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Owner**

To set roles on the Azure portal, see the Manage access to Azure resources using RBAC and the Azure portal in the Azure documentation.

6.2.5. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

**Prerequisites**

- Install or update the Azure CLI.
- Install the **jq** package.
- Your Azure account has the required roles for the subscription that you use.

**Procedure**

1. Log in to the Azure CLI:

   ```
   $ az login
   ```

   Log in to Azure in the web console by using your credentials.

2. If your Azure account uses subscriptions, ensure that you are using the right subscription.

   a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

   ```
   $ az account list --refresh
   ```

   **Example output**

   ```
   [
   
   
   
   
   "tenantId": "6057c7e9-b3ae-489d-de3f6bf6a8ee",
   "name": "you@example.com",
   "type": "user"
   ]
   ```
b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

**Example output**

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

1. Ensure that the value of the **tenantId** parameter is the UUID of the correct subscription.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id>
```

1. Substitute the value of the **id** for the subscription that you want to use for `<id>`.

d. If you changed the active subscription, display your account information again:

```
$ az account show
```

**Example output**

```
{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```
3. Record the values of the tenantId and id parameters from the previous output. You need these values during OpenShift Container Platform installation.

4. Create the service principal for your account:

   $ az ad sp create-for-rbac --role Contributor --name <service_principal>

   Replace <service_principal> with the name to assign to the service principal.

   **Example output**

   Changing "<service_principal>" to a valid URI of "http://<service_principal>", which is the required format used for service principal names
   Retrying role assignment creation: 1/36
   Retrying role assignment creation: 2/36
   Retrying role assignment creation: 3/36
   Retrying role assignment creation: 4/36
   {
     "appId": "8bd0d04d-0ac2-43a8-928d-705c598c6956",
     "displayName": "<service_principal>",
     "name": "http://<service_principal>",
     "password": "ac461d78-bf4b-4387-ad16-7e32e328ae6c",
     "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
   }

5. Record the values of the appId and password parameters from the previous output. You need these values during OpenShift Container Platform installation.

6. Grant additional permissions to the service principal.

   - You must always add the **Contributor** and **User Access Administrator** roles to the app registration service principal so the cluster can assign credentials for its components.

   - To operate the Cloud Credential Operator (CCO) in *mint mode*, the app registration service principal also requires the **Azure Active Directory Graph/Application.ReadWrite.OwnedBy** API permission.

   - To operate the CCO in *passthrough mode*, the app registration service principal does not require additional API permissions.

   For more information about CCO modes, see “About the Cloud Credential Operator” in the "Managing cloud provider credentials” section of the **Authentication and authorization** guide.

   **NOTE**

   If you limit the service principal scope of the OpenShift Container Platform installation program to an already existing Azure resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying a cluster using the installation program deletes this resource group.

   a. To assign the **User Access Administrator** role, run the following command:
$ az role assignment create --role "User Access Administrator" \ 
   --assignee-object-id $(az ad sp list --filter "appId eq '<appId>'" \ 
   | jq '.[0].objectId' -r)

Replace <appId> with the appId parameter value for your service principal.

b. To assign the Azure Active Directory Graph permission, run the following command:

$ az ad app permission add --id <appId> \ 
   --api 00000002-0000-0000-c000-000000000000 \ 
   --api-permissions 824c81eb-e3f8-4ee6-8f6d-de7f50d565b7=Role

Replace <appId> with the appId parameter value for your service principal.

Example output

Invoking "az ad app permission grant --id 46d33abc-b8a3-46d8-8c84-f0fd58177435 --api 00000002-0000-0000-c000-000000000000" is needed to make the change effective

For more information about the specific permissions that you grant with this command, see the GUID Table for Windows Azure Active Directory Permissions.

c. Approve the permissions request. If your account does not have the Azure Active Directory tenant administrator role, follow the guidelines for your organization to request that the tenant administrator approve your permissions request.

$ az ad app permission grant --id <appId> \ 
   --api 00000002-0000-0000-c000-000000000000

Replace <appId> with the appId parameter value for your service principal.

Additional resources

- For more information about CCO modes, see About the Cloud Credential Operator.

6.2.6. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- canadaeast (Canada East)
- centralindia (Central India)
- centralus (Central US)
- eastasia (East Asia)
- eastus (East US)
- eastus2 (East US 2)
- francecentral (France Central)
- germanywestcentral (Germany West Central)
- japaneast (Japan East)
- japanwest (Japan West)
- koreacentral (Korea Central)
- koreasouth (Korea South)
- northcentralus (North Central US)
- northeurope (North Europe)
- norwayeast (Norway East)
- southafricanorth (South Africa North)
- southcentralus (South Central US)
- southeastasia (Southeast Asia)
- southindia (South India)
- swedencentral (Sweden Central)
- switzerlandnorth (Switzerland North)
- uaenorth (UAE North)
- uksouth (UK South)
- ukwest (UK West)
- westcentralus (West Central US)
- westeurope (West Europe)
- westindia (West India)
- westus (West US)
- westus2 (West US 2)
Supported Azure Government regions
Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- usgovtexas (US Gov Texas)
- usgovvirginia (US Gov Virginia)

You can reference all available MAG regions in the Azure documentation. Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

6.2.7. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can install a customized cluster or quickly install a cluster with default options.

6.3. MANUALLY CREATING IAM FOR AZURE

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster kube-system namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

6.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the credentialsMode parameter in the install-config.yaml file.

If you prefer not to store an administrator-level credential secret in the cluster kube-system project, you can set the credentialsMode parameter for the CCO to Manual when installing OpenShift Container Platform and manage your cloud credentials manually.

Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

Additional resources

- For a detailed description of all available CCO credential modes and their supported platforms, see About the Cloud Credential Operator.

6.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster kube-system namespace.
Procedure

1. Change to the directory that contains the installation program and create the `install-config.yaml` file:

   ```
   $ openshift-install create install-config --dir <installation_directory>
   ```

   where `<installation_directory>` is the directory in which the installation program creates files.

2. Edit the `install-config.yaml` configuration file so that it contains the `credentialsMode` parameter set to `Manual`.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
   ...
   ```

   1 This line is added to set the `credentialsMode` parameter to `Manual`.

3. Generate the manifests by running the following command from the directory that contains the installation program:

   ```
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`

   Specifies the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   ```
   $ openshift-install version
   ```

   **Example output**

   ```
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ```

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on:

   ```
   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=azure
   ```

   This command creates a YAML file for each `CredentialsRequest` object.

   **Sample CredentialsRequest object**

   ```yaml
   ```
6. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

**IMPORTANT**

The release image includes `CredentialsRequest` objects for Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set. You can identify these objects by their use of the `release.openshift.io/feature-gate: TechPreviewNoUpgrade` annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.

- If you are using any of these features, you must create secrets for the corresponding objects.

- To find `CredentialsRequest` objects with the `TechPreviewNoUpgrade` annotation, run the following command:

  ```bash
  $ grep "release.openshift.io/feature-gate" *
  
  Example output
  
  0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate: TechPreviewNoUpgrade
  ```

7. From the directory that contains the installation program, proceed with your cluster creation:

  ```bash
  $ openshift-install create cluster --dir <installation_directory>
  ```
IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

Additional references

- Updating a cluster using the web console
- Updating a cluster using the CLI

6.3.3. Admin credentials root secret format

Each cloud provider uses a credentials root secret in the **kube-system** namespace by convention, which is then used to satisfy all credentials requests and create their respective secrets. This is done by copying the credentials root secret with *passthrough mode*.

The format for the secret varies by cloud, and is also used for each **CredentialsRequest** secret.

**Microsoft Azure secret format**

```yaml
apiVersion: v1
kind: Secret
metadata:
  namespace: kube-system
  name: azure-credentials
stringData:
  azure_subscription_id: <SubscriptionID>
  azure_client_id: <ClientID>
  azure_client_secret: <ClientSecret>
  azure_tenant_id: <TenantID>
  azure_resource_prefix: <ResourcePrefix>
  azure_resourcegroup: <ResourceGroup>
  azure_region: <Region>
```

On Microsoft Azure, the credentials secret format includes two properties that must contain the cluster’s infrastructure ID, generated randomly for each cluster installation. This value can be found after running create manifests:

```
$ cat .openshift_install_state.json | jq '."*installconfig.ClusterID".InfraID' -r
```

**Example output**

```
mycluster-2mpcn
```

This value would be used in the secret data as follows:

```
  azure_resource_prefix: mycluster-2mpcn
  azure_resourcegroup: mycluster-2mpcn-rg
```

6.3.4. Next steps

- Install an OpenShift Container Platform cluster:
6.4. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure that uses the default configuration options.

6.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the
installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the /openshift-install gather command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

```
$ eval "$ (ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

```
$ ssh-add <path>/<file_name> 1
```

Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```
For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

a. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

b. Select `azure` as the platform to target.

c. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

   - `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.
   - `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.
   - `azure service principal client id` The value of the `appId` parameter for the service principal.
   - `azure service principal client secret` The value of the `password` parameter for the service principal.

d. Select the region to deploy the cluster to.

e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

f. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.
g. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the kubeadmin user, display in your terminal.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.4.6. Installing the OpenShift CLI by downloading the binary
You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

### Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.

4. Unpack the archive:

   ```bash
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your **PATH**.
   
   To check your **PATH**, execute the following command:

   ```bash
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```bash
$ oc <command>
```

### Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your **PATH**.
   
   To check your **PATH**, open the command prompt and execute the following command:

   ```cmd
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```bash
$ oc <command>
```
Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

6.4.7. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

```
$ oc whoami
```

Example output
Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

6.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

6.4.9. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

6.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.
You must have internet access to:

- Access **OpenShift Cluster Manager** to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access **Quay.io** to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```
1. Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```
   Agent pid 31874
   ```

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   ```bash
   $ ssh-add <path>/<file_name>
   ```

   **Example output**

   ```
   ```

   **1** Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa
Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.
Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   IMPORTANT

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      NOTE

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select `azure` as the platform to target.

      iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

         - `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.

         - `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.

         - `azure service principal client id` The value of the `appId` parameter for the service principal.

         - `azure service principal client secret` The value of the `password` parameter for the service principal.
iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the install-config.yaml file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.

**IMPORTANT**

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the install-config.yaml installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the install-config.yaml file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the install-config.yaml file.

#### 6.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 6.1. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the install-config.yaml content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
</tbody>
</table>
## Parameter Details

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <code>&lt;metadata.name&gt;</code>. &lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}. {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### 6.5.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.2. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>You cannot modify parameters specified by the networking object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.networkType</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of 23 provides 510 (2^{(32 - 23)} - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking: machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use <code>networking.machineNetwork</code>. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>Set the <code>networking.machineNetwork</code> to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

### 6.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

#### Table 6.3. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>

<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**
Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the `Cloud Credential Operator` entry in the `Platform Operators` reference content.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

### 6.5.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

#### Table 6.4. Additional Azure parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.azure.osDisk.diskSize</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 128.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>standard_LRS, premium_LRS, or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform.azure.osDisk.diskSizeGB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 1024.</td>
</tr>
<tr>
<td>controlPlane.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>premium_LRS or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>platform.azure.baseDomainResourceGroupName</td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example production_cluster.</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.azure.networkResourceGroupName</code></td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <code>platform.azure.baseDomainResourceGroupName</code>.</td>
<td>String.</td>
</tr>
<tr>
<td><code>platform.azure.virtualNetwork</code></td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td><code>platform.azure.controlPlaneSubnet</code></td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example <code>10.0.0.0/16</code>.</td>
</tr>
<tr>
<td><code>platform.azure.computeSubnet</code></td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example <code>10.0.0.0/16</code>.</td>
</tr>
<tr>
<td><code>platform.azure.cloudName</code></td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <code>AzurePublicCloud</code> is used.</td>
<td>Any valid cloud environment, such as <code>AzurePublicCloud</code> or <code>AzureUSGovernmentCloud</code>.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

### 6.5.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>
1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with `premiumI0` set to `true`. The machines must also have the `hyperVGeneration` property contain `V1`.

### 6.5.5.3. Sample customized `install-config.yaml` file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:  
  hyperthreading: Enabled
  name: master
  platform:  
    azure:
      osDisk:
        diskSizeGB: 1024
        diskType: Premium_LRS
        type: Standard_D8s_v3
  replicas: 3
compute:  
- hyperthreading: Enabled
  name: worker
  platform:  
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512
        diskType: Standard_LRS
zones:  
- "1"
- "2"
```
Required. The installation program prompts you for this value.

2. If you do not provide these parameters and values, the installation program provides the default value.

3. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, - , and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

4. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

5. You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

6. Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

7. Specify the name of the resource group that contains the DNS zone for your base domain.

---

```yaml
- "3"
  replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    outboundType: LoadBalancer
    cloudName: AzurePublicCloud
    pullSecret: '{"auths": ...}'
    fips: false
    sshKey: ssh-ed25519 AAAA...
```

---

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.
Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

### 6.5.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   ```
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

The installation program does not support the proxy readinessEndpoints field.

Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

Only the Proxy object named cluster is supported, and no additional proxies can be created.

6.5.6. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding acceleratedNetworking to your machine set YAML file before you install the cluster.

Prerequisites

- You have created the install-config.yaml file and completed any modifications to it.
Procedure

1. Change to the directory that contains the installation program and create the manifests:

$$./openshift-install create manifests --dir <installation_directory>$$  

1. `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

Example output

INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.azure/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: installation_directory/manifests and installation_directory/openshift

2. Change to the `openshift` directory within the directory that contains the installation program. The `openshift` directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

Machine set files in `openshift` directory listing

```yaml
99_openshift-cluster-api_worker-machineset-0.yaml
99_openshift-cluster-api_worker-machineset-1.yaml
99_openshift-cluster-api_worker-machineset-2.yaml
```

3. Add the following to the `providerSpec` field in each machine set file:

```
providerSpec:
  value:
    ...  
    acceleratedNetworking: true  
    ...  
    vmSize: <azure-vm-size> 
    ...
```

1. This line enables Accelerated Networking.

2. Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see Microsoft Azure documentation.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

6.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT
You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites
- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure
1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadm` user, display in your terminal.

Example output
```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadm", and password: "4vYZb-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**
The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending *node-bootstrapper* certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 6.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (*oc*) to interact with OpenShift Container Platform from a command-line interface. You can install *oc* on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of *oc*, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of *oc*.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (*oc*) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the *Version* drop-down menu.

3. Click *Download Now* next to the *OpenShift v4.10 Linux Client* entry and save the file.

4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the *oc* binary in a directory that is on your *PATH*.
   To check your *PATH*, execute the following command:

   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the *oc* command:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.

To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the OpenShift CLI, it is available using the oc command:

   C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.

To check your PATH, open a terminal and execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

   $ oc <command>

6.5.9. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container
Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.5.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

6.5.11. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
6.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only kubeProxy configuration parameters in a running cluster.

6.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials. Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

6.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the
installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH into the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH into your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT
Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE
   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

   $ eval "$(ssh-agent -s)"

Example output

   Agent pid 31874

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>

   1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

$ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   $ ./openshift-install create install-config --dir <installation_directory>  

   **For `<installation_directory>`**, specify the directory name to store the files that the installation program creates.
IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   NOTE

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select `azure` as the platform to target.

   iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

       • `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.

       • `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.

       • `azure service principal client id` The value of the `appId` parameter for the service principal.

       • `azure service principal client secret` The value of the `password` parameter for the service principal.

   iv. Select the region to deploy the cluster to.

   v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

   vi. Enter a descriptive name for your cluster.

   IMPORTANT

   All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

   vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### 6.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 6.5. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apiVersion</code></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><code>baseDomain</code></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td><code>metadata</code></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>metadata.name</strong></td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {.metadata.name}. {.baseDomain}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td><strong>platform</strong></td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}. For additional information about <strong>platform.&lt;platform&gt;</strong> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>pullSecret</strong></td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;cloud.openshift.com&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;quay.io&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

### 6.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.6. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
</tr>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVN Kubernetes</strong>. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
|                            | The default value is **10.128.0.0/14** with a host prefix of /23. | networking:
|                            | If you specify multiple IP address blocks, the blocks must not overlap. |   - clusterNetwork:
|                            |                                                       |     - cidr: **10.128.0.0/14**
|                            |                                                       |     - hostPrefix: **23**                                               |
| networking.clusterNetwork.cidr | Required if you use `networking.clusterNetwork`. An IP address block. | An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between **0** and **32**. |
| networking.clusterNetwork.hostPrefix | The subnet prefix length to assign to each individual node. For example, if `hostPrefix` is set to **23** then each node is assigned a /23 subnet out of the given `cidr`. A `hostPrefix` value of **23** provides **510** (2^(32 - 23) - 2) pod IP addresses. | A subnet prefix.                                                      |
|                            | The default value is **23**.                          | The default value is **23**.                                           |
| networking.serviceNetwork  | The IP address block for services. The default value is **172.30.0.0/16**. | An array with an IP address block in CIDR format. For example:          |
|                            | The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network. | networking:
|                            |                                                       |   - serviceNetwork:
|                            |                                                       |     - **172.30.0.0/16**                                                |
### 6.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><code>true</code></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>alibaba</code>, <code>aws</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code></td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.</td>
<td></td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <strong>x86_64</strong> architecture.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you are using Azure File storage, you cannot enable FIPS mode.</td>
<td></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
</tbody>
</table>
6.6.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 6.8. Additional Azure parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.azure.osDisk.diskSize GB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 128.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.azure.osDisk.diskType</code></td>
<td>Defines the type of disk.</td>
<td>standard_LRS, premium_LRS, or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>controlPlane.platform.azure.osDisk.disk SizeGB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 1024.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>controlPlane.platform.azure.osDisk.disk Type</code></td>
<td>Defines the type of disk.</td>
<td>premium_LRS or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>platform.azure.baseDomainResourceGroupName</code></td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example production_cluster.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>platform.azure.resourceGroupName</code></td>
<td>The name of an already existing resource group to install your cluster to.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td></td>
<td>This resource group must be empty and only used for this specific cluster;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>platform.azure.outboundType</code></td>
<td>The outbound routing strategy used to connect your cluster to the internet.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td></td>
<td>If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>platform.azure.region</code></td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>platform.azure.zone</code></td>
<td>List of availability zones to place machines in. For high availability,</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
<tr>
<td></td>
<td>specify at least two zones.</td>
<td></td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example <code>10.0.0.0/16</code>.</td>
</tr>
<tr>
<td>platform.azure.computeSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example <code>10.0.0.0/16</code>.</td>
</tr>
<tr>
<td>platform.azure.cloudName</td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <code>AzurePublicCloud</code> is used.</td>
<td>Any valid cloud environment, such as <code>AzurePublicCloud</code> or <code>AzureUSGovernmentCloud</code>.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

### 6.6.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th>Machine</th>
<th>Operating System</th>
<th>vCPU</th>
<th>Virtual RAM</th>
<th>Storage</th>
<th>IOPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>
1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with `premiumI0` set to `true`. The machines must also have the `hyperVGeneration` property contain `V1`.

### 6.6.5.3. Sample customized install-config.yaml file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:  
  hyperthreading: Enabled  
  name: master  
  platform:  
    azure:  
      osDisk:  
        diskSizeGB: 1024  
        diskType: Premium_LRS  
        type: Standard_D8s_v3  
  replicas: 3  
compute:  
  - hyperthreading: Enabled  
    name: worker  
    platform:  
      azure:  
        type: Standard_D2s_v3  
        osDisk:  
          diskSizeGB: 512  
          diskType: Standard_LRS  
  zones:  
    - "1"  
    - "2"  
```
- "3"
replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
    pullSecret: '{"auths": ...}'
    fips: false
    sshKey: ssh-ed25519 AAAA...

1. Required. The installation program prompts you for this value.
2. If you do not provide these parameters and values, the installation program provides the default value.
3. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
4. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

5. You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
6. Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
7. Specify the name of the resource group that contains the DNS zone for your base domain.
Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

### 6.6.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object's `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   ```
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
noProxy: example.com
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE

Only the Proxy object named cluster is supported, and no additional proxies can be created.

6.6.6. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the install-config.yaml file before you create the manifest files:
For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**Phase 2**

After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

**6.6.7. Specifying advanced network configuration**

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>  
   ```

   - The `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   ```
3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

**Specify a different VXLAN port for the OpenShift SDN network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

**Enable IPsec for the OVN-Kubernetes network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

### 6.6.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named `cluster`. The CR specifies the fields for the `Network` API in the `operator.openshift.io` API group.

The CNO configuration inherits the following fields during cluster installation from the `Network` API in the `Network.config.openshift.io` API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.

- **serviceNetwork**
  - IP address pool for services.

- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

#### 6.6.8.1. Cluster Network Operator configuration object
The fields for the Cluster Network Operator (CNO) are described in the following table:

### Table 6.9. Cluster Network Operator configuration object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <strong>cluster</strong>.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <strong>install-config.yaml</strong> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.serviceNetwork</td>
<td>array</td>
<td>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <strong>install-config.yaml</strong> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.defaultNetwork</td>
<td>object</td>
<td>Configures the Container Network Interface (CNI) cluster network provider for the cluster network.</td>
</tr>
<tr>
<td>spec.kubeProxyConfig</td>
<td>object</td>
<td>The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.</td>
</tr>
</tbody>
</table>

**defaultNetwork object configuration**
The values for the **defaultNetwork** object are defined in the following table:

### Table 6.10. defaultNetwork object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.

NOTE

OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.

Table 6.11. openshiftSDNConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>

**Configuration for the OpenShift SDN CNI cluster network provider**

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 6.11. openshiftSDNConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy. The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>
The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.

This value cannot be changed after cluster installation.

The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.

If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.

Example OpenShift SDN configuration

defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789

Configuration for the OVN-Kubernetes CNI cluster network provider
The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 6.12. ovnKubernetesConfig object
The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.

Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.

Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</td>
</tr>
<tr>
<td>genevePort</td>
<td>integer</td>
<td>The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>ipsecConfig</td>
<td>object</td>
<td>Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>policyAuditConfig</td>
<td>object</td>
<td>Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.</td>
</tr>
<tr>
<td>gatewayConfig</td>
<td>object</td>
<td>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
</tbody>
</table>
maxFileSize: integer
The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.

destination: string
One of the following additional audit log targets:
- libc
  The libc syslog() function of the journal process on the host.
- udp:<host>[:<port>]
  A syslog server. Replace <host>:<port> with the host and port of the syslog server.
- unix:<file>
  A Unix Domain Socket file specified by <file>.
- null
  Do not send the audit logs to any additional target.

syslogFacility: string
The syslog facility, such as kern, as defined by RFC5424. The default value is local0.

