OpenShift Container Platform 4.11

Installing

Installing and configuring OpenShift Container Platform clusters
OpenShift Container Platform 4.11 Installing

Installing and configuring OpenShift Container Platform clusters
Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.
Table of Contents

CHAPTER 1. OPENSIFHT CONTAINER PLATFORM INSTALLATION OVERVIEW ........................................ 70
  1.1. ABOUT OPENSIFHT CONTAINER PLATFORM INSTALLATION ........................................ 70
      1.1.1. About the installation program ........................................ 70
      1.1.2. About Red Hat Enterprise Linux CoreOS (RHCOS) ......................... 71
      1.1.3. Glossary of common terms for OpenShift Container Platform installing ........................................ 71
      1.1.4. Installation process
      The installation process with installer-provisioned infrastructure ............. 73
      The installation process with user-provisioned infrastructure .................. 74
      Installation process details ........................................ 74
      1.1.5. Verifying node state after installation ........................................ 76
      Installation scope ........................................ 77
      1.1.6. OpenShift Local overview ........................................ 77
  1.2. SUPPORTED PLATFORMS FOR OPENSIFHT CONTAINER PLATFORM CLUSTERS ...................... 78

CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS .......... 80
  2.1. SELECTING A CLUSTER INSTALLATION TYPE ........................................ 80
      2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself? ................. 80
      2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4? ....... 81
      2.1.3. Do you want to use existing components in your cluster? ........................................ 81
      2.1.4. Do you need extra security for your cluster? ........................................ 82
  2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION ........................................ 82
  2.3. PREPARING YOUR CLUSTER FOR WORKLOADS ........................................ 82
  2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS ........................................ 83

CHAPTER 3. DISCONNECTED INSTALLATION MIRRORING ................................................................. 88
  3.1. ABOUT DISCONNECTED INSTALLATION MIRRORING ....................................................... 88
      3.1.1. Creating a mirror registry ........................................ 88
      3.1.2. Mirroring images for a disconnected installation ........................................ 88
  3.2. CREATING A MIRROR REGISTRY WITH MIRROR REGISTRY FOR RED HAT OPENSIFHT ....... 88
      3.2.1. Prerequisites ........................................ 88
      3.2.2. Mirror registry for Red Hat OpenShift introduction ........................................ 89
      3.2.2.1. Mirror registry for Red Hat OpenShift limitations ........................................ 89
      3.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift ......... 90
      3.2.4. Updating mirror registry for Red Hat OpenShift from a local host ................................. 91
      3.2.5. Mirroring on a remote host with mirror registry for Red Hat OpenShift .............. 91
      3.2.6. Updating mirror registry for Red Hat OpenShift from a remote host .............. 92
      3.2.7. Replacing mirror registry for Red Hat OpenShift SSL/TLS certificates .............. 93
      3.2.8. Uninstalling the mirror registry for Red Hat OpenShift ........................................ 94
      3.2.9. Mirror registry for Red Hat OpenShift flags ........................................ 94
      3.2.10. Mirror registry for Red Hat OpenShift release notes ........................................ 95
      3.2.10.1. Mirror registry for Red Hat OpenShift 1.3.10 ........................................ 96
      3.2.10.2. Mirror registry for Red Hat OpenShift 1.3.9 ........................................ 96
      3.2.10.3. Mirror registry for Red Hat OpenShift 1.3.8 ........................................ 96
      3.2.10.4. Mirror registry for Red Hat OpenShift 1.3.7 ........................................ 96
      3.2.10.5. Mirror registry for Red Hat OpenShift 1.3.6 ........................................ 96
      3.2.10.6. Mirror registry for Red Hat OpenShift 1.3.5 ........................................ 97
      3.2.10.7. Mirror registry for Red Hat OpenShift 1.3.4 ........................................ 97
      3.2.10.8. Mirror registry for Red Hat OpenShift 1.3.3 ........................................ 97
      3.2.10.9. Mirror registry for Red Hat OpenShift 1.3.2 ........................................ 97
      3.2.10.10. Mirror registry for Red Hat OpenShift 1.3.1 ........................................ 97
      3.2.10.11. Mirror registry for Red Hat OpenShift 1.3.0 ........................................ 97
3.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

3.3.1. Prerequisites

3.3.2. About the mirror registry

3.3.3. Preparing your mirror host

3.3.3.1. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS

3.3.4. Configuring credentials that allow images to be mirrored

3.3.5. Mirroring the OpenShift Container Platform image repository

3.3.6. The Cluster Samples Operator in a disconnected environment

3.3.6.1. Cluster Samples Operator assistance for mirroring

3.3.7. Mirroring Operator catalogs for use with disconnected clusters

3.3.7.1. Prerequisites

3.3.7.2. Extracting and mirroring catalog contents
  3.3.7.2.1. Mirroring catalog contents to registries on the same network
  3.3.7.2.2. Mirroring catalog contents to airgapped registries

3.3.7.3. Generated manifests

3.3.7.4. Postinstallation requirements

3.3.8. Next steps

3.3.9. Additional resources

3.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUGIN

3.4.1. About the oc-mirror plugin

3.4.2. oc-mirror compatibility and support

3.4.3. About the mirror registry

3.4.4. Prerequisites

3.4.5. Preparing your mirror hosts

3.4.5.1. Installing the oc-mirror OpenShift CLI plugin

3.4.5.2. Configuring credentials that allow images to be mirrored

3.4.6. Creating the image set configuration

3.4.7. Mirroring an image set to a mirror registry

3.4.7.1. Mirroring an image set in a partially disconnected environment
  3.4.7.1.1. Mirroring from mirror to mirror
  3.4.7.1.2. Mirroring from mirror to disk

3.4.7.2. Mirroring an image set in a fully disconnected environment

3.4.8. Next steps

3.4.9. Additional resources
3.4.7.2.2. Mirroring from disk to mirror
3.4.8. Configuring your cluster to use the resources generated by oc-mirror
3.4.9. Keeping your mirror registry content updated
   3.4.9.1. About updating your mirror registry content
      Adding new and updated images
      Pruning images
   3.4.9.2. Updating your mirror registry content
3.4.10. Performing a dry run
3.4.11. Image set configuration parameters
3.4.12. Image set configuration examples
   Use case: Including arbitrary images and helm charts
   Use case: Including Operator versions from a minimum to the latest
   Use case: Including the shortest OpenShift Container Platform upgrade path
   Use case: Including all versions of OpenShift Container Platform from a minimum to the latest
   Use case: Including Operator versions from a minimum to a maximum
3.4.13. Command reference for oc-mirror
3.4.14. Additional resources

CHAPTER 4. INSTALLING ON ALIBABA .................................................. 144
4.1. PREPARING TO INSTALL ON ALIBABA CLOUD .......................... 144
   4.1.1. Prerequisites .................................................................... 144
   4.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud 144
   4.1.3. Registering and Configuring Alibaba Cloud Domain .......... 144
   4.1.4. Supported Alibaba regions ............................................... 145
   4.1.5. Next steps ...................................................................... 145
4.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES .......... 145
   4.2.1. Creating the required RAM user ...................................... 145
   4.2.2. Configuring the Cloud Credential Operator utility ........... 150
   4.2.3. Next steps ...................................................................... 151
4.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD ................. 151
   4.3.1. Prerequisites .................................................................... 152
   4.3.2. Internet access for OpenShift Container Platform ............. 152
   4.3.3. Generating a key pair for cluster node SSH access .......... 152
   4.3.4. Obtaining the installation program .................................. 154
   4.3.5. Creating the installation configuration file ...................... 155
   4.3.6. Generating the required installation manifests ................. 157
   4.3.7. Creating credentials for OpenShift Container Platform components with the ccoctl tool 157
   4.3.8. Deploying the cluster ...................................................... 160
   4.3.9. Installing the OpenShift CLI by downloading the binary ...... 161
      Installing the OpenShift CLI on Linux .................................. 161
      Installing the OpenShift CLI on Windows ............................ 162
      Installing the OpenShift CLI on macOS ............................. 162
   4.3.10. Logging in to the cluster by using the CLI ....................... 163
   4.3.11. Logging in to the cluster by using the web console ........... 163
   4.3.12. Telemetry access for OpenShift Container Platform ......... 164
   4.3.13. Next steps ...................................................................... 165
4.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS 165
   4.4.1. Prerequisites .................................................................... 165
   4.4.2. Internet access for OpenShift Container Platform ............. 165
   4.4.3. Generating a key pair for cluster node SSH access .......... 166
   4.4.4. Obtaining the installation program .................................. 168
      4.4.4.1. Creating the installation configuration file ................. 168
      4.4.4.2. Generating the required installation manifests .......... 170
4.4.4.3. Creating credentials for OpenShift Container Platform components with the ccoctl tool

4.4.4.4. Installation configuration parameters
   4.4.4.4.1. Required configuration parameters
   4.4.4.4.2. Network configuration parameters
   4.4.4.4.3. Optional configuration parameters
   4.4.4.4.4. Additional Alibaba Cloud configuration parameters
   4.4.4.5. Sample customized install-config.yaml file for Alibaba Cloud

4.4.4.6. Configuring the cluster-wide proxy during installation

4.4.5. Deploying the cluster

4.4.6. Installing the OpenShift CLI by downloading the binary
   4.4.6.1. Installing the OpenShift CLI on Linux
   4.4.6.2. Installing the OpenShift CLI on Windows
   4.4.6.3. Installing the OpenShift CLI on macOS

4.4.7. Logging in to the cluster by using the CLI

4.4.8. Logging in to the cluster by using the web console

4.4.9. Telemetry access for OpenShift Container Platform

4.4.10. Next steps

4.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS

4.5.1. Prerequisites

4.5.2. Internet access for OpenShift Container Platform

4.5.3. Generating a key pair for cluster node SSH access

4.5.4. Obtaining the installation program

4.5.5. Network configuration phases
   4.5.5.1. Creating the installation configuration file
   4.5.5.2. Generating the required installation manifests
   4.5.5.3. Installation configuration parameters
      4.5.5.3.1. Required configuration parameters
      4.5.5.3.2. Network configuration parameters
      4.5.5.3.3. Optional configuration parameters
   4.5.5.4. Sample customized install-config.yaml file for Alibaba Cloud
   4.5.5.5. Configuring the cluster-wide proxy during installation

4.5.6. Cluster Network Operator configuration
   4.5.6.1. Cluster Network Operator configuration object
      defaultNetwork object configuration
      Configuration for the OpenShift SDN CNI cluster network provider
      Configuration for the OVN-Kubernetes CNI cluster network provider
      kubeProxyConfig object configuration

4.5.7. Specifying advanced network configuration

4.5.8. Configuring hybrid networking with OVN-Kubernetes

4.5.9. Deploying the cluster

4.5.10. Installing the OpenShift CLI by downloading the binary
   4.5.10.1. Installing the OpenShift CLI on Linux
   4.5.10.2. Installing the OpenShift CLI on Windows
   4.5.10.3. Installing the OpenShift CLI on macOS

4.5.11. Logging in to the cluster by using the CLI

4.5.12. Logging in to the cluster by using the web console

4.5.13. Telemetry access for OpenShift Container Platform

4.5.14. Next steps

4.6. INSTALLING A CLUSTER ON ALIBABA CLOUD INTO AN EXISTING VPC

4.6.1. Prerequisites

4.6.2. Using a custom VPC
   4.6.2.1. Requirements for using your VPC
   4.6.2.2. VPC validation
4.6.2.3. Division of permissions
4.6.2.4. Isolation between clusters
4.6.3. Internet access for OpenShift Container Platform
4.6.4. Generating a key pair for cluster node SSH access
4.6.5. Obtaining the installation program
4.6.5.1. Creating the installation configuration file
4.6.5.2. Installation configuration parameters
4.6.5.2.1. Required configuration parameters
4.6.5.2.2. Network configuration parameters
4.6.5.2.3. Optional configuration parameters
4.6.5.2.4. Additional Alibaba Cloud configuration parameters
4.6.5.3. Sample customized install-config.yaml file for Alibaba Cloud
4.6.5.4. Generating the required installation manifests
4.6.5.5. Configuring the Cloud Credential Operator utility
4.6.5.6. Creating credentials for OpenShift Container Platform components with the ccoct1 tool
4.6.6. Deploying the cluster
4.6.7. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
4.6.8. Logging in to the cluster by using the CLI
4.6.9. Logging in to the cluster by using the web console
4.6.10. Telemetry access for OpenShift Container Platform
4.6.11. Next steps

4.7. UNINSTALLING A CLUSTER ON ALIBABA CLOUD
4.7.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 5. INSTALLING ON AWS

5.1. PREPARING TO INSTALL ON AWS
5.1.1. Prerequisites
5.1.2. Requirements for installing OpenShift Container Platform on AWS
5.1.3. Choosing a method to install OpenShift Container Platform on AWS
5.1.3.1. Installing a cluster on installer-provisioned infrastructure
5.1.3.2. Installing a cluster on user-provisioned infrastructure
5.1.4. Next steps

5.2. CONFIGURING AN AWS ACCOUNT
5.2.1. Configuring Route 53
    5.2.1.1. Ingress Operator endpoint configuration for AWS Route 53
5.2.2. AWS account limits
5.2.3. Required AWS permissions for the IAM user
5.2.4. Creating an IAM user
5.2.5. IAM Policies and AWS authentication
    5.2.5.1. Default permissions for IAM instance profiles
    5.2.5.2. Specifying an existing IAM role
    5.2.5.3. Using AWS IAM Analyzer to create policy templates
5.2.6. Supported AWS Marketplace regions
5.2.7. Supported AWS regions
    5.2.7.1. AWS public regions
    5.2.7.2. AWS GovCloud regions
    5.2.7.3. AWS SC2S and C2S secret regions
    5.2.7.4. AWS China regions
5.2.8. Next steps

5.3. MANUALLY CREATING IAM FOR AWS
5.3.1. Alternatives to storing administrator-level secrets in the kube-system project 277
5.3.2. Manually create IAM 278
5.3.3. Mint mode 281
5.3.4. Mint mode with removal or rotation of the administrator-level credential 281
5.3.5. Next steps 281

5.4. INSTALLING A CLUSTER QUICKLY ON AWS 282
5.4.1. Prerequisites 282
5.4.2. Internet access for OpenShift Container Platform 282
5.4.3. Generating a key pair for cluster node SSH access 283
5.4.4. Obtaining the installation program 284
5.4.5. Deploying the cluster 285
5.4.6. Installing the OpenShift CLI by downloading the binary 288
   Installing the OpenShift CLI on Linux 288
   Installing the OpenShift CLI on Windows 289
   Installing the OpenShift CLI on macOS 289
5.4.7. Logging in to the cluster by using the CLI 290
5.4.8. Logging in to the cluster by using the web console 290
5.4.9. Telemetry access for OpenShift Container Platform 291
5.4.10. Next steps 291

5.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS 292
5.5.1. Prerequisites 292
5.5.2. Internet access for OpenShift Container Platform 292
5.5.3. Generating a key pair for cluster node SSH access 293
5.5.4. Obtaining an AWS Marketplace image 294
5.5.5. Obtaining the installation program 295
5.5.6. Creating the installation configuration file 296
   5.5.6.1. Installation configuration parameters 297
      5.5.6.1.1. Required configuration parameters 298
      5.5.6.1.2. Network configuration parameters 299
      5.5.6.1.3. Optional configuration parameters 301
      5.5.6.1.4. Optional AWS configuration parameters 307
   5.5.6.2. Minimum resource requirements for cluster installation 311
   5.5.6.3. Tested instance types for AWS 312
   5.5.6.4. Tested instance types for AWS on 64-bit ARM infrastructures 312
   5.5.6.5. Sample customized install-config.yaml file for AWS 313
   5.5.6.6. Configuring the cluster-wide proxy during installation 315
5.5.7. Deploying the cluster 317
5.5.8. Installing the OpenShift CLI by downloading the binary 319
   Installing the OpenShift CLI on Linux 319
   Installing the OpenShift CLI on Windows 320
   Installing the OpenShift CLI on macOS 320
5.5.9. Logging in to the cluster by using the CLI 321
5.5.10. Logging in to the cluster by using the web console 321
5.5.11. Telemetry access for OpenShift Container Platform 322
5.5.12. Next steps 322