Table 6.14. gatewayConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to true to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is false. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to true, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}

kubeProxyConfig object configuration
The values for the kubeProxyConfig object are defined in the following table:
Table 6.15. **kubeProxyConfig** object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>iptablesSyncPeriod</code></td>
<td>string</td>
<td>The refresh period for <em>iptables</em> rules. The default value is <strong>30s</strong>. Valid suffixes include <code>s</code>, <code>m</code>, and <code>h</code> and are described in the Go time package documentation.</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td></td>
<td>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <code>iptablesSyncPeriod</code> parameter is no longer necessary.</td>
</tr>
<tr>
<td><code>proxyArguments.iptables-min-sync-period</code></td>
<td>array</td>
<td>The minimum duration before refreshing <em>iptables</em> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <code>s</code>, <code>m</code>, and <code>h</code> and are described in the Go time package. The default value is:</td>
</tr>
</tbody>
</table>

```yaml
kubeProxyConfig:
  proxyArguments:
    iptables-min-sync-period:
      - 0s
```

6.6.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**

- You defined **OVN Kubernetes** for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```
where:

<installation_directory>

Specifies the name of the directory that contains the install-config.yaml file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named cluster-network-03-config.yml in the <installation_directory>/manifests/ directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

where:

<installation_directory>

Specifies the directory name that contains the manifests/ directory for your cluster.

3. Open the cluster-network-03-config.yml file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

**Specify a hybrid networking configuration**

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork:
          - cidr: 10.132.0.0/14
            hostPrefix: 23
        hybridOverlayVXLANPort: 9898
```

1. Specify the CIDR configuration used for nodes on the additional overlay network. The hybridClusterNetwork CIDR cannot overlap with the clusterNetwork CIDR.

2. Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.
NOTE
Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom `hybridOverlayVXLANPort` value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

NOTE
For more information on using Linux and Windows nodes in the same cluster, see Understanding Windows container workloads.

6.6.10. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding `acceleratedNetworking` to your machine set YAML file before you install the cluster.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.
- You have created the manifests for your cluster.

**Procedure**

1. Change to the `openshift` directory within the directory that contains the installation program. The `openshift` directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

   **Machine set files in openshift directory listing**

   - `99_openshift-cluster-api_worker-machineset-0.yaml`
   - `99_openshift-cluster-api_worker-machineset-1.yaml`
   - `99_openshift-cluster-api_worker-machineset-2.yaml`

2. Add the following to the `providerSpec` field in each machine set file:

   ```yaml
   providerSpec:
   value:
   ...
   acceleratedNetworking: true 1
   ...
   vmSize: <azure-vm-size> 2
   ...
   ```

   **1** This line enables Accelerated Networking.

   **2** Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see Microsoft Azure documentation.
Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

6.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```
   ... INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   ```
NOTE
The cluster access and credential information also outputs to `<installation_directory>/os-install.log` when an installation succeeds.

IMPORTANT
- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT
You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

IMPORTANT
If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of `oc`.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

Procedure
2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
5. Place the `oc` binary in a directory that is on your `PATH`. To check your `PATH`, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the `Version` drop-down menu.

3. Click `Download Now` next to the `OpenShift v4.10 Windows Client` entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your `PATH`. To check your `PATH`, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the `Version` drop-down menu.

3. Click `Download Now` next to the `OpenShift v4.10 MacOSX Client` entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your `PATH`. To check your `PATH`, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

---

OpenShift Container Platform 4.10 Installing
After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 6.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

```
$ oc whoami
```

**Example output**

```
system:admin
```

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.6.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service
6.6.15. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

In OpenShift Container Platform version 4.10, you can install a cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

6.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

6.7.2. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.10, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

6.7.2.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- V Nets
- Network Security Groups
If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

**NOTE**

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

### 6.7.2.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

**Table 6.16. Required ports**
### Port Description

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows internal communication to the machine config server for provisioning machines</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

### NOTE

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

#### 6.7.2.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNet, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNet and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

#### 6.7.2.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

#### 6.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access [Quay.io](#) to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the /openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   **Example output**

      Agent pid 31874

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>  

   Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

   **Example output**

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.7.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following
Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory>

1
```

For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select azure as the platform to target.

iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

- **azure subscription id** The subscription ID to use for the cluster. Specify the `id` value in your account output.
- **azure tenant id** The tenant ID. Specify the `tenantId` value in your account output.
- **azure service principal client id** The value of the `appId` parameter for the service principal.
- **azure service principal client secret** The value of the `password` parameter for the service principal.

iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.
vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 6.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 6.17. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td></td>
<td>routes to your OpenShift Container Platform cluster components. The full DNS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>name for your cluster is a combination of the baseDomain and metadata.name</td>
<td></td>
</tr>
<tr>
<td></td>
<td>parameter values that uses the &lt;metadata.name&gt;, &lt;baseDomain&gt; format.</td>
<td></td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td>consumed.</td>
<td></td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td></td>
<td>{{.metadata.name}}. {{.baseDomain}}.</td>
<td></td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the</td>
<td>Object</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td>parameters, consult the table for your specific platform that follows.</td>
<td></td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 6.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 6.18. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>networking.network</strong></td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td><strong>networking.clusterNetwork</strong></td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: <code>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</code></td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^{(32 - 23)} - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td>networking: serviceNetwork:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>networking: serviceNetwork: - 172.30.0.0/16</td>
<td></td>
<td></td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td>networking: machineNetwork:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>networking: machineNetwork: - cidr: 10.0.0.0/16</td>
<td></td>
<td></td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td>NOTE</td>
<td>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

### 6.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.19. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <strong>compute</strong>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <code>hypertreading</code>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
### imageContentSources
Sources and repositories for the release-image content.

**imageContentSources.source**
Required if you use `imageContentSources`. Specify the repository that users refer to, for example, in image pull specifications.

**imageContentSources.mirrors**
Specify one or more repositories that may also contain the same images.

### publish
How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

**Internal** or **External**. To deploy a private cluster, which cannot be accessed from the internet, set `publish` to **Internal**. The default value is **External**.

### sshKey
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

**Values**
One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

---

### 6.7.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 6.20. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.azure.osDisk.diskSize GB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is <strong>128</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.azure.osDisk.diskType</code></td>
<td>Defines the type of disk.</td>
<td><code>standard_LRS</code>, <code>premium_LRS</code>, or <code>standardSSD_LRS</code>. The default is <code>premium_LRS</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform.azure.osDisk.diskSizeGB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 1024.</td>
</tr>
<tr>
<td>controlPlane.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>premium_LRS or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>platform.azure.baseDomainResourceGroupName</td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example production_cluster.</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example ['1', '2', '3'].</td>
</tr>
</tbody>
</table>
The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.

String.

The name of the existing VNet that you want to deploy your cluster to.

String.

The name of the existing subnet in your VNet that you want to deploy your control plane machines to.

Valid CIDR, for example `10.0.0.0/16`.

The name of the existing subnet in your VNet that you want to deploy your compute machines to.

Valid CIDR, for example `10.0.0.0/16`.

The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value `AzurePublicCloud` is used.

Any valid cloud environment, such as `AzurePublicCloud` or `AzureUSGovernmentCloud`.

NOTE

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

6.7.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th>Machine</th>
<th>Operating System</th>
<th>vCPU</th>
<th>Virtual RAM</th>
<th>Storage</th>
<th>IOPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>
1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

   **IMPORTANT**

   You are required to use Azure virtual machines with `premiumIO` set to `true`. The machines must also have the `hyperVGeneration` property contain `V1`.

**6.7.6.3. Sample customized install-config.yaml file for Azure**

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

   **IMPORTANT**

   This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        diskType: Premium_LRS
        type: Standard_D8s_v3
  replicas: 3
compute:
  - name: worker
    platform:
      azure:
        type: Standard_D2s_v3
    osDisk:
      diskSizeGB: 512
      diskType: Standard_LRS
zones:
  - "1"
  - "2"
```
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The `controlPlane` section is a single mapping, but the `compute` section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the `compute` section must begin with a hyphen, `-`, and the first line of the `controlPlane` section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to `Disabled`. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as `Standard_D8s_v3`, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane

```
- "3"
replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    networkResourceGroupName: vnet_resource_group
    virtualNetwork: vnet
    controlPlaneSubnet: control_plane_subnet
    computeSubnet: compute_subnet
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
    pullSecret: '{"auths": ...}'
    fips: false
    sshKey: ssh-ed25519 AAAA...
```
Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### 6.7.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

**Prerequisites**

- You have an existing **install-config.yaml** file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object’s **spec.noProxy** field to bypass the proxy if necessary.
NOTE

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>  # 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port>  # 2
     noProxy: example.com  # 3
     additionalTrustBundle: |
       -----BEGIN CERTIFICATE-----
       <MY_TRUSTED_CA_CERT>
       -----END CERTIFICATE-----
   ...
   
   # 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
   # 2 A proxy URL to use for creating HTTPS connections outside the cluster.
   # 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.
   # 4 If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil `spec`.  

698
**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.7.7. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding `acceleratedNetworking` to your machine set YAML file before you install the cluster.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.
- You have created the manifests for your cluster.

**Procedure**

1. Change to the `openshift` directory within the directory that contains the installation program. The `openshift` directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

   **Machine set files in openshift directory listing**

   ```
   99_openshift-cluster-api_worker-machineset-0.yaml
   99_openshift-cluster-api_worker-machineset-1.yaml
   99_openshift-cluster-api_worker-machineset-2.yaml
   ```

2. Add the following to the `providerSpec` field in each machine set file:

   ```yaml
   providerSpec:
   value:
   ...
   acceleratedNetworking: true
   ...
   vmSize: <azure-vm-size>
   ...
   ```

   - **1** This line enables Accelerated Networking.
   - **2** Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see [Microsoft Azure documentation](https://azure.microsoft.com).

**Additional resources**

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](https://azure.microsoft.com).

### 6.7.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \ 1
   --log-level=info 2
   ```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   NOTE

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   Example output

   ```
   ...  
   INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export
   KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
   INFO Time elapsed: 36m22s
   ```

   NOTE

   The cluster access and credential information also outputs to
   `<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.7.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

\$ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

To check your PATH, execute the following command:

\$ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

6.7.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container
Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

6.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

6.7.12. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.8. INSTALLING A PRIVATE CLUSTER ON AZURE
In OpenShift Container Platform version 4.10, you can install a private cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

### 6.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 6.8.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 6.8.2.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.
Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster’s private DNS records. The cluster’s machines use 168.63.129.16 internally for DNS resolution. For more information, see What is Azure Private DNS? and What is IP address 168.63.129.16? in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A BaseDomainResourceGroup, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

6.8.2.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

6.8.2.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the install-config.yaml file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an internal registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the Configuring your firewall section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.
Private cluster with network address translation
You can use Azure VNET network address translation (NAT) to provide outbound internet access for the subnets in your cluster. You can reference Create a NAT gateway using Azure CLI in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with Azure Firewall
You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about providing user-defined routing with Azure Firewall in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with a proxy configuration
You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with 0.0.0.0/0 populated automatically by Azure, all Azure API requests are routed over Azure’s internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

Private cluster with no internet access
You can have VNets with no access to the internet if your cluster has access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

6.8.3. About reusing a VNet for your OpenShift Container Platform cluster
In OpenShift Container Platform 4.10, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

6.8.3.1. Requirements for using your VNet
When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
VNets

Network Security Groups

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for.

**NOTE**

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

6.8.3.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 6.21. Required ports
<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows internal communication to the machine config server for provisioning machines</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### 6.8.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNETs, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNETs and core networking components within the VNET, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

### 6.8.3.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNET.

### 6.8.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.8.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name> 1
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

```
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

```
NOTE
On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.
```

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

```
NOTE
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.
```

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.8.6. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.8.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
1. Create an installation directory to store your required installation assets in:

```bash
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`.

**NOTE**

For some platform types, you can alternatively run `./openshift-install create install-config --dir <installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

### 6.8.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### 6.8.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<p>| Table 6.22. Required parameters |  |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}. {{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 6.8.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.23. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
</tbody>
</table>
| networking.clusterNetwork | The IP address blocks for pods. The default value is **10.128.0.0/14** with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap. | An array of objects. For example: ```json
  networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23 ``` |
### Table 6.24. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>networking.clusterNetwork.cidr</code></td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td><code>networking.clusterNetwork.hostPrefix</code></td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td><code>networking.serviceNetwork</code></td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: <code>networking: serviceNetwork: - 172.30.0.0/16</code></td>
</tr>
<tr>
<td><code>networking.machineNetwork</code></td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: <code>networking: machineNetwork: - cidr: 10.0.0.0/16</code></td>
</tr>
<tr>
<td><code>networking.machineNetwork.cidr</code></td>
<td>Required if you use <code>networking.machineNetwork</code>. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16. <strong>NOTE</strong> Set the <code>networking.machineNetwork</code> to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

### 6.8.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.24. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<p>| compute.name           | Required if you use <strong>compute</strong>. The name of the machine pool.                                                                                                                                          | worker                              |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the *x86_64* architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <code>imageContentSources</code>, Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set publish to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
</tbody>
</table>
**Parameter** | **Description** | **Values**
--- | --- | ---
**sshKey** | The SSH key or keys to authenticate access your cluster machines. | One or more keys. For example:
| sshKey: | <key1> | 
| <key2> | 
| <key3> |

*NOTE*
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 6.8.7.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 6.25. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.azure.osDisk.diskSize GB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 128.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>standard_LRS, premium_LRS, or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>controlPlane.platform.azure.osDisk.diskSizeGB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 1024.</td>
</tr>
<tr>
<td>controlPlane.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>premium_LRS or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>platform.azure.baseDomainResourceGroupName</td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example production_cluster.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.azure.computeSubnet</code></td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
<tr>
<td><code>platform.azure.cloud Name</code></td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <code>AzurePublicCloud</code> is used.</td>
<td>Any valid cloud environment, such as <code>AzurePublicCloud</code> or <code>AzureUSGovernmentCloud</code>.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

### 6.8.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.
IMPORTANT

You are required to use Azure virtual machines with premiumIO set to true. The machines must also have the hyperVGeneration property contain V1.

6.8.7.3. Sample customized install-config.yaml file for Azure

You can customize the install-config.yaml file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
    compute:
      - hyperthreading: Enabled
        name: worker
        platform:
          azure:
            type: Standard_D2s_v3
            osDisk:
              diskSizeGB: 512
              diskType: Standard_LRS
          zones:
            - "1"
            - "2"
            - "3"
        replicas: 5
  metadata:
    name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
```
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.
If you use an existing VNet, specify the name of the subnet to host the compute machines.

You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the internet. The default value is `External`.

### 6.8.7.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).
Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>  
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
noProxy: example.com
additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster` Proxy object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 6.8.8. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding `acceleratedNetworking` to your machine set YAML file before you install the cluster.
CHAPTER 6. INSTALLING ON AZURE

Prerequisites

- You have created the `install-config.yaml` file and completed any modifications to it.
- You have created the manifests for your cluster.

Procedure

1. Change to the `openshift` directory within the directory that contains the installation program. The `openshift` directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

   Machine set files in `openshift` directory listing
   
   99_openshift-cluster-api_worker-machineset-0.yaml
   99_openshift-cluster-api_worker-machineset-1.yaml
   99_openshift-cluster-api_worker-machineset-2.yaml

2. Add the following to the `providerSpec` field in each machine set file:

   ```yaml
   providerSpec:
     value:
       ...
       acceleratedNetworking: true 1
       ...
       vmSize: <azure-vm-size> 2
       ...
   
   1 This line enables Accelerated Networking.
   2 Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see Microsoft Azure documentation.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

6.8.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1. For `<installation_directory>`, specify the 
   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**
   
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```
   ... 
   INFO Install complete! 
   INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig' 
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com 
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL" 
   INFO Time elapsed: 36m22s 
   ```

   **NOTE**

   The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.8.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

6.8.11. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container
Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadm` credentials:

   ```bash
   $ export KUBECONFIG=/<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

6.8.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

6.8.13. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
6.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure into a government region. To configure the government region, you modify parameters in the install-config.yaml file before you install the cluster.

6.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated government region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.9.2. Azure government regions

OpenShift Container Platform supports deploying a cluster to Microsoft Azure Government (MAG) regions. MAG is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure. MAG is composed of government-only data center regions, all granted an Impact Level 5 Provisional Authorization.

Installing to a MAG region requires manually configuring the Azure Government dedicated cloud instance and region in the install-config.yaml file. You must also update your service principal to reference the appropriate government environment.

**NOTE**

The Azure government region cannot be selected using the guided terminal prompts from the installation program. You must define the region manually in the install-config.yaml file. Remember to also set the dedicated cloud instance, like AzureUSGovernmentCloud, based on the region specified.

6.9.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must:
Use existing networking that meets your requirements. Your cluster resources might be shared
between other clusters on the network.

Deploy from a machine that has access to:

- The API services for the cloud to which you provision.
- The hosts on the network that you provision.
- The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

6.9.3.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster’s private DNS records. The cluster’s machines use 168.63.129.16 internally for DNS resolution. For more information, see What is Azure Private DNS? and What is IP address 168.63.129.16? in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A `BaseDomainResourceGroup`, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

6.9.3.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

6.9.3.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the `install-config.yaml` file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.
When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an internal registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the Configuring your firewall section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

**Private cluster with network address translation**
You can use Azure VNET network address translation (NAT) to provide outbound internet access for the subnets in your cluster. You can reference Create a NAT gateway using Azure CLI in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with Azure Firewall**
You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about providing user-defined routing with Azure Firewall in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with a proxy configuration**
You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with 0.0.0.0/0 populated automatically by Azure, all Azure API requests are routed over Azure’s internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

**Private cluster with no internet access**
You can have VNets with no access to the internet if your cluster has access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.
6.9.4. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.10, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

6.9.4.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the Networking.MachineCIDR range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned
in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

**NOTE**

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

### 6.9.4.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

**Table 6.26. Required ports**

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows internal communication to the machine config server for provisioning machines</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### 6.9.4.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application
resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

6.9.4.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

6.9.5. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.9.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>

   1 Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

NOTE
If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   Example output

      Agent pid 31874
NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```bash
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 6.9.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.9.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure into a government region, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   $ mkdir <installation_directory>

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.
6.9.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

6.9.8.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.27. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}**. For additional information about **platform.<platform>** parameters, consult the table for your specific platform that follows.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>platform</strong></td>
<td>The configuration for the specific platform upon which to perform the installation: <strong>alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}</strong>. For additional information about <strong>platform.&lt;platform&gt;</strong> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>

### 6.9.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 6.28. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the **networking** object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
| | The default value is 10.128.0.0/14 with a host prefix of /23. | networking: 
  | clusterNetwork: | - cidr: 10.128.0.0/14 hostPrefix: 23 |
| | If you specify multiple IP address blocks, the blocks must not overlap. | |
| networking.clusterNetwork.cidr | Required if you use networking.clusterNetwork. An IP address block. | An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32. |
| | An IPv4 network. | |
| networking.clusterNetwork.hostPrefix | The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses. | A subnet prefix. The default value is 23. |
| networking.serviceNetwork | The IP address block for services. The default value is 172.30.0.0/16. | An array with an IP address block in CIDR format. For example: |
| | The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network. | networking: 
  | serviceNetwork: | - 172.30.0.0/16 |
| networking.machineNetwork | The IP address blocks for machines. | An array of objects. For example: |
| | If you specify multiple IP address blocks, the blocks must not overlap. | networking: 
  | machineNetwork: | - cidr: 10.0.0.0/16 |
networking.machineNetwork.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is **10.0.0.0/16** for all platforms other than libvirt. For libvirt, the default value is **192.168.126.0/24**.

An IP network block in CIDR notation. For example, **10.0.0.0/16**.

**NOTE**

Set the networking.machinelnetwork to match the CIDR that the preferred NIC resides in.

### 6.9.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter List

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (“”)</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.</td>
<td></td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <strong>x86_64</strong> architecture.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you are using Azure File storage, you cannot enable FIPS mode.</td>
<td></td>
</tr>
</tbody>
</table>
### 6.9.8.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.azure.osDisk.diskSize GB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is <strong>128</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.azure.osDisk.diskType</code></td>
<td>Defines the type of disk.</td>
<td><strong>standard_LRS</strong>, <strong>premium_LRS</strong>, or <strong>standardSSD_LRS</strong>. The default is <strong>premium_LRS</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>controlPlane.platfor m.azure.osDisk.disk SizeGB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 1024.</td>
</tr>
<tr>
<td>controlPlane.platfor m.azure.osDisk.disk Type</td>
<td>Defines the type of disk.</td>
<td>premium_LRS or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>platform.azure.base DomainResourceGr oupName</td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example production_cluster.</td>
</tr>
<tr>
<td>platform.azure.resou rceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outbo undType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.regio n</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
</tbody>
</table>
### Parameter Table

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
<tr>
<td>platform.azure.computeSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
<tr>
<td>platform.azure.cloudName</td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.</td>
<td>Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

### 6.9.8.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>
1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyper-threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with `premiumIO` set to `true`. The machines must also have the `hyperVGeneration` property contain `V1`.

### 6.9.8.3. Sample customized install-config.yaml file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
      compute:
        - hyperthreading: Enabled
          name: worker
          platform:
            azure:
              type: Standard_D2s_v3
              osDisk:
                diskSizeGB: 512
                diskType: Standard_LRS
              zones:
                - "1"
                - "2"
```
```
- "3"
  replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: usgov virginia
    resourceGroupName: existing_resource_group
    networkResourceGroupName: vnet_resource_group
    virtualNetwork: vnet
    controlPlaneSubnet: control_plane_subnet
    computeSubnet: compute_subnet
    outboundType: UserDefinedRouting
    cloudName: AzureUSGovernmentCloud
    pullSecret: '{"auths": ...}'
    fips: false
    sshKey: ssh-ed25519 AAA...
    publish: Internal
```

1. **Required.**

2. **If you do not provide these parameters and values, the installation program provides the default value.**

3. **The controlPlane section is a single mapping, but the compute section is a sequence of mappings.** To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, `-`, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

4. **Whether to enable or disable simultaneous multithreading, or hyperthreading.** By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.
5. You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9. Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11. Specify the name of the resource group that contains the DNS zone for your base domain.

12. Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

13. If you use an existing VNet, specify the name of the resource group that contains it.

14. If you use an existing VNet, specify its name.

15. If you use an existing VNet, specify the name of the subnet to host the control plane machines.

16. If you use an existing VNet, specify the name of the subnet to host the compute machines.

17. You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

18. Specify the name of the Azure cloud environment to deploy your cluster to. Set `AzureUSGovernmentCloud` to deploy to a Microsoft Azure Government (MAG) region. The default value is `AzurePublicCloud`.

20. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

21. You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

22. How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the internet. The default value is `External`.

### 6.9.8.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.
Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ¹
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ²
     noProxy: example.com ³
   additionalTrustBundle: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA_CERT>
   -----END CERTIFICATE-----
   ...
   ...
   
   ¹ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   ² A proxy URL to use for creating HTTPS connections outside the cluster.
   ³ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
   ⁴ If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.
NOTE

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

6.9.9. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding `acceleratedNetworking` to your machine set YAML file before you install the cluster.

Prerequisites

- You have created the `install-config.yaml` file and completed any modifications to it.
- You have created the manifests for your cluster.

Procedure

1. Change to the `openshift` directory within the directory that contains the installation program. The `openshift` directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

   **Machine set files in `openshift` directory listing**

   - 99_openshift-cluster-api_worker-machineset-0.yaml
   - 99_openshift-cluster-api_worker-machineset-1.yaml
   - 99_openshift-cluster-api_worker-machineset-2.yaml

2. Add the following to the `providerSpec` field in each machine set file:

   ```yaml
   providerSpec:
     value:
       ...
       acceleratedNetworking: true
       ...
       vmSize: <azure-vm-size>
       ...
   ```

   1. This line enables Accelerated Networking.
   2. Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see Microsoft Azure documentation.
Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

6.9.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   NOTE

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
```
NOTE

The cluster access and credential information also outputs to
<installation_directory>/.openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain
certificates that expire after 24 hours, which are then renewed at that time. If
the cluster is shut down before renewing the certificates and the cluster is
later restarted after the 24 hours have elapsed, the cluster automatically
recovers the expired certificates. The exception is that you must manually
approve the pending node-bootstrapper certificate signing requests (CSRs)
to recover kubelet certificates. See the documentation for Recovering from
expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they
are generated because the 24-hour certificate rotates from 16 to 22 hours
after the cluster is installed. By using the Ignition config files within 12 hours,
you can avoid installation failure if the certificate update runs during
installation.

IMPORTANT

You must not delete the installation program or the files that the installation
program creates. Both are required to delete the cluster.

6.9.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-
line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands
in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the OpenShift Container Platform downloads page on the Red Hat Customer
   Portal.

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```
After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 6.9.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**
   
   ```
   system:admin
   ```

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.9.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service.
6.9.14. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure by using infrastructure that you provide.

Several Azure Resource Manager (ARM) templates are provided to assist in completing these steps or to help model your own.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

6.10.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See Install the Azure CLI in the Azure documentation. The documentation below was last tested using version 2.2.0 of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

6.10.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:
• Access **OpenShift Cluster Manager** to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

• Access **Quay.io** to obtain the packages that are required to install your cluster.

• Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.10.3. Configuring your Azure project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see **Resolve reserved resource name errors** in the Azure documentation.

### 6.10.3.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default **Azure subscription and service limits, quotas, and constraints** affect your ability to install OpenShift Container Platform clusters.

**IMPORTANT**

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
</table>

761
A default cluster requires 40 vCPUs, so you must increase the account limit.

By default, each cluster creates the following instances:

- One bootstrap machine, which is removed after installation
- Three control plane machines
- Three compute machines

Because the bootstrap machine uses **Standard_D4s_v3** machines, which use 4 vCPUs, the control plane machines use **Standard_D8s_v3** virtual machines, which use 8 vCPUs, and the worker machines use **Standard_D4s_v3** virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.

To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.

By default, the installation program distributes control plane and compute machines across all availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.
<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OS Disk</td>
<td>7</td>
<td></td>
<td>VM OS disk must be able to sustain a minimum throughput of 5000 IOPS / 200MBps. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by <code>Standard_D8s_v3</code>, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required. Host caching must be set to <code>ReadOnly</code> for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</td>
</tr>
<tr>
<td>VNet</td>
<td>1</td>
<td>1000 per region</td>
<td>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</td>
</tr>
<tr>
<td>Network interfaces</td>
<td>7</td>
<td>65,536 per region</td>
<td>Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</td>
</tr>
<tr>
<td>Network security groups</td>
<td>2</td>
<td>5000</td>
<td>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>control plane</strong> Allows the control plane machines to be reached on port 6443 from anywhere</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>node</strong> Allows worker nodes to be reached from the internet on ports 80 and 443</td>
</tr>
</tbody>
</table>
Each cluster creates the following load balancers:

- **default**: Public IP address that load balances requests to ports 80 and 443 across worker machines.
- **internal**: Private IP address that load balances requests to ports 6443 and 22623 across control plane machines.
- **external**: Public IP address that load balances requests to port 6443 across control plane machines.

If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.

Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.

The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.

This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.

**NOTE**

Using spot VMs for control plane nodes is not recommended.

### 6.10.3.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**
1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

**NOTE**

For more information about purchasing domains through Azure, see Buy a custom domain name for Azure App Service in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See Migrate an active DNS name to Azure App Service in the Azure documentation.

3. Configure DNS for your domain. Follow the steps in the Tutorial: Host your domain in Azure DNS in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses. Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain.

You can view Azure’s DNS solution by visiting this example for creating DNS zones.

### 6.10.3.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click Help + support in the lower left corner.

2. Click New support request and then select the required values:
   a. From the Issue type list, select Service and subscription limits (quotas).
   b. From the Subscription list, select the subscription to modify.
   c. From the Quota type list, select the quota to increase. For example, select Compute-VM (cores-vCPUs) subscription limit increases to increase the number of vCPUs, which is required to install a cluster.
   d. Click Next: Solutions.

3. On the Problem Details page, provide the required information for your quota increase:
   a. Click Provide details and provide the required details in the Quota details window.
   b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.

4. Click Next: Review + create and then click Create.
6.10.3.4. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The `kube-controller-manager` only approves the kubelet client CSRs. The `machine-approver` cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

6.10.3.5. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Owner**

To set roles on the Azure portal, see the Manage access to Azure resources using RBAC and the Azure portal in the Azure documentation.

6.10.3.6. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

**Prerequisites**

- Install or update the Azure CLI.
- Install the `jq` package.
- Your Azure account has the required roles for the subscription that you use.

**Procedure**

1. Log in to the Azure CLI:

   ```bash
   $ az login
   
   Log in to Azure in the web console by using your credentials.
   
   2. If your Azure account uses subscriptions, ensure that you are using the right subscription.

      a. View the list of available accounts and record the `tenantId` value for the subscription you want to use for your cluster:

      ```bash
      $ az account list --refresh
      
      Example output
      
      ```

      ```json
      {
        "cloudName": "AzureCloud",
      ```
b. View your active account details and confirm that the `tenantId` value matches the subscription you want to use:

```
$ az account show
```

**Example output**

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

Ensure that the value of the `tenantId` parameter is the UUID of the correct subscription.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id> 1
```

1 Substitute the value of the `id` for the subscription that you want to use for `<id>`.

d. If you changed the active subscription, display your account information again:

```
$ az account show
```

**Example output**

```
{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```
3. Record the values of the `tenantId` and `id` parameters from the previous output. You need these values during OpenShift Container Platform installation.

4. Create the service principal for your account:

   ```bash
   $ az ad sp create-for-rbac --role Contributor --name <service_principal>
   ```

   Replace `<service_principal>` with the name to assign to the service principal.

   **Example output**

   ```json
   {
     "appId": "8bd0d04d-0ac2-43a8-92d8-705c598c6956",
     "displayName": "<service_principal>",
     "name": "http://<service_principal>",
     "password": "ac461d78-bf4b-4387-ad16-7e32e328aecc6",
     "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
   }
   ```

5. Record the values of the `appId` and `password` parameters from the previous output. You need these values during OpenShift Container Platform installation.

6. Grant additional permissions to the service principal.

   - You must always add the **Contributor** and **User Access Administrator** roles to the app registration service principal so the cluster can assign credentials for its components.

   - To operate the Cloud Credential Operator (CCO) in **mint mode**, the app registration service principal also requires the **Azure Active Directory Graph/Application.ReadWrite.OwnedBy** API permission.

   - To operate the CCO in **passthrough mode**, the app registration service principal does not require additional API permissions.

   For more information about CCO modes, see "About the Cloud Credential Operator" in the "Managing cloud provider credentials" section of the **Authentication and authorization** guide.
NOTE
If you limit the service principal scope of the OpenShift Container Platform installation program to an already existing Azure resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying a cluster using the installation program deletes this resource group.

a. To assign the **User Access Administrator** role, run the following command:

```bash
$ az role assignment create --role "User Access Administrator" \   --assignee-object-id $(az ad sp list --filter "appId eq '<appId>'" \   | jq '.[0].objectId' -r)
```

Replace `<appId>` with the **appld** parameter value for your service principal.

b. To assign the **Azure Active Directory Graph** permission, run the following command:

```bash
$ az ad app permission add --id <appId> \   --api 00000002-0000-0000-c000-000000000000 \   --api-permissions 824c81eb-e3f8-4ee6-8f6d-de7f50d565b7=Role
```

Replace `<appId>` with the **appld** parameter value for your service principal.

Example output

Invoking "az ad app permission grant --id 46d33abc-b8a3-46d8-8c84-f0fd58177435 --api 00000002-0000-0000-c000-000000000000" is needed to make the change effective

For more information about the specific permissions that you grant with this command, see the **GUID Table for Windows Azure Active Directory Permissions**.

c. Approve the permissions request. If your account does not have the Azure Active Directory tenant administrator role, follow the guidelines for your organization to request that the tenant administrator approve your permissions request.

```bash
$ az ad app permission grant --id <appId> \   --api 00000002-0000-0000-c000-000000000000
```

Replace `<appId>` with the **appld** parameter value for your service principal.

**Additional resources**

- For more information about CCO modes, see About the Cloud Credential Operator.

**6.10.3.7. Supported Azure regions**

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

**Supported Azure public regions**
- **australiacentral** (Australia Central)
- **australi#aeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **swedencentral** (Sweden Central)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- westcentralus (West Central US)
- westeurope (West Europe)
- westindia (West India)
- westus (West US)
- westus2 (West US 2)
- westus3 (West US 3)

**Supported Azure Government regions**
Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- usgovtexas (US Gov Texas)
- usgovvirginia (US Gov Virginia)

You can reference all available MAG regions in the Azure documentation. Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 6.10.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 6.10.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 6.31. Minimum required hosts**

<table>
<thead>
<tr>
<th>Hosts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One temporary bootstrap machine</td>
<td>The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.</td>
</tr>
<tr>
<td>Three control plane machines</td>
<td>The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.</td>
</tr>
<tr>
<td>At least two compute machines, which are also known as worker machines.</td>
<td>The workloads requested by OpenShift Container Platform users run on the compute machines.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.
The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.4, or RHEL 8.5.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See Red Hat Enterprise Linux technology capabilities and limits.

6.10.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th>Machine</th>
<th>Operating System</th>
<th>vCPU</th>
<th>Virtual RAM</th>
<th>Storage</th>
<th>IOPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with `premiumI0` set to `true`. The machines must also have the `hyperVGeneration` property contain `V1`.

6.10.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**
1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.10.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH into the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH into your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `/openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

   **IMPORTANT**

   Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **Note**
   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **Note**
   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**
   ```bash
   Agent pid 31874
   ```
NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>

   Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

   Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

   - When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

6.10.7. Creating the installation files for Azure

To install OpenShift Container Platform on Microsoft Azure using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the install-config.yaml file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate var partition during the preparation phases of installation.

6.10.7.1. Optional: Creating a separate /var partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the /var partition or a subdirectory of /var. For example:

   - /var/lib/containers: Holds container-related content that can grow as more images and containers are added to a system.
   - /var/lib/etcd: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
   - /var: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a /var directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because /var must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate /var partition by creating a machine config manifest that is
inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Procedure**

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```
   $ mkdir $HOME/clusterconfig
   ```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   ```
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ```

**Example output**

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and $HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the `clusterconfig/openshift` directory:

   ```
   $ ls $HOME/clusterconfig/openshift/
   ```

**Example output**

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...```

4. Create a Butane config that configures the additional partition. For example, name the file `$HOME/clusterconfig/98-var-partition.bu`, change the disk device name to the name of the storage device on the worker systems, and set the storage size as appropriate. This example places the `/var` directory on a separate partition:

```
  variant: openshift
  version: 4.10.0
  metadata:
    labels:
      machineconfiguration.openshift.io/role: worker
    name: 98-var-partition
  storage:
```
The storage device name of the disk that you want to partition.

When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

The size of the data partition in mebibytes.

The `prjquota` mount option must be enabled for filesystems used for container storage.

**NOTE**

When creating a separate `/var` partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the `clusterconfig/openshift` directory. For example, run the following command:

   ```bash
   $ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
   ```

6. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

   ```bash
   $ openshift-install create ignition-configs --dir $HOME/clusterconfig
   $ ls $HOME/clusterconfig/
   auth bootstrap.ign master.ign metadata.json worker.ign
   ```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 6.10.7.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

**Prerequisites**
• Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

• Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select `azure` as the platform to target.

      iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

          • `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.

          • `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.

          • `azure service principal client id` The value of the `appId` parameter for the service principal.

          • `azure service principal client secret` The value of the `password` parameter for the service principal.

      iv. Select the region to deploy the cluster to.
v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see *Resolve reserved resource name errors* in the Azure documentation.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

---

c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting *install-config.yaml* file to set `replicas` to 0 for the compute pool:

```
compute:
  - hyperthreading: Enabled
    name: worker
    platform: {}
    replicas: 0
```

Set to 0.

2. Modify the *install-config.yaml* file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the *install-config.yaml* file so that you can use it to install multiple clusters.

**IMPORTANT**

The *install-config.yaml* file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.10.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the *install-config.yaml* file.

**Prerequisites**

- You have an existing *install-config.yaml* file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>  
  httpsProxy: https://<username>:<pswd>@<ip>:<port>  
  noProxy: example.com
additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.
NOTE

Only the Proxy object named cluster is supported, and no additional proxies can be created.

6.10.7.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure.

NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Export common variables found in the install-config.yaml to be used by the provided ARM templates:

```
$ export CLUSTER_NAME=<cluster_name> 1
$ export AZURE_REGION=<azure_region> 2
$ export SSH_KEY=<ssh_key> 3
$ export BASE_DOMAIN=<base_domain> 4
$ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group> 5
```

   1 The value of the .metadata.name attribute from the install-config.yaml file.

   2 The region to deploy the cluster into, for example centralus. This is the value of the .platform.azure.region attribute from the install-config.yaml file.

   3 The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the .sshKey attribute from the install-config.yaml file.

   4 The base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster. This is the value of the .baseDomain attribute from the install-config.yaml file.

   5 The resource group where the public DNS zone exists. This is the value of the .platform.azure.baseDomainResourceGroupName attribute from the install-config.yaml file.

For example:

```
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
```
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster

2. Export the kubadmin credentials:

$ export KUBECONFIG=$(installation_directory)/auth/kubeconfig

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

### 6.10.7.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program.

- You created the `install-config.yaml` installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

**Example output**

```
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: install_dir/manifests and install_dir/openshift
```
For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
   name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone: 1
       id: mycluster-100419-private-zone
     publicZone: 2
       id: example.openshift.com
   status: {}
   ```

   1 2 Remove this section completely.

   If you do so, you must add ingress DNS records manually in a later step.

6. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:
OpenShift Container Platform 4.10 Installing

a. Export the infrastructure ID by using the following command:

```
$ export INFRA_ID=<infra_id>
```

The OpenShift Container Platform cluster has been assigned an identifier (INFRA_ID) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the .status.infrastructureName attribute from the manifests/cluster-infrastructure-02-config.yml file.

b. Export the resource group by using the following command:

```
$ export RESOURCE_GROUP=<resource_group>
```

All resources created in this Azure deployment exists as part of a resource group. The resource group name is also based on the INFRA_ID, in the form of `<cluster_name>-<random_string>-rg`. This is the value of the .status.platformStatus.azure.resourceGroupName attribute from the manifests/cluster-infrastructure-02-config.yml file.

7. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory>
```

For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadm-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

```
├── auth
│   ├── kubeadm-password
│   └── kubeconfig
│       ├── bootstrap.ign
│       └── master.ign
│           └── metadata.json
└── worker.ign
```

6.10.8. Creating the Azure resource group

You must create a Microsoft Azure resource group and an identity for that resource group. These are both used during the installation of your OpenShift Container Platform cluster on Azure.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
Procedure

1. Create the resource group in a supported Azure region:
   
   ```
   $ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
   ```

2. Create an Azure identity for the resource group:
   
   ```
   $ az identity create -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity
   ```

   This is used to grant the required access to Operators in your cluster. For example, this allows the Ingress Operator to create a public IP and its load balancer. You must assign the Azure identity to a role.

3. Grant the Contributor role to the Azure identity:
   a. Export the following variables required by the Azure role assignment:
      
      ```
      $ export PRINCIPAL_ID=`az identity show -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity --query principalId --out tsv`
      
      $ export RESOURCE_GROUP_ID=`az group show -g ${RESOURCE_GROUP} --query id --out tsv`
      ```
   b. Assign the Contributor role to the identity:
      
      ```
      $ az role assignment create --assignee "${PRINCIPAL_ID}" --role 'Contributor' --scope "${RESOURCE_GROUP_ID}"
      ```

6.10.9. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally. You must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Create an Azure storage account to store the VHD cluster image:
   
   ```
   $ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
   ```
WARNING

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your 
CLUSTER_NAME variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see Resolve errors for storage account names in the Azure documentation.

2. Export the storage account key as an environment variable:

   $ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query '[0].value' -o tsv`

3. Export the URL of the RHCOS VHD to an environment variable:

   $ export VHD_URL=`openshift-install coreos print-stream-json | jq -r ".architectures.x86_64."rhel-coreos-extensions"."azure-disk".url"`

IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Create the storage container for the VHD:

   $ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}

5. Copy the local VHD to a blob:

   $ az storage blob copy start --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --destination-blob "rhcos.vhd" --destination-container vhd --source-uri "$[VHD_URL]"

6. Create a blob storage container and upload the generated bootstrap.ign file:

   $ az storage container create --name files --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}

   $ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"

6.10.10. Example for creating DNS zones
DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, Azure’s DNS solution is used, so you will create a new public DNS zone for external (internet) visibility and a private DNS zone for internal cluster resolution.

**NOTE**

The public DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the public DNS zone; be sure the installation config you generated earlier reflects that scenario.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Create the new public DNS zone in the resource group exported in the `BASE_DOMAIN_RESOURCE_GROUP` environment variable:

   ```bash
   $ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
   ``

   You can skip this step if you are using a public DNS zone that already exists.

2. Create the private DNS zone in the same resource group as the rest of this deployment:

   ```bash
   $ az network private-dns zone create -g ${RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
   ``

   You can learn more about configuring a public DNS zone in Azure by visiting that section.

**6.10.11. Creating a VNet in Azure**

You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
Procedure

1. Copy the template from the **ARM template for the VNet** section of this topic and save it as **01_vnet.json** in your cluster’s installation directory. This template describes the VNet that your cluster requires.

2. Create the deployment by using the **az** CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/01_vnet.json" \
   --parameters baseName="${INFRA_ID}"
   
   The base name to be used in resource names; this is usually the cluster’s infrastructure ID.
   ```

3. Link the VNet template to the private DNS zone:

   ```bash
   $ az network private-dns link vnet create -g ${RESOURCE_GROUP} -z 
   ${CLUSTER_NAME}.${BASE_DOMAIN} -n ${INFRA_ID}-network-link -v 
   "${INFRA_ID}-vnet" -e false
   ```

6.10.11.1. **ARM template for the VNet**

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

**Example 6.1. 01_vnet.json ARM template**

```json
{
   "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
   "contentVersion": "1.0.0.0",
   "parameters": {
      "baseName": {
         "type": "string",
         "minLength": 1,
         "metadata": {
            "description": "Base name to be used in resource names (usually the cluster’s Infra ID)"
         }
      }
   },
   "variables": {
      "location": “[resourceGroup().location]",
      "virtualNetworkName": "[concat(parameters('baseName'), '-vnet')]",
      "addressPrefix": "10.0.0.0/16",
      "masterSubnetName": "[concat(parameters('baseName'), '-master-subnet')]",
      "masterSubnetPrefix": "10.0.0.0/24",
      "nodeSubnetName": "[concat(parameters('baseName'), '-worker-subnet')]",
      "nodeSubnetPrefix": "10.0.1.0/24",
      "clusterNsgName": "[concat(parameters('baseName'), '-nsg')]"
   },
   "resources": [
      {
         "apiVersion": "2018-12-01",
         "type": "Microsoft.Network/virtualNetworks",
```
"name": "[variables('virtualNetworkName')]",
"location": "[variables('location')]",
"dependsOn": [
    "[concat('Microsoft.Network/networkSecurityGroups/', variables('clusterNsgName'))]"
],
"properties": {
    "addressSpace": {
        "addressPrefixes": [
            "[variables('addressPrefix')]"
        ]
    },
    "subnets": [
        {
            "name": "[variables('masterSubnetName')]",
            "properties": {
                "addressPrefix": "[variables('masterSubnetPrefix')]",
                "serviceEndpoints": [],
                "networkSecurityGroup": {
                    "id": "[resourceId('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))]"
                }
            }
        },
        {
            "name": "[variables('nodeSubnetName')]",
            "properties": {
                "addressPrefix": "[variables('nodeSubnetPrefix')]",
                "serviceEndpoints": [],
                "networkSecurityGroup": {
                    "id": "[resourceId('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))]"
                }
            }
        }
    ]
},
"type": "Microsoft.Network/networkSecurityGroups",

        }
    ]
}
6.10.12. Deploying the RHCOS cluster image for the Azure infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure for your OpenShift Container Platform nodes.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

Procedure

1. Copy the template from the ARM template for image storage section of this topic and save it as `02_storage.json` in your cluster’s installation directory. This template describes the image storage that your cluster requires.

2. Export the RHCOS VHD blob URL as a variable:

   ```bash
   $ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --name rhcos.vhd -o tsv`
   ```

3. Deploy the cluster image:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/02_storage.json" \
   --parameters vhdBlobURL="${VHD_BLOB_URL}"  \n   --parameters baseName="${INFRA_ID}"
   ``

   1. The blob URL of the RHCOS VHD to be used to create master and worker machines.
   2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

6.10.12.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

Example 6.2. 02_storage.json ARM template
6.10.13. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in initramfs during boot to fetch their Ignition config files.

6.10.13.1. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.
This section provides details about the ports that are required.

**IMPORTANT**

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

### Table 6.32. Ports used for all-machine to all-machine communications

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICMP</td>
<td>N/A</td>
<td>Network reachability tests</td>
</tr>
<tr>
<td>TCP</td>
<td>1936</td>
<td>Metrics</td>
</tr>
<tr>
<td></td>
<td>9000-9999</td>
<td>Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099.</td>
</tr>
<tr>
<td></td>
<td>10250-10259</td>
<td>The default ports that Kubernetes reserves</td>
</tr>
<tr>
<td></td>
<td>10256</td>
<td>openshift-sdn</td>
</tr>
<tr>
<td>UDP</td>
<td>4789</td>
<td>VXLAN</td>
</tr>
<tr>
<td></td>
<td>6081</td>
<td>Geneve</td>
</tr>
<tr>
<td></td>
<td>9000-9999</td>
<td>Host level services, including the node exporter on ports 9100-9101.</td>
</tr>
<tr>

</table>

### 6.10.14. Creating networking and load balancing components in Azure
You must configure networking and load balancing in Microsoft Azure for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.

Procedure

1. Copy the template from the ARM template for the network and load balancers section of this topic and save it as `03_infra.json` in your cluster’s installation directory. This template describes the networking and load balancing objects that your cluster requires.

2. Create the deployment by using the `az` CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/03_infra.json" \
   --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASEDOMAIN}"  \
   --parameters baseName="${INFRA_ID}"
   
   1 The name of the private DNS zone.
   2 The base name to be used in resource names; this is usually the cluster’s infrastructure ID.
   
3. Create an api DNS record in the public zone for the API public load balancer. The `$BASE_DOMAINRESOURCE_GROUP` variable must point to the resource group where the public DNS zone exists.

   a. Export the following variable:

      ```bash
      $ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
      
   b. Create the api DNS record in a new public zone:

      ```bash
      $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a $PUBLIC_IP --ttl 60
      
      If you are adding the cluster to an existing public zone, you can create the api DNS record in it instead:
6.10.14.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

Example 6.3.03_infra.json ARM template