5.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS 323
5.6.1. Prerequisites 323
5.6.2. Internet access for OpenShift Container Platform 323
5.6.3. Generating a key pair for cluster node SSH access 324
5.6.4. Obtaining the installation program 325
5.6.5. Network configuration phases 326
5.6.6. Creating the installation configuration file 327
   5.6.6.1. Installation configuration parameters 328
5.6.6.1. Required configuration parameters 328
5.6.6.1.2. Network configuration parameters 330
5.6.6.1.3. Optional configuration parameters 332
5.6.6.1.4. Optional AWS configuration parameters 338
5.6.6.2. Minimum resource requirements for cluster installation 342
5.6.6.3. Tested instance types for AWS 343
5.6.6.4. Tested instance types for AWS on 64-bit ARM infrastructures 344
5.6.6.5. Sample customized install-config.yaml file for AWS 344
5.6.6.6. Configuring the cluster-wide proxy during installation 346
5.6.7. Cluster Network Operator configuration 348
5.6.7.1. Cluster Network Operator configuration object 348
defaultNetwork object configuration 349
Configuration for the OpenShift SDN CNI cluster network provider 350
Configuration for the OVN-Kubernetes CNI cluster network provider 351
kubeProxyConfig object configuration 353
5.6.8. Specifying advanced network configuration 354
5.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster 355
5.6.10. Configuring hybrid networking with OVN-Kubernetes 356
5.6.11. Deploying the cluster 358
5.6.12. Installing the OpenShift CLI by downloading the binary 360
Installing the OpenShift CLI on Linux 360
Installing the OpenShift CLI on Windows 361
Installing the OpenShift CLI on macOS 361
5.6.13. Logging in to the cluster by using the CLI 362
5.6.14. Logging in to the cluster by using the web console 362
5.6.15. Telemetry access for OpenShift Container Platform 363
5.6.16. Next steps 363
5.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK 364
5.7.1. Prerequisites 364
5.7.2. About installations in restricted networks 365
5.7.2.1. Additional limits 365
5.7.3. About using a custom VPC 365
5.7.3.1. Requirements for using your VPC 365
Option 1: Create VPC endpoints 366
Option 2: Create a proxy without VPC endpoints 367
Option 3: Create a proxy with VPC endpoints 367
5.7.3.2. VPC validation 368
5.7.3.3. Division of permissions 369
5.7.3.4. Isolation between clusters 369
5.7.4. Internet access for OpenShift Container Platform 369
5.7.5. Generating a key pair for cluster node SSH access 370
5.7.6. Creating the installation configuration file 371
5.7.6.1. Installation configuration parameters 374
5.7.6.1.1. Required configuration parameters 374
5.7.6.1.2. Network configuration parameters 375
5.7.6.1.3. Optional configuration parameters 377
5.7.6.1.4. Optional AWS configuration parameters 383
5.7.6.2. Minimum resource requirements for cluster installation 387
5.7.6.3. Sample customized install-config.yaml file for AWS 388
5.7.6.4. Configuring the cluster-wide proxy during installation 391
5.7.7. Deploying the cluster 392
5.7.8. Installing the OpenShift CLI by downloading the binary 394
Installing the OpenShift CLI on Linux 394
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
5.7.9. Logging in to the cluster by using the CLI
5.7.10. Disabling the default OperatorHub sources
5.7.11. Telemetry access for OpenShift Container Platform
5.7.12. Next steps
5.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC
5.8.1. Prerequisites
5.8.2. About using a custom VPC
  5.8.2.1. Requirements for using your VPC
    Option 1: Create VPC endpoints
    Option 2: Create a proxy without VPC endpoints
    Option 3: Create a proxy with VPC endpoints
  5.8.2.2. VPC validation
  5.8.2.3. Division of permissions
  5.8.2.4. Isolation between clusters
5.8.3. Internet access for OpenShift Container Platform
5.8.4. Generating a key pair for cluster node SSH access
5.8.5. Obtaining the installation program
5.8.6. Creating the installation configuration file
  5.8.6.1. Installation configuration parameters
    5.8.6.1.1. Required configuration parameters
    5.8.6.1.2. Network configuration parameters
    5.8.6.1.3. Optional configuration parameters
    5.8.6.1.4. Optional AWS configuration parameters
  5.8.6.2. Minimum resource requirements for cluster installation
  5.8.6.3. Tested instance types for AWS
  5.8.6.4. Tested instance types for AWS on 64-bit ARM infrastructures
  5.8.6.5. Sample customized install-config.yaml file for AWS
  5.8.6.6. Configuring the cluster-wide proxy during installation
5.8.7. Deploying the cluster
5.8.8. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
5.8.9. Logging in to the cluster by using the CLI
5.8.10. Logging in to the cluster by using the web console
5.8.11. Telemetry access for OpenShift Container Platform
5.8.12. Next steps
5.9. INSTALLING A PRIVATE CLUSTER ON AWS
5.9.1. Prerequisites
5.9.2. Private clusters
  5.9.2.1. Private clusters in AWS
    5.9.2.1.1. Limitations
  5.9.3. About using a custom VPC
    5.9.3.1. Requirements for using your VPC
      Option 1: Create VPC endpoints
      Option 2: Create a proxy without VPC endpoints
      Option 3: Create a proxy with VPC endpoints
    5.9.3.2. VPC validation
    5.9.3.3. Division of permissions
    5.9.3.4. Isolation between clusters
5.9.4. Internet access for OpenShift Container Platform
5.9.5. Generating a key pair for cluster node SSH access

5.9.6. Obtaining the installation program

5.9.7. Manually creating the installation configuration file
  5.9.7.1. Installation configuration parameters
    5.9.7.1.1. Required configuration parameters
    5.9.7.1.2. Network configuration parameters
    5.9.7.1.3. Optional configuration parameters
    5.9.7.1.4. Optional AWS configuration parameters
  5.9.7.2. Minimum resource requirements for cluster installation
  5.9.7.3. Tested instance types for AWS
  5.9.7.4. Tested instance types for AWS on 64-bit ARM infrastructures
  5.9.7.5. Sample customized install-config.yaml file for AWS
  5.9.7.6. Configuring the cluster-wide proxy during installation

5.9.8. Deploying the cluster

5.9.9. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS

5.9.10. Logging in to the cluster by using the CLI
  5.9.10.1. Logging in to the cluster by using the web console

5.9.12. Telemetry access for OpenShift Container Platform

5.9.13. Next steps

5.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION

5.10.1. Prerequisites

5.10.2. AWS government regions

5.10.3. Installation requirements

5.10.4. Private clusters
  5.10.4.1. Private clusters in AWS
    5.10.4.1.1. Limitations

5.10.5. About using a custom VPC
  5.10.5.1. Requirements for using your VPC
    Option 1: Create VPC endpoints
    Option 2: Create a proxy without VPC endpoints
    Option 3: Create a proxy with VPC endpoints
  5.10.5.2. VPC validation
  5.10.5.3. Division of permissions
  5.10.5.4. Isolation between clusters

5.10.6. Internet access for OpenShift Container Platform

5.10.7. Generating a key pair for cluster node SSH access

5.10.8. Obtaining an AWS Marketplace image

5.10.9. Obtaining the installation program

5.10.10. Manually creating the installation configuration file
  5.10.10.1. Installation configuration parameters
    5.10.10.1.1. Required configuration parameters
    5.10.10.1.2. Network configuration parameters
    5.10.10.1.3. Optional configuration parameters
    5.10.10.1.4. Optional AWS configuration parameters
  5.10.10.2. Minimum resource requirements for cluster installation
  5.10.10.3. Tested instance types for AWS
  5.10.10.4. Tested instance types for AWS on 64-bit ARM infrastructures
  5.10.10.5. Sample customized install-config.yaml file for AWS
  5.10.10.6. Configuring the cluster-wide proxy during installation

5.10.11. Deploying the cluster
5.10.12. Installing the OpenShift CLI by downloading the binary

5.10.12.1. Installing the OpenShift CLI on Linux
5.10.12.2. Installing the OpenShift CLI on Windows
5.10.12.3. Installing the OpenShift CLI on macOS

5.10.13. Logging in to the cluster by using the CLI

5.10.14. Logging in to the cluster by using the web console

5.10.15. Telemetry access for OpenShift Container Platform

5.10.16. Next steps

5.11. INSTALLING A CLUSTER ON AWS INTO A SECRET OR TOP SECRET REGION

5.11.1. Prerequisites

5.11.2. AWS secret regions

5.11.3. Installation requirements

5.11.4. Private clusters

5.11.4.1. Private clusters in AWS

5.11.4.1.1. Limitations

5.11.5. About using a custom VPC

5.11.5.1. Requirements for using your VPC

5.11.5.1.1. Option 1: Create VPC endpoints

5.11.5.1.2. Option 2: Create a proxy without VPC endpoints

5.11.5.1.3. Option 3: Create a proxy with VPC endpoints

5.11.5.2. VPC validation

5.11.5.3. Division of permissions

5.11.5.4. Isolation between clusters

5.11.6. Internet access for OpenShift Container Platform

5.11.7. Uploading a custom RH COS AMI in AWS

5.11.8. Generating a key pair for cluster node SSH access

5.11.9. Obtaining the installation program

5.11.10. Manually creating the installation configuration file

5.11.10.1. Installation configuration parameters

5.11.10.1.1. Required configuration parameters

5.11.10.1.2. Network configuration parameters

5.11.10.1.3. Optional configuration parameters

5.11.10.1.4. Optional AWS configuration parameters

5.11.10.2. Tested instance types for AWS

5.11.10.3. Sample customized install-config.yaml file for AWS

5.11.10.4. Configuring the cluster-wide proxy during installation

5.11.11. Deploying the cluster

5.11.12. Installing the OpenShift CLI by downloading the binary

5.11.12.1. Installing the OpenShift CLI on Linux
5.11.12.2. Installing the OpenShift CLI on Windows
5.11.12.3. Installing the OpenShift CLI on macOS

5.11.13. Logging in to the cluster by using the CLI

5.11.14. Logging in to the cluster by using the web console

5.11.15. Telemetry access for OpenShift Container Platform

5.11.16. Next steps

5.12. INSTALLING A CLUSTER ON AWS CHINA

5.12.1. Prerequisites

5.12.2. Installation requirements

5.12.3. Internet access for OpenShift Container Platform

5.12.4. Private clusters

5.12.4.1. Private clusters in AWS

5.12.4.1.1. Limitations

5.12.5. About using a custom VPC
5.12.5.1. Requirements for using your VPC
   Option 1: Create VPC endpoints
   Option 2: Create a proxy without VPC endpoints
   Option 3: Create a proxy with VPC endpoints
5.12.5.2. VPC validation
5.12.5.3. Division of permissions
5.12.5.4. Isolation between clusters
5.12.6. Generating a key pair for cluster node SSH access
5.12.7. Uploading a custom RHCOS AMI in AWS
5.12.8. Obtaining the installation program
5.12.9. Manually creating the installation configuration file
   5.12.9.1. Installation configuration parameters
   5.12.9.1.1. Required configuration parameters
   5.12.9.1.2. Network configuration parameters
   5.12.9.1.3. Optional configuration parameters
   5.12.9.2. Sample customized install-config.yaml file for AWS
   5.12.9.3. Minimum resource requirements for cluster installation
   5.12.9.4. Tested instance types for AWS
   5.12.9.5. Tested instance types for AWS on 64-bit ARM infrastructures
   5.12.9.6. Configuring the cluster-wide proxy during installation
5.12.10. Deploying the cluster
5.12.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
5.12.12. Logging in to the cluster by using the CLI
5.12.13. Logging in to the cluster by using the web console
5.12.14. Telemetry access for OpenShift Container Platform
5.12.15. Next steps
5.13. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING
   CLOUDFORMATION TEMPLATES
5.13.1. Prerequisites
5.13.2. Internet access for OpenShift Container Platform
5.13.3. Requirements for a cluster with user-provisioned infrastructure
   5.13.3.1. Required machines for cluster installation
   5.13.3.2. Minimum resource requirements for cluster installation
   5.13.3.3. Tested instance types for AWS
   5.13.3.4. Tested instance types for AWS on 64-bit ARM infrastructures
   5.13.3.5. Certificate signing requests management
5.13.4. Required AWS infrastructure components
   5.13.4.1. Other infrastructure components
   Option 1: Create VPC endpoints
   Option 2: Create a proxy without VPC endpoints
   Option 3: Create a proxy with VPC endpoints
   5.13.4.2. Cluster machines
   5.13.4.3. Required AWS permissions for the IAM user
5.13.5. Obtaining an AWS Marketplace image
5.13.6. Obtaining the installation program
5.13.7. Generating a key pair for cluster node SSH access
5.13.8. Creating the installation files for AWS
   5.13.8.1. Optional: Creating a separate /var partition
   5.13.8.2. Creating the installation configuration file
   5.13.8.3. Configuring the cluster-wide proxy during installation
5.13.8.4. Creating the Kubernetes manifest and Ignition config files
5.13.9. Extracting the infrastructure name
5.13.10. Creating a VPC in AWS
  5.13.10.1. CloudFormation template for the VPC
5.13.11. Creating networking and load balancing components in AWS
  5.13.11.1. CloudFormation template for the network and load balancers
5.13.12. Creating security group and roles in AWS
  5.13.12.1. CloudFormation template for security objects
5.13.13. Accessing RHCOS AMIs with stream metadata
5.13.14. RHCOS AMIs for the AWS infrastructure
  5.13.14.1. AWS regions without a published RHCOS AMI
  5.13.14.2. Uploading a custom RHCOS AMI in AWS
5.13.15. Creating the bootstrap node in AWS
  5.13.15.1. CloudFormation template for the bootstrap machine
5.13.16. Creating the control plane machines in AWS
  5.13.16.1. CloudFormation template for control plane machines
5.13.17. Creating the worker nodes in AWS
  5.13.17.1. CloudFormation template for worker machines
5.13.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure
5.13.19. Installing the OpenShift CLI by downloading the binary
  5.13.19.1. Installing the OpenShift CLI on Linux
  5.13.19.2. Installing the OpenShift CLI on Windows
  5.13.19.3. Installing the OpenShift CLI on macOS
5.13.20. Logging in to the cluster by using the CLI
5.13.21. Approving the certificate signing requests for your machines
5.13.22. Initial Operator configuration
  5.13.22.1. Image registry storage configuration
    5.13.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure
    5.13.22.1.2. Configuring storage for the image registry in non-production clusters
5.13.23. Deleting the bootstrap resources
5.13.24. Creating the Ingress DNS Records
5.13.25. Completing an AWS installation on user-provisioned infrastructure
5.13.26. Logging in to the cluster by using the web console
5.13.27. Telemetry access for OpenShift Container Platform
5.13.28. Additional resources
5.13.29. Next steps
5.14. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
  5.14.1. Prerequisites
  5.14.2. About installations in restricted networks
    5.14.2.1. Additional limits
  5.14.3. Internet access for OpenShift Container Platform
  5.14.4. Requirements for a cluster with user-provisioned infrastructure
    5.14.4.1. Required machines for cluster installation
    5.14.4.2. Minimum resource requirements for cluster installation
    5.14.4.3. Tested instance types for AWS
    5.14.4.4. Tested instance types for AWS on 64-bit ARM infrastructures
    5.14.4.5. Certificate signing requests management
  5.14.5. Required AWS infrastructure components
    5.14.5.1. Other infrastructure components
      Option 1: Create VPC endpoints
      Option 2: Create a proxy without VPC endpoints
      Option 3: Create a proxy with VPC endpoints
5.14.5.2. Cluster machines
5.14.5.3. Required AWS permissions for the IAM user
5.14.6. Generating a key pair for cluster node SSH access
5.14.7. Creating the installation files for AWS
  5.14.7.1. Optional: Creating a separate /var partition
  5.14.7.2. Creating the installation configuration file
  5.14.7.3. Configuring the cluster-wide proxy during installation
  5.14.7.4. Creating the Kubernetes manifest and Ignition config files
5.14.8. Extracting the infrastructure name
5.14.9. Creating a VPC in AWS
  5.14.9.1. CloudFormation template for the VPC
5.14.10. Creating networking and load balancing components in AWS
  5.14.10.1. CloudFormation template for the network and load balancers
5.14.11. Creating security group and roles in AWS
  5.14.11.1. CloudFormation template for security objects
5.14.12. Accessing RHCOS AMIs with stream metadata
5.14.13. RHCOS AMIs for the AWS infrastructure
5.14.15. Creating the control plane machines in AWS
  5.14.15.1. CloudFormation template for control plane machines
5.14.16. Creating the worker nodes in AWS
  5.14.16.1. CloudFormation template for worker machines
5.14.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure
5.14.18. Logging in to the cluster by using the CLI
5.14.19. Approving the certificate signing requests for your machines
5.14.20. Initial Operator configuration
  5.14.20.1. Disabling the default OperatorHub sources
  5.14.20.2. Image registry storage configuration
    5.14.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure
    5.14.20.2.2. Configuring storage for the image registry in non-production clusters
5.14.21. Deleting the bootstrap resources
5.14.22. Creating the Ingress DNS Records
5.14.23. Completing an AWS installation on user-provisioned infrastructure
5.14.24. Logging in to the cluster by using the web console
5.14.25. Telemetry access for OpenShift Container Platform
5.14.26. Additional resources
5.14.27. Next steps
5.15. UNINSTALLING A CLUSTER ON AWS
5.15.1. Removing a cluster that uses installer-provisioned infrastructure
5.15.2. Deleting AWS resources with the Cloud Credential Operator utility

CHAPTER 6. INSTALLING ON AZURE

6.1. PREPARING TO INSTALL ON AZURE
  6.1.1. Prerequisites
  6.1.2. Requirements for installing OpenShift Container Platform on Azure
  6.1.3. Choosing a method to install OpenShift Container Platform on Azure
    6.1.3.1. Installing a cluster on installer-provisioned infrastructure
    6.1.3.2. Installing a cluster on user-provisioned infrastructure
  6.1.4. Next steps
6.2. CONFIGURING AN AZURE ACCOUNT
  6.2.1. Azure account limits
  6.2.2. Configuring a public DNS zone in Azure
6.2.3. Increasing Azure account limits
6.2.4. Required Azure roles
6.2.5. Creating a service principal
6.2.6. Supported Azure Marketplace regions
6.2.7. Supported Azure regions
  Supported Azure public regions
  Supported Azure Government regions
6.2.8. Next steps

6.3. MANUALLY CREATING IAM FOR AZURE
6.3.1. Alternatives to storing administrator-level secrets in the kube-system project
6.3.2. Manually create IAM
6.3.3. Next steps

6.4. ENABLING USER-MANAGED ENCRYPTION FOR AZURE
6.4.1. Preparing an Azure Disk Encryption Set
6.4.2. Next steps

6.5. INSTALLING A CLUSTER QUICKLY ON AZURE
6.5.1. Prerequisites
6.5.2. Internet access for OpenShift Container Platform
6.5.3. Generating a key pair for cluster node SSH access
6.5.4. Obtaining the installation program
6.5.5. Deploying the cluster
6.5.6. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
6.5.7. Logging in to the cluster by using the CLI
6.5.8. Telemetry access for OpenShift Container Platform
6.5.9. Next steps

6.6. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS
6.6.1. Prerequisites
6.6.2. Internet access for OpenShift Container Platform
6.6.3. Generating a key pair for cluster node SSH access
6.6.4. Selecting an Azure Marketplace image
6.6.5. Obtaining the installation program
6.6.6. Creating the installation configuration file
  6.6.6.1. Installation configuration parameters
    6.6.6.1.1. Required configuration parameters
    6.6.6.1.2. Network configuration parameters
    6.6.6.1.3. Optional configuration parameters
    6.6.6.1.4. Additional Azure configuration parameters
    6.6.6.2. Minimum resource requirements for cluster installation
  6.6.6.3. Tested instance types for Azure
  6.6.6.4. Sample customized install-config.yaml file for Azure
  6.6.6.5. Configuring the cluster-wide proxy during installation
6.6.7. Deploying the cluster
6.6.8. Finalizing user-managed encryption after installation
6.6.9. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
6.6.10. Logging in to the cluster by using the CLI
6.6.11. Telemetry access for OpenShift Container Platform
6.6.12. Next steps
6.7. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

6.7.1. Prerequisites

6.7.2. Internet access for OpenShift Container Platform

6.7.3. Generating a key pair for cluster node SSH access

6.7.4. Obtaining the installation program

6.7.5. Creating the installation configuration file

6.7.5.1. Installation configuration parameters

6.7.5.1.1. Required configuration parameters

6.7.5.1.2. Network configuration parameters

6.7.5.1.3. Optional configuration parameters

6.7.5.1.4. Additional Azure configuration parameters

6.7.5.2. Minimum resource requirements for cluster installation

6.7.5.3. Tested instance types for Azure

6.7.5.4. Sample customized install-config.yaml file for Azure

6.7.5.5. Configuring the cluster-wide proxy during installation

6.7.6. Network configuration phases

6.7.7. Specifying advanced network configuration

6.7.8. Cluster Network Operator configuration

6.7.8.1. Cluster Network Operator configuration object

   defaultNetwork object configuration

   Configuration for the OpenShift SDN CNI cluster network provider

   Configuration for the OVN-Kubernetes CNI cluster network provider

   kubeProxyConfig object configuration

6.7.9. Configuring hybrid networking with OVN-Kubernetes

6.7.10. Deploying the cluster

6.7.11. Finalizing user-managed encryption after installation

6.7.12. Installing the OpenShift CLI by downloading the binary

   Installing the OpenShift CLI on Linux

   Installing the OpenShift CLI on Windows

   Installing the OpenShift CLI on macOS

6.7.13. Logging in to the cluster by using the CLI

6.7.14. Telemetry access for OpenShift Container Platform

6.7.15. Next steps

6.8. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

6.8.1. Prerequisites

6.8.2. About reusing a VNet for your OpenShift Container Platform cluster

6.8.2.1. Requirements for using your VNet

   6.8.2.1.1. Network security group requirements

   6.8.2.2. Division of permissions

   6.8.2.3. Isolation between clusters

6.8.3. Internet access for OpenShift Container Platform

6.8.4. Generating a key pair for cluster node SSH access

6.8.5. Obtaining the installation program

6.8.6. Creating the installation configuration file

6.8.6.1. Installation configuration parameters

   6.8.6.1.1. Required configuration parameters

   6.8.6.1.2. Network configuration parameters

   6.8.6.1.3. Optional configuration parameters

   6.8.6.1.4. Additional Azure configuration parameters

6.8.6.2. Minimum resource requirements for cluster installation

6.8.6.3. Tested instance types for Azure

6.8.6.4. Sample customized install-config.yaml file for Azure

6.8.6.5. Configuring the cluster-wide proxy during installation
6.8.7. Deploying the cluster
6.8.8. Finalizing user–managed encryption after installation
6.8.9. Installing the OpenShift CLI by downloading the binary
- Installing the OpenShift CLI on Linux
- Installing the OpenShift CLI on Windows
- Installing the OpenShift CLI on macOS
6.8.10. Logging in to the cluster by using the CLI
6.8.11. Telemetry access for OpenShift Container Platform
6.8.12. Next steps

6.9. INSTALLING A PRIVATE CLUSTER ON AZURE
6.9.1. Prerequisites
6.9.2. Private clusters
   - 6.9.2.1. Private clusters in Azure
   - 6.9.2.1.1. Limitations
6.9.2.2. User-defined outbound routing
   - Private cluster with network address translation
   - Private cluster with Azure Firewall
   - Private cluster with a proxy configuration
   - Private cluster with no internet access
6.9.3. About reusing a VNet for your OpenShift Container Platform cluster
   - 6.9.3.1. Requirements for using your VNet
   - 6.9.3.1.1. Network security group requirements
6.9.3.2. Division of permissions
6.9.3.3. Isolation between clusters
6.9.4. Internet access for OpenShift Container Platform
6.9.5. Generating a key pair for cluster node SSH access
6.9.6. Obtaining the installation program
6.9.7. Manually creating the installation configuration file
   - 6.9.7.1. Installation configuration parameters
   - 6.9.7.1.1. Required configuration parameters
   - 6.9.7.1.2. Network configuration parameters
   - 6.9.7.1.3. Optional configuration parameters
   - 6.9.7.1.4. Additional Azure configuration parameters
6.9.7.2. Minimum resource requirements for cluster installation
6.9.7.3. Tested instance types for Azure
6.9.7.4. Sample customized install-config.yaml file for Azure
6.9.7.5. Configuring the cluster-wide proxy during installation
6.9.8. Deploying the cluster
6.9.9. Finalizing user–managed encryption after installation
6.9.10. Installing the OpenShift CLI by downloading the binary
   - Installing the OpenShift CLI on Linux
   - Installing the OpenShift CLI on Windows
   - Installing the OpenShift CLI on macOS
6.9.11. Logging in to the cluster by using the CLI
6.9.12. Telemetry access for OpenShift Container Platform
6.9.13. Next steps

6.10. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION
6.10.1. Prerequisites
6.10.2. Azure government regions
6.10.3. Private clusters
   - 6.10.3.1. Private clusters in Azure
   - 6.10.3.1.1. Limitations
6.10.3.2. User-defined outbound routing

6.11.8.2. Creating the installation configuration file
6.11.8.3. Configuring the cluster-wide proxy during installation
6.11.8.4. Exporting common variables for ARM templates
6.11.8.5. Creating the Kubernetes manifest and Ignition config files
6.11.9. Creating the Azure resource group
6.11.10. Uploading the RHCOS cluster image and bootstrap Ignition config file
6.11.11. Example for creating DNS zones
6.11.12. Creating a VNet in Azure
6.11.12.1. ARM template for the VNet
6.11.13. Deploying the RHCOS cluster image for the Azure infrastructure
6.11.13.1. ARM template for image storage
6.11.14. Networking requirements for user-provisioned infrastructure
6.11.14.1. Network connectivity requirements
6.11.15. Creating networking and load balancing components in Azure
6.11.15.1. ARM template for the network and load balancers
6.11.16. Creating the bootstrap machine in Azure
6.11.16.1. ARM template for the bootstrap machine
6.11.17. Creating the control plane machines in Azure
6.11.17.1. ARM template for control plane machines
6.11.18. Wait for bootstrap completion and remove bootstrap resources in Azure
6.11.19. Creating additional worker machines in Azure
6.11.19.1. ARM template for worker machines
6.11.20. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.11.21. Logging in to the cluster by using the CLI
6.11.22. Approving the certificate signing requests for your machines
6.11.23. Adding the Ingress DNS records
6.11.24. Completing an Azure installation on user-provisioned infrastructure
6.11.25. Telemetry access for OpenShift Container Platform
6.12. UNINSTALLING A CLUSTER ON AZURE
6.12.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 7. INSTALLING ON AZURE STACK HUB

7.1. PREPARING TO INSTALL ON AZURE STACK HUB
7.1.1. Prerequisites
7.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub
7.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub
   7.1.3.1. Installing a cluster on installer-provisioned infrastructure
   7.1.3.2. Installing a cluster on user-provisioned infrastructure
7.1.4. Next steps
7.2. CONFIGURING AN AZURE STACK HUB ACCOUNT
   7.2.1. Azure Stack Hub account limits
   7.2.2. Configuring a DNS zone in Azure Stack Hub
   7.2.3. Required Azure Stack Hub roles
   7.2.4. Creating a service principal
7.2.5. Next steps
7.3. INSTALLING A CLUSTER ON AZURE STACK HUB WITH AN INSTALLER-PROVISIONED INFRASTRUCTURE
   7.3.1. Prerequisites
   7.3.2. Internet access for OpenShift Container Platform
   7.3.3. Generating a key pair for cluster node SSH access
7.3.4. Uploading the RHCOs cluster image
7.3.5. Obtaining the installation program
7.3.6. Manually creating the installation configuration file
  7.3.6.1. Installation configuration parameters
    7.3.6.1.1. Required configuration parameters
    7.3.6.1.2. Network configuration parameters
    7.3.6.1.3. Optional configuration parameters
    7.3.6.1.4. Additional Azure Stack Hub configuration parameters
  7.3.6.2. Sample customized install-config.yaml file for Azure Stack Hub
7.3.7. Manually manage cloud credentials
7.3.8. Configuring the cluster to use an internal CA
7.3.9. Deploying the cluster
7.3.10. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
7.3.11. Logging in to the cluster by using the CLI
7.3.12. Logging in to the cluster by using the web console
7.3.13. Telemetry access for OpenShift Container Platform
7.3.14. Next steps

7.4. INSTALLING A CLUSTER ON AZURE STACK HUB WITH NETWORK CUSTOMIZATIONS
7.4.1. Prerequisites
7.4.2. Internet access for OpenShift Container Platform
7.4.3. Generating a key pair for cluster node SSH access
7.4.4. Uploading the RHCOs cluster image
7.4.5. Obtaining the installation program
7.4.6. Manually creating the installation configuration file
  7.4.6.1. Installation configuration parameters
    7.4.6.1.1. Required configuration parameters
    7.4.6.1.2. Network configuration parameters
    7.4.6.1.3. Optional configuration parameters
    7.4.6.1.4. Additional Azure Stack Hub configuration parameters
  7.4.6.2. Sample customized install-config.yaml file for Azure Stack Hub
7.4.7. Manually manage cloud credentials
7.4.8. Configuring the cluster to use an internal CA
7.4.9. Network configuration phases
7.4.10. Specifying advanced network configuration
    7.4.11. Cluster Network Operator configuration
      7.4.11.1. Cluster Network Operator configuration object
        defaultNetwork object configuration
        Configuration for the OpenShift SDN CNI cluster network provider
        Configuration for the OVN-Kubernetes CNI cluster network provider
        kubeProxyConfig object configuration
    7.4.12. Configuring hybrid networking with OVN-Kubernetes
7.4.13. Deploying the cluster
7.4.14. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
7.4.15. Logging in to the cluster by using the CLI
7.4.16. Logging in to the cluster by using the web console
7.4.17. Telemetry access for OpenShift Container Platform
7.4.18. Next steps
7.5. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES

7.5.1. Prerequisites
7.5.2. Internet access for OpenShift Container Platform
7.5.3. Configuring your Azure Stack Hub project
  7.5.3.1. Azure Stack Hub account limits
  7.5.3.2. Configuring a DNS zone in Azure Stack Hub
  7.5.3.3. Certificate signing requests management
  7.5.3.4. Required Azure Stack Hub roles
  7.5.3.5. Creating a service principal
7.5.4. Obtaining the installation program
7.5.5. Generating a key pair for cluster node SSH access
  7.5.5.1. Manually creating the installation configuration file
  7.5.5.2. Sample customized install-config.yaml file for Azure Stack Hub
  7.5.5.3. Configuring the cluster-wide proxy during installation
  7.5.5.4. Exporting common variables for ARM templates
  7.5.5.5. Creating the Kubernetes manifest and Ignition config files
  7.5.5.6. Optional: Creating a separate /var partition
7.5.6. Creating the installation files for Azure Stack Hub
  7.5.6.1. Deploying the RH COS cluster image and bootstrap Ignition config file
  7.5.6.2. Creating new DNS zones
7.5.7. Creating the Azure resource group
7.5.8. Uploading the RH COS cluster image and bootstrap Ignition config file
7.5.9. Creating the control plane machines in Azure Stack Hub
7.5.10. Creating a VNet in Azure Stack Hub
  7.5.10.1. ARM template for the VNet
7.5.11. Deploying the RH COS cluster image for the Azure Stack Hub infrastructure
  7.5.11.1. ARM template for image storage
7.5.12. Networking requirements for user-provisioned infrastructure
  7.5.12.1. Network connectivity requirements
7.5.13. Creating networking and load balancing components in Azure Stack Hub
  7.5.13.1. ARM template for the network and load balancers
7.5.14. Creating the bootstrap machine in Azure Stack Hub
  7.5.14.1. ARM template for the bootstrap machine
7.5.15. Creating the control plane machines in Azure Stack Hub
  7.5.15.1. ARM template for control plane machines
7.5.16. Creating additional worker machines in Azure Stack Hub
  7.5.16.1. ARM template for worker machines
7.5.17. Installing the OpenShift CLI by downloading the binary
  7.5.17.1. ARM template for worker machines
7.5.18. Installing the OpenShift CLI by using the CLI
  7.5.18.1. ARM template for worker machines
7.5.19. Logging in to the cluster by using the CLI
7.5.20. Approving the certificate signing requests for your machines
7.5.21. Adding the Ingress DNS records
7.5.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure

7.6. UNINSTALLING A CLUSTER ON AZURE STACK HUB

8. UNINSTALLING A CLUSTER ON AZURE STACK HUB

CHAPTER 8. INSTALLING ON GCP

8.1. PREPARING TO INSTALL ON GCP

8.1.1. Prerequisites
8.1.2. Requirements for installing OpenShift Container Platform on GCP
8.1.3. Choosing a method to install OpenShift Container Platform on GCP
  8.1.3.1. Installing a cluster on installer-provisioned infrastructure
8.1.3.2. Installing a cluster on user-provisioned infrastructure
8.1.4. Next steps
8.2. CONFIGURING A GCP PROJECT
  8.2.1. Creating a GCP project
  8.2.2. Enabling API services in GCP
  8.2.3. Configuring DNS for GCP
  8.2.4. GCP account limits
  8.2.5. Creating a service account in GCP
    8.2.5.1. Required GCP roles
    8.2.5.2. Required GCP permissions for installer-provisioned infrastructure
  8.2.6. Supported GCP regions
  8.2.7. Next steps
8.2.5.1. Required GCP roles
8.2.5.2. Required GCP permissions for installer-provisioned infrastructure
8.2.6. Supported GCP regions
8.2.7. Next steps
8.3. MANUALLY CREATING IAM FOR GCP
  8.3.1. Alternatives to storing administrator-level secrets in the kube-system project
  8.3.2. Manually create IAM
  8.3.3. Mint mode
  8.3.4. Mint mode with removal or rotation of the administrator-level credential
  8.3.5. Next steps
8.3.1. Alternatives to storing administrator-level secrets in the kube-system project
8.3.2. Manually create IAM
8.3.3. Mint mode
8.3.4. Mint mode with removal or rotation of the administrator-level credential
8.3.5. Next steps
8.4. INSTALLING A CLUSTER QUICKLY ON GCP
  8.4.1. Prerequisites
  8.4.2. Internet access for OpenShift Container Platform
  8.4.3. Generating a key pair for cluster node SSH access
  8.4.4. Obtaining the installation program
  8.4.5. Deploying the cluster
  8.4.6. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
  8.4.7. Logging in to the cluster by using the CLI
  8.4.8. Telemetry access for OpenShift Container Platform
  8.4.9. Next steps
8.4.1. Prerequisites
8.4.2. Internet access for OpenShift Container Platform
8.4.3. Generating a key pair for cluster node SSH access
8.4.4. Obtaining the installation program
8.4.5. Deploying the cluster
8.4.6. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
8.4.7. Logging in to the cluster by using the CLI
8.4.8. Telemetry access for OpenShift Container Platform
8.4.9. Next steps
8.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS
  8.5.1. Prerequisites
  8.5.2. Internet access for OpenShift Container Platform
  8.5.3. Generating a key pair for cluster node SSH access
  8.5.4. Obtaining the installation program
  8.5.5. Creating the installation configuration file
    8.5.5.1. Installation configuration parameters
      8.5.5.1.1. Required configuration parameters
      8.5.5.1.2. Network configuration parameters
      8.5.5.1.3. Optional configuration parameters
      8.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
    8.5.5.2. Minimum resource requirements for cluster installation
    8.5.5.3. Tested instance types for GCP
    8.5.5.4. Using custom machine types
    8.5.5.5. Sample customized install-config.yaml file for GCP
    8.5.5.6. Configuring the cluster-wide proxy during installation
  8.5.6. Using the GCP Marketplace offering
  8.5.7. Deploying the cluster
  8.5.8. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
8.5.9. Logging in to the cluster by using the CLI
8.5.10. Telemetry access for OpenShift Container Platform
8.5.11. Next steps

8.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS
8.6.1. Prerequisites
8.6.2. Internet access for OpenShift Container Platform
8.6.3. Generating a key pair for cluster node SSH access
8.6.4. Obtaining the installation program
8.6.5. Creating the installation configuration file
8.6.5.1. Installation configuration parameters
8.6.5.1.1. Required configuration parameters
8.6.5.1.2. Network configuration parameters
8.6.5.1.3. Optional configuration parameters
8.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.6.5.2. Minimum resource requirements for cluster installation
8.6.5.3. Tested instance types for GCP
8.6.5.4. Using custom machine types
8.6.5.5. Sample customized install-config.yaml file for GCP
8.6.6. Additional resources
8.6.6.1. Configuring the cluster-wide proxy during installation
8.6.7. Network configuration phases
8.6.8. Specifying advanced network configuration
8.6.9. Cluster Network Operator configuration
8.6.9.1. Cluster Network Operator configuration object
8.6.9.2. defaultNetwork object configuration
8.6.9.3. Configuration for the OpenShift SDN CNI cluster network provider
8.6.9.4. Configuration for the OVN-Kubernetes CNI cluster network provider
8.6.9.5. kubeProxyConfig object configuration
8.6.10. Deploying the cluster
8.6.11. Installing the OpenShift CLI by downloading the binary
8.6.11.1. Installing the OpenShift CLI on Linux
8.6.11.2. Installing the OpenShift CLI on Windows
8.6.11.3. Installing the OpenShift CLI on macOS
8.6.12. Logging in to the cluster by using the CLI
8.6.13. Telemetry access for OpenShift Container Platform
8.6.14. Next steps

8.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK
8.7.1. Prerequisites
8.7.2. About installations in restricted networks
8.7.2.1. Additional limits
8.7.3. Internet access for OpenShift Container Platform
8.7.4. Generating a key pair for cluster node SSH access
8.7.5. Creating the installation configuration file
8.7.5.1. Installation configuration parameters
8.7.5.1.1. Required configuration parameters
8.7.5.1.2. Network configuration parameters
8.7.5.1.3. Optional configuration parameters
8.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.7.5.2. Minimum resource requirements for cluster installation
8.7.5.3. Tested instance types for GCP
8.7.5.4. Using custom machine types
8.7.5.5. Sample customized install-config.yaml file for GCP
8.7.5.6. Create an Ingress Controller with global access on GCP
8.7.5.7. Create an Ingress Controller with native access on GCP
8.7.5.8. Create an Ingress Controller with external access on GCP
8.7.6. Additional resources
8.7.6.1. Configuring the cluster-wide proxy during installation
8.7.6.2. About installations in restricted networks
8.7.6.3. Additional limits
8.7.6.4. Internet access for OpenShift Container Platform
8.7.6.5. Generating a key pair for cluster node SSH access
8.7.6.6. Creating the installation configuration file
8.7.6.7. Installation configuration parameters
8.7.6.8. Required configuration parameters
8.7.6.9. Network configuration parameters
8.7.6.10. Optional configuration parameters
8.7.6.11. Additional Google Cloud Platform (GCP) configuration parameters
8.7.6.12. Minimum resource requirements for cluster installation
8.7.6.13. Tested instance types for GCP
8.7.6.14. Using custom machine types
8.7.6.15. Sample customized install-config.yaml file for GCP
8.7.6.16. Create an Ingress Controller with global access on GCP
8.7.6.17. Create an Ingress Controller with native access on GCP
8.7.6.18. Create an Ingress Controller with external access on GCP
8.7.7. Network configuration phases
8.7.8. Specifying advanced network configuration
8.7.9. Cluster Network Operator configuration
8.7.9.1. Cluster Network Operator configuration object
8.7.9.2. defaultNetwork object configuration
8.7.9.3. Configuration for the OpenShift SDN CNI cluster network provider
8.7.9.4. Configuration for the OVN-Kubernetes CNI cluster network provider
8.7.9.5. kubeProxyConfig object configuration
8.7.10. Deploying the cluster
8.7.11. Installing the OpenShift CLI by downloading the binary
8.7.11.1. Installing the OpenShift CLI on Linux
8.7.11.2. Installing the OpenShift CLI on Windows
8.7.11.3. Installing the OpenShift CLI on macOS
8.7.12. Logging in to the cluster by using the CLI
8.7.13. Telemetry access for OpenShift Container Platform
8.7.14. Next steps
8.7.5.7. Configuring the cluster-wide proxy during installation
8.7.6. Deploying the cluster
8.7.7. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
8.7.8. Logging in to the cluster by using the CLI
8.7.9. Disabling the default OperatorHub sources
8.7.10. Telemetry access for OpenShift Container Platform
8.7.11. Next steps

8.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC
8.8.1. Prerequisites
  8.8.2. About using a custom VPC
    8.8.2.1. Requirements for using your VPC
    8.8.2.2. VPC validation
    8.8.2.3. Division of permissions
    8.8.2.4. Isolation between clusters
  8.8.3. Internet access for OpenShift Container Platform
  8.8.4. Generating a key pair for cluster node SSH access
  8.8.5. Obtaining the installation program
  8.8.6. Creating the installation configuration file
    8.8.6.1. Installation configuration parameters
      8.8.6.1.1. Required configuration parameters
      8.8.6.1.2. Network configuration parameters
      8.8.6.1.3. Optional configuration parameters
      8.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters
    8.8.6.2. Minimum resource requirements for cluster installation
    8.8.6.3. Tested instance types for GCP
    8.8.6.4. Using custom machine types
    8.8.6.5. Sample customized install-config.yaml file for GCP
    8.8.6.6. Create an Ingress Controller with global access on GCP
  8.8.7. Additional resources
    8.8.7.1. Configuring the cluster-wide proxy during installation
    8.8.8. Deploying the cluster
    8.8.9. Installing the OpenShift CLI by downloading the binary
      Installing the OpenShift CLI on Linux
      Installing the OpenShift CLI on Windows
      Installing the OpenShift CLI on macOS
    8.8.10. Logging in to the cluster by using the CLI
    8.8.11. Telemetry access for OpenShift Container Platform
    8.8.12. Next steps

8.9. INSTALLING A PRIVATE CLUSTER ON GCP
8.9.1. Prerequisites
8.9.2. Private clusters
  8.9.2.1. Private clusters in GCP
    8.9.2.1.1. Limitations
  8.9.3. About using a custom VPC
    8.9.3.1. Requirements for using your VPC
    8.9.3.2. Division of permissions
    8.9.3.3. Isolation between clusters
  8.9.4. Internet access for OpenShift Container Platform
  8.9.5. Generating a key pair for cluster node SSH access
  8.9.6. Obtaining the installation program
8.9.7. Manually creating the installation configuration file
8.9.7.1. Installation configuration parameters
8.9.7.1.1. Required configuration parameters
8.9.7.1.2. Network configuration parameters
8.9.7.1.3. Optional configuration parameters
8.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters
8.9.7.2. Minimum resource requirements for cluster installation
8.9.7.3. Tested instance types for GCP
8.9.7.4. Using custom machine types
8.9.7.5. Sample customized install-config.yaml file for GCP
8.9.7.6. Create an Ingress Controller with global access on GCP
8.9.8. Additional resources
8.9.8.1. Configuring the cluster-wide proxy during installation
8.9.9. Deploying the cluster
8.9.10. Installing the OpenShift CLI by downloading the binary
8.9.10.1. Installing the OpenShift CLI on Linux
8.9.10.2. Installing the OpenShift CLI on Windows
8.9.10.3. Installing the OpenShift CLI on macOS
8.9.11. Logging in to the cluster by using the CLI
8.9.12. Telemetry access for OpenShift Container Platform
8.9.13. Next steps

8.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES
8.10.1. Prerequisites
8.10.2. Certificate signing requests management
8.10.3. Internet access for OpenShift Container Platform
8.10.4. Configuring your GCP project
8.10.4.1. Creating a GCP project
8.10.4.2. Enabling API services in GCP
8.10.4.3. Configuring DNS for GCP
8.10.4.4. GCP account limits
8.10.4.5. Creating a service account in GCP
8.10.4.6. Required GCP roles
8.10.4.7. Required GCP permissions for user-provisioned infrastructure
8.10.4.8. Supported GCP regions
8.10.4.9. Installing and configuring CLI tools for GCP
8.10.5. Requirements for a cluster with user-provisioned infrastructure
8.10.5.1. Required machines for cluster installation
8.10.5.2. Minimum resource requirements for cluster installation
8.10.5.3. Tested instance types for GCP
8.10.5.4. Using custom machine types
8.10.6. Creating the installation files for GCP
8.10.6.1. Optional: Creating a separate /var partition
8.10.6.2. Creating the installation configuration file
8.10.6.3. Configuring the cluster-wide proxy during installation
8.10.6.4. Creating the Kubernetes manifest and Ignition config files
8.10.7. Exporting common variables
8.10.7.1. Extracting the infrastructure name
8.10.7.2. Exporting common variables for Deployment Manager templates
8.10.8. Creating a VPC in GCP
8.10.8.1. Deployment Manager template for the VPC
8.10.9. Networking requirements for user-provisioned infrastructure
8.10.9.1. Setting the cluster node hostnames through DHCP
8.10.2. Network connectivity requirements
8.10.10. Creating load balancers in GCP
  8.10.10.1. Deployment Manager template for the external load balancer
  8.10.10.2. Deployment Manager template for the internal load balancer
8.10.11. Creating a private DNS zone in GCP
  8.10.11.1. Deployment Manager template for the private DNS
8.10.12. Creating firewall rules in GCP
  8.10.12.1. Deployment Manager template for firewall rules
8.10.13. Creating IAM roles in GCP
  8.10.13.1. Deployment Manager template for IAM roles
8.10.14. Creating the RHCOS cluster image for the GCP infrastructure
8.10.15. Creating the bootstrap machine in GCP
  8.10.15.1. Deployment Manager template for the bootstrap machine
8.10.16. Creating the control plane machines in GCP
  8.10.16.1. Deployment Manager template for control plane machines
8.10.17. Wait for bootstrap completion and remove bootstrap resources in GCP
8.10.18. Creating additional worker machines in GCP
  8.10.18.1. Deployment Manager template for worker machines
8.10.19. Installing the OpenShift CLI by downloading the binary
  - Installing the OpenShift CLI on Linux
  - Installing the OpenShift CLI on Windows
  - Installing the OpenShift CLI on macOS
8.10.20. Logging in to the cluster by using the CLI
8.10.21. Approving the certificate signing requests for your machines
8.10.22. Optional: Adding the ingress DNS records
8.10.23. Completing a GCP installation on user-provisioned infrastructure
8.10.24. Telemetry access for OpenShift Container Platform
8.10.25. Next steps

8.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES

8.11.1. Prerequisites
8.11.2. Certificate signing requests management
8.11.3. Internet access for OpenShift Container Platform
8.11.4. Configuring the GCP project that hosts your cluster
  8.11.4.1. Creating a GCP project
  8.11.4.2. Enabling API services in GCP
  8.11.4.3. GCP account limits
  8.11.4.4. Creating a service account in GCP
    - 8.11.4.4.1. Required GCP roles
    - 8.11.4.4.5. Supported GCP regions
    - 8.11.4.6. Installing and configuring CLI tools for GCP
  8.11.5. Requirements for a cluster with user-provisioned infrastructure
    - 8.11.5.1. Required machines for cluster installation
    - 8.11.5.2. Minimum resource requirements for cluster installation
    - 8.11.5.3. Tested instance types for GCP
    - 8.11.5.4. Using custom machine types
  8.11.6. Configuring the GCP project that hosts your shared VPC network
    - 8.11.6.1. Configuring DNS for GCP
    - 8.11.6.2. Creating a VPC in GCP
      - 8.11.6.2.1. Deployment Manager template for the VPC
  8.11.7. Creating the installation files for GCP
    - 8.11.7.1. Manually creating the installation configuration file
    - 8.11.7.2. Sample customized install-config.yaml file for GCP
8.11.7.3. Configuring the cluster-wide proxy during installation
8.11.7.4. Creating the Kubernetes manifest and Ignition config files
8.11.8. Exporting common variables
8.11.8.1. Extracting the infrastructure name
8.11.8.2. Exporting common variables for Deployment Manager templates
8.11.9. Networking requirements for user-provisioned infrastructure
8.11.9.1. Setting the cluster node hostnames through DHCP
8.11.9.2. Network connectivity requirements
8.11.10. Creating load balancers in GCP
8.11.10.1. Deployment Manager template for the external load balancer
8.11.10.2. Deployment Manager template for the internal load balancer
8.11.11. Creating a private DNS zone in GCP
8.11.11.1. Deployment Manager template for the private DNS
8.11.12. Creating firewall rules in GCP
8.11.12.1. Deployment Manager template for firewall rules
8.11.13. Creating IAM roles in GCP
8.11.13.1. Deployment Manager template for IAM roles
8.11.14. Creating the RH COS cluster image for the GCP infrastructure
8.11.15. Creating the bootstrap machine in GCP
8.11.15.1. Deployment Manager template for the bootstrap machine
8.11.16. Creating the control plane machines in GCP
8.11.16.1. Deployment Manager template for control plane machines
8.11.17. Wait for bootstrap completion and remove bootstrap resources in GCP
8.11.18. Creating additional worker machines in GCP
8.11.18.1. Deployment Manager template for worker machines
8.11.19. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
8.11.20. Logging in to the cluster by using the CLI
8.11.21. Approving the certificate signing requests for your machines
8.11.22. Adding the ingress DNS records
8.11.23. Adding ingress firewall rules
8.11.23.1. Creating cluster-wide firewall rules for a shared VPC in GCP
8.11.24. Completing a GCP installation on user-provisioned infrastructure
8.11.25. Telemetry access for OpenShift Container Platform
8.11.26. Next steps