```json
{
    "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
    "contentVersion": "1.0.0.0",
    "parameters": {
        "baseName": {
            "type": "string",
            "minLength": 1,
            "metadata": {
                "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
            }
        },
        "privateDNSZoneName": {
            "type": "string",
            "metadata": {
                "description": "Name of the private DNS zone"
            }
        }
    },
    "variables": {
        "location": "[resourceGroup().location]",
        "virtualNetworkName": "[concat(parameters('baseName'), '-vnet')]",
        "virtualNetworkID": "[resourceId('Microsoft.Network/virtualNetworks', variables('virtualNetworkName'))]",
        "masterSubnetName": "[concat(parameters('baseName'), '-master-subnet')]",
        "masterSubnetRef": "[concat(variables('virtualNetworkID'), '/subnets/', variables('masterSubnetName'))]",
        "masterPublicIpAddressName": "[concat(parameters('baseName'), '-master-pip')]",
        "masterPublicIpAddressID": "[resourceId('Microsoft.Network/publicIPAddresses', variables('masterPublicIpAddressName'))]",
        "masterLoadBalancerName": "[concat(parameters('baseName'), '-public-lb')]",
        "masterLoadBalancerID": "[resourceId('Microsoft.Network/loadBalancers', variables('masterLoadBalancerName'))]",
        "internalLoadBalancerName": "[concat(parameters('baseName'), '-internal-lb')]",
        "internalLoadBalancerID": "[resourceId('Microsoft.Network/loadBalancers', variables('internalLoadBalancerName'))]",
        "skuName": "Standard"
    },
    "resources": [
        {
            "apiVersion": "2018-12-01",
            "type": "Microsoft.Network/publicIPAddresses",
            "name": "[variables('masterPublicIpAddressName')]",
            "location": "[variables('location')]",
            "sku": {
            "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
            "contentVersion": "1.0.0.0",
            "parameters": {
                "baseName": {
                    "type": "string",
                    "minLength": 1,
                    "metadata": {
                        "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
                    }
                },
                "privateDNSZoneName": {
                    "type": "string",
                    "metadata": {
                        "description": "Name of the private DNS zone"
                    }
                }
            },
            "variables": {
                "location": "[resourceGroup().location]",
                "virtualNetworkName": "[concat(parameters('baseName'), '-vnet')]",
                "virtualNetworkID": "[resourceId('Microsoft.Network/virtualNetworks', variables('virtualNetworkName'))]",
                "masterSubnetName": "[concat(parameters('baseName'), '-master-subnet')]",
                "masterSubnetRef": "[concat(variables('virtualNetworkID'), '/subnets/', variables('masterSubnetName'))]",
                "masterPublicIpAddressName": "[concat(parameters('baseName'), '-master-pip')]",
                "masterPublicIpAddressID": "[resourceId('Microsoft.Network/publicIPAddresses', variables('masterPublicIpAddressName'))]",
                "masterLoadBalancerName": "[concat(parameters('baseName'), '-public-lb')]",
                "masterLoadBalancerID": "[resourceId('Microsoft.Network/loadBalancers', variables('masterLoadBalancerName'))]",
                "internalLoadBalancerName": "[concat(parameters('baseName'), '-internal-lb')]",
                "internalLoadBalancerID": "[resourceId('Microsoft.Network/loadBalancers', variables('internalLoadBalancerName'))]",
                "skuName": "Standard"
            },
            "resources": [
                {
                    "apiVersion": "2018-12-01",

        }
    }
]
6.10.15. Creating the bootstrap machine in Azure

You must create the bootstrap machine in Microsoft Azure to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

```json

[  
    
    
    
    
    
    
    
    
    
    
    
    
    
    
    

    ]

},

{  
    "apiVersion": "2018-09-01",
    "type": "Microsoft.Network/privateDnsZones/A",
    "name": [concat(parameters('privateDNSZoneName'), '/api')],
    "location": [variables('location')],
    "dependsOn": [  
        [concat('Microsoft.Network/loadBalancers/', variables('internalLoadBalancerName'))]
    ],
    "properties": {
        "ttl": 60,
        "aRecords": [
            {  
                "ipv4Address": "[reference(variables('internalLoadBalancerName')).frontendIPConfigurations[0].properties.privateIPAddress"
            }
        ]
    }
},

{  
    "apiVersion": "2018-09-01",
    "type": "Microsoft.Network/privateDnsZones/A",
    "name": [concat(parameters('privateDNSZoneName'), '/api-int')],
    "location": [variables('location')],
    "dependsOn": [  
        [concat('Microsoft.Network/loadBalancers/', variables('internalLoadBalancerName'))]
    ],
    "properties": {
        "ttl": 60,
        "aRecords": [
            {  
                "ipv4Address": "[reference(variables('internalLoadBalancerName')).frontendIPConfigurations[0].properties.privateIPAddress"
            }
        ]
    }
}  
```
NOTE

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.

Procedure

1. Copy the template from the ARM template for the bootstrap machine section of this topic and save it as 04_bootstrap.json in your cluster’s installation directory. This template describes the bootstrap machine that your cluster requires.

2. Export the bootstrap URL variable:

   $ bootstrap_url_expiry=`date -u -d "10 hours" '+%Y-%m-%dT%H:%MZ'`
   
   $ export BOOTSTRAP_URL=`az storage blob generate-sas -c 'files' -n 'bootstrap.ign' --https-only --full-uri --permissions r --expiry $bootstrap_url_expiry --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -o tsv`

3. Export the bootstrap ignition variable:

   $ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d '
'

4. Create the deployment by using the az CLI:

   $ az deployment group create -g ${RESOURCE_GROUP} --template-file "<installation_directory>/04_bootstrap.json" --parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" --parameters baseName="${INFRA_ID}"

   1 The bootstrap Ignition content for the bootstrap cluster.
   2 The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

6.10.15.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:
Example 6.4. 04_bootstrap.json ARM template

{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {
    "baseName": {
      "type": "string",
      "minLength": 1,
      "metadata": {
        "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "bootstrapIgnition": {
      "type": "string",
      "minLength": 1,
      "metadata": {
        "description": "Bootstrap ignition content for the bootstrap cluster"
      }
    },
    "sshKeyData": {
      "type": "securestring",
      "defaultValue": "Unused",
      "metadata": {
        "description": "Unused"
      }
    },
    "bootstrapVMSize": {
      "type": "string",
      "defaultValue": "Standard_D4s_v3",
      "metadata": {
        "description": "The size of the Bootstrap Virtual Machine"
      }
    }
  },
  "variables": {
    "location": "[resourceGroup().location]",

6.10.16. Creating the control plane machines in Azure

You must create the control plane machines in Microsoft Azure for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

**Procedure**

1. Copy the template from the ARM template for control plane machines section of this topic and save it as **05_masters.json** in your cluster’s installation directory. This template describes the control plane machines that your cluster requires.

2. Export the following variable needed by the control plane machine deployment:

   ```bash
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d "\n"
   ```

3. Create the deployment by using the **az CLI**:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/05_masters.json"
   ```
The Ignition content for the control plane nodes.

The base name to be used in resource names; this is usually the cluster's infrastructure ID.

6.10.16.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

Example 6.5. 05_masters.json ARM template

```
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {
    "baseName": {
      "type": "string",
      "minLength": 1,
      "metadata": {
        "description": "Base name to be used in resource names (usually the cluster’s Infra ID)"
      }
    },
    "masterIgnition": {
      "type": "string",
      "metadata": {
        "description": "Ignition content for the master nodes"
      }
    },
    "numberOfMasters": {
      "type": "int",
      "defaultValue": 3,
      "minValue": 2,
      "maxValue": 30,
      "metadata": {
        "description": "Number of OpenShift masters to deploy"
      }
    },
    "sshKeyData": {
      "type": "securestring",
      "defaultValue": "Unused",
      "metadata": {
        "description": "Unused"
      }
    },
    "privateDNSZoneName": {
      "type": "string",
      "defaultValue": "",
      "metadata": {
        "description": "unused"
      }
    }
  }
}
```
"masterVMSize": {
  "type": "string",
  "defaultValue": "Standard_D8s_v3",
  "metadata": {
    "description": "The size of the Master Virtual Machines"
  }
},
"diskSizeGB": {
  "type": "int",
  "defaultValue": 1024,
  "metadata": {
    "description": "Size of the Master VM OS disk, in GB"
  }
},
"variables": {
  "location": "[resourceGroup().location]",
  "virtualNetworkName": "[concat(parameters('baseName'), '-vnet')]",
  "virtualNetworkID": "[resourceId('Microsoft.Network/virtualNetworks',
    variables('virtualNetworkName'))]",
  "masterSubnetName": "[concat(parameters('baseName'), '-master-subnet')]",
  "masterSubnetRef": "[concat(variables('virtualNetworkID'), '/subnets,'
    variables('masterSubnetName'))]",
  "masterLoadBalancerName": "[concat(parameters('baseName'), '-public-lb')]",
  "internalLoadBalancerName": "[concat(parameters('baseName'), '-internal-lb')]",
  "sshKeyPath": "/home/core/.ssh/authorized_keys",
  "identityName": "[concat(parameters('baseName'), '-identity')]",
  "imageName": "[concat(parameters('baseName'), '-image')]",
  "copy": [
    {

OpenShift Container Platform 4.10 Installing
6.10.17. Wait for bootstrap completion and remove bootstrap resources in Azure

After you create all of the required infrastructure in Microsoft Azure, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \
   --log-level info
```
For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

If the command exits without a FATAL warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```bash
$ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --name bootstrap_ssh_in
$ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
$ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap_OSDisk --no-wait --yes
$ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-wait
$ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name ${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
$ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-ssh-pip
```

**NOTE**

If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

### 6.10.18. Creating additional worker machines in Azure

You can create worker machines in Microsoft Azure for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM) template. Additional instances can be launched by including additional resources of type `06_workers.json` in the file.

**NOTE**

If you do not use the provided ARM template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Copy the template from the ARM template for worker machines section of this topic and save it as `06_workers.json` in your cluster’s installation directory. This template describes the worker machines that your cluster requires.

2. Export the following variable needed by the worker machine deployment:

   ```
   $ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d '
'
   ``

3. Create the deployment by using the `az` CLI:

   ```
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/06_workers.json" \
   --parameters workerIgnition="${WORKER_IGNITION}" \
   --parameters baseName="${INFRA_ID}" 
   ```

   1. The Ignition content for the worker nodes.
   2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

**6.10.18.1. ARM template for worker machines**

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

**Example 6.6. 06_workers.json ARM template**

```json
{
   "contentVersion" : "1.0.0.0",
   "parameters" : {
      "baseName" : {
         "type" : "string",
         "minLength" : 1,
         "metadata" : {
            "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
         }
      },
      "workerIgnition" : {
         "type" : "string",
         "metadata" : {
            "description" : "Ignition content for the worker nodes"
         }
      }
   },
   "parametersWorkerIgnition" : {
      "type" : "string",
      "metadata" : {
         "description" : "Ignition content for the worker nodes"
      }
   }
}
```
"numberOfNodes": {
    "type": "int",
    "defaultValue": 3,
    "minValue": 2,
    "maxValue": 30,
    "metadata": {
        "description": "Number of OpenShift compute nodes to deploy"
    }
},
"sshKeyData": {
    "type": "securestring",
    "defaultValue": "Unused",
    "metadata": {
        "description": "Unused"
    }
},
"nodeVMSize": {
    "type": "string",
    "defaultValue": "Standard_D4s_v3",
    "metadata": {
        "description": "The size of the each Node Virtual Machine"
    }
},
"variables": {
    "location": ":[resourceGroup().location],
    "virtualNetworkName": "[concat(parameters('baseName'), '-vnet')],
    "virtualNetworkID": ":[resourceId('Microsoft.Network/virtualNetworks',
variables('virtualNetworkName'))],
    "nodeSubnetName": "[concat(parameters('baseName'), '-worker-subnet')],
    "nodeSubnetRef": "[concat(variables('virtualNetworkID'), '/subnets/',
variables('nodeSubnetName'))],
    "infraLoadBalancerName": "[parameters('baseName')],
    "sshKeyPath": "/home/capi/.ssh/authorized_keys",

          "vmSize": "[parameters('nodeVMSize')]"
        },
        "osProfile": {
          "computerName": "[variables('vmNames')[copyIndex()]]",
          "adminUsername": "capi",
          "adminPassword": "NotActuallyApplied!",
          "customData": "[parameters('workerIgnition')]",
          "linuxConfiguration": {
            "disablePasswordAuthentication": false
          }
        }
      }
    }
  ]
}
6.10.19. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.

4. Unpack the archive:
   
   ```bash
   $ tar xzvf <file>
   ```

5. Place the **oc** binary in a directory that is on your **PATH**.
   
   To check your **PATH**, execute the following command:
   
   ```bash
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the **oc** command:

```bash
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
   
   To check your **PATH**, open the command prompt and execute the following command:
   
   ```cmd
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the **oc** command:

```cmd
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your **PATH**.
   
   To check your **PATH**, open a terminal and execute the following command:
   
   ```bash
   $ echo $PATH
   ```

   ```bash
   $ oc <command>
   ```
After you install the OpenShift CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

### 6.10.20. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   system:admin
   ```

### 6.10.21. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

**Prerequisites**

- You added machines to your cluster.

**Procedure**

1. Confirm that the cluster recognizes the machines:

   ```bash
   $ oc get nodes
   ```
Example output

```
NAME    STATUS    ROLES   AGE  VERSION
master-0 Ready  master  63m  v1.23.0
master-1 Ready  master  63m  v1.23.0
master-2 Ready  master  64m  v1.23.0
```

The output lists all of the machines that you created.

**NOTE**

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

Example output

```
NAME    AGE   REQUESTOR                                           CONDITION
csr-8b2br 15m  system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
csr-8vnps 15m  system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.
OpenShift Container Platform 4.10 Installing

NOTE
For clusters running on platforms that are not machine API enabled, such as bare
metal and other user-provisioned infrastructure, you must implement a method
of automatically approving the kubelet serving certificate requests (CSRs). If a
request is not approved, then the oc exec, oc rsh, and oc logs commands
cannot succeed, because a serving certificate is required when the API server
connects to the kubelet. Any operation that contacts the Kubelet endpoint
requires this certificate approval to be in place. The method must watch for new
CSRs, confirm that the CSR was submitted by the node-bootstrapper service
account in the system:node or system:admin groups, and confirm the identity
of the node.
To approve them individually, run the following command for each valid CSR:
$ oc adm certificate approve <csr_name> 1
1

<csr_name> is the name of a CSR from the list of current CSRs.

To approve all pending CSRs, run the following command:
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}
{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve

NOTE
Some Operators might not become available until some CSRs are approved.
4. Now that your client requests are approved, you must review the server requests for each
machine that you added to the cluster:
$ oc get csr

Example output
NAME
AGE REQUESTOR
CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
5. If the remaining CSRs are not approved, and are in the Pending status, approve the CSRs for
your cluster machines:
To approve them individually, run the following command for each valid CSR:
$ oc adm certificate approve <csr_name> 1
1

816

<csr_name> is the name of a CSR from the list of current CSRs.


To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>

</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

**Additional information**

- For more information on CSRs, see *Certificate Signing Requests*.

### 6.10.22. Adding the Ingress DNS records

If you removed the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can create either a wildcard `*.apps.[baseDomain]`. or specific records. You can use A, CNAME, and other records per your requirements.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster on Microsoft Azure by using infrastructure that you provisioned.
- Install the OpenShift CLI (`oc`).
- Install or update the **Azure CLI**.

**Procedure**

1. Confirm the Ingress router has created a load balancer and populated the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

**Example output**
OpenShift Container Platform 4.10 Installing

NAME
TYPE
CLUSTER-IP
EXTERNAL-IP PORT(S)
router-default LoadBalancer 172.30.20.10 35.130.120.110
80:32288/TCP,443:31215/TCP 20

AGE

2. Export the Ingress router IP as a variable:
$ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --noheaders | awk '{print $4}'`
3. Add a *.apps record to the public DNS zone.
a. If you are adding this cluster to a new public zone, run:
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300
b. If you are adding this cluster to an already existing public zone, run:
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300
4. Add a *.apps record to the private DNS zone:
a. Create a *.apps record by using the following command:
$ az network private-dns record-set a create -g ${RESOURCE_GROUP} -z
${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps --ttl 300
b. Add the *.apps record to the private DNS zone by using the following command:
$ az network private-dns record-set a add-record -g ${RESOURCE_GROUP} -z
${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER}
If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the
cluster’s current routes:
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}
{end}' routes

Example output
oauth-openshift.apps.cluster.basedomain.com
console-openshift-console.apps.cluster.basedomain.com
downloads-openshift-console.apps.cluster.basedomain.com
alertmanager-main-openshift-monitoring.apps.cluster.basedomain.com
grafana-openshift-monitoring.apps.cluster.basedomain.com
prometheus-k8s-openshift-monitoring.apps.cluster.basedomain.com

6.10.23. Completing an Azure installation on user-provisioned infrastructure
After you start the OpenShift Container Platform installation on Microsoft Azure user-provisioned
infrastructure, you can monitor the cluster events until the cluster is ready.

818


Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure infrastructure.
- Install the `oc` CLI and log in.

Procedure

- Complete the cluster installation:

  ```
  $ ./openshift-install --dir <installation_directory> wait-for install-complete
  ```

  **Example output**

  ```
  INFO Waiting up to 30m0s for the cluster to initialize...
  ```

  For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

  **IMPORTANT**

  - The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

  - It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

6.10.24. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to *OpenShift Cluster Manager*.

After you confirm that your *OpenShift Cluster Manager* inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See *About remote health monitoring* for more information about the Telemetry service

6.11. UNINSTALLING A CLUSTER ON AZURE
You can remove a cluster that you deployed to Microsoft Azure.

6.11.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

**NOTE**

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

**Prerequisites**

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

**Procedure**

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

   ```sh
   $ ./openshift-install destroy cluster \ 
   --dir <installation_directory> --log-level info 1 2
   
   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
   
   2 To view different details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

1. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.
7.1. PREPARING TO INSTALL ON AZURE STACK HUB

7.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

7.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub

Before installing OpenShift Container Platform on Microsoft Azure Stack Hub, you must configure an Azure account.

See [Configuring an Azure Stack Hub account](#) for details about account configuration, account limits, DNS zone configuration, required roles, and creating service principals.

7.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

7.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure Stack Hub infrastructure that is provisioned by the OpenShift Container Platform installation program, by using the following method:

- [Installing a cluster on Azure Stack Hub with an installer-provisioned infrastructure](#) You can install OpenShift Container Platform on Azure Stack Hub infrastructure that is provisioned by the OpenShift Container Platform installation program.

7.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure Stack Hub infrastructure that you provision, by using the following method:

- [Installing a cluster on Azure Stack Hub using ARM templates](#) You can install OpenShift Container Platform on Azure Stack Hub by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

7.1.4. Next steps

- [Configuring an Azure Stack Hub account](#)
7.2. CONFIGURING AN AZURE STACK HUB ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 7.2.1. Azure Stack Hub account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure Stack Hub components, and the default [Quota types in Azure Stack Hub](#) affect your ability to install OpenShift Container Platform clusters.

The following table summarizes the Azure Stack Hub components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Description</th>
</tr>
</thead>
</table>
| vCPU           | 56                                       | A default cluster requires 56 vCPUs, so you must increase the account limit. By default, each cluster creates the following instances:  
  - One bootstrap machine, which is removed after installation  
  - Three control plane machines  
  - Three compute machines  
  Because the bootstrap, control plane, and worker machines use **Standard_DS4_v2** virtual machines, which use 8 vCPUs, a default cluster requires 56 vCPUs. The bootstrap node VM is used only during installation.  
  To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require. |
| VNet           | 1                                        | Each default cluster requires one Virtual Network (VNet), which contains two subnets. |
| Network interfaces | 7                                        | Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces. |
### Component | Number of components required by default | Description
--- | --- | ---
Network security groups | 2 | Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:

| **controlplane** | Allows the control plane machines to be reached on port 6443 from anywhere |
| **node** | Allows worker nodes to be reached from the internet on ports 80 and 443 |

Network load balancers | 3 | Each cluster creates the following load balancers:

| **default** | Public IP address that load balances requests to ports 80 and 443 across worker machines |
| **internal** | Private IP address that load balances requests to ports 6443 and 22623 across control plane machines |
| **external** | Public IP address that load balances requests to port 6443 across control plane machines |

If your applications create more Kubernetes `LoadBalancer` service objects, your cluster uses more load balancers.

Public IP addresses | 2 | The public load balancer uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.

Private IP addresses | 7 | The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.

#### 7.2.2. Configuring a DNS zone in Azure Stack Hub

To successfully install OpenShift Container Platform on Azure Stack Hub, you must create DNS records in an Azure Stack Hub DNS zone. The DNS zone must be authoritative for the domain. To delegate a registrar’s DNS zone to Azure Stack Hub, see Microsoft’s documentation for Azure Stack Hub datacenter DNS integration.

#### 7.2.3. Required Azure Stack Hub roles

Your Microsoft Azure Stack Hub account must have the following roles for the subscription that you use:
To set roles on the Azure portal, see the Manage access to resources in Azure Stack Hub with role-based access control in the Microsoft documentation.

7.2.4. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

Prerequisites

- Install or update the Azure CLI.
- Install the jq package.
- Your Azure account has the required roles for the subscription that you use.

Procedure

1. Register your Azure Stack Cloud environment with your Azure CLI. For more details on this process, see Microsoft’s documentation for Connecting to Azure Stack Hub.
   
   a. Register your environment with the Azure CLI:
      
      ```
      $ az cloud register -n <environment_name> --endpoint-resource-manager <arm_endpoint>
      ```
   
   b. Set the active environment:
      
      ```
      $ az cloud set -n <environment_name>
      ```
   
   c. Update your environment configuration to use the specific API version for Azure Stack Hub:
      
      ```
      $ az cloud update --profile 2019-03-01-hybrid
      ```

2. Log in to the Azure CLI:

   ```
   $ az login
   ```

   Log in to Azure in the web console by using your credentials. If you are in a multitenant environment, you must also supply the tenant ID.

3. If your Azure account uses subscriptions, ensure that you are using the right subscription.
   
   a. View the list of available accounts and record the `tenantId` value for the subscription you want to use for your cluster:
      
      ```
      $ az account list --refresh
      ```

Example output

```
[
  {
```
b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

**Example output**

```json
{
  "environmentName": "AzureStackCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

Ensure that the value of the **tenantId** parameter is the UUID of the correct subscription.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id>
```

1 Substitute the value of the **id** for the subscription that you want to use for `<id>`.

d. If you changed the active subscription, display your account information again:

```
$ az account show
```

**Example output**

```json
{
  "environmentName": "AzureStackCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
```

---

825

CHAPTER 7. INSTALLING ON AZURE STACK HUB
4. Record the values of the `tenantId` and `id` parameters from the previous output. You need these values during OpenShift Container Platform installation.

5. Create the service principal for your account:

   ```bash
   $ az ad sp create-for-rbac --role Contributor --name <service_principal>
   ```

   Replace `<service_principal>` with the name to assign to the service principal.

   **Example output**

   ```json
   Changing "<service_principal>" to a valid URI of "http://<service_principal>", which is the required format used for service principal names
   Retrying role assignment creation: 1/36
   Retrying role assignment creation: 2/36
   Retrying role assignment creation: 3/36
   Retrying role assignment creation: 4/36
   ```

   ```json
   "appId": "8bd0d04d-0ac2-43a8-928d-705c598c6956",
   "displayName": "<service_principal>",
   "name": "http://<service_principal>",
   "password": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
   "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
   ```

6. Record the values of the `appId` and `password` parameters from the previous output. You need these values during OpenShift Container Platform installation.

**Additional resources**

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

### 7.2.5. Next steps

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on Azure Stack Hub.
  - Install an OpenShift Container Platform cluster on Azure Stack Hub with user-provisioned infrastructure by following [Installing a cluster on Azure Stack Hub using ARM templates](#).

### 7.3. Installing a cluster on Azure Stack Hub with an installer-provisioned infrastructure
In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure Stack Hub with an installer-provisioned infrastructure. However, you must manually configure the `install-config.yaml` file to specify values that are specific to Azure Stack Hub.

**NOTE**

While you can select `azure` when using the installation program to deploy a cluster using installer-provisioned infrastructure, this option is only supported for the Azure Public Cloud.

### 7.3.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure Stack Hub account to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- You verified that you have approximately 16 GB of local disk space. Installing the cluster requires that you download the RHCOS virtual hard disk (VHD) cluster image and upload it to your Azure Stack Hub environment so that it is accessible during deployment. Decompressing the VHD files requires this amount of local disk space.

### 7.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 7.3.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added
to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

$ eval "$(ssh-agent -s)"

Example output

Agent pid 31874

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

$ ssh-add <path>/<file_name>  

Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

7.3.4. Uploading the RHCOS cluster image

You must download the RHCOS virtual hard disk (VHD) cluster image and upload it to your Azure Stack Hub environment so that it is accessible during deployment.

Prerequisites

- Configure an Azure account.

Procedure

1. Obtain the RHCOS VHD cluster image:

   a. Export the URL of the RHCOS VHD to an environment variable.

      $ export COMPRESSED_VHD_URL=$(openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.artifacts.azurestack.formats."vhd.gz".disk.location')
b. Download the compressed RHCOS VHD file locally.

```
$ curl -O -L ${COMPRESSED_VHD_URL}
```

2. Decompress the VHD file.

**NOTE**

The decompressed VHD file is approximately 16 GB, so be sure that your host system has 16 GB of free space available. The VHD file can be deleted once you have uploaded it.

3. Upload the local VHD to the Azure Stack Hub environment, making sure that the blob is publicly available. For example, you can upload the VHD to a blob using the `az` cli or the web portal.

### 7.3.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**
- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select **Azure** as the cloud provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```
5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 7.3.6. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure Stack Hub, you must manually create your installation configuration file.

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**
   
   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**
   
   You must name this configuration file `install-config.yaml`.

   Make the following modifications:
   
   a. Specify the required installation parameters.
   
   b. Update the `platform.azure` section to specify the parameters that are specific to Azure Stack Hub.
   
   c. Optional: Update one or more of the default configuration parameters to customize the installation.
      
      For more information about the parameters, see "Installation configuration parameters".

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.
The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

7.3.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide a customized `install-config.yaml` installation configuration file that describes the details for your environment.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

7.3.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: 
- alibabacloud
- aws
- baremetal
- azure
- ibmcloud
- openstack
- ovirt
- vsphere
- { }

For additional information about `platform.<platform>` parameters, consult the table for your specific platform that follows.

### pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 7.3.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 7.2. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>hostPrefix is set to 23 then each node is assigned a /23 subnet out of the</td>
<td>The default value is 23.</td>
</tr>
<tr>
<td></td>
<td>given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>IP address block for the service network.</td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
networking.machine Network.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

NOTE

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

7.3.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 7.3. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use <strong>compute</strong>. The name of the machine pool.</td>
<td><strong>worker</strong></td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use <strong>compute</strong>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <strong>controlPlane.platform</strong> parameter value.</td>
<td><strong>alibaba</strong>, <strong>aws</strong>, <strong>azure</strong>, <strong>gcp</strong>, <strong>ibmcloud</strong>, <strong>openstack</strong>, <strong>ovirt</strong>, <strong>vsphere</strong>, or <strong>{}</strong></td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to <strong>2</strong>. The default value is <strong>3</strong>.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td><strong>String</strong></td>
</tr>
</tbody>
</table>
### Parameter | Description | Values
--- | --- | ---
controlPlane.hyperv | Whether to enable or disable simultaneous multithreading, or **hyperv**, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. | Enabled or Disabled

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

controlPlane.name | Required if you use `controlPlane`. The name of the machine pool. | master

controlPlane.platform | Required if you use `controlPlane`. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the `compute.platform` parameter value. | alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or{}

controlPlane.replicas | The number of control plane machines to provision. | The only supported value is 3, which is the default value.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. The default value is <strong>External</strong>. Setting this field to <strong>Internal</strong> is not supported on non-cloud platforms and IBM Cloud.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If the value of the field is set to **Internal**, the cluster will become non-functional. For more information, refer to BZ#1953035.
### 7.3.6.1.4. Additional Azure Stack Hub configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 7.4. Additional Azure Stack Hub parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.azure.armEndpoint</td>
<td>The URL of the Azure Resource Manager endpoint that your Azure Stack Hub operator provides.</td>
<td>String</td>
</tr>
<tr>
<td>platform.azure.baseDomainResourceGroupName</td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example <code>production_cluster</code>.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of your Azure Stack Hub local region.</td>
<td>String</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.</td>
<td>String, for example <code>existing_resource_group</code>.</td>
</tr>
</tbody>
</table>
### 7.3.6.2. Sample customized install-config.yaml file for Azure Stack Hub

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
controlPlane: 
  name: master
  replicas: 3
compute: 
  - name: worker
    platform: {}
    replicas: 3
metadata: 
  name: test-cluster
networking: 
  clusterNetwork: 
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork: 
    - cidr: 10.0.0.0/16
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.cloud Name</td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints.</td>
<td>AzureStackCloud</td>
</tr>
<tr>
<td>clusterOSImage</td>
<td>The URL of a storage blob in the Azure Stack environment that contains an RHCOS VHD.</td>
<td>String, for example, <a href="https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-azurestack.x86_64.vhd">https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-azurestack.x86_64.vhd</a></td>
</tr>
</tbody>
</table>
networkType: OpenShiftSDN
serviceNetwork: - 172.30.0.0/16
platform:
  azure:
    armEndpoint: azurestack_arm_endpoint 7 8
    baseDomainResourceGroupName: resource_group 9 10
    region: azure_stack_local_region 11 12
    resourceGroupName: existing_resource_group 13
    outboundType: Loadbalancer
    cloudName: AzureStackCloud 14
    clusterOSimage: https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-
    azurestack.x86_64.vhd 15 16
    pullSecret: {'"auths": ...'} 17 18
    fips: false 19
    sshKey: ssh-ed25519 AAAA... 20
    additionalTrustBundle: | 21
      -----BEGIN CERTIFICATE-----
      <MY_TRUSTED_CA_CERT>
      -----END CERTIFICATE-----

1 5 7 9 11 14 15 17 Required.
2 4 If you do not provide these parameters and values, the installation program provides the default value.
3 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
6 The name of the cluster.
8 The Azure Resource Manager endpoint that your Azure Stack Hub operator provides.
10 The name of the resource group that contains the DNS zone for your base domain.
12 The name of your Azure Stack Hub local region.
13 The name of an existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
16 The URL of a storage blob in the Azure Stack environment that contains an RHCOS VHD.
18 The pull secret required to authenticate your cluster.
19 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

If the Azure Stack Hub environment is using an internal Certificate Authority (CA), adding the CA certificate is required.

7.3.7. Manually manage cloud credentials

The Cloud Credential Operator (CCO) only supports your cloud provider in manual mode. As a result, you must specify the identity and access management (IAM) secrets for your cloud provider.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

   $ openshift-install create manifests --dir <installation_directory>

   where:

   `<installation_directory>`
   Specifies the directory in which the installation program creates files.

2. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your openshift-install binary is built to use:

   $ openshift-install version

   Example output

   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64

3. Locate all CredentialsRequest objects in this release image that target the cloud you are deploying on:

   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=azure

   This command creates a YAML file for each CredentialsRequest object.

Sample CredentialsRequest object
4. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

IMPORTANT

The release image includes `CredentialsRequest` objects for Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set. You can identify these objects by their use of the `release.openshift.io/feature-gate: TechPreviewNoUpgrade` annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.

- If you are using any of these features, you must create secrets for the corresponding objects.

- To find `CredentialsRequest` objects with the `TechPreviewNoUpgrade` annotation, run the following command:

```bash
$ grep "release.openshift.io/feature-gate" *
```

Example output

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate: TechPreviewNoUpgrade
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

Additional resources
7.3.8. Configuring the cluster to use an internal CA

If the Azure Stack Hub environment is using an internal Certificate Authority (CA), update the `cluster-proxy-01-config.yaml` file to configure the cluster to use the internal CA.

**Prerequisites**

- Create the `install-config.yaml` file and specify the certificate trust bundle in `.pem` format.
- Create the cluster manifests.

**Procedure**

1. From the directory in which the installation program creates files, go to the `manifests` directory.

2. Add `user-ca-bundle` to the `spec.trustedCA.name` field.

**Example cluster-proxy-01-config.yaml file**

```yaml
apiVersion: config.openshift.io/v1
kind: Proxy
metadata:
  creationTimestamp: null
  name: cluster
spec:
  trustedCA:
    name: user-ca-bundle
status: {}  
```

3. Optional: Back up the `manifests/cluster-proxy-01-config.yaml` file. The installation program consumes the `manifests/` directory when you deploy the cluster.

7.3.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**
1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \  
--log-level=info  
```

1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
...  
INFO Install complete!  
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'  
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com  
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"  
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.
IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

7.3.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xvf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

$ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   C:\> oc <command>
   ```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your **PATH**.
   To check your **PATH**, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   ```

### 7.3.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the **kubeadmin** credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   **For** `<installation_directory>`, specify the path to the directory that you stored the installation files in.
2. Verify you can run `oc` commands successfully using the exported configuration:

```
$ oc whoami
```

**Example output**

```
system:admin
```

### 7.3.12. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**Example output**

```
console   console-openshift-console.apps.<cluster_name>.<base_domain>   console
https   reencrypt/Redirect   None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

#### Additional resources

- [Accessing the web console](#)
7.3.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources
- About remote health monitoring

7.3.14. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

7.4. INSTALLING A CLUSTER ON AZURE STACK HUB WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Azure Stack Hub. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

**NOTE**

While you can select azure when using the installation program to deploy a cluster using installer-provisioned infrastructure, this option is only supported for the Azure Public Cloud.

7.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure Stack Hub account to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- You verified that you have approximately 16 GB of local disk space. Installing the cluster requires that you download the RHCOS virtual hard disk (VHD) cluster image and upload it to your Azure Stack Hub environment so that it is accessible during deployment. Decompressing the VHD files requires this amount of local disk space.
7.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

7.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:
Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**
If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   
   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:
   ```

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   **NOTE**
   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   
   Example output
   ```

   ```bash
   Agent pid 31874
   ```

   **NOTE**
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`.

```
OpenShift Container Platform 4.10 Installing
```

852
Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

7.4.4. Uploading the RHCOS cluster image

You must download the RHCOS virtual hard disk (VHD) cluster image and upload it to your Azure Stack Hub environment so that it is accessible during deployment.

Prerequisites

- Configure an Azure account.

Procedure

1. Obtain the RHCOS VHD cluster image:
   a. Export the URL of the RHCOS VHD to an environment variable.
      
      ```shell
      $ export COMPRESSED_VHD_URL=$(openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.artifacts.azurestack.formats."vhd.gz".disk.location')
      ```
   b. Download the compressed RHCOS VHD file locally.
      
      ```shell
      $ curl -O -L $(COMPRESSED_VHD_URL)
      ```

2. Decompress the VHD file.

   **NOTE**
   
   The decompressed VHD file is approximately 16 GB, so be sure that your host system has 16 GB of free space available. The VHD file can be deleted once you have uploaded it.

3. Upload the local VHD to the Azure Stack Hub environment, making sure that the blob is publicly available. For example, you can upload the VHD to a blob using the `az` cli or the web portal.

7.4.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure
1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select Azure as the cloud provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   $ mkdir <installation_directory>
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 7.4.6. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure Stack Hub, you must manually create your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

   ```
   $ mkdir <installation_directory>
   ```
IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

NOTE

You must name this configuration file `install-config.yaml`.

Make the following modifications:

a. Specify the required installation parameters.

b. Update the `platform.azure` section to specify the parameters that are specific to Azure Stack Hub.

c. Optional: Update one or more of the default configuration parameters to customize the installation.

For more information about the parameters, see "Installation configuration parameters".

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

7.4.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide a customized `install-config.yaml` installation configuration file that describes the details for your environment.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

7.4.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the install-config.yaml content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>. <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>. <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 7.4.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 7.6. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>networking.network</strong></td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td><strong>networking.clusterNetwork</strong></td>
<td>The IP address blocks for pods. The default value is <strong>10.128.0.0/14</strong> with a host prefix of <strong>/23</strong>. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>

```yaml
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of 23 provides ( 2^{32 - 23} - 2 ) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use <code>networking.machineNetwork</code>. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
</tbody>
</table>

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### 7.4.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 7.7. Optional parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <code>hypertreading</code>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**
Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.
### imageContentSources

Sources and repositories for the release-image content.

- **source**: Required if you use `imageContentSources`. Specify the repository that users refer to, for example, in image pull specifications.

- **mirrors**: Specify one or more repositories that may also contain the same images.

### publish

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

- **Internal** or **External**. The default value is **External**.

  Setting this field to **Internal** is not supported on non-cloud platforms and IBM Cloud.

**IMPORTANT**

If the value of the field is set to **Internal**, the cluster will become non-functional. For more information, refer to [BZ#1953035](#).

### sshKey

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- **Values**: One or more keys. For example:

\[
\text{sshKey:} \\
<\text{key1}> \\
<\text{key2}> \\
<\text{key3}>
\]

---

### 7.4.6.1.4. Additional Azure Stack Hub configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 7.8. Additional Azure Stack Hub parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.azure.armEndpoint</td>
<td>The URL of the Azure Resource Manager endpoint that your Azure Stack Hub operator provides.</td>
<td>String</td>
</tr>
<tr>
<td>platform.azure.baseDomainResourceId</td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example production_cluster.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of your Azure Stack Hub local region.</td>
<td>String</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.cloudName</td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints.</td>
<td>AzureStackCloud</td>
</tr>
<tr>
<td>clusterOSImage</td>
<td>The URL of a storage blob in the Azure Stack environment that contains an RHCOS VHD.</td>
<td>String, for example, <a href="https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-azurestack.x86_64.vhd">https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-azurestack.x86_64.vhd</a></td>
</tr>
</tbody>
</table>

7.4.6.2. Sample customized install-config.yaml file for Azure Stack Hub

You can customize the install-config.yaml file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
```
Required.

If you do not provide these parameters and values, the installation program provides the default value.

The `controlPlane` section is a single mapping, but the `compute` section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the `compute` section must begin with a hyphen, `-`, and the first line of the `controlPlane` section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

The name of the cluster.

The Azure Resource Manager endpoint that your Azure Stack Hub operator provides.

The name of the resource group that contains the DNS zone for your base domain.
The name of your Azure Stack Hub local region.

The name of an existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

The URL of a storage blob in the Azure Stack environment that contains an RHCOS VHD.

The pull secret required to authenticate your cluster.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

If the Azure Stack Hub environment is using an internal Certificate Authority (CA), adding the CA certificate is required.

### 7.4.7. Manually manage cloud credentials

The Cloud Credential Operator (CCO) only supports your cloud provider in manual mode. As a result, you must specify the identity and access management (IAM) secrets for your cloud provider.

**Procedure**

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```shell
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`

   Specifies the directory in which the installation program creates files.

2. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   ```shell
   $ openshift-install version
   ```
Example output

```bash
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=azure
```

This command creates a YAML file for each `CredentialsRequest` object.

Sample `CredentialsRequest` object

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
  name: openshift-image-registry-azure
namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
```

4. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

**IMPORTANT**

The release image includes `CredentialsRequest` objects for Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set. You can identify these objects by their use of the `release.openshift.io/feature-gate: TechPreviewNoUpgrade` annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.

- If you are using any of these features, you must create secrets for the corresponding objects.

To find `CredentialsRequest` objects with the `TechPreviewNoUpgrade` annotation, run the following command:

```bash
$ grep "release.openshift.io/feature-gate" *
```
Example output

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate:
TechPreviewNoUpgrade
```

**IMPORTANT**
Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

Additional resources
- Updating a cluster using the web console
- Updating a cluster using the CLI

### 7.4.8. Configuring the cluster to use an internal CA

If the Azure Stack Hub environment is using an internal Certificate Authority (CA), update the `cluster-proxy-01-config.yaml` file to configure the cluster to use the internal CA.

#### Prerequisites
- Create the `install-config.yaml` file and specify the certificate trust bundle in `.pem` format.
- Create the cluster manifests.

#### Procedure
1. From the directory in which the installation program creates files, go to the `manifests` directory.
2. Add `user-ca-bundle` to the `spec.trustedCA.name` field.

**Example cluster-proxy-01-config.yaml file**

```
apiVersion: config.openshift.io/v1
kind: Proxy
metadata:
  creationTimestamp: null
name: cluster
spec:
  trustedCA:
    name: user-ca-bundle
  status: {}
```

3. Optional: Back up the `manifests/cluster-proxy-01-config.yaml` file. The installation program consumes the `manifests/` directory when you deploy the cluster.

### 7.4.9. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.
Phase 1
You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**
Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

Phase 2
After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

7.4.10. Specifying advanced network configuration
You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**
Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**
- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**
1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

`<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.
2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

**Specify a different VXLAN port for the OpenShift SDN network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

**Enable IPsec for the OVN-Kubernetes network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

### 7.4.11. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named `cluster`. The CR specifies the fields for the `Network` API in the `operator.openshift.io` API group.

The CNO configuration inherits the following fields during cluster installation from the `Network` API in the `Network.config.openshift.io` API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.

- **serviceNetwork**
  - IP address pool for services.

- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.
You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

### 7.4.11.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 7.9. Cluster Network Operator configuration object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <code>cluster</code>.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <code>install-config.yaml</code> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.serviceNetwork</td>
<td>array</td>
<td>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <code>install-config.yaml</code> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.defaultNetwork</td>
<td>object</td>
<td>Configures the Container Network Interface (CNI) cluster network provider for the cluster network.</td>
</tr>
<tr>
<td>spec.kubeProxy Config</td>
<td>object</td>
<td>The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.</td>
</tr>
</tbody>
</table>

**defaultNetwork object configuration**

The values for the `defaultNetwork` object are defined in the following table:

**Table 7.10. defaultNetwork object**
Configuration for the OpenShift SDN CNI cluster network provider
The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 7.11. openshiftSDNConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy. The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>
The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.

This value cannot be changed after cluster installation.

The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.

If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.
The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

genevePort

The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.

ipsecConfig

Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.

policyAuditConfig

Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

gatewayConfig

Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.

Table 7.13. policyAuditConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.</td>
</tr>
</tbody>
</table>
One of the following additional audit log targets:

**libc**
The libc `syslog()` function of the journald process on the host.

**udp:<host>:<port>**
A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.

**unix:<file>**
A Unix Domain Socket file specified by `<file>`.

**null**
Do not send the audit logs to any additional target.

The syslog facility, such as `kern`, as defined by RFC5424. The default value is `local0`.

---

**Table 7.14. gatewayConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to <code>true</code> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <code>false</code>. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <code>true</code>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

---

**Example OVN-Kubernetes configuration with IPSec enabled**

```yaml
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

**kubeProxyConfig object configuration**
The values for the `kubeProxyConfig` object are defined in the following table:

**Table 7.15. kubeProxyConfig object**
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iptables Sync Period</td>
<td>string</td>
<td>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</td>
</tr>
<tr>
<td>NOTE</td>
<td></td>
<td>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptables Sync Period parameter is no longer necessary.</td>
</tr>
<tr>
<td>proxyArguments.iptables-min-sync-period</td>
<td>array</td>
<td>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is: kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</td>
</tr>
</tbody>
</table>

### 7.4.12. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**

- You defined OVNKubernetes for the networking.networkType parameter in the install-config.yaml file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   where:
1. **<installation_directory>**
   Specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```bash
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     EOF
   ```

   where:

   **<installation_directory>**
   Specifies the directory name that contains the `manifests/` directory for your cluster.

3. Open the `cluster-network-03-config.yml` file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

   **Specify a hybrid networking configuration**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnKubernetesConfig:
         hybridOverlayConfig:
           hybridClusterNetwork:
             - cidr: 10.132.0.0/14
               hostPrefix: 23
           hybridOverlayVXLANPort: 9898
   ```

   1. Specify the CIDR configuration used for nodes on the additional overlay network. The `hybridClusterNetwork` CIDR cannot overlap with the `clusterNetwork` CIDR.

   2. Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.

**NOTE**

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom `hybridOverlayVXLANPort` value because this Windows server version does not support selecting a custom VXLAN port.
4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

   **NOTE**

   For more information on using Linux and Windows nodes in the same cluster, see Understanding Windows container workloads.

### 7.4.13. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \ 
   --log-level=info  
   ```

   - If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```bash
   INFO Install complete!
   ```
NOTE

The cluster access and credential information also outputs to <installation_directory>/openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

7.4.14. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.

4. Unpack the archive:

   ```bash
   $ tar xzvf <file>
   ```

5. Place the `oc` binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   ```bash
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```bash
   $ oc <command>
   ```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```bash
   C:\> path
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```bash
   C:\> oc <command>
   ```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```bash
   $ tar xvzf <file>
   $ echo $PATH
   $ oc <command>
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```bash
   C:\> oc <command>
   ```
After you install the OpenShift CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

### 7.4.15. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   
   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
   
2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   
   Example output
   
   system:admin
   ```

### 7.4.16. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:
$ cat <installation_directory>/auth/kubeadmin-password

**NOTE**

Alternatively, you can obtain the *kubeadmin* password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console   console-openshift-console.apps.<cluster_name>.<base_domain>   console
   https     reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the *kubeadmin* user.

**Additional resources**

- Accessing the web console.

### 7.4.17. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to *OpenShift Cluster Manager*.

After you confirm that your *OpenShift Cluster Manager* inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use *subscription watch* to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- About remote health monitoring

### 7.4.18. Next steps

- Validating an installation.