8.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
8.12.1. Prerequisites
8.12.2. About installations in restricted networks
8.12.2.1. Additional limits
8.12.3. Internet access for OpenShift Container Platform
8.12.4. Configuring your GCP project
8.12.4.1. Creating a GCP project
8.12.4.2. Enabling API services in GCP
8.12.4.3. Configuring DNS for GCP
8.12.4.4. GCP account limits
8.12.4.5. Creating a service account in GCP
8.12.4.6. Required GCP roles
8.12.4.7. Required GCP permissions for user-provisioned infrastructure
8.12.4.8. Supported GCP regions
8.12.4.9. Installing and configuring CLI tools for GCP
8.12.5. Requirements for a cluster with user-provisioned infrastructure
  8.12.5.1. Required machines for cluster installation
  8.12.5.2. Minimum resource requirements for cluster installation
  8.12.5.3. Tested instance types for GCP
  8.12.5.4. Using custom machine types
8.12.6. Creating the installation files for GCP
  8.12.6.1. Optional: Creating a separate /var partition
  8.12.6.2. Creating the installation configuration file
  8.12.6.3. Configuring the cluster-wide proxy during installation
  8.12.6.4. Creating the Kubernetes manifest and Ignition config files
8.12.7. Exporting common variables
  8.12.7.1. Extracting the infrastructure name
  8.12.7.2. Exporting common variables for Deployment Manager templates
8.12.8. Creating a VPC in GCP
  8.12.8.1. Deployment Manager template for the VPC
8.12.9. Networking requirements for user-provisioned infrastructure
  8.12.9.1. Setting the cluster node hostnames through DHCP
  8.12.9.2. Network connectivity requirements
8.12.10. Creating load balancers in GCP
  8.12.10.1. Deployment Manager template for the external load balancer
  8.12.10.2. Deployment Manager template for the internal load balancer
8.12.11. Creating a private DNS zone in GCP
  8.12.11.1. Deployment Manager template for the private DNS
  8.12.12.1. Deployment Manager template for firewall rules
8.12.13. Creating IAM roles in GCP
  8.12.13.1. Deployment Manager template for IAM roles
8.12.14. Creating the RHCOS cluster image for the GCP infrastructure
8.12.15. Creating the bootstrap machine in GCP
  8.12.15.1. Deployment Manager template for the bootstrap machine
8.12.16. Creating the control plane machines in GCP
  8.12.16.1. Deployment Manager template for control plane machines
8.12.17. Wait for bootstrap completion and remove bootstrap resources in GCP
8.12.18. Creating additional worker machines in GCP
  8.12.18.1. Deployment Manager template for worker machines
8.12.19. Logging in to the cluster by using the CLI
8.12.20. Disabling the default OperatorHub sources
8.12.21. Approving the certificate signing requests for your machines
8.12.22. Optional: Adding the ingress DNS records
8.12.23. Completing a GCP installation on user-provisioned infrastructure
8.12.24. Telemetry access for OpenShift Container Platform
8.12.25. Next steps
8.13. UNINSTALLING A CLUSTER ON GCP
  8.13.1. Removing a cluster that uses installer-provisioned infrastructure
  8.13.2. Deleting GCP resources with the Cloud Credential Operator utility

CHAPTER 9. INSTALLING ON IBM CLOUD VPC

9.1. PREPARING TO INSTALL ON IBM CLOUD VPC
  9.1.1. Prerequisites
  9.1.2. Requirements for installing OpenShift Container Platform on IBM Cloud VPC
9.1.3. Choosing a method to install OpenShift Container Platform on IBM Cloud VPC
  9.1.3.1. Installing a cluster on installer-provisioned infrastructure
  9.1.4. Next steps
9.2. CONFIGURING AN IBM CLOUD ACCOUNT

9.2.1. Prerequisites

9.2.2. Quotas and limits on IBM Cloud VPC
- Virtual Private Cloud (VPC)
- Application load balancer
- Floating IP address
- Virtual Server Instances (VSI)
- Block Storage Volumes

9.2.3. Configuring DNS resolution using Cloud Internet Services

9.2.4. IBM Cloud VPC IAM Policies and API Key
- Required access policies
- Access policy assignment
- Creating an API key

9.2.5. Supported IBM Cloud VPC regions

9.2.6. Next steps

9.3. CONFIGURING IAM FOR IBM CLOUD VPC

9.3.1. Alternatives to storing administrator-level secrets in the kube-system project

9.3.2. Configuring the Cloud Credential Operator utility

9.3.3. Next steps

9.3.4. Additional resources

9.4. INSTALLING A CLUSTER ON IBM CLOUD VPC WITH CUSTOMIZATIONS

9.4.1. Prerequisites

9.4.2. Internet access for OpenShift Container Platform

9.4.3. Generating a key pair for cluster node SSH access

9.4.4. Obtaining the installation program

9.4.5. Exporting the IBM Cloud VPC API key

9.4.6. Creating the installation configuration file
- Required configuration parameters
- Network configuration parameters
- Optional configuration parameters
- Additional IBM Cloud VPC configuration parameters

9.4.7. Manually creating IAM for IBM Cloud VPC

9.4.8. Deploying the cluster

9.4.9. Installing the OpenShift CLI by downloading the binary
- Installing the OpenShift CLI on Linux
- Installing the OpenShift CLI on Windows
- Installing the OpenShift CLI on macOS

9.4.10. Logging in to the cluster by using the CLI

9.4.11. Telemetry access for OpenShift Container Platform

9.4.12. Next steps

9.5. INSTALLING A CLUSTER ON IBM CLOUD VPC WITH NETWORK CUSTOMIZATIONS

9.5.1. Prerequisites

9.5.2. Internet access for OpenShift Container Platform

9.5.3. Generating a key pair for cluster node SSH access

9.5.4. Obtaining the installation program

9.5.5. Exporting the IBM Cloud VPC API key

9.5.6. Creating the installation configuration file
- Required configuration parameters
- Network configuration parameters
CHAPTER 9. INSTALLING ON IBM CLOUD VPC ........................................ 1612
9.5.6.1.3. Optional configuration parameters .......................... 1612
9.5.6.1.4. Additional IBM Cloud VPC configuration parameters ..... 1617
9.5.6.2. Sample customized install-config.yaml file for IBM Cloud VPC 1618
9.5.6.3. Configuring the cluster-wide proxy during installation ...... 1620
9.5.7. Manually creating IAM for IBM Cloud VPC ...................... 1621
9.5.8. Network configuration phases ...................................... 1624
9.5.9. Specifying advanced network configuration ................. 1624
9.5.10. Cluster Network Operator configuration ....................... 1625
  9.5.10.1. Cluster Network Operator configuration object .......... 1626
     defaultNetwork object configuration .......................... 1626
     Configuration for the OpenShift SDN CNI cluster network provider 1627
     Configuration for the OVN-Kubernetes CNI cluster network provider 1628
     kubeProxyConfig object configuration ....................... 1630
9.5.11. Deploying the cluster ............................................ 1631
  9.5.12. Installing the OpenShift CLI by downloading the binary 1632
    Installing the OpenShift CLI on Linux ......................... 1633
    Installing the OpenShift CLI on Windows ..................... 1633
    Installing the OpenShift CLI on macOS ..................... 1634
9.5.13. Logging in to the cluster by using the CLI ................... 1634
9.5.14. Telemetry access for OpenShift Container Platform ....... 1635
9.5.15. Next steps .................................................... 1635
9.6. UNINSTALLING A CLUSTER ON IBM CLOUD VPC .............. 1635
  9.6.1. Removing a cluster that uses installer-provisioned infrastructure 1635

CHAPTER 10. INSTALLING ON NUTANIX ....................................... 1638
10.1. PREPARING TO INSTALL ON NUTANIX .......................... 1638
  10.1.1. Nutanix version requirements ............................... 1638
  10.1.2. Environment requirements .................................... 1638
      10.1.2.1. Required account privileges ......................... 1638
      10.1.2.2. Cluster limits ....................................... 1639
      10.1.2.3. Cluster resources .................................. 1639
      10.1.2.4. Networking requirements ............................ 1640
      10.1.2.4.1. Required IP Addresses ........................... 1640
      10.1.2.4.2. DNS records ..................................... 1640
  10.1.3. Configuring the Cloud Credential Operator utility ....... 1641
10.2. INSTALLING A CLUSTER ON NUTANIX .......................... 1642
  10.2.1. Prerequisites ................................................. 1642
  10.2.2. Internet access for OpenShift Container Platform ....... 1643
  10.2.3. Internet access for Prism Central .......................... 1643
  10.2.4. Generating a key pair for cluster node SSH access ....... 1644
  10.2.5. Obtaining the installation program ....................... 1645
  10.2.6. Adding Nutanix root CA certificates to your system trust 1646
  10.2.7. Creating the installation configuration file ............... 1647
      10.2.7.1. Installation configuration parameters .............. 1648
      10.2.7.1.1. Required configuration parameters ............... 1648
      10.2.7.1.2. Network configuration parameters .............. 1650
      10.2.7.1.3. Optional configuration parameters ............... 1652
      10.2.7.1.4. Additional Nutanix configuration parameters .... 1657
  10.2.8. Installing the OpenShift CLI by downloading the binary 1662
      Installing the OpenShift CLI on Linux ....................... 1662
      Installing the OpenShift CLI on Windows .................... 1663
Installing the OpenShift CLI on macOS
10.2.9. Configuring IAM for Nutanix
10.2.10. Deploying the cluster
10.2.11. Configuring the default storage container
10.2.12. Telemetry access for OpenShift Container Platform
10.2.13. Additional resources
10.2.14. Next steps

10.3. UNINSTALLING A CLUSTER ON NUTANIX
10.3.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 11. INSTALLING ON BARE METAL

11.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION
11.1.1. Prerequisites
11.1.2. Planning a bare metal cluster for OpenShift Virtualization
11.1.3. Choosing a method to install OpenShift Container Platform on bare metal
11.1.3.1. Installing a cluster on installer-provisioned infrastructure
11.1.3.2. Installing a cluster on user-provisioned infrastructure

11.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL
11.2.1. Prerequisites
11.2.2. Internet access for OpenShift Container Platform
11.2.3. Requirements for a cluster with user-provisioned infrastructure
11.2.3.1. Required machines for cluster installation
11.2.3.2. Minimum resource requirements for cluster installation
11.2.3.3. Certificate signing requests management
11.2.3.4. Networking requirements for user-provisioned infrastructure
11.2.3.4.1. Setting the cluster node hostnames through DHCP
11.2.3.4.2. Network connectivity requirements
11.2.3.5. User-provisioned DNS requirements
11.2.3.5.1. Example DNS configuration for user-provisioned clusters
11.2.3.6. Load balancing requirements for user-provisioned infrastructure
11.2.3.6.1. Example load balancer configuration for user-provisioned clusters
11.2.4. Preparing the user-provisioned infrastructure
11.2.5. Validating DNS resolution for user-provisioned infrastructure
11.2.6. Generating a key pair for cluster node SSH access
11.2.7. Obtaining the installation program
11.2.8. Installing the OpenShift CLI by downloading the binary
11.2.9. Manually creating the installation configuration file
11.2.9.1. Installation configuration parameters
11.2.9.1.1. Required configuration parameters
11.2.9.1.2. Network configuration parameters
11.2.9.1.3. Optional configuration parameters
11.2.9.2. Sample install-config.yaml file for bare metal
11.2.9.3. Configuring the cluster-wide proxy during installation
11.2.9.4. Configuring a three-node cluster
11.2.10. Creating the Kubernetes manifest and Ignition config files
11.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
11.2.11.1. Installing RHCOS by using an ISO image
11.2.11.2. Installing RHCOS by using PXE or iPXE booting
11.2.11.3. Advanced RHCOS installation configuration
11.2.11.3.1. Using advanced networking options for PXE and ISO installations
11.2.11.3.2. Disk partitioning
   11.2.11.3.2.1. Creating a separate /var partition
   11.2.11.3.2.2. Retaining existing partitions
11.2.11.3.3. Identifying Ignition configs
   11.2.11.3.3.1. Customizing a live RH COS ISO or PXE install
   11.2.11.3.3.2. Customizing a live RH COS ISO image
   11.2.11.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority
   11.2.11.3.3.2.2. Modifying a live install ISO image with customized network settings
   11.2.11.3.3.3. Customizing a live RH COS PXE environment
   11.2.11.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority
   11.2.11.3.3.3.2. Modifying a live install PXE environment with customized network settings
11.2.11.3.4. Advanced RH COS installation reference
   11.2.11.3.4.1. Networking and bonding options for ISO installations
      Configuring DHCP or static IP addresses
      Configuring an IP address without a static hostname
      Specifying multiple network interfaces
      Configuring default gateway and route
      Disabling DHCP on a single interface
      Combining DHCP and static IP configurations
      Configuring VLANs on individual interfaces
      Providing multiple DNS servers
      Bonding multiple network interfaces to a single interface
      Bonding multiple network interfaces to a single interface
      Using network teaming
   11.2.11.3.4.2. coreos-installer options for ISO and PXE installations
   11.2.11.3.4.3. coreos.inst boot options for ISO or PXE installations
   11.2.11.4. Enabling multipathing with kernel arguments on RH COS
   11.2.11.5. Updating the bootloader using bootupd
11.2.12. Waiting for the bootstrap process to complete
11.2.13. Logging in to the cluster by using the CLI
11.2.14. Approving the certificate signing requests for your machines
11.2.15. Initial Operator configuration
   11.2.15.1. Image registry removed during installation
   11.2.15.2. Image registry storage configuration
      11.2.15.2.1. Configuring registry storage for bare metal and other manual installations
      11.2.15.2.2. Configuring storage for the image registry in non-production clusters
   11.2.15.2.3. Configuring block registry storage
11.2.16. Completing installation on user-provisioned infrastructure
11.2.17. Telemetry access for OpenShift Container Platform
11.2.18. Next steps

11.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS
11.3.1. Prerequisites
11.3.2. Internet access for OpenShift Container Platform
11.3.3. Requirements for a cluster with user-provisioned infrastructure
   11.3.3.1. Required machines for cluster installation
   11.3.3.2. Minimum resource requirements for cluster installation
   11.3.3.3. Certificate signing requests management
   11.3.3.4. Networking requirements for user-provisioned infrastructure
      11.3.3.4.1. Setting the cluster node hostnames through DHCP
      11.3.3.4.2. Network connectivity requirements
      NTP configuration for user-provisioned infrastructure
   11.3.3.5. User-provisioned DNS requirements
11.3.3.5.1. Example DNS configuration for user-provisioned clusters 1761
11.3.3.6. Load balancing requirements for user-provisioned infrastructure 1764
11.3.3.6.1. Example load balancer configuration for user-provisioned clusters 1766
11.3.4. Preparing the user-provisioned infrastructure 1767
11.3.5. Validating DNS resolution for user-provisioned infrastructure 1770
11.3.6. Generating a key pair for cluster node SSH access 1772
11.3.7. Obtaining the installation program 1774
11.3.8. Installing the OpenShift CLI by downloading the binary 1775
  Installing the OpenShift CLI on Linux 1775
  Installing the OpenShift CLI on Windows 1775
  Installing the OpenShift CLI on macOS 1776
11.3.9. Manually creating the installation configuration file 1776
  11.3.9.1. Installation configuration parameters 1777
    11.3.9.1.1. Required configuration parameters 1777
    11.3.9.1.2. Network configuration parameters 1779
    11.3.9.1.3. Optional configuration parameters 1781
  11.3.9.2. Sample install-config.yaml file for bare metal 1787
11.3.10. Network configuration phases 1790
11.3.11. Specifying advanced network configuration 1790
11.3.12. Cluster Network Operator configuration 1792
  11.3.12.1. Cluster Network Operator configuration object 1792
    defaultNetwork object configuration 1793
    Configuration for the OpenShift SDN CNI cluster network provider 1793
    Configuration for the OVN-Kubernetes CNI cluster network provider 1795
    kubeProxyConfig object configuration 1796
11.3.13. Creating the Ignition config files 1797
11.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process 1798
  11.3.14.1. Installing RHCOS by using an ISO image 1799
  11.3.14.2. Installing RHCOS by using PXE or iPXE booting 1802
  11.3.14.3. Advanced RHCOS installation configuration 1807
    11.3.14.3.1. Using advanced networking options for PXE and ISO installations 1807
    11.3.14.3.2. Disk partitioning 1808
      11.3.14.3.2.1. Creating a separate /var partition 1809
      11.3.14.3.2.2. Retaining existing partitions 1811
    11.3.14.3.3. Identifying Ignition configs 1812
      11.3.14.3.3.1. Customizing a live RHCOS ISO or PXE install 1813
      11.3.14.3.3.2. Customizing a live RHCOS ISO image 1813
      11.3.14.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority 1814
      11.3.14.3.3.2.2. Modifying a live install ISO image with customized network settings 1814
      11.3.14.3.3.3. Customizing a live RHCOS PXE environment 1816
      11.3.14.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority 1816
      11.3.14.3.3.3.2. Modifying a live install PXE environment with customized network settings 1817
  11.3.14.4. Advanced RHCOS installation reference 1819
    11.3.14.4.1. Networking and bonding options for ISO installations 1819
      Configuring DHCP or static IP addresses 1819
      Configuring an IP address without a static hostname 1820
      Specifying multiple network interfaces 1820
      Configuring default gateway and route 1820
      Disabling DHCP on a single interface 1821
      Combining DHCP and static IP configurations 1821
      Configuring VLANs on individual interfaces 1821
      Providing multiple DNS servers 1821
      Bonding multiple network interfaces to a single interface 1821
Bonding multiple network interfaces to a single interface 1822
Using network teaming 1822
11.3.14.3.4.2. coreos-installer options for ISO and PXE installations 1822
11.3.14.3.4.3. coreos.inst boot options for ISO or PXE installations 1826
11.3.14.4. Enabling multipathing with kernel arguments on RHCOS 1828
11.3.14.5. Updating the bootloader using bootupd 1829
11.3.15. Waiting for the bootstrap process to complete 1831
11.3.16. Logging in to the cluster by using the CLI 1832
11.3.17. Approving the certificate signing requests for your machines 1833
11.3.18. Initial Operator configuration 1835
11.3.18.1. Image registry removed during installation 1836
11.3.18.2. Image registry storage configuration 1837
11.3.18.3. Configuring block registry storage 1837
11.3.19. Completing installation on user-provisioned infrastructure 1837
11.3.20. Telemetry access for OpenShift Container Platform 1840
11.3.21. Next steps 1840
11.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK 1840
11.4.1. Prerequisites 1840
11.4.2. About installations in restricted networks 1841
11.4.2.1. Additional limits 1841
11.4.3. Internet access for OpenShift Container Platform 1841
11.4.4. Requirements for a cluster with user-provisioned infrastructure 1842
11.4.4.1. Required machines for cluster installation 1842
11.4.4.2. Minimum resource requirements for cluster installation 1843
11.4.4.3. Certificate signing requests management 1843
11.4.4.4. Networking requirements for user-provisioned infrastructure 1844
11.4.4.4.1. Setting the cluster node hostnames through DHCP 1844
11.4.4.4.2. Network connectivity requirements 1845
11.4.4.4.3. NTP configuration for user-provisioned infrastructure 1846
11.4.4.5. User-provisioned DNS requirements 1846
11.4.4.5.1. Example DNS configuration for user-provisioned clusters 1848
11.4.4.6. Load balancing requirements for user-provisioned infrastructure 1850
11.4.4.6.1. Example load balancer configuration for user-provisioned clusters 1852
11.4.5. Preparing the user-provisioned infrastructure 1854
11.4.6. Validating DNS resolution for user-provisioned infrastructure 1856
11.4.7. Generating a key pair for cluster node SSH access 1858
11.4.8. Manually creating the installation configuration file 1860
11.4.8.1. Installation configuration parameters 1861
11.4.8.1.1. Required configuration parameters 1861
11.4.8.1.2. Network configuration parameters 1863
11.4.8.1.3. Optional configuration parameters 1865
11.4.8.2. Sample install-config.yaml file for bare metal 1871
11.4.8.3. Configuring the cluster-wide proxy during installation 1874
11.4.8.4. Configuring a three-node cluster 1876
11.4.9. Creating the Kubernetes manifest and Ignition config files 1877
11.4.10. Configuring chrony time service 1878
11.4.11. Installing RHCOs and starting the OpenShift Container Platform bootstrap process 1880
11.4.11.1. Installing RHCOs by using an ISO image 1881
11.4.11.2. Installing RHCOs by using PXE or iPXE booting 1884
11.4.11.3. Advanced RHCOs installation configuration 1888
11.4.11.3.1. Using advanced networking options for PXE and ISO installations 1889
11.4.11.3.2. Disk partitioning 1890
11.4.11.3.2.1. Creating a separate /var partition 1890
11.4.11.3.2.2. Retaining existing partitions
11.4.11.3.3. Identifying Ignition configs
11.4.11.3.3.1. Customizing a live RHCOs ISO or PXE install
11.4.11.3.3.2. Customizing a live RHCOs ISO image
11.4.11.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority
11.4.11.3.3.2.2. Modifying a live install ISO image with customized network settings
11.4.11.3.3.3. Customizing a live RHCOs PXE environment
11.4.11.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority
11.4.11.3.3.3.2. Modifying a live install PXE environment with customized network settings
11.4.11.3.4. Advanced RHCOs installation reference
11.4.11.3.4.1. Networking and bonding options for ISO installations
Configuring DHCP or static IP addresses
Configuring an IP address without a static hostname
Specifying multiple network interfaces
Configuring default gateway and route
Disabling DHCP on a single interface
Combining DHCP and static IP configurations
Configuring VLANs on individual interfaces
Providing multiple DNS servers
Bonding multiple network interfaces to a single interface
Bonding multiple network interfaces to a single interface
Using network teaming
11.4.11.3.4.2. coreos-installer options for ISO and PXE installations
11.4.11.3.4.3. coreos.inst boot options for ISO or PXE installations
11.4.11.4. Enabling multipathing with kernel arguments on RHCOs
11.4.11.5. Updating the bootloader using bootupd
11.4.12. Waiting for the bootstrap process to complete
11.4.13. Logging in to the cluster by using the CLI
11.4.14. Approving the certificate signing requests for your machines
11.4.15. Initial Operator configuration
11.4.15.1. Disabling the default OperatorHub sources
11.4.15.2. Image registry storage configuration
11.4.15.2.1. Changing the image registry’s management state
11.4.15.2.2. Configuring registry storage for bare metal and other manual installations
11.4.15.2.3. Configuring storage for the image registry in non-production clusters
11.4.15.2.4. Configuring block registry storage
11.4.16. Completing installation on user-provisioned infrastructure
11.4.17. Telemetry access for OpenShift Container Platform
11.4.18. Next steps

CHAPTER 12. INSTALLING ON-PREMISE WITH ASSISTED INSTALLER

12.1. INSTALLING AN ON-PREMISE CLUSTER USING THE ASSISTED INSTALLER
12.1.1. Using the Assisted Installer
12.1.2. API support for the Assisted Installer
12.2. PREPARING TO INSTALL WITH THE ASSISTED INSTALLER
12.2.1. Prerequisites
12.2.2. Assisted Installer prerequisites
12.2.2.1. Hardware
12.2.2.2. Networking
12.2.2.3. Preflight validations
12.2.3. Additional resources
12.3. INSTALLING WITH THE ASSISTED INSTALLER
12.3.1. Preinstallation considerations
12.3.2. Setting the cluster details
12.3.3. Optional: Configuring host network interfaces
12.3.4. Adding hosts to the cluster
12.3.5. Creating an ISO image on a USB drive
12.3.6. Booting with a USB drive
12.3.7. Booting from an HTTP-hosted ISO image using the Redfish API
12.3.8. Configuring hosts
12.3.9. Configuring networking
12.3.10. Installing the cluster
12.3.11. Completing the installation
12.3.12. Additional resources

CHAPTER 13. INSTALLING ON A SINGLE NODE ........................................ 1936
13.1. PREPARING TO INSTALL ON A SINGLE NODE ............................ 1936
  13.1.1. Prerequisites
  13.1.2. About OpenShift on a single node
  13.1.3. Requirements for installing OpenShift on a single node
13.2. INSTALLING OPENSHEET ON A SINGLE NODE .............................. 1937
  13.2.1. Installing single-node OpenShift using the Assisted Installer
  13.2.1.1. Generating the discovery ISO with the Assisted Installer
  13.2.1.2. Installing single-node OpenShift with the Assisted Installer
  13.2.2. Installing single-node OpenShift manually
  13.2.2.1. Generating the installation ISO with coreos-installer
  13.2.2.2. Monitoring the cluster installation using openshift-install
  13.2.3. Creating a bootable ISO image on a USB drive
  13.2.4. Booting from an HTTP-hosted ISO image using the Redfish API

CHAPTER 14. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL 1944
14.1. OVERVIEW ..................................................................................... 1944
14.2. PREREQUISITES ............................................................................ 1945
  14.2.1. Node requirements
  14.2.2. Planning a bare metal cluster for OpenShift Virtualization
  14.2.3. Firmware requirements for installing with virtual media
  14.2.4. Network requirements
  14.2.4.1. Increase the network MTU
  14.2.4.2. Configuring NICs
  14.2.4.3. DNS requirements
  14.2.4.4. Dynamic Host Configuration Protocol (DHCP) requirements
  14.2.4.5. Reserving IP addresses for nodes with the DHCP server
  14.2.4.6. Provisioner node requirements
  14.2.4.7. Network Time Protocol (NTP)
  14.2.4.8. Port access for the out-of-band management IP address
  14.2.5. Configuring nodes
  14.2.5.1. Configuring nodes when using the provisioning network
  14.2.5.2. Configuring nodes without the provisioning network
  14.2.5.3. Configuring nodes for Secure Boot manually
  14.2.5.4. Configuring the Compatibility Support Module for Fujitsu iRMC
  14.2.6. Out-of-band management
  14.2.7. Required data for installation
  14.2.8. Validation checklist for nodes
14.3. SETTING UP THE ENVIRONMENT FOR AN OPENSHEET INSTALLATION 1957
  14.3.1. Installing RHEL on the provisioner node
  14.3.2. Preparing the provisioner node for OpenShift Container Platform installation
14.3.3. Checking NTP server synchronization
14.3.4. Configuring networking
14.3.5. Establishing communication between subnets
14.3.6. Retrieving the OpenShift Container Platform installer
14.3.7. Extracting the OpenShift Container Platform installer
14.3.8. Optional: Creating an RHCOS images cache
14.3.9. Configuring the install-config.yaml file
  14.3.9.1. Configuring the install-config.yaml file
  14.3.9.2. Additional install-config parameters
    Hosts
  14.3.9.3. BMC addressing
    IPMI
    Redfish network boot
    Redfish APIs
  14.3.9.4. BMC addressing for Dell iDRAC
    BMC address formats for Dell iDRAC
    Redfish virtual media for Dell iDRAC
    Redfish network boot for iDRAC
  14.3.9.5. BMC addressing for HPE iLO
    Redfish virtual media for HPE iLO
    Redfish network boot for HPE iLO
  14.3.9.6. BMC addressing for Fujitsu iRMC
  14.3.9.7. Root device hints
  14.3.9.8. Optional: Setting proxy settings
  14.3.9.9. Optional: Deploying with no provisioning network
  14.3.9.10. Optional: Deploying with dual-stack networking
  14.3.9.11. Optional: Configuring host network interfaces
  14.3.9.12. Configuring host network interfaces for subnets
  14.3.9.13. Optional: Configuring address generation modes for SLAAC in dual-stack networks
  14.3.9.14. Configuring multiple cluster nodes
  14.3.9.15. Optional: Configuring managed Secure Boot
14.3.10. Manifest configuration files
  14.3.10.1. Creating the OpenShift Container Platform manifests
  14.3.10.2. Optional: Configuring NTP for disconnected clusters
  14.3.10.3. Configuring network components to run on the control plane
  14.3.10.4. Optional: Deploying routers on worker nodes
  14.3.10.5. Optional: Configuring the BIOS
  14.3.10.6. Optional: Configuring the RAID
  14.3.11. Creating a disconnected registry
    Prerequisites
    14.3.11.1. Preparing the registry node to host the mirrored registry
    14.3.11.2. Mirroring the OpenShift Container Platform image repository for a disconnected registry
    14.3.11.3. Modify the install-config.yaml file to use the disconnected registry
  14.3.12. Validation checklist for installation
  14.3.13. Deploying the cluster via the OpenShift Container Platform installer
  14.3.14. Following the installation
  14.3.15. Verifying static IP address configuration
  14.3.16. Preparing to reinstall a cluster on bare metal
  14.3.17. Additional resources
14.4. INSTALLER-PROVISIONED POSTINSTALLATION CONFIGURATION
  14.4.1. Optional: Configuring NTP for disconnected clusters
  14.4.2. Enabling a provisioning network after installation
  14.4.3. Configuring an external load balancer
14.5. Expanding the cluster

14.5.1. Preparing the bare metal node
14.5.2. Replacing a bare-metal control plane node
14.5.3. Preparing to deploy with Virtual Media on the baremetal network
14.5.4. Diagnosing a duplicate MAC address when provisioning a new host in the cluster
14.5.5. Provisioning the bare metal node

14.6. Troubleshooting

14.6.1. Troubleshooting the installer workflow
14.6.2. Troubleshooting install-config.yaml
14.6.3. Bootstrap VM issues
   14.6.3.1. Bootstrap VM cannot boot up the cluster nodes
   14.6.3.2. Inspecting logs
14.6.4. Cluster nodes will not PXE boot
14.6.5. Unable to discover new bare metal hosts using the BMC
14.6.6. The API is not accessible
14.6.7. Troubleshooting worker nodes that cannot join the cluster
14.6.8. Cleaning up previous installations
14.6.9. Issues with creating the registry
14.6.10. Miscellaneous issues
   14.6.10.1. Addressing the runtime network not ready error
   14.6.10.2. Cluster nodes not getting the correct IPv6 address over DHCP
   14.6.10.3. Cluster nodes not getting the correct hostname over DHCP
   14.6.10.4. Routes do not reach endpoints
   14.6.10.5. Failed Ignition during Firstboot
   14.6.10.6. NTP out of sync
14.6.11. Reviewing the installation

15. Chapter 15. Installing IBM Cloud Bare Metal (Classic)

15.1. Prerequisites

15.1.1. Setting up IBM Cloud Bare Metal (Classic) infrastructure
   Use one data center per cluster
   Create public and private VLANs
   Ensure subnets have sufficient IP addresses
   Configuring NICs
   Configuring canonical names
   Creating DNS entries
   Network Time Protocol (NTP)
   Configure a DHCP server
   Ensure BMC access privileges
   Create bare metal servers

15.2. Setting up the environment for an OpenShift Container Platform installation

15.2.1. Preparing the provisioner node on IBM Cloud Bare Metal (Classic) infrastructure
15.2.2. Configuring the public subnet
15.2.3. Retrieving the OpenShift Container Platform installer
15.2.4. Extracting the OpenShift Container Platform installer
15.2.5. Configuring the install-config.yaml file
15.2.6. Additional install-config parameters
   Hosts
15.2.7. Root device hints
15.2.8. Creating the OpenShift Container Platform manifests
15.2.9. Deploying the cluster via the OpenShift Container Platform installer
15.2.10. Following the installation
CHAPTER 16. INSTALLING WITH Z/VM ON IBM Z AND LINUXONE  ........................................... 2068
16.1. PREPARING TO INSTALL WITH Z/VM ON IBM Z AND LINUXONE  .................................. 2068
  16.1.1. Prerequisites .............................................................................................................. 2068
  16.1.2. Choosing a method to install OpenShift Container Platform with z/VM on IBM Z or LinuxONE 2068
16.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE  ........................................ 2068
  16.2.1. Prerequisites .............................................................................................................. 2068
  16.2.2. Internet access for OpenShift Container Platform .......................................................... 2069
  16.2.3. Requirements for a cluster with user-provisioned infrastructure ................................. 2069
    16.2.3.1. Required machines for cluster installation ................................................................. 2069
    16.2.3.2. Minimum resource requirements for cluster installation ........................................ 2070
    16.2.3.3. Minimum IBM Z system environment ..................................................................... 2071
      Hardware requirements ........................................................................................................ 2071
      Operating system requirements .......................................................................................... 2071
      IBM Z network connectivity requirements ....................................................................... 2071
      Disk storage for the z/VM guest virtual machines ............................................................. 2071
      Storage / Main Memory ....................................................................................................... 2072
    16.2.3.4. Preferred IBM Z system environment ..................................................................... 2072
      Hardware requirements ........................................................................................................ 2072
      Operating system requirements .......................................................................................... 2072
      IBM Z network connectivity requirements ....................................................................... 2072
      Disk storage for the z/VM guest virtual machines ............................................................. 2072
      Storage / Main Memory ....................................................................................................... 2073
  16.2.3.5. Certificate signing requests management .................................................................... 2073
  16.2.3.6. Networking requirements for user-provisioned infrastructure ................................. 2073
    16.2.3.6.1. Network connectivity requirements ..................................................................... 2073
      NTP configuration for user-provisioned infrastructure ....................................................... 2075
  16.2.3.7. User-provisioned DNS requirements ....................................................................... 2075
    16.2.3.7.1. Example DNS configuration for user-provisioned clusters ................................. 2077
    16.2.3.7.2. Load balancing requirements for user-provisioned infrastructure ..................... 2079
    16.2.3.7.3. Example load balancer configuration for user-provisioned clusters ................. 2081
  16.2.4. Preparing the user-provisioned infrastructure ............................................................... 2083
  16.2.5. Validating DNS resolution for user-provisioned infrastructure .................................... 2084
  16.2.6. Generating a key pair for cluster node SSH access ...................................................... 2086
  16.2.7. Obtaining the installation program .............................................................................. 2088
  16.2.8. Installing the OpenShift CLI by downloading the binary ........................................... 2089
    Installing the OpenShift CLI on Linux .................................................................................. 2089
    Installing the OpenShift CLI on Windows ........................................................................... 2090
    Installing the OpenShift CLI on macOS .............................................................................. 2090
  16.2.9. Manually creating the installation configuration file ..................................................... 2091
    16.2.9.1. Installation configuration parameters ..................................................................... 2091
      16.2.9.1.1. Required configuration parameters ................................................................... 2092
      16.2.9.1.2. Network configuration parameters ................................................................... 2093
      16.2.9.1.3. Optional configuration parameters .................................................................... 2095
      16.2.9.2. Sample install-config.yaml file for IBM Z ............................................................ 2101
      16.2.9.3. Configuring the cluster-wide proxy during installation ........................................ 2104
      16.2.9.4. Configuring a three-node cluster ......................................................................... 2105
  16.2.10. Cluster Network Operator configuration ................................................................. 2107
    16.2.10.1. Cluster Network Operator configuration object .................................................. 2107
      defaultNetwork object configuration .................................................................................. 2108
      Configuration for the OpenShift SDN CNI cluster network provider .............................. 2108
      Configuration for the OVN-Kubernetes CNI cluster network provider ............................ 2109
      kubeProxyConfig object configuration ............................................................................ 2111
  16.2.11. Creating the Kubernetes manifest and Ignition config files ....................................... 2112
16.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process