- Customize your cluster.

- If necessary, you can opt out of remote health reporting.

- If necessary, you can remove cloud provider credentials.
7.5. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure Stack Hub by using infrastructure that you provide.

Several Azure Resource Manager (ARM) templates are provided to assist in completing these steps or to help model your own.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

7.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure Stack Hub account to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See Install the Azure CLI in the Azure documentation. The documentation below was tested using version 2.28.0 of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

7.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
7.5.3. Configuring your Azure Stack Hub project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

IMPORTANT

All Azure Stack Hub resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure Stack Hub restricts, see Resolve reserved resource name errors in the Azure documentation.

7.5.3.1. Azure Stack Hub account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure Stack Hub components, and the default Quota types in Azure Stack Hub affect your ability to install OpenShift Container Platform clusters.

The following table summarizes the Azure Stack Hub components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Description</th>
</tr>
</thead>
</table>
| vCPU      | 56                                     | A default cluster requires 56 vCPUs, so you must increase the account limit. By default, each cluster creates the following instances:  
  - One bootstrap machine, which is removed after installation  
  - Three control plane machines  
  - Three compute machines  
Because the bootstrap, control plane, and worker machines use Standard_DS4_v2 virtual machines, which use 8 vCPUs, a default cluster requires 56 vCPUs. The bootstrap node VM is used only during installation.  
To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require. |
Each default cluster requires one Virtual Network (VNet), which contains two subnets.

Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.

Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:

- **controlplane**: Allows the control plane machines to be reached on port 6443 from anywhere
- **node**: Allows worker nodes to be reached from the internet on ports 80 and 443

Each cluster creates the following load balancers:

- **default**: Public IP address that load balances requests to ports 80 and 443 across worker machines
- **internal**: Private IP address that load balances requests to ports 6443 and 22623 across control plane machines
- **external**: Public IP address that load balances requests to port 6443 across control plane machines

If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.

The public load balancer uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.

The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.

### 7.5.3.2. Configuring a DNS zone in Azure Stack Hub

To successfully install OpenShift Container Platform on Azure Stack Hub, you must create DNS records in an Azure Stack Hub DNS zone. The DNS zone must be authoritative for the domain. To delegate a
registrar’s DNS zone to Azure Stack Hub, see Microsoft’s documentation for Azure Stack Hub datacenter DNS integration.

You can view Azure’s DNS solution by visiting this example for creating DNS zones.

7.5.3.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The kube-controller-manager only approves the kubelet client CSRs. The machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

7.5.3.4. Required Azure Stack Hub roles

Your Microsoft Azure Stack Hub account must have the following roles for the subscription that you use:

- Owner

To set roles on the Azure portal, see the Manage access to resources in Azure Stack Hub with role-based access control in the Microsoft documentation.

7.5.3.5. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

Prerequisites

- Install or update the Azure CLI.
- Install the jq package.
- Your Azure account has the required roles for the subscription that you use.

Procedure

1. Register your Azure Stack Cloud environment with your Azure CLI. For more details on this process, see Microsoft’s documentation for Connecting to Azure Stack Hub.

   a. Register your environment with the Azure CLI:

      ```shell
      $ az cloud register -n <environment_name> --endpoint-resource-manager <arm_endpoint>
      $$ az cloud set -n <environment_name>
      $ az cloud update --profile 2019-03-01-hybrid
      ```
2. Log in to the Azure CLI:

   ```
   $ az login
   ```

   Log in to Azure in the web console by using your credentials. If you are in a multitenant environment, you must also supply the tenant ID.

3. If your Azure account uses subscriptions, ensure that you are using the right subscription.
   a. View the list of available accounts and record the `tenantId` value for the subscription you want to use for your cluster:

   ```
   $ az account list --refresh
   ```

   **Example output**

   ```
   [
   {
   "cloudName": "AzureStackCloud",
   "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
   "isDefault": true,
   "name": "Subscription Name",
   "state": "Enabled",
   "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
   "user": {
   "name": "you@example.com",
   "type": "user"
   }
   }
   ]
   ```

   b. View your active account details and confirm that the `tenantId` value matches the subscription you want to use:

   ```
   $ az account show
   ```

   **Example output**

   ```
   {
   "environmentName": "AzureStackCloud",
   "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
   "isDefault": true,
   "name": "Subscription Name",
   "state": "Enabled",
   "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
   "user": {
   "name": "you@example.com",
   "type": "user"
   }
   }
   ```

1. Ensure that the value of the `tenantId` parameter is the UUID of the correct subscription.
c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id>
```

1 Substitute the value of the id for the subscription that you want to use for <id>.

d. If you changed the active subscription, display your account information again:

```
$ az account show
```

### Example output

```
{}
```

```
  "environmentName": AzureStackCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

4. Record the values of the tenantId and id parameters from the previous output. You need these values during OpenShift Container Platform installation.

5. Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal>
```

1 Replace <service_principal> with the name to assign to the service principal.

### Example output

```
Changing "<service_principal>" to a valid URI of "http://<service_principal>", which is the required format used for service principal names
```

```
Changing "<service_principal>" to a valid URI of "http://<service_principal>", which is the required format used for service principal names

Retrying role assignment creation: 1/36
Retrying role assignment creation: 2/36
Retrying role assignment creation: 3/36
Retrying role assignment creation: 4/36
```

```
  "appId": "8bd0d04d-0ac2-43a8-928d-705c598c6956",
  "displayName": "<service_principal>",
  "name": "http://<service_principal>",
  "password": "ac461d78-bf4b-4387-ad16-7e32e328ae6c6",
  "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
}
```

6. Record the values of the appid and password parameters from the previous output. You need these values during OpenShift Container Platform installation.
Additional resources

- For more information about CCO modes, see About the Cloud Credential Operator.

7.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select Azure as the cloud provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

7.5.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.
After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   
   1
   
   1
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   
   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:
   ```

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   
   3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.
a. If the *ssh-agent* process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the *ssh-agent*:

```bash
$ ssh-add <path>/<file_name>  
```

Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 7.5.6. Creating the installation files for Azure Stack Hub

To install OpenShift Container Platform on Microsoft Azure Stack Hub using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You manually create the *install-config.yaml* file, and then generate and customize the Kubernetes manifests and Ignition config files. You also have the option to first set up a separate *var* partition during the preparation phases of installation.

#### 7.5.6.1. Manually creating the installation configuration file

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**
1. Create an installation directory to store your required installation assets in:

```bash
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`.

Make the following modifications for Azure Stack Hub:

a. Set the `replicas` parameter to 0 for the `compute` pool:

```yaml
compute:
  - hyperthreading: Enabled
    name: worker
    platform: {}
    replicas: 0 1

1 Set to 0.

The compute machines will be provisioned manually later.

b. Update the `platform.azure` section of the `install-config.yaml` file to configure your Azure Stack Hub configuration:

```yaml
platform: azure:
  armEndpoint: <azurestack_arm_endpoint> 1
  baseDomainResourceGroupName: <resource_group> 2
  cloudName: AzureStackCloud 3
  region: <azurestack_region> 4

1 Specify the Azure Resource Manager endpoint of your Azure Stack Hub environment, like https://management.local.azurestack.external.

2 Specify the name of the resource group that contains the DNS zone for your base domain.

3 Specify the Azure Stack Hub environment, which is used to configure the Azure SDK with the appropriate Azure API endpoints.
Specify the name of your Azure Stack Hub region.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

### 7.5.6.2. Sample customized `install-config.yaml` file for Azure Stack Hub

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:  
  name: master
  replicas: 3
compute: 2
  - name: worker
    platform: {}
    replicas: 0
metadata:
  name: test-cluster
 3
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
  azure:
    armEndpoint: azurestack_arm_endpoint
    baseDomainResourceGroupName: resource_group
    region: azure_stack_local_region
    resourceGroupName: existing_resource_group
    outboundType: Loadbalancer
cloudName: AzureStackCloud
pullSecret: | "auths": {...} |
  pullSecret: |
  fips: false
  additionalTrustBundle: |
------BEGIN CERTIFICATE------
```
The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

3 Specify the name of the cluster.

4 Specify the Azure Resource Manager endpoint that your Azure Stack Hub operator provides.

5 Specify the name of the resource group that contains the DNS zone for your base domain.

6 Specify the name of your Azure Stack Hub local region.

7 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

8 Specify the Azure Stack Hub environment as your target platform.

9 Specify the pull secret required to authenticate your cluster.

10 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

11 If your Azure Stack Hub environment uses an internal certificate authority (CA), add the necessary certificate bundle in .pem format.

12 You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 7.5.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.
Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**
The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (`169.254.169.254`).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ¹
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ²
     noProxy: example.com ³
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   ...
   
   ¹ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   ² A proxy URL to use for creating HTTPS connections outside the cluster.
   ³ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
   ⁴ If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.
NOTE

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster–wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

7.5.6.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure Stack Hub.

NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Export common variables found in the `install-config.yaml` to be used by the provided ARM templates:

   ```
   $ export CLUSTER_NAME=<cluster_name>
   $ export AZURE_REGION=<azure_region>
   $ export SSH_KEY=<ssh_key>
   $ export BASE_DOMAIN=<base_domain>
   $ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group>
   ```

   1. The value of the `.metadata.name` attribute from the `install-config.yaml` file.
   2. The region to deploy the cluster into. This is the value of the `.platform.azure.region` attribute from the `install-config.yaml` file.
   3. The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the `.sshKey` attribute from the `install-config.yaml` file.
   4. The base domain to deploy the cluster to. The base domain corresponds to the DNS zone that you created for your cluster. This is the value of the `.baseDomain` attribute from the `install-config.yaml` file.
The resource group where the DNS zone exists. This is the value of the .platform.azure.baseDomainResourceGroupName attribute from the install-

For example:

$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster

2. Export the kubeadmin credentials:

   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

7.5.6.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program.

- You created the install-config.yaml installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:
Example output

INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: install_dir/manifests and install_dir/openshift

For `<installation_directory>`, specify the installation directory that contains the install-config.yaml file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the mastersSchedulable parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to false. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the mastersSchedulable parameter and ensure that it is set to false.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the privateZone and publicZone sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```yaml
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
name: cluster
spec:
  baseDomain: example.openshift.com
privateZone:
  id: mycluster-100419-private-zone
publicZone:
  id: example.openshift.com
status: {}
```
If you do so, you must add ingress DNS records manually in a later step.

6. Optional: If your Azure Stack Hub environment uses an internal certificate authority (CA), you must update the `.spec.trustedCA.name` field in the `<installation_directory>/manifests/cluster-proxy-01-config.yaml` file to use `user-ca-bundle`:

   ```yaml
   ...
   spec:
     trustedCA:
       name: user-ca-bundle
   ...
   
   Later, you must update your bootstrap ignition to include the CA.

7. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:

   a. Export the infrastructure ID by using the following command:

   ```bash
   $ export INFRA_ID=<infra_id>
   ```

   The OpenShift Container Platform cluster has been assigned an identifier (`INFRA_ID`) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the `.status.infrastructureName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

   b. Export the resource group by using the following command:

   ```bash
   $ export RESOURCE_GROUP=<resource_group>
   ```

   All resources created in this Azure deployment exists as part of a resource group. The resource group name is also based on the `INFRA_ID`, in the form of `<cluster_name>-<random_string>-rg`. This is the value of the `.status.platformStatus.azure.resourceGroupName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

8. Manually create your cloud credentials.

   a. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   ```bash
   $ openshift-install version
   ```

   Example output

   ```text
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ```
b. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=azure
```

This command creates a YAML file for each `CredentialsRequest` object.

**Sample `CredentialsRequest` object**

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
  name: openshift-image-registry-azure
  namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
    - role: Contributor
```

c. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

**IMPORTANT**

The release image includes `CredentialsRequest` objects for Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set. You can identify these objects by their use of the `release.openshift.io/feature-gate: TechPreviewNoUpgrade` annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.

- If you are using any of these features, you must create secrets for the corresponding objects.

To find `CredentialsRequest` objects with the `TechPreviewNoUpgrade` annotation, run the following command:

```
$ grep "release.openshift.io/feature-gate" *
```

**Example output**
d. Create a `cco-configmap.yaml` file in the manifests directory with the Cloud Credential Operator (CCO) disabled:

**Sample ConfigMap object**

```yaml
apiVersion: v1
kind: ConfigMap
metadata:
  name: cloud-credential-operator-config
namespace: openshift-cloud-credential-operator
annotations:
  release.openshift.io/create-only: "true"
data:
  disabled: "true"
```

9. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```sh
$ ./openshift-install create ignition-configs --dir <installation_directory>
```

For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

```
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

7.5.6.6. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
• /var: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a /var directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because /var must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate /var partition by creating a machine config manifest that is inserted during the openshift-install preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate /var partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Procedure**

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```bash
   $ mkdir $HOME/clusterconfig
   ```

2. Run openshift-install to create a set of files in the manifest and openshift subdirectories. Answer the system questions as you are prompted:

   ```bash
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ```

**Example output**

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift

$ ls $HOME/clusterconfig/openshift/
99_kubeadmin-password-secret.yaml 99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml 99_openshift-cluster-api_master-machines-2.yaml
...```

3. Optional: Confirm that the installation program created manifests in the clusterconfig/openshift directory:

   ```bash
   $ ls $HOME/clusterconfig/openshift/
   ```

**Example output**

```
99_kubeadmin-password-secret.yaml 99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml 99_openshift-cluster-api_master-machines-2.yaml
...```

4. Create a Butane config that configures the additional partition. For example, name the file $HOME/clusterconfig/98-var-partition.bu, change the disk device name to the name of the storage device on the worker systems, and set the storage size as appropriate. This example
places the `/var` directory on a separate partition:

variant: openshift
version: 4.10.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
name: 98-var-partition
storage:
disks:
  - device: /dev/<device_name> ①
    partitions:
      - label: var
        start_mib: <partition_start_offset> ②
        size_mib: <partition_size> ③
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] ④
          with_mount_unit: true

① The storage device name of the disk that you want to partition.

② When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

③ The size of the data partition in mebibytes.

④ The `prjquota` mount option must be enabled for filesystems used for container storage.

**NOTE**

When creating a separate `/var` partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the `clusterconfig/openshift` directory. For example, run the following command:

   ```bash
   $ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
   ```

6. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

   ```bash
   $ openshift-install create ignition-configs --dir $HOME/clusterconfig
   $ ls $HOME/clusterconfig/
   auth bootstrap.ign master.ign metadata.json worker.ign
   ```
Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 7.5.7. Creating the Azure resource group

You must create a Microsoft Azure [resource group](#). This is used during the installation of your OpenShift Container Platform cluster on Azure Stack Hub.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

- Create the resource group in a supported Azure region:

  ```bash
  $ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
  ```

### 7.5.8. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally. You must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Create an Azure storage account to store the VHD cluster image:

   ```bash
   $ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
   ```

   **WARNING**

   The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your `CLUSTER_NAME` variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see [Resolve errors for storage account names](#) in the Azure documentation.
2. Export the storage account key as an environment variable:

   ```bash
   $ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query "[0].value" -o tsv`
   ````

3. Export the URL of the RHCOS VHD to an environment variable:

   ```bash
   $ export COMPRESSED_VHD_URL=$(openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.artifacts.azurestack.formats."vhd.gz".disk.location')
   ```

   **IMPORTANT**
   The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Create the storage container for the VHD:

   ```bash
   $ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
   ````

5. Download the compressed RHCOS VHD file locally:

   ```bash
   $ curl -O -L ${COMPRESSED_VHD_URL}
   ````

6. Decompress the VHD file.

   **NOTE**
   The decompressed VHD file is approximately 16 GB, so be sure that your host system has 16 GB of free space available. You can delete the VHD file after you upload it.

7. Copy the local VHD to a blob:

   ```bash
   $ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -f rhcos-<rhcos_version>-azurestack.x86_64.vhd
   ````

8. Create a blob storage container and upload the generated `bootstrap.ign` file:

   ```bash
   $ az storage container create --name files --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
   $ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"
   ````

**7.5.9. Example for creating DNS zones**

DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.
For this example, Azure Stack Hub’s datacenter DNS integration is used, so you will create a DNS zone.

**NOTE**

The DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the DNS zone; be sure the installation config you generated earlier reflects that scenario.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

- Create the new DNS zone in the resource group exported in the \texttt{BASE\_DOMAIN\_RESOURCE\_GROUP} environment variable:

  
  
  $ az network dns zone create -g \$(BASE\_DOMAIN\_RESOURCE\_GROUP) -n \$(CLUSTER\_NAME)\$.\$(BASE\_DOMAIN)$

  You can skip this step if you are using a DNS zone that already exists.

You can learn more about configuring a DNS zone in Azure Stack Hub by visiting that section.

### 7.5.10. Creating a VNet in Azure Stack Hub

You must create a virtual network (VNet) in Microsoft Azure Stack Hub for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your Azure Stack Hub infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Copy the template from the ARM template for the VNet section of this topic and save it as \texttt{01\_vnet.json} in your cluster’s installation directory. This template describes the VNet that your cluster requires.

2. Create the deployment by using the `az` CLI:
7.5.10.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

Example 7.1. 01_vnet.json ARM template

```
link:https://raw.githubusercontent.com/openshift/installer/release-4.10/upi/azurestack/01_vnet.json[]
```

7.5.11. Deploying the RHCOS cluster image for the Azure Stack Hub infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure Stack Hub for your OpenShift Container Platform nodes.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

**Procedure**

1. Copy the template from the **ARM template for image storage** section of this topic and save it as **02_storage.json** in your cluster’s installation directory. This template describes the image storage that your cluster requires.

2. Export the RHCOS VHD blob URL as a variable:

   ```bash
   $ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
   
3. Deploy the cluster image:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/02_storage.json" \
   --parameters vhdBlobURL="${VHD_BLOB_URL}" \  
   --parameters baseName="${INFRA_ID}"  
   ``

```

1 The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

2 The blob URL of the RHCOS VHD to be used to create master and worker machines.
7.5.11.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

Example 7.2. 02_storage.json ARM template

[link:https://raw.githubusercontent.com/openshift/installer/release-4.10/upi/azurestack/02_storage.json]

7.5.12. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in `initramfs` during boot to fetch their Ignition config files.

7.5.12.1. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

**IMPORTANT**

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 7.16. Ports used for all-machine to all-machine communications

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICMP</td>

### 7.5.13. Creating networking and load balancing components in Azure Stack Hub

You must configure networking and load balancing in Microsoft Azure Stack Hub for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

Load balancing requires the following DNS records:

- An **api** DNS record for the API public load balancer in the DNS zone.
- An **api-int** DNS record for the API internal load balancer in the DNS zone.

**NOTE**

If you do not use the provided ARM template to create your Azure Stack Hub infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.

**Procedure**
1. Copy the template from the **ARM template for the network and load balancers** section of this topic and save it as `03_infra.json` in your cluster’s installation directory. This template describes the networking and load balancing objects that your cluster requires.

2. Create the deployment by using the `az` CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/03_infra.json" \
   --parameters baseName=${INFRA_ID}
   ```

   **1.** The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

3. Create an `api` DNS record and an `api-int` DNS record. When creating the API DNS records, the `$(BASE_DOMAINRESOURCE_GROUP)` variable must point to the resource group where the DNS zone exists.

   a. Export the following variable:

      ```bash
      $ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
      ```

   b. Export the following variable:

      ```bash
      $ export PRIVATE_IP=`az network lb frontend-ip show -g "$RESOURCE_GROUP" --lb-name "${INFRA_ID}-internal" -n internal-lb-ip --query "privatetIpAddress" -o tsv`
      ```

   c. Create the `api` DNS record in a new DNS zone:

      ```bash
      $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
      ```

      If you are adding the cluster to an existing DNS zone, you can create the `api` DNS record in it instead:

      ```bash
      $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
      ```

   d. Create the `api-int` DNS record in a new DNS zone:

      ```bash
      $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z "$\{CLUSTER\_NAME\}.${BASE\_DOMAIN}\" -n api-int -a ${PRIVATE_IP} --ttl 60
      ```

      If you are adding the cluster to an existing DNS zone, you can create the `api-int` DNS record in it instead:

      ```bash
      $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${BASE_DOMAIN} -n api-int.${CLUSTER_NAME} -a ${PRIVATE_IP} --ttl 60
      ```

---

### 7.5.13.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:
7.5.14. Creating the bootstrap machine in Azure Stack Hub

You must create the bootstrap machine in Microsoft Azure Stack Hub to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.

**Procedure**

1. Copy the template from the ARM template for the bootstrap machine section of this topic and save it as `04_bootstrap.json` in your cluster’s installation directory. This template describes the bootstrap machine that your cluster requires.

2. Export the bootstrap URL variable:

   ```
   $ bootstrap_url_expiry=`date -u -d "10 hours" '+%Y-%m-%dT%H:%MZ'`
   $ export BOOTSTRAP_URL=`az storage blob generate-sas -c 'files' -n 'bootstrap.ign' --https-only --full-uri --permissions r --expiry $bootstrap_url_expiry --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -o tsv`
   $ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d "\n"
   ```

3. Export the bootstrap ignition variable:
   
   a. If your environment uses a public certificate authority (CA), run this command:

   ```
   $ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d "\n"
   ```

Example 7.3. `03_infra.json` ARM template

[link:https://raw.githubusercontent.com/openshift/installer/release-4.10/upi/azurestack/03_infra.json]
b. If your environment uses an internal CA, you must add your PEM encoded bundle to the
bootstrap ignition stub so that your bootstrap virtual machine can pull the bootstrap
ignition from the storage account. Run the following commands, which assume your CA is in
a file called **CA.pem**:

```
$ export CA="data:text/plain;charset=utf-8;base64,$(cat CA.pem |base64 |tr -d "\n")"
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url
"$BOOTSTRAP_URL" --arg cert "$CA" '{ignition:{version:$v,security:{tls:
{certificateAuthorities:[{source:$cert}]}}},config:{replace:{source:$url}}}' | base64 | tr -d
"\n"
```

4. Create the deployment by using the **az** CLI:

```
$ az deployment group create --verbose -g ${RESOURCE_GROUP} \ 
--template-file "<installation_directory>/04_bootstrap.json" \ 
--parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \ 
--parameters baseName="${INFRA_ID}" \ 
--parameters diagnosticsStorageAccountName="${CLUSTER_NAME}sa" 
```

1. The bootstrap Ignition content for the bootstrap cluster.
2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.
3. The name of the storage account for your cluster.

### 7.5.14.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine
that you need for your OpenShift Container Platform cluster:

**Example 7.4. 04_bootstrap.json ARM template**

[link](https://raw.githubusercontent.com/openshift/installer/release-4.10/upi/azurestack/04_bootstrap.json)

### 7.5.15. Creating the control plane machines in Azure Stack Hub

You must create the control plane machines in Microsoft Azure Stack Hub for your cluster to use. One
way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your control plane machines, you
must review the provided information and manually create the infrastructure. If your
cluster does not initialize correctly, you might have to contact Red Hat support with your
installation logs.

**Prerequisites**
Configure an Azure account.

Generate the Ignition config files for your cluster.

Create and configure a VNet and associated subnets in Azure Stack Hub.