16.2.12.1. Advanced RHCOS installation reference
  16.2.12.1.1. Networking and bonding options for ISO installations
    Configuring DHCP or static IP addresses
    Configuring an IP address without a static hostname
    Specifying multiple network interfaces
    Configuring default gateway and route
    Disabling DHCP on a single interface
    Combining DHCP and static IP configurations
    Configuring VLANs on individual interfaces
    Providing multiple DNS servers
    Bonding multiple network interfaces to a single interface
    Bonding multiple network interfaces to a single interface
    Using network teaming

16.2.13. Waiting for the bootstrap process to complete

16.2.14. Logging in to the cluster by using the CLI

16.2.15. Approving the certificate signing requests for your machines

16.2.16. Initial Operator configuration
  16.2.16.1. Image registry storage configuration
    16.2.16.1.1. Configuring registry storage for IBM Z
    16.2.16.1.2. Configuring storage for the image registry in non-production clusters

16.2.17. Completing installation on user-provisioned infrastructure

16.2.18. Telemetry access for OpenShift Container Platform

16.2.19. Next steps

16.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK

16.3.1. Prerequisites

16.3.2. About installations in restricted networks
  16.3.2.1. Additional limits

16.3.3. Internet access for OpenShift Container Platform

16.3.4. Requirements for a cluster with user-provisioned infrastructure
  16.3.4.1. Required machines for cluster installation
  16.3.4.2. Minimum resource requirements for cluster installation
  16.3.4.3. Minimum IBM Z system environment
    Hardware requirements
    Operating system requirements
    IBM Z network connectivity requirements
    Disk storage for the z/VM guest virtual machines
    Storage / Main Memory

16.3.4.4. Preferred IBM Z system environment
  Hardware requirements
  Operating system requirements
  IBM Z network connectivity requirements
  Disk storage for the z/VM guest virtual machines
  Storage / Main Memory

16.3.4.5. Certificate signing requests management

16.3.4.6. Networking requirements for user-provisioned infrastructure
  16.3.4.6.1. Setting the cluster node hostnames through DHCP
  16.3.4.6.2. Network connectivity requirements
    NTP configuration for user-provisioned infrastructure

16.3.4.7. User-provisioned DNS requirements
  16.3.4.7.1. Example DNS configuration for user-provisioned clusters

16.3.4.8. Load balancing requirements for user-provisioned infrastructure
  16.3.4.8.1. Example load balancer configuration for user-provisioned clusters
16.3.5. Preparing the user-provisioned infrastructure

16.3.6. Validating DNS resolution for user-provisioned infrastructure

16.3.7. Generating a key pair for cluster node SSH access

16.3.8. Manually creating the installation configuration file
  16.3.8.1. Installation configuration parameters
    16.3.8.1.1. Required configuration parameters
    16.3.8.1.2. Network configuration parameters
    16.3.8.1.3. Optional configuration parameters
  16.3.8.2. Sample install-config.yaml file for IBM Z
  16.3.8.3. Configuring the cluster-wide proxy during installation
  16.3.8.4. Configuring a three-node cluster

16.3.9. Cluster Network Operator configuration
  16.3.9.1. Cluster Network Operator configuration object
  defaultNetwork object configuration
  Configuration for the OpenShift SDN CNI cluster network provider
  Configuration for the OVN-Kubernetes CNI cluster network provider
  kubeProxyConfig object configuration

16.3.10. Creating the Kubernetes manifest and Ignition config files

16.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  16.3.11.1. Advanced RHCOS installation reference
    16.3.11.1.1. Networking and bonding options for ISO installations
    Configuring DHCP or static IP addresses
    Configuring an IP address without a static hostname
    Specifying multiple network interfaces
    Configuring default gateway and route
    Disabling DHCP on a single interface
    Combining DHCP and static IP configurations
    Configuring VLANs on individual interfaces
    Providing multiple DNS servers
    Bonding multiple network interfaces to a single interface
    Bonding multiple network interfaces to a single interface
    Using network teaming

16.3.12. Waiting for the bootstrap process to complete

16.3.13. Logging in to the cluster by using the CLI

16.3.14. Approving the certificate signing requests for your machines

16.3.15. Initial Operator configuration
  16.3.15.1. Disabling the default OperatorHub sources
  16.3.15.2. Image registry storage configuration
    16.3.15.2.1. Configuring registry storage for IBM Z
    16.3.15.2.2. Configuring storage for the image registry in non-production clusters

16.3.16. Completing installation on user-provisioned infrastructure

16.3.17. Next steps

CHAPTER 17. INSTALLING WITH RHEL KVM ON IBM Z AND LINUXONE

17.1. PREPARING TO INSTALL WITH RHEL KVM ON IBM Z AND LINUXONE

17.1.1. Prerequisites

17.1.2. Choosing a method to install OpenShift Container Platform with RHEL KVM on IBM Z or LinuxONE

17.2. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE

17.2.1. Prerequisites

17.2.2. Internet access for OpenShift Container Platform

17.2.3. Machine requirements for a cluster with user-provisioned infrastructure
  17.2.3.1. Required machines
17.2.3.2. Network connectivity requirements
17.2.3.3. IBM Z network connectivity requirements
17.2.3.4. Host machine resource requirements
17.2.3.5. Minimum IBM Z system environment
  Hardware requirements
  Operating system requirements
17.2.3.6. Minimum resource requirements
17.2.3.7. Preferred IBM Z system environment
  Hardware requirements
  Operating system requirements
17.2.3.8. Preferred resource requirements
17.2.3.9. Certificate signing requests management
17.2.3.10. Networking requirements for user-provisioned infrastructure
  17.2.3.10.1. Setting the cluster node hostnames through DHCP
  17.2.3.10.2. Network connectivity requirements
    NTP configuration for user-provisioned infrastructure
17.2.3.11. User-provisioned DNS requirements
  17.2.3.11.1. Example DNS configuration for user-provisioned clusters
17.2.3.12. Load balancing requirements for user-provisioned infrastructure
  17.2.3.12.1. Example load balancer configuration for user-provisioned clusters
17.2.4. Preparing the user-provisioned infrastructure
17.2.5. Validating DNS resolution for user-provisioned infrastructure
17.2.6. Generating a key pair for cluster node SSH access
17.2.7. Obtaining the installation program
17.2.8. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
17.2.9. Manually creating the installation configuration file
  17.2.9.1. Installation configuration parameters
    17.2.9.1.1. Required configuration parameters
    17.2.9.1.2. Network configuration parameters
    17.2.9.1.3. Optional configuration parameters
    17.2.9.2. Sample install-config.yaml file for IBM Z
  17.2.9.3. Configuring the cluster-wide proxy during installation
  17.2.9.4. Configuring a three-node cluster
17.2.10. Cluster Network Operator configuration
  17.2.10.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
17.2.11. Creating the Kubernetes manifest and Ignition config files
17.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  17.2.12.1. Fast-track installation by using a prepackaged QCOW2 disk image
  17.2.12.2. Full installation on a new QCOW2 disk image
  17.2.12.3. Advanced RHCOS installation reference
  17.2.12.3.1. Networking options for ISO installations
    Configuring DHCP or static IP addresses
    Configuring an IP address without a static hostname
    Specifying multiple network interfaces
    Configuring default gateway and route
    Disabling DHCP on a single interface
17.3.9.1. Cluster Network Operator configuration object
defaultNetwork object configuration
Configuration for the OpenShift SDN CNI cluster network provider
Configuration for the OVN-Kubernetes CNI cluster network provider
kubeProxyConfig object configuration
17.3.10. Creating the Kubernetes manifest and Ignition config files
17.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
17.3.11.1. Fast-track installation by using a prepackaged QCOW2 disk image
17.3.11.2. Full installation on a new QCOW2 disk image
17.3.11.3. Advanced RHCOS installation reference
  17.3.11.3.1. Networking options for ISO installations
    Configuring DHCP or static IP addresses
    Configuring an IP address without a static hostname
    Specifying multiple network interfaces
    Configuring default gateway and route
    Disabling DHCP on a single interface
    Combining DHCP and static IP configurations
    Configuring VLANs on individual interfaces
    Providing multiple DNS servers
17.3.12. Waiting for the bootstrap process to complete
17.3.13. Logging in to the cluster by using the CLI
17.3.14. Approving the certificate signing requests for your machines
17.3.15. Initial Operator configuration
  17.3.15.1. Disabling the default OperatorHub sources
  17.3.15.2. Image registry storage configuration
    17.3.15.2.1. Configuring registry storage for IBM Z
    17.3.15.2.2. Configuring storage for the image registry in non-production clusters
17.3.16. Completing installation on user-provisioned infrastructure
17.3.17. Next steps

CHAPTER 18. INSTALLING ON IBM POWER

18.1. PREPARING TO INSTALL ON IBM POWER
  18.1.1. Prerequisites
  18.1.2. Choosing a method to install OpenShift Container Platform on IBM Power

18.2. INSTALLING A CLUSTER ON IBM POWER
  18.2.1. Prerequisites
  18.2.2. Internet access for OpenShift Container Platform
  18.2.3. Requirements for a cluster with user-provisioned infrastructure
    18.2.3.1. Required machines for cluster installation
    18.2.3.2. Minimum resource requirements for cluster installation
    18.2.3.3. Minimum IBM Power requirements
      Hardware requirements
      Operating system requirements
      Disk storage for the IBM Power guest virtual machines
      Network for the PowerVM guest virtual machines
      Storage / main memory
    18.2.3.4. Recommended IBM Power system requirements
      Hardware requirements
      Operating system requirements
      Disk storage for the IBM Power guest virtual machines
      Network for the PowerVM guest virtual machines
      Storage / main memory
    18.2.3.5. Certificate signing requests management
18.2.3.6. Networking requirements for user-provisioned infrastructure

18.2.3.6.1. Setting the cluster node hostnames through DHCP

18.2.3.6.2. Network connectivity requirements

NTP configuration for user-provisioned infrastructure

18.2.3.7. User-provisioned DNS requirements

18.2.3.7.1. Example DNS configuration for user-provisioned clusters

18.2.3.8. Load balancing requirements for user-provisioned infrastructure

18.2.3.8.1. Example load balancer configuration for user-provisioned clusters

18.2.4. Preparing the user-provisioned infrastructure

18.2.5. Validating DNS resolution for user-provisioned infrastructure

18.2.6. Generating a key pair for cluster node SSH access

18.2.7. Obtaining the installation program

18.2.8. Installing the OpenShift CLI by downloading the binary

Installing the OpenShift CLI on Linux

Installing the OpenShift CLI on Windows

Installing the OpenShift CLI on macOS

18.2.9. Manually creating the installation configuration file

18.2.9.1. Installation configuration parameters

18.2.9.1.1. Required configuration parameters

18.2.9.1.2. Network configuration parameters

18.2.9.1.3. Optional configuration parameters

18.2.9.2. Sample install-config.yaml file for IBM Power

18.2.9.3. Configuring the cluster-wide proxy during installation

18.2.9.4. Configuring a three-node cluster

18.2.10. Cluster Network Operator configuration

18.2.10.1. Cluster Network Operator configuration object

defaultNetwork object configuration

Configuration for the OpenShift SDN CNI cluster network provider

Configuration for the OVN-Kubernetes CNI cluster network provider

kubeProxyConfig object configuration

18.2.11. Creating the Kubernetes manifest and Ignition config files

18.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process

18.2.12.1. Installing RHCOS by using an ISO image

18.2.12.1.1. Advanced RHCOS installation reference

18.2.12.1.1.1. Networking and bonding options for ISO installations

Configuring DHCP or static IP addresses

Configuring an IP address without a static hostname

Specifying multiple network interfaces

Configuring default gateway and route

Disabling DHCP on a single interface

Combining DHCP and static IP configurations

Configuring VLANs on individual interfaces

Providing multiple DNS servers

Bonding multiple network interfaces to a single interface

Bonding multiple network interfaces to a single interface

Using network teaming

18.2.12.2. Installing RHCOS by using PXE booting

18.2.12.3. Enabling multipathing with kernel arguments on RHCOS

18.2.13. Waiting for the bootstrap process to complete

18.2.14. Logging in to the cluster by using the CLI

18.2.15. Approving the certificate signing requests for your machines

18.2.16. Initial Operator configuration

18.2.16.1. Image registry storage configuration
18.2.16.1. Configuring registry storage for IBM Power
18.2.16.1.2. Configuring storage for the image registry in non-production clusters
18.2.17. Completing installation on user-provisioned infrastructure
18.2.18. Telemetry access for OpenShift Container Platform
18.2.19. Next steps
18.3. INSTALLING A CLUSTER ON IBM POWER IN A RESTRICTED NETWORK
18.3.1. Prerequisites
18.3.2. About installations in restricted networks
18.3.2.1. Additional limits
18.3.3. Internet access for OpenShift Container Platform
18.3.4. Requirements for a cluster with user-provisioned infrastructure
18.3.4.1. Required machines for cluster installation
18.3.4.2. Minimum resource requirements for cluster installation
18.3.4.3. Minimum IBM Power requirements
   Hardware requirements
   Operating system requirements
   Disk storage for the IBM Power guest virtual machines
   Network for the PowerVM guest virtual machines
   Storage / main memory
18.3.4.4. Recommended IBM Power system requirements
   Hardware requirements
   Operating system requirements
   Disk storage for the IBM Power guest virtual machines
   Network for the PowerVM guest virtual machines
   Storage / main memory
18.3.4.5. Certificate signing requests management
18.3.4.6. Networking requirements for user-provisioned infrastructure
18.3.4.6.1. Setting the cluster node hostnames through DHCP
18.3.4.6.2. Network connectivity requirements
   NTP configuration for user-provisioned infrastructure
18.3.4.7. User-provisioned DNS requirements
18.3.4.7.1. Example DNS configuration for user-provisioned clusters
18.3.4.8. Load balancing requirements for user-provisioned infrastructure
18.3.4.8.1. Example load balancer configuration for user-provisioned clusters
18.3.5. Preparing the user-provisioned infrastructure
18.3.6. Validating DNS resolution for user-provisioned infrastructure
18.3.7. Generating a key pair for cluster node SSH access
18.3.8. Manually creating the installation configuration file
18.3.8.1. Installation configuration parameters
18.3.8.1.1. Required configuration parameters
18.3.8.1.2. Network configuration parameters
18.3.8.1.3. Optional configuration parameters
18.3.8.2. Sample install-config.yaml file for IBM Power
18.3.8.3. Configuring the cluster-wide proxy during installation
18.3.8.4. Configuring a three-node cluster
18.3.9. Cluster Network Operator configuration
18.3.9.1. Cluster Network Operator configuration object
   defaultNetwork object configuration
   Configuration for the OpenShift SDN CNI cluster network provider
   Configuration for the OVN-Kubernetes CNI cluster network provider
   kubeProxyConfig object configuration
18.3.10. Creating the Kubernetes manifest and Ignition config files
18.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process

Table of Contents
18.3.11.1. Installing RHCOS by using an ISO image
18.3.11.1.1. Networking and bonding options for ISO installations
   Configuring DHCP or static IP addresses
   Configuring an IP address without a static hostname
   Specifying multiple network interfaces
   Configuring default gateway and route
   Disabling DHCP on a single interface
   Combining DHCP and static IP configurations
   Configuring VLANs on individual interfaces
   Providing multiple DNS servers
   Bonding multiple network interfaces to a single interface
   Bonding multiple network interfaces to a single interface
   Using network teaming

18.3.11.2. Installing RHCOS by using PXE booting
18.3.11.3. Enabling multipathing with kernel arguments on RHCOS

18.3.12. Waiting for the bootstrap process to complete
18.3.13. Logging in to the cluster by using the CLI
18.3.14. Approving the certificate signing requests for your machines
18.3.15. Initial Operator configuration
   18.3.15.1. Disabling the default OperatorHub sources
   18.3.15.2. Image registry storage configuration
      18.3.15.2.1. Changing the image registry’s management state
      18.3.15.2.2. Configuring registry storage for IBM Power
      18.3.15.2.3. Configuring storage for the image registry in non-production clusters
   18.3.16. Completing installation on user-provisioned infrastructure
18.3.17. Next steps