Create and configure networking and load balancers in Azure Stack Hub.

Create control plane and compute roles.

Create the bootstrap machine.

Procedure

1. Copy the template from the ARM template for control plane machines section of this topic and save it as 05_masters.json in your cluster’s installation directory. This template describes the control plane machines that your cluster requires.

2. Export the following variable needed by the control plane machine deployment:

   ```
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d "\n"
   ```

3. Create the deployment by using the `az` CLI:

   ```
   $ az deployment group create -g ${RESOURCE_GROUP} \
      --template-file "<installation_directory>/05_masters.json" \
      --parameters masterIgnition="${MASTER_IGNITION}" \1
      --parameters baseName="${INFRA_ID}" \2
      --parameters diagnosticsStorageAccountName="${CLUSTER_NAME}sa" \3
   ```

   1. The Ignition content for the control plane nodes (also known as the master nodes).
   2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.
   3. The name of the storage account for your cluster.

7.5.15.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

Example 7.5. 05_masters.json ARM template

link:https://raw.githubusercontent.com/openshift/installer/release-4.10/upi/azurestack/05_masters.json[]

7.5.16. Wait for bootstrap completion and remove bootstrap resources in Azure Stack Hub

After you create all of the required infrastructure in Microsoft Azure Stack Hub, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.
Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \
   --log-level info
   ```

   **1** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

   ```
   $ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --name bootstrap_ssh_in
   $ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
   $ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
   $ az vm delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
   $ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap_OSDisk --no-wait --yes
   $ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-wait
   $ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name ${CLUSTER_NAME}sa --account-name $(CLUSTER_NAME)sa --container-name files --name bootstrap.ign
   $ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-ssh-pip
   ```

**NOTE**

If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

7.5.17. Creating additional worker machines in Azure Stack Hub

You can create worker machines in Microsoft Azure Stack Hub for your cluster to use by launching
individual instances discretely or by automated processes outside the cluster, such as auto scaling
groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in
OpenShift Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM)
template. Additional instances can be launched by including additional resources of type
**06_workers.json** in the file.

**NOTE**

If you do not use the provided ARM template to create your worker machines, you must
review the provided information and manually create the infrastructure. If your cluster
does not initialize correctly, you might have to contact Red Hat support with your
installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Copy the template from the **ARM template for worker machines** section of this topic and save
   it as **06_workers.json** in your cluster’s installation directory. This template describes the worker
   machines that your cluster requires.

2. Export the following variable needed by the worker machine deployment:

   ```bash
   $ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d 'n'
   ```

3. Create the deployment by using the **az CLI**:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/06_workers.json" \
   --parameters workerIgnition="${WORKER_IGNITION}" 1 \
   --parameters baseName="${INFRA_ID}" 2 \
   --parameters diagnosticsStorageAccountName="${CLUSTER_NAME}sa" 3
   ```

   1. The Ignition content for the worker nodes.
   2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.
   3. The name of the storage account for your cluster.
7.5.17.1. ARM template for worker machines

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

Example 7.6. 06_workers.json ARM template

link:https://raw.githubusercontent.com/openshift/installer/release-4.10/upi/azurestack/06_workers.json[]

7.5.18. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   
   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   
   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

   
   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```c:
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

#### Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```bash
$ oc <command>
```

### 7.5.19. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.
Procedure

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

7.5.20. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

**Prerequisites**

- You added machines to your cluster.

**Procedure**

1. Confirm that the cluster recognizes the machines:

   ```
   $ oc get nodes
   ```

   **Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>64m</td>
<td>v1.23.0</td>
</tr>
</tbody>
</table>

   The output lists all of the machines that you created.

   **NOTE**

   The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

   ```
   $ oc get csr
   ```
Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-8b2br</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-8vnps</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in Pending status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the machine-approver if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the oc exec, oc rsh, and oc logs commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the node-bootstrapper service account in the system:node or system:admin groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  ```
  $ oc adm certificate approve <csr_name> 1
  
  <csr_name> is the name of a CSR from the list of current CSRs.
  ```

- To approve all pending CSRs, run the following command:

  ```
  $ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
  ```
4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

**NOTE**

*<csr_name>* is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}} {{end}}{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>74m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.23.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.23.0</td>
</tr>
</tbody>
</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.
Additional information

- For more information on CSRs, see Certificate Signing Requests.

7.5.21. Adding the Ingress DNS records

If you removed the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can create either a wildcard *.apps.{baseDomain} or specific records. You can use A, CNAME, and other records per your requirements.

Prerequisites

- You deployed an OpenShift Container Platform cluster on Microsoft Azure Stack Hub by using infrastructure that you provisioned.
- Install the OpenShift CLI (oc).
- Install or update the Azure CLI.

Procedure

1. Confirm the Ingress router has created a load balancer and populated the EXTERNAL-IP field:

   $ oc -n openshift-ingress get service router-default

   Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>router-default</td>
<td>LoadBalancer</td>
<td>172.30.20.10</td>
<td>35.130.120.110</td>
<td>80:32288/TCP,443:31215/TCP</td>
<td>20</td>
</tr>
</tbody>
</table>

2. Export the Ingress router IP as a variable:

   $ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`

   $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300

   $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300

3. Add a *.apps record to the DNS zone.

   a. If you are adding this cluster to a new DNS zone, run:

      $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps -a $PUBLIC_IP_ROUTER --ttl 300

   b. If you are adding this cluster to an already existing DNS zone, run:

      $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a $PUBLIC_IP_ROUTER --ttl 300

If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the cluster’s current routes:
7.5.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Microsoft Azure Stack Hub user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure Stack Hub infrastructure.
- Install the `oc` CLI and log in.

Procedure

- Complete the cluster installation:

  ```bash
  $ ./openshift-install --dir <installation_directory> wait-for install-complete
  ```

  **Example output**

  ```bash
  INFO Waiting up to 30m0s for the cluster to initialize...
  ```

  **1** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

7.6. UNINSTALLING A CLUSTER ON AZURE STACK HUB

You can remove a cluster that you deployed to Azure Stack Hub.

7.6.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.

- Have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

   ```
   $ ./openshift-install destroy cluster \
   --dir <installation_directory> --log-level info
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   2 To view different details, specify warn, debug, or error instead of info.
NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

1. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.
CHAPTER 8. INSTALLING ON GCP

8.1. PREPARING TO INSTALL ON GCP

8.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

8.1.2. Requirements for installing OpenShift Container Platform on GCP

Before installing OpenShift Container Platform on Google Cloud Platform (GCP), you must create a service account and configure a GCP project. See Configuring a GCP project for details about creating a project, enabling API services, configuring DNS, GCP account limits, and supported GCP regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for GCP for other options.

8.1.3. Choosing a method to install OpenShift Container Platform on GCP

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

8.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on GCP**: You can install OpenShift Container Platform on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on GCP**: You can install a customized cluster on GCP infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on GCP with network customizations**: You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on GCP in a restricted network**: You can install OpenShift Container Platform on GCP on installer-provisioned infrastructure by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an...
active internet connection to obtain the software components. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the GCP APIs.

- **Installing a cluster into an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing GCP Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits on creating new accounts or infrastructure.

- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing GCP VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

### 8.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on GCP infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on GCP with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP infrastructure that you provide. You can use the provided Deployment Manager templates to assist with the installation.

- **Installing a cluster with shared VPC on user-provisioned infrastructure in GCP** You can use the provided Deployment Manager templates to create GCP resources in a shared VPC infrastructure.

- **Installing a cluster on GCP in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP in a restricted network with user-provisioned infrastructure. By creating an internal mirror of the installation release content, you can install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content.

### 8.1.4. Next steps

- Configuring a GCP project

### 8.2. CONFIGURING A GCP PROJECT

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

#### 8.2.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

**Procedure**

- Create a project to host your OpenShift Container Platform cluster. See Creating and Managing Projects in the GCP documentation.
**IMPORTANT**

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the `api-int.<cluster_name>.<base_domain>` URL; the Premium Tier is required for internal load balancing.

8.2.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

**Prerequisites**

- You created a project to host your cluster.

**Procedure**

- Enable the following required API services in the project that hosts your cluster. See Enabling services in the GCP documentation.

<table>
<thead>
<tr>
<th>API service</th>
<th>Console service name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compute Engine API</td>
<td>compute.googleapis.com</td>
</tr>
<tr>
<td>Google Cloud APIs</td>
<td>cloudapis.googleapis.com</td>
</tr>
<tr>
<td>Cloud Resource Manager API</td>
<td>cloudresourcemanager.googleapis.com</td>
</tr>
<tr>
<td>Google DNS API</td>
<td>dns.googleapis.com</td>
</tr>
<tr>
<td>IAM Service Account Credentials API</td>
<td>iamcredentials.googleapis.com</td>
</tr>
<tr>
<td>Identity and Access Management (IAM) API</td>
<td>iam.googleapis.com</td>
</tr>
<tr>
<td>Service Management API</td>
<td>servicemanagement.googleapis.com</td>
</tr>
<tr>
<td>Service Usage API</td>
<td>serviceusage.googleapis.com</td>
</tr>
<tr>
<td>Google Cloud Storage JSON API</td>
<td>storage-api.googleapis.com</td>
</tr>
<tr>
<td>Cloud Storage</td>
<td>storage-component.googleapis.com</td>
</tr>
</tbody>
</table>

8.2.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform.
cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

   **NOTE**
   
   If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see Google Domains.

2. Create a public hosted zone for your domain or subdomain in your GCP project. See Creating public zones in the GCP documentation. Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

3. Extract the new authoritative name servers from the hosted zone records. See Look up your Cloud DNS name servers in the GCP documentation. You typically have four name servers.

4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: How to switch to custom name servers.

5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See Migrating to Cloud DNS in the GCP documentation.

6. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain. This process might include a request to your company’s IT department or the division that controls the root domain and DNS services for your company.

8.2.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default Quotas do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

<table>
<thead>
<tr>
<th>Table 8.2. GCP resources used in a default cluster</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service</td>
</tr>
<tr>
<td>---------</td>
</tr>
<tr>
<td>Service account</td>
</tr>
<tr>
<td>Firewall rules</td>
</tr>
<tr>
<td>Service</td>
</tr>
<tr>
<td>-------------------------</td>
</tr>
<tr>
<td>Forwarding rules</td>
</tr>
<tr>
<td>In-use global IP addresses</td>
</tr>
<tr>
<td>Health checks</td>
</tr>
<tr>
<td>Images</td>
</tr>
<tr>
<td>Networks</td>
</tr>
<tr>
<td>Static IP addresses</td>
</tr>
<tr>
<td>Routers</td>
</tr>
<tr>
<td>Routes</td>
</tr>
<tr>
<td>Subnetworks</td>
</tr>
<tr>
<td>Target pools</td>
</tr>
<tr>
<td>CPUs</td>
</tr>
<tr>
<td>Persistent disk SSD (GB)</td>
</tr>
</tbody>
</table>

**NOTE**

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- asia-east2
- asia-northeast2
- asia-south1
- australia-southeast1
You can increase resource quotas from the GCP console, but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

8.2.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See Creating a service account in the GCP documentation.

2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See Granting roles to a service account for specific resources.

   **NOTE**

   While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See Creating service account keys in the GCP documentation.
   The service account key is required to create a cluster.

8.2.5.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:
Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 8.3. GCP service account permissions

<table>
<thead>
<tr>
<th>Account</th>
<th>Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Plane</td>
<td>roles/compute.instanceAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.networkAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.securityAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
<tr>
<td></td>
<td>roles/iam.serviceAccountUser</td>
</tr>
<tr>
<td>Compute</td>
<td>roles/compute.viewer</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
</tbody>
</table>

8.2.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- asia-east1 (Changhua County, Taiwan)
- asia-east2 (Hong Kong)
- asia-northeast1 (Tokyo, Japan)
- asia-northeast2 (Osaka, Japan)
- asia-northeast3 (Seoul, South Korea)
- asia-south1 (Mumbai, India)
- asia-southeast1 (Jurong West, Singapore)
- asia-southeast2 (Jakarta, Indonesia)
- australia-southeast1 (Sydney, Australia)
- europe-central2 (Warsaw, Poland)
- europe-north1 (Hamina, Finland)
- europe-west1 (St. Ghislain, Belgium)
- europe-west2 (London, England, UK)
- europe-west3 (Frankfurt, Germany)
- europe-west4 (Eemshaven, Netherlands)
- europe-west6 (Zürich, Switzerland)
- northamerica-northeast1 (Montréal, Québec, Canada)
- northamerica-northeast2 (Toronto, Ontario, Canada)
- southamerica-east1 (São Paulo, Brazil)
- us-central1 (Council Bluffs, Iowa, USA)
- us-east1 (Moncks Corner, South Carolina, USA)
- us-east4 (Ashburn, Northern Virginia, USA)
- us-west1 (The Dalles, Oregon, USA)
- us-west2 (Los Angeles, California, USA)
- us-west3 (Salt Lake City, Utah, USA)
- us-west4 (Las Vegas, Nevada, USA)

8.2.7. Next steps

- Install an OpenShift Container Platform cluster on GCP. You can install a customized cluster or quickly install a cluster with default options.

8.3. MANUALLY CREATING IAM FOR GCP

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster kube-system namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.
8.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the credentialsMode parameter in the install-config.yaml file.

If you prefer not to store an administrator-level credential secret in the cluster kube-system project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use manual mode with GCP Workload Identity**
  You can use the CCO utility (ccoctl) to configure the cluster to use manual mode with GCP Workload Identity. When the CCO utility is used to configure the cluster for GCP Workload Identity, it signs service account tokens that provide short-term, limited-privilege security credentials to components.

  **NOTE**
  This credentials strategy is supported for only new OpenShift Container Platform clusters and must be configured during installation. You cannot reconfigure an existing cluster that uses a different credentials strategy to use this feature.

- **Manage cloud credentials manually**
  You can set the credentialsMode parameter for the CCO to Manual to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode**
  If you are using the CCO with the credentialsMode parameter set to Mint, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

  **NOTE**
  Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

Additional resources

- **Using manual mode with GCP Workload Identity**
- **Rotating or removing cloud provider credentials**

For a detailed description of all available CCO credential modes and their supported platforms, see About the Cloud Credential Operator.
8.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the **install-config.yaml** file:
   
   ```bash
   $ openshift-install create install-config --dir <installation_directory>
   
   where `<installation_directory>` is the directory in which the installation program creates files.
   
2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
   ...
   ```

   This line is added to set the **credentialsMode** parameter to **Manual**.

3. Generate the manifests by running the following command from the directory that contains the installation program:
   
   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   
   Specifies the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use:

   ```bash
   $ openshift-install version
   ```

   **Example output**

   ```
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on:
This command creates a YAML file for each `CredentialsRequest` object.

**Sample CredentialsRequest object**

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
name: openshift-image-registry-gcs
namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: GCPProviderSpec
    predefinedRoles:
    - roles/storage.admin
    - roles/iam.serviceAccountUser
    skipServiceCheck: true
```

6. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

**IMPORTANT**

The release image includes `CredentialsRequest` objects for Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set. You can identify these objects by their use of the `release.openshift.io/feature-gate: TechPreviewNoUpgrade` annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.
- If you are using any of these features, you must create secrets for the corresponding objects.

- To find `CredentialsRequest` objects with the `TechPreviewNoUpgrade` annotation, run the following command:

  ```bash
  $ grep "release.openshift.io/feature-gate" *
  ```

**Example output**

```bash
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate: TechPreviewNoUpgrade
```
7. From the directory that contains the installation program, proceed with your cluster creation:

```bash
$ openshift-install create cluster --dir <installation_directory>
```

**IMPORTANT**

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

Additional references

- Updating a cluster using the web console
- Updating a cluster using the CLI

### 8.3.3. Admin credentials root secret format

Each cloud provider uses a credentials root secret in the `kube-system` namespace by convention, which is then used to satisfy all credentials requests and create their respective secrets. This is done either by minting new credentials with `mint mode`, or by copying the credentials root secret with `passthrough mode`.

The format for the secret varies by cloud, and is also used for each `CredentialsRequest` secret.

#### Google Cloud Platform (GCP) secret format

```yaml
apiVersion: v1
kind: Secret
metadata:
  namespace: kube-system
  name: gcp-credentials
stringData:
  service_account.json: <ServiceAccount>
```

### 8.3.4. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform on platforms that support it. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the `admin` credential is stored in the `kube-system` namespace and then used by the CCO to process the `CredentialsRequest` objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires `admin` credential storage in a cluster `kube-system` secret.

### 8.3.5. Mint mode with removal or rotation of the administrator-level credential
Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all `CredentialsRequest` objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

### 8.3.6. Next steps

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on GCP with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure

### 8.4. INSTALLING A CLUSTER QUICKLY ON GCP

In OpenShift Container Platform version 4.10, you can install a cluster on Google Cloud Platform (GCP) that uses the default configuration options.

### 8.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.
8.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

8.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:
Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```text
   Agent pid 31874
   ```

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`.
Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

8.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

8.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**
You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:

   - The `GOOGLE_CREDENTIALS`, `GOOGLE_CLOUD_KEYFILE_JSON`, or `GPROJECT_KEYFILE_JSON` environment variables
   - The `~/.gcp/osServiceAccount.json` file
   - The gcloud cli default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   
   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.
   ```
IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

a. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

b. Select `gcp` as the platform to target.

c. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

d. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

e. Select the region to deploy the cluster to.

f. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

g. Enter a descriptive name for your cluster. If you provide a name that is longer than 6 characters, only the first 6 characters will be used in the infrastructure ID that is generated from the cluster name.

h. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
```
NOTE

The cluster access and credential information also outputs to
<installation_directory>/.openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.

   - If you assigned the Owner role to your service account, you can remove that role and replace it with the Viewer role.

   - If you included the Service Account Key Admin role, you can remove it.

8.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.
Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.

4. Unpack the archive:

   $ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

$ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.

   To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the OpenShift CLI, it is available using the oc command:

C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your **PATH**, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   ```

   **8.4.7. Logging in to the cluster by using the CLI**

   You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

   **Prerequisites**

   - You deployed an OpenShift Container Platform cluster.
   - You installed the `oc` CLI.

   **Procedure**

   1. Export the `kubeadmin` credentials:

      ```
      $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
      ```

      For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   2. Verify you can run `oc` commands successfully using the exported configuration:

      ```
      $ oc whoami
      ```

      **Example output**

      ```
      system:admin
      ```

   **Additional resources**

   - See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

   **8.4.8. Telemetry access for OpenShift Container Platform**
In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources
- See About remote health monitoring for more information about the Telemetry service

8.4.9. Next steps
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

8.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Google Cloud Platform (GCP). To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

8.5.1. Prerequisites
- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

8.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:
- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

8.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

      **Example output**

      Agent pid 31874

      **NOTE**

      If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>  

   Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

   **Example output**

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

5. Set the **GOOGLE_APPLICATION_CREDENTIALS** environment variable to the full path to your service account private key file.

   $ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"

6. Verify that the credentials were applied.

   $ gcloud auth list
Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

8.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

8.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).
**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.
   
a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   **IMPORTANT**
   
   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      
      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**
      
      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select `gcp` as the platform to target.

      iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

      iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

      v. Select the region to deploy the cluster to.

      vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

      vii. Enter a descriptive name for your cluster.
viii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the install-config.yaml file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.

**IMPORTANT**

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 8.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the install-config.yaml installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the install-config.yaml file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the install-config.yaml file.

#### 8.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the install-config.yaml content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;, &lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <strong>ObjectMeta</strong>, from which only the <strong>name</strong> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>

</table>

8.5.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 8.5. Network parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
Parameter | Description | Values
--- | --- | ---
**networking.machineNetwork.cidr** | Required if you use `networking.machineNetwork`. An IP address block. The default value is **10.0.0.0/16** for all platforms other than libvirt. For libvirt, the default value is **192.168.126.0/24**. | An IP network block in CIDR notation. For example, **10.0.0.0/16**.

**NOTE**
Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

---

### 8.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

#### Table 8.6. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>additionalTrustBundle</strong></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><strong>cgroupsV2</strong></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><strong>true</strong></td>
</tr>
<tr>
<td><strong>compute</strong></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td><strong>compute.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
compute.hypertreading  Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

</tbody>
</table>
Sources and repositories for the release-image content. Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.

Required if you use `imageContentSources`. Specify the repository that users refer to, for example, in image pull specifications.

Specify one or more repositories that may also contain the same images.

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

### 8.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 8.7. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.gcp.network</td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>platform.gcp.region</td>
<td>The name of the GCP region that hosts your cluster.</td>
<td>Any valid region name, such as <code>us-central1</code>.</td>
</tr>
<tr>
<td>platform.gcp.type</td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td>platform.gcp.zones</td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td>platform.gcp.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.computeSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.licenses</td>
<td>A list of license URLs that must be applied to the compute images.</td>
<td>Any license available with the license API, such as the license to enable nested virtualization. You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.</td>
</tr>
<tr>
<td>platform.gcp.osDisk.diskSizeGB</td>
<td>The size of the disk in gigabytes (GB).</td>
<td>Any size between 16 GB and 65536 GB.</td>
</tr>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Description</strong></td>
<td><strong>Values</strong></td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>---------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>platform.gcp.osDisk.disk.Type</code></td>
<td>The type of disk.</td>
<td>Either the default <strong>pd-ssd</strong> or the <strong>pd-standard</strong> disk type. The control plane nodes must be the <strong>pd-ssd</strong> disk type. The worker nodes can be either type.</td>
</tr>
<tr>
<td><code>controlPlane.platfrom.gcp.osDisk.encryptKey.kmsKey.name</code></td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td><code>controlPlane.platfrom.gcp.osDisk.encryptKey.kmsKey.keyRing</code></td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td><code>controlPlane.platfrom.gcp.osDisk.encryptKey.kmsKey.location</code></td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on <a href="https://cloud.google.com/kms/docs/locations">Cloud KMS locations</a>.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlePlane.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
</tbody>
</table>
### 8.5.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 8.5.5.3. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.
IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-ssd
        diskSizeGB: 1024
        encryptionKey:
          kmsKey:
            name: worker-key
            keyRing: test-machine-keys
            location: global
            projectID: project-id
  replicas: 3
compute:
  - hyperthreading: Enabled
    name: worker
    platform:
      gcp:
        type: n2-standard-4
        zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-standard
        diskSizeGB: 128
        encryptionKey:
          kmsKey:
            name: worker-key
            keyRing: test-machine-keys
            location: global
            projectID: project-id
  replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
```
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, - , and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as n1-standard-8, for your machines if you disable simultaneous multithreading.

Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the service-<project_number>-@compute-system.iam.gserviceaccount.com pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

8.5.6. Additional resources

- Enabling customer-managed encryption keys for a machine set

8.5.6.1. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
noProxy: example.com
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
```

...
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

8.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
- The `GOOGLE_CREDENTIALS`, `GOOGLE_CLOUD_KEYFILE_JSON`, or `GCloud_KEYFILE_JSON` environment variables
- The `~/.gcp/osServiceAccount.json` file
- The `gcloud cli` default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> --log-level=info
```

1. For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
   - If you assigned the Owner role to your service account, you can remove that role and replace it with the Viewer role.
   - If you included the Service Account Key Admin role, you can remove it.

8.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure
2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
   
   $ tar xvzf <file>
5. Place the \texttt{oc} binary in a directory that is on your \texttt{PATH}.
   To check your \texttt{PATH}, execute the following command:

   \begin{verbatim}
   $ echo $PATH
   \end{verbatim}

   After you install the OpenShift CLI, it is available using the \texttt{oc} command:

   \begin{verbatim}
   $ oc <command>
   \end{verbatim}

\textbf{Installing the OpenShift CLI on Windows}

You can install the OpenShift CLI (\texttt{oc}) binary on Windows by using the following procedure.

\textbf{Procedure}

2. Select the appropriate version in the \texttt{Version} drop-down menu.

3. Click \texttt{Download Now} next to the \texttt{OpenShift v4.10 Windows Client} entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the \texttt{oc} binary to a directory that is on your \texttt{PATH}.
   To check your \texttt{PATH}, open the command prompt and execute the following command:

   \begin{verbatim}
   C:\> path
   \end{verbatim}

   After you install the OpenShift CLI, it is available using the \texttt{oc} command:

   \begin{verbatim}
   C:\> oc <command>
   \end{verbatim}

\textbf{Installing the OpenShift CLI on macOS}

You can install the OpenShift CLI (\texttt{oc}) binary on macOS by using the following procedure.

\textbf{Procedure}

2. Select the appropriate version in the \texttt{Version} drop-down menu.

3. Click \texttt{Download Now} next to the \texttt{OpenShift v4.10 MacOSX Client} entry and save the file.

4. Unpack and unzip the archive.

5. Move the \texttt{oc} binary to a directory on your \texttt{PATH}.
   To check your \texttt{PATH}, open a terminal and execute the following command:

   \begin{verbatim}
   $ echo $PATH
   \end{verbatim}

   After you install the OpenShift CLI, it is available using the \texttt{oc} command:
8.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   `system:admin`

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

8.5.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager**.

After you confirm that your **OpenShift Cluster Manager** inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service
8.5.11. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

8.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Google Cloud Platform (GCP). By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

You must set most of the network configuration parameters during installation, and you can modify only `kubeProxy` configuration parameters in a running cluster.

8.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

8.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

8.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>

1 Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

$ cat <path>/<file_name>.pub

For example, run the following to view the ~/.ssh/id_rsa.pub public key:

$ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

$ eval "$(ssh-agent -s)"

Example output

Agent pid 31874

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

$ ssh-add <path>/<file_name>

Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

5. Set the GOOGLE_APPLICATION_CREDENTIALS environment variable to the full path to your service account private key file.

$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"

6. Verify that the credentials were applied.

$ gcloud auth list
Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

8.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

8.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).
Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   
   a. Change to the directory that contains the installation program and run the following command:

   ```sh
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select `gcp` as the platform to target.

   iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

   iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

   v. Select the region to deploy the cluster to.

   vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

   vii. Enter a descriptive name for your cluster.
viii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

8.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

8.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <strong>ObjectMeta</strong>, from which only the <strong>name</strong> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or {}. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;cloud.openshift.com&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;quay.io&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

8.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 8.9. Network parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clustersNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
networking.machineNetwork.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation. For example, 10.0.0.0/16.

NOTE

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

8.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 8.10. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
Sources and repositories for the release-image content.

Array of objects. Includes a `source` and, optionally, `mirrors`, as described in the following rows of this table.

**imageContentSources**

Required if you use `imageContentSources`. Specify the repository that users refer to, for example, in image pull specifications.

String

**imageContentSources.source**

Specify one or more repositories that may also contain the same images.

Array of strings

**imageContentSources.mirrors**

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

**internal** or **external**. To deploy a private cluster, which cannot be accessed from the internet, set `publish` to **internal**. The default value is **external**.

**publish**

The SSH key or keys to authenticate access your cluster machines.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

**sshKey**

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

8.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 8.11. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.gcp.network</code></td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>platform.gcp.region</code></td>
<td>The name of the GCP region that hosts your cluster.</td>
<td>Any valid region name, such as <code>us-central1</code></td>
</tr>
<tr>
<td><code>platform.gcp.type</code></td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td><code>platform.gcp.zones</code></td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>platform.gcp.controlPlaneSubnet</code></td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td><code>platform.gcp.computeSubnet</code></td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td><code>platform.gcp.licenses</code></td>
<td>A list of license URLs that must be applied to the compute images.</td>
<td>Any license available with the license API, such as the license to enable nested virtualization. You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

The `licenses` parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.

<p>| <code>platform.gcp.osDisk.diskSizeGB</code> | The size of the disk in gigabytes (GB).                                      | Any size between 16 GB and 65536 GB.                                                             |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.gcp.osDisk.disk Type</td>
<td>The type of disk.</td>
<td>Either the default <strong>pd-ssd</strong> or the <strong>pd-standard</strong> disk type. The control plane nodes must be the <strong>pd-ssd</strong> disk type. The worker nodes can be either type.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyName</td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyId</td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on <a href="https://cloud.google.com/kms/docs/locations">Cloud KMS locations</a>.</td>
<td>The GCP location for the key ring.</td>
</tr>
</tbody>
</table>
8.6.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th>Machine</th>
<th>Operating System</th>
<th>vCPU</th>
<th>Virtual RAM</th>
<th>Storage</th>
<th>IOPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

8.6.5.3. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.
IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      osDisk:
        diskType: pd-ssd
        diskSizeGB: 1024
        encryptionKey:
          kmsKey:
            name: worker-key
            keyRing: test-machine-keys
            location: global
            projectID: project-id
  replicas: 3
compute:
  - hyperthreading: Enabled
    name: worker
    platform:
      gcp:
        type: n2-standard-4
        zones:
          - us-central1-a
          - us-central1-c
      osDisk:
        diskType: pd-standard
        diskSizeGB: 128
        encryptionKey:
          kmsKey:
            name: worker-key
            keyRing: test-machine-keys
            location: global
            projectID: project-id
  replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    - cidr: 10.0.0.0/16
  machineNetwork:
  networkType: OpenShiftSDN
```
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as n1-standard-8, for your machines if you disable simultaneous multithreading.

Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the service-<project_number>@compute-system.iam.gserviceaccount.com pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

8.6.6. Additional resources

- Enabling customer-managed encryption keys for a machine set

8.6.6.1. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
  ...
```
1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 8.6.7. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

**Phase 1**

You can customize the following network-related fields in the install-config.yaml file before you create the manifest files:

- networking.networkType
- networking.clusterNetwork
- networking.serviceNetwork
- networking.machineNetwork

For more information on these fields, refer to Installation configuration parameters.
Phase 2

After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 8.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```shell
   $ ./openshift-install create manifests --dir <installation_directory>
   ``

   `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   ``

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

   ```yaml
   Specify a different VXLAN port for the OpenShift SDN network provider
   ```
Enable IPsec for the OVN-Kubernetes network provider

Optional: Back up the manifests/cluster-network-03-config.yml file. The installation program consumes the manifests/ directory when you create the Ignition config files.

8.6.9. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named cluster. The CR specifies the fields for the Network API in the operator.openshift.io API group.

The CNO configuration inherits the following fields during cluster installation from the Network API in the Network.config.openshift.io API group and these fields cannot be changed:

clusterNetwork
   IP address pools from which pod IP addresses are allocated.

serviceNetwork
   IP address pool for services.

defaultNetwork.type
   Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the defaultNetwork object in the CNO object named cluster.

8.6.9.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always cluster.</td>
</tr>
</tbody>
</table>
spec.clusterNetwork

A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:

```
spec:
  clusterNetwork:
    - cidr: 10.128.0.0/19
      hostPrefix: 23
    - cidr: 10.128.32.0/19
      hostPrefix: 23
```

You can customize this field only in the `install-config.yml` file before you create the manifests. The value is read-only in the manifest file.

spec.serviceNetwork

A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:

```
spec:
  serviceNetwork:
    - 172.30.0.0/14
```

You can customize this field only in the `install-config.yml` file before you create the manifests. The value is read-only in the manifest file.

defaultNetwork object configuration

The values for the `defaultNetwork` object are defined in the following table:

**Table 8.13. defaultNetwork object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
</tbody>
</table>
|                        |           | spec:
|                        |           |  clusterNetwork:
|                        |           |    - cidr: 10.128.0.0/19
|                        |           |      hostPrefix: 23
|                        |           |    - cidr: 10.128.32.0/19
|                        |           |      hostPrefix: 23
| spec.serviceNetwork    | array     | A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example: |
|                        |           | spec:
|                        |           |  serviceNetwork:
|                        |           |    - 172.30.0.0/14
| spec.defaultNetwork    | object    | Configures the Container Network Interface (CNI) cluster network provider for the cluster network. |
| spec.kubeProxyConfig   | object    | The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect. |
Either **OpenShiftSDN** or **OVNKubernetes**. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.

**NOTE**

OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>openshiftSDNConfig</th>
<th>object</th>
<th>This object is only valid for the OpenShift SDN cluster network provider.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

**Configuration for the OpenShift SDN CNI cluster network provider**

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 8.14. openshiftSDNConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>. The values <strong>Multitenant</strong> and <strong>Subnet</strong> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>
The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.

This value cannot be changed after cluster installation.

The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.

If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 8.15. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultNetwork</td>
<td>object</td>
<td></td>
</tr>
<tr>
<td>openshiftSDNConfig</td>
<td>object</td>
<td></td>
</tr>
<tr>
<td>mode</td>
<td>string</td>
<td>NetworkPolicy</td>
</tr>
<tr>
<td>mtu</td>
<td>integer</td>
<td></td>
</tr>
<tr>
<td>vxlanPort</td>
<td>integer</td>
<td></td>
</tr>
</tbody>
</table>
### mtu

**Type:** integer  

The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

### genevePort

**Type:** integer  

The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.

### ipsecConfig

**Type:** object  

Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.

### policyAuditConfig

**Type:** object  

Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

### gatewayConfig

**Type:** object  

Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.

**NOTE**

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Table 8.16. policyAuditConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.</td>
</tr>
</tbody>
</table>
One of the following additional audit log targets:

**libc**

The libc `syslog()` function of the journald process on the host.

**udp:<host>:<port>**

A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.

**unix:<file>**

A Unix Domain Socket file specified by `<file>`.

**null**

Do not send the audit logs to any additional target.

Table 8.17. `gatewayConfig` object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to <code>true</code> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <code>false</code>. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <code>true</code>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

Example OVN-Kubernetes configuration with IPSec enabled

```yaml
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}

kubeProxyConfig object configuration
The values for the `kubeProxyConfig` object are defined in the following table:

Table 8.18. `kubeProxyConfig` object
```
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iptablesSyncPeriod</td>
<td>string</td>
<td>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</td>
</tr>
<tr>
<td>proxyArguments.iptables-min-sync-period</td>
<td>array</td>
<td>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is: kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</td>
</tr>
</tbody>
</table>

#### NOTE

Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptablesSyncPeriod parameter is no longer necessary.

---

### 8.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> --log-level=info
   ```
For `<installation_directory>`, specify the

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.
8.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
   
   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:
   
   $ echo $PATH

After you install the OpenShift CLI, it is available using the oc command:

$ oc <command>

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   
   C:\> path
After you install the OpenShift CLI, it is available using the `oc` command:

```
C:> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.

   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 8.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```
Example output

```
  system:admin
```

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

8.6.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

8.6.14. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

8.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK

In OpenShift Container Platform 4.10, you can install a cluster on Google Cloud Platform (GCP) in a restricted network by creating an internal mirror of the installation release content on an existing Google Virtual Private Cloud (VPC).

**IMPORTANT**

You can install an OpenShift Container Platform cluster by using mirrored installation release content, but your cluster will require internet access to use the GCP APIs.

8.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update processes](#).
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the [imageContentSources](#) data for your version of OpenShift Container Platform.
Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in GCP. While installing a cluster in a restricted network that uses installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere

- If you use a firewall, you configured it to allow the sites that your cluster requires access to. While you might need to grant access to more sites, you must grant access to *.googleapis.com and accounts.google.com.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

8.7.2. About installations in restricted networks

In OpenShift Container Platform 4.10, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s IAM service, require internet access, so you might still require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

8.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The ClusterVersion status includes an Unable to retrieve available updates error.

- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

8.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:
Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

Access Quay.io to obtain the packages that are required to install your cluster.

Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

8.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.
NOTE
If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the /openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

      Example output

      Agent pid 31874

      NOTE
      If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>

   1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

   Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

5. Set the GOOGLE_APPLICATION_CREDENTIALS environment variable to the full path to your service account private key file.
6. Verify that the credentials were applied.

$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"

$ gcloud auth list

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

8.7.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the `imageContentSources` values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory>
```

   IMPORTANT

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

ii. Select gcp as the platform to target.

iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

v. Select the region to deploy the cluster to.

vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

vii. Enter a descriptive name for your cluster.

viii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Edit the install-config.yaml file to provide the additional information that is required for an installation in a restricted network.

a. Update the pullSecret value to contain the authentication information for your registry:

```yaml
pullSecret: \{"auths\":\{"<mirror_host_name>:5000\": \{"auth": \"<credentials>\", \"email\": \"you@example.com\"\}\}\}
```

For `<mirror_host_name>`, specify the registry domain name that you specified in the certificate for your mirror registry, and for `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

b. Add the additionalTrustBundle parameter and value:

```yaml
additionalTrustBundle:
    -----BEGIN CERTIFICATE-----
    ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
For `platform.gcp.network`, specify the name for the existing Google VPC. For `platform.gcp.controlPlaneSubnet` and `platform.gcp.computeSubnet`, specify the existing subnets to deploy the control plane machines and compute machines, respectively.

d. Add the image content resources, which look like this excerpt:

```yaml
imageContentSources:
  - mirrors:
    - <mirror_host_name>:5000/<repo_name>/release
      source: quay.example.com/openshift-release-dev/ocp-release
    - mirrors:
      - <mirror_host_name>:5000/<repo_name>/release
        source: registry.example.com/ocp/release
```

To complete these values, use the `imageContentSources` that you recorded during mirror registry creation.

3. Make any other modifications to the `install-config.yaml` file that you require. You can find more information about the available parameters in the Installation configuration parameters section.

4. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 8.7.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 8.7.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 8.19. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>{baseDomain}</code> and <code>{metadata.name}</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td></td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{.metadata.name}</code>. <code>{.baseDomain}</code>.</td>
<td>String of lowercase letters, hyphens (<code>-</code>), and periods (<code>.</code>), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>ibmcloud</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 8.7.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 8.20. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
</tbody>
</table>

The default value is 10.128.0.0/14 with a host prefix of /23.

If you specify multiple IP address blocks, the blocks must not overlap.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^{32 - 23} - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
</tbody>
</table>
|                                               | The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network. | networking:
|                                               | serviceNetwork:                                                            | - 172.30.0.0/16                                                        |

<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td><strong>Mint, Passthrough, Manual</strong>, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Platform Operators reference content.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageContentSources</code></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><code>imageContentSources.mirrors</code></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><code>publish</code></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to Internal. The default value is External.</td>
</tr>
<tr>
<td><code>sshKey</code></td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example: sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</td>
</tr>
</tbody>
</table>

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

#### 8.7.5.14. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 8.22. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.gcp.network</code></td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>platform.gcp.region</td>
<td>The name of the GCP region that hosts your cluster.</td>
<td>Any valid region name, such as <code>us-central1</code>.</td>
</tr>
<tr>
<td>platform.gcp.type</td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td>platform.gcp.zones</td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td>platform.gcp.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.computeSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.licenses</td>
<td>A list of license URLs that must be applied to the compute images. IMPORTANT The <code>licenses</code> parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</td>
<td>Any license available with the license API, such as the license to enable nested virtualization. You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.</td>
</tr>
<tr>
<td>platform.gcp.osDisk.diskSizeGB</td>
<td>The size of the disk in gigabytes (GB).</td>
<td>Any size between 16 GB and 65536 GB.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>platform.gcp.osDisk.diskType</code></td>
<td>The type of disk.</td>
<td>Either the default <code>pd-ssd</code> or the <code>pd-standard</code> disk type. The control plane nodes must be the <code>pd-ssd</code> disk type. The worker nodes can be either type.</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyName</code></td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing</code></td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.location</code></td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on <a href="https://cloud.google.com/kms/docs/locations">Cloud KMS locations</a>.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyId</code></td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyId.name</code></td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyId.keyRing</code></td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyId.location</code></td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
</tbody>
</table>
For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.

The GCP project ID.

### 8.7.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 7.9, or RHEL 8.4 [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 8.7.5.3. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.
IMPORTANT
This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane: 
  hypethreading: Enabled
name: master
platform:
gcp:
  type: n2-standard-4
  zones:
    - us-central1-a
    - us-central1-c
osDisk:
  diskType: pd-ssd
diskSizeGB: 1024
encryptionKey: 
kmsKey:
  name: worker-key
  keyRing: test-machine-keys
  location: global
  projectID: project-id
replicas: 3
compute:
  - hypethreading: Enabled
name: worker
platform:
gcp:
  type: n2-standard-4
  zones:
    - us-central1-a
    - us-central1-c
osDisk:
  diskType: pd-standard
diskSizeGB: 128
encryptionKey: 
kmsKey:
  name: worker-key
  keyRing: test-machine-keys
  location: global
  projectID: project-id
replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
  hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
```

OpenShift Container Platform 4.10 Installing
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as n1-standard-8, for your machines if you disable simultaneous multithreading.

Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the service-<project_number>@compute-system.iam.gserviceaccount.com pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP". 
Specify the name of an existing VPC.

Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.

Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.

For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

Provide the contents of the certificate file that you used for your mirror registry.

Provide the `imageContentSources` section from the output of the command to mirror the repository.

### 8.7.5.4. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

**Prerequisites**

- You created the `install-config.yaml` and complete any modifications to it.

**Procedure**

Create an Ingress Controller with global access on a new GCP cluster.

1. Change to the directory that contains the installation program and create a manifest file:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```
For `<installation_directory>`, specify the name of the directory that contains the `install-config.yaml` file for your cluster.

After creating the file, several network configuration files are in the `manifests/` directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

**Example output**

```
cluster-ingress-default-ingresscontroller.yaml
```

2. Open the `cluster-ingress-default-ingresscontroller.yaml` file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

**Sample clientAccess configuration to Global**

```
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global
          type: GCP
          scope: Internal
          type: LoadBalancerService
```

2. Global access is only available to Ingress Controllers using internal load balancers.

### 8.7.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ¹
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ²
  noProxy: example.com ³
additionalTrustBundle: | ⁴
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

¹ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

² A proxy URL to use for creating HTTPS connections outside the cluster.

³ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

⁴ If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.
NOTE

Only the Proxy object named cluster is supported, and no additional proxies can be created.

8.7.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
   - The GOOGLE_CREDENTIALS, GOOGLE_CLOUD_KEYFILE_JSON, or GCP_KEYFILE_JSON environment variables
   - The ~/.gcp/osServiceAccount.json file
   - The gcloud cli default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

   $ ./openshift-install create cluster --dir <installation_directory> \[1
   --log-level=info  \[2

   [1] For <installation_directory>, specify the location of your customized ./install-config.yaml file.

   [2] To view different installation details, specify warn, debug, or error instead of info.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the kubeadmin user, display in your terminal.
Example output

... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-W15AL"
INFO Time elapsed: 36m22s

NOTE
The cluster access and credential information also outputs to 
<installation_directory>/openshift_install.log when an installation succeeds.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

IMPORTANT
You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.

  - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.

  - If you included the **Service Account Key Admin** role, you can remove it.

8.7.7. Installing the OpenShift CLI by downloading the binary
You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.
IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Linux Client entry and save the file.
4. Unpack the archive:
   ```
   $ tar xvzf <file>
   ```
5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:
   ```
   $ echo $PATH
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   ```

After you install the OpenShift CLI, it is available using the oc command:

```
C:\> oc <command>
```
Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.10 MacOSX Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ``

After you install the OpenShift CLI, it is available using the oc command:

```
$ oc <command>
```

8.7.8. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```
   
   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output
   ```
   system:admin
   ```
8.7.9. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:

  ```bash
  $ oc patch OperatorHub cluster --type json \-p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
  ```

TIP

Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Configuration → OperatorHub page, click the Sources tab, where you can create, delete, disable, and enable individual sources.

8.7.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager.

After you confirm that your OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

8.7.11. Next steps

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the `must-gather` tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.

8.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC

In OpenShift Container Platform version 4.10, you can install a cluster into an existing Virtual Private Cloud (VPC) on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify
parameters in the `install-config.yaml` file before you install the cluster.

8.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

8.8.2. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Virtual Private Cloud (VPC) in Google Cloud Platform (GCP). By deploying OpenShift Container Platform into an existing GCP VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option. You must configure networking for the subnets.

8.8.2.1. Requirements for using your VPC

The union of the VPC CIDR block and the machine network CIDR must be non-empty. The subnets must be within the machine network.

The installation program does not create the following components:

- NAT gateways
- Subnets
- Route tables
- VPC network

8.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide one subnet for control-plane machines and one subnet for compute machines.
- The subnet’s CIDRs belong to the machine CIDR that you specified.

8.8.2.3. Division of permissions
Some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

8.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed to the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

8.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

8.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.
If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```bash
$ ssh-add /path/to/file
```

Example output

```
Identity added: /home/<you>/path/to/file (<computer_name>)
```

5. Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```bash
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>
```

6. Verify that the credentials were applied.

```bash
$ gcloud auth list
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

8.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 8.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   1. **For `<installation_directory>`**, specify the directory name to store the files that the installation program creates.
b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select `gcp` as the platform to target.

iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

v. Select the region to deploy the cluster to.

vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

vii. Enter a descriptive name for your cluster.

viii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the “Installation configuration parameters” section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 8.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.
NOTE
After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 8.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 8.23. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}, {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
platform

The configuration for the specific platform upon which to perform the installation: **alibabacloud, aws, baremetal, azure, ibmcloud, openstack, ovirt, vsphere, or {}**. For additional information about *platform.<platform>* parameters, consult the table for your specific platform that follows.

## pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 8.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 8.24. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>

**Parameter**: Network configuration parameters

**Description**: You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

**Values**: Only IPv4 addresses are supported.

**Table 8.24. Network parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
</tr>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider</td>
<td>Either <code>OpenShiftSDN</code> or <code>OVNKubernetes</code>. The default value is <code>OpenShiftSDN</code>.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is <code>10.128.0.0/14</code> with a host prefix of <code>/23</code>.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: <code>10.128.0.0/14</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- hostPrefix: <code>23</code></td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR notation). The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An IPv4 network.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to <code>23</code> then each node is assigned a <code>/23</code> subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of <code>23</code> provides 510 ($2^{(32 - 23)} - 2$) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default value is <code>23</code>.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is <code>172.30.0.0/16</code>.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking: serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>172.30.0.0/16</code></td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: <code>10.0.0.0/16</code></td>
</tr>
</tbody>
</table>
networking.machineNetwork.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation. For example, 10.0.0.0/16.

NOTE

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

8.8.6.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 8.25. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibaba, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td><code>controlPlane.architec ture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------</td>