CHAPTER 19. INSTALLING ON OPENSTACK

19.1. PREPARING TO INSTALL ON OPENSTACK
   19.1.1. Prerequisites
   19.1.2. Choosing a method to install OpenShift Container Platform on OpenStack
      19.1.2.1. Installing a cluster on installer-provisioned infrastructure
      19.1.2.2. Installing a cluster on user-provisioned infrastructure
   19.1.3. Scanning RHOSP endpoints for legacy HTTPS certificates
      19.1.3.1. Scanning RHOSP endpoints for legacy HTTPS certificates manually

19.2. PREPARING TO INSTALL A CLUSTER THAT USES SR-IOV OR OVS-DPDK ON OPENSTACK
   19.2.1. Requirements for clusters on RHOSP that use either SR-IOV or OVS-DPDK
   19.2.1.1. Requirements for clusters on RHOSP that use SR-IOV
   19.2.1.2. Requirements for clusters on RHOSP that use OVS-DPDK
   19.2.2. Preparing to install a cluster that uses SR-IOV
      19.2.2.1. Creating SR-IOV networks for compute machines
   19.2.3. Preparing to install a cluster that uses OVS-DPDK
   19.2.4. Next steps

19.3. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS
   19.3.1. Prerequisites
   19.3.2. Resource guidelines for installing OpenShift Container Platform on RHOSP
      19.3.2.1. Control plane machines
      19.3.2.2. Compute machines
      19.3.2.3. Bootstrap machine
   19.3.3. Internet access for OpenShift Container Platform
   19.3.4. Enabling Swift on RHOSP
   19.3.5. Configuring an image registry with custom storage on clusters that run on RHOSP
19.3.6. Verifying external network access
19.3.7. Defining parameters for the installation program
19.3.8. Setting cloud provider options
   19.3.8.1. External load balancers that use pre-defined floating IP addresses
19.3.9. Obtaining the installation program
19.3.10. Creating the installation configuration file
   19.3.10.1. Configuring the cluster-wide proxy during installation
19.3.11. Installation configuration parameters
   19.3.11.1. Required configuration parameters
   19.3.11.2. Network configuration parameters
   19.3.11.3. Optional configuration parameters
   19.3.11.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
19.3.11.5. Optional RHOSP configuration parameters
19.3.11.6. Custom subnets in RHOSP deployments
19.3.11.7. Deploying a cluster with bare metal machines
19.3.11.8. Cluster deployment on RHOSP provider networks
   19.3.11.8.1. RHOSP provider network requirements for cluster installation
   19.3.11.8.2. Deploying a cluster that has a primary interface on a provider network
19.3.11.9. Sample customized install-config.yaml file for RHOSP
19.3.12. Generating a key pair for cluster node SSH access
19.3.13. Enabling access to the environment
   19.3.13.1. Enabling access with floating IP addresses
   19.3.13.2. Completing installation without floating IP addresses
19.3.14. Deploying the cluster
19.3.15. Verifying cluster status
19.3.16. Logging in to the cluster by using the CLI
19.3.17. Telemetry access for OpenShift Container Platform
19.3.18. Next steps
19.4. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR
19.4.1. Prerequisites
19.4.2. About Kuryr SDN
19.4.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr
   19.4.3.1. Increasing quota
   19.4.3.2. Configuring Neutron
   19.4.3.3. Configuring Octavia
      19.4.3.3.1. The Octavia OVN Driver
   19.4.3.4. Known limitations of installing with Kuryr
      RHOSP general limitations
      RHOSP version limitations
      RHOSP environment limitations
      RHOSP upgrade limitations
19.4.3.5. Control plane machines
19.4.3.6. Compute machines
19.4.3.7. Bootstrap machine
19.4.4. Internet access for OpenShift Container Platform
19.4.5. Enabling Swift on RHOSP
19.4.6. Verifying external network access
19.4.7. Defining parameters for the installation program
19.4.8. Setting cloud provider options
   19.4.8.1. External load balancers that use pre-defined floating IP addresses
19.4.9. Obtaining the installation program
19.4.10. Creating the installation configuration file
   19.4.10.1. Configuring the cluster-wide proxy during installation
19.4.11. Installation configuration parameters
  19.4.11.1. Required configuration parameters
  19.4.11.2. Network configuration parameters
  19.4.11.3. Optional configuration parameters
  19.4.11.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
  19.4.11.5. Optional RHOSP configuration parameters
  19.4.11.6. Custom subnets in RHOSP deployments
  19.4.11.7. Sample customized install-config.yaml file for RHOSP with Kuryr
  19.4.11.8. Cluster deployment on RHOSP provider networks
    19.4.11.8.1. RHOSP provider network requirements for cluster installation
    19.4.11.8.2. Deploying a cluster that has a primary interface on a provider network
  19.4.11.9. Kuryr ports pools
  19.4.11.10. Adjusting Kuryr ports pools during installation
  19.4.12. Generating a key pair for cluster node SSH access
  19.4.13. Enabling access to the environment
    19.4.13.1. Enabling access with floating IP addresses
    19.4.13.2. Completing installation without floating IP addresses
  19.4.14. Deploying the cluster
  19.4.15. Verifying cluster status
  19.4.16. Logging in to the cluster by using the CLI
  19.4.17. Telemetry access for OpenShift Container Platform
  19.4.18. Next steps

19.5. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN INFRASTRUCTURE
  19.5.1. Prerequisites
  19.5.2. Internet access for OpenShift Container Platform
  19.5.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
    19.5.3.1. Control plane machines
    19.5.3.2. Compute machines
    19.5.3.3. Bootstrap machine
  19.5.4. Downloading playbook dependencies
  19.5.5. Downloading the installation playbooks
  19.5.6. Obtaining the installation program
  19.5.7. Generating a key pair for cluster node SSH access
  19.5.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
  19.5.9. Verifying external network access
  19.5.10. Enabling access to the environment
    19.5.10.1. Enabling access with floating IP addresses
    19.5.10.2. Completing installation without floating IP addresses
  19.5.11. Defining parameters for the installation program
  19.5.12. Creating the installation configuration file
  19.5.13. Installation configuration parameters
    19.5.13.1. Required configuration parameters
    19.5.13.2. Network configuration parameters
    19.5.13.3. Optional configuration parameters
    19.5.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
    19.5.13.5. Optional RHOSP configuration parameters
    19.5.13.6. Custom subnets in RHOSP deployments
    19.5.13.7. Sample customized install-config.yaml file for RHOSP
    19.5.13.8. Setting a custom subnet for machines
    19.5.13.9. Emptying compute machine pools
    19.5.13.10. Cluster deployment on RHOSP provider networks
      19.5.13.10.1. RHOSP provider network requirements for cluster installation
      19.5.13.10.2. Deploying a cluster that has a primary interface on a provider network
19.5.14. Creating the Kubernetes manifest and Ignition config files
19.5.15. Preparing the bootstrap Ignition files
19.5.16. Creating control plane Ignition config files on RHOSP
19.5.17. Creating network resources on RHOSP
  19.5.17.1. Deploying a cluster with bare metal machines
19.5.18. Creating the bootstrap machine on RHOSP
19.5.19. Creating the control plane machines on RHOSP
19.5.20. Logging in to the cluster by using the CLI
19.5.21. Deleting bootstrap resources from RHOSP
19.5.22. Creating compute machines on RHOSP
19.5.23. Approving the certificate signing requests for your machines
19.5.24. Verifying a successful installation
19.5.25. Telemetry access for OpenShift Container Platform
19.5.26. Next steps

19.6. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR ON YOUR OWN INFRASTRUCTURE
19.6.1. Prerequisites
19.6.2. About Kuryr SDN
19.6.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr
  19.6.3.1. Increasing quota
  19.6.3.2. Configuring Neutron
  19.6.3.3. Configuring Octavia
    19.6.3.3.1. The Octavia OVN Driver
  19.6.3.4. Known limitations of installing with Kuryr
    RHOSP general limitations
    RHOSP version limitations
    RHOSP environment limitations
    RHOSP upgrade limitations
  19.6.3.5. Control plane machines
  19.6.3.6. Compute machines
  19.6.3.7. Bootstrap machine
19.6.4. Internet access for OpenShift Container Platform
19.6.5. Downloading playbook dependencies
19.6.6. Downloading the installation playbooks
19.6.7. Obtaining the installation program
19.6.8. Generating a key pair for cluster node SSH access
19.6.9. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
19.6.10. Verifying external network access
19.6.11. Enabling access to the environment
  19.6.11.1. Enabling access with floating IP addresses
  19.6.11.2. Completing installation without floating IP addresses
  19.6.12. Defining parameters for the installation program
19.6.13. Creating the installation configuration file
  19.6.14.1. Required configuration parameters
  19.6.14.2. Network configuration parameters
  19.6.14.3. Optional configuration parameters
  19.6.14.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
  19.6.14.5. Optional RHOSP configuration parameters
  19.6.14.6. Custom subnets in RHOSP deployments
  19.6.14.7. Sample customized install-config.yaml file for RHOSP with Kuryr
  19.6.14.8.1. RHOSP provider network requirements for cluster installation
  19.6.14.8.2. Deploying a cluster that has a primary interface on a provider network
19.6.14.10. Adjusting Kuryr ports pools during installation
19.6.14.11. Setting a custom subnet for machines
19.6.14.13. Modifying the network type
19.6.15. Creating the Kubernetes manifest and Ignition config files
19.6.16. Preparing the bootstrap Ignition files
19.6.17. Creating control plane Ignition config files on RHOSP
19.6.18. Creating network resources on RHOSP
19.6.19. Creating the bootstrap machine on RHOSP
19.6.20. Creating the control plane machines on RHOSP
19.6.21. Logging in to the cluster by using the CLI
19.6.22. Deleting bootstrap resources from RHOSP
19.6.23. Creating compute machines on RHOSP
19.6.24. Approving the certificate signing requests for your machines
19.6.25. Verifying a successful installation
19.6.26. Telemetry access for OpenShift Container Platform
19.6.27. Next steps

19.7. INSTALLING A CLUSTER ON OPENSTACK IN A RESTRICTED NETWORK
19.7.1. Prerequisites
19.7.2. About installations in restricted networks
19.7.2.1. Additional limits
19.7.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
19.7.3.1. Control plane machines
19.7.3.2. Compute machines
19.7.3.3. Bootstrap machine
19.7.4. Internet access for OpenShift Container Platform
19.7.5. Enabling Swift on RHOSP
19.7.6. Defining parameters for the installation program
19.7.7. Setting cloud provider options
19.7.7.1. External load balancers that use pre-defined floating IP addresses
19.7.8. Creating the RHCOS image for restricted network installations
19.7.9. Creating the installation configuration file
19.7.9.1. Configuring the cluster-wide proxy during installation
19.7.9.2. Installation configuration parameters
19.7.9.2.1. Required configuration parameters
19.7.9.2.2. Network configuration parameters
19.7.9.2.3. Optional configuration parameters
19.7.9.2.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
19.7.9.2.5. Optional RHOSP configuration parameters
19.7.9.3. Sample customized install-config.yaml file for restricted OpenStack installations
19.7.10. Generating a key pair for cluster node SSH access
19.7.11. Enabling access to the environment
19.7.11.1. Enabling access with floating IP addresses
19.7.11.2. Completing installation without floating IP addresses
19.7.12. Deploying the cluster
19.7.13. Verifying cluster status
19.7.14. Logging in to the cluster by using the CLI
19.7.15. Disabling the default OperatorHub sources
19.7.16. Telemetry access for OpenShift Container Platform
19.7.17. Next steps

19.8. OPENSTACK CLOUD CONFIGURATION REFERENCE GUIDE
19.8.1. OpenStack cloud provider options
19.8.1.1. Global options
19.8.1.2. Load balancer options
19.8.1.3. Metadata options
19.9. UNINSTALLING A CLUSTER ON OPENSTACK
   19.9.1. Removing a cluster that uses installer-provisioned infrastructure
19.10. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE
   19.10.1. Downloading playbook dependencies
   19.10.2. Removing a cluster from RHOSP that uses your own infrastructure

CHAPTER 20. INSTALLING ON RHV

20.1. PREPARING TO INSTALL ON RED HAT VIRTUALIZATION (RHV)
   20.1.1. Prerequisites
   20.1.2. Choosing a method to install OpenShift Container Platform on RHV
      20.1.2.1. Installing a cluster on installer-provisioned infrastructure
      20.1.2.2. Installing a cluster on user-provisioned infrastructure
   20.2. INSTALLING A CLUSTER QUICKLY ON RHV
      20.2.1. Prerequisites
      20.2.2. Internet access for OpenShift Container Platform
      20.2.3. Requirements for the RHV environment
      20.2.4. Verifying the requirements for the RHV environment
      20.2.5. Preparing the network environment on RHV
      20.2.6. Installing OpenShift Container Platform on RHV in insecure mode
      20.2.7. Generating a key pair for cluster node SSH access
      20.2.8. Obtaining the installation program
      20.2.9. Deploying the cluster
      20.2.10. Installing the OpenShift CLI by downloading the binary
         Installing the OpenShift CLI on Linux
         Installing the OpenShift CLI on Windows
         Installing the OpenShift CLI on macOS
      20.2.11. Logging in to the cluster by using the CLI
      20.2.12. Verifying cluster status
      20.2.13. Accessing the OpenShift Container Platform web console on RHV
      20.2.14. Telemetry access for OpenShift Container Platform
      20.2.15. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)
         20.2.15.1. CPU load increases and nodes go into a Not Ready state
         20.2.15.2. Trouble connecting the OpenShift Container Platform cluster API
      20.2.16. Post-installation tasks
   20.3. INSTALLING A CLUSTER ON RHV WITH CUSTOMIZATIONS
      20.3.1. Prerequisites
      20.3.2. Internet access for OpenShift Container Platform
      20.3.3. Requirements for the RHV environment
      20.3.4. Verifying the requirements for the RHV environment
      20.3.5. Preparing the network environment on RHV
      20.3.6. Installing OpenShift Container Platform on RHV in insecure mode
      20.3.7. Generating a key pair for cluster node SSH access
      20.3.8. Obtaining the installation program
      20.3.9. Creating the installation configuration file
         20.3.9.1. Example install-config.yaml files for Red Hat Virtualization (RHV)
            Example default install-config.yaml file
            Example minimal install-config.yaml file
            Example Custom machine pools in an install-config.yaml file
            Example non-enforcing affinity group
            Example removing all affinity groups for a non-production lab setup
20.3.9.2. Installation configuration parameters
  20.3.9.2.1. Required configuration parameters
  20.3.9.2.2. Network configuration parameters
  20.3.9.2.3. Optional configuration parameters
  20.3.9.2.4. Additional Red Hat Virtualization (RHV) configuration parameters
  20.3.9.2.5. Additional RHV parameters for machine pools

20.3.10. Deploying the cluster

20.3.11. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS

20.3.12. Logging in to the cluster by using the CLI

20.3.13. Verifying cluster status

20.3.14. Accessing the OpenShift Container Platform web console on RHV

20.3.15. Telemetry access for OpenShift Container Platform

20.3.16. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)
  20.3.16.1. CPU load increases and nodes go into a Not Ready state
  20.3.16.2. Trouble connecting the OpenShift Container Platform cluster API

20.3.17. Post-installation tasks

20.3.18. Next steps

20.4. INSTALLING A CLUSTER ON RHV WITH USER-PROVISIONED INFRASTRUCTURE

20.4.1. Prerequisites

20.4.2. Internet access for OpenShift Container Platform

20.4.3. Requirements for the RHV environment

20.4.4. Verifying the requirements for the RHV environment

20.4.5. Networking requirements for user-provisioned infrastructure
  20.4.5.1. Setting the cluster node hostnames through DHCP
  20.4.5.2. Network connectivity requirements
    NTP configuration for user-provisioned infrastructure

20.4.6. Setting up the installation machine

20.4.7. Installing OpenShift Container Platform on RHV in insecure mode

20.4.8. Generating a key pair for cluster node SSH access

20.4.9. Obtaining the installation program

20.4.10. Downloading the Ansible playbooks

20.4.11. The inventory.yml file

20.4.12. Specifying the RHCOs image settings

20.4.13. Creating the install config file

20.4.14. Customizing install-config.yaml

20.4.15. Generate manifest files

20.4.16. Making control-plane nodes non-schedulable

20.4.17. Building the Ignition files

20.4.18. Creating templates and virtual machines

20.4.19. Creating the bootstrap machine

20.4.20. Creating the control plane nodes

20.4.21. Verifying cluster status

20.4.22. Removing the bootstrap machine

20.4.23. Creating the worker nodes and completing the installation

20.4.24. Telemetry access for OpenShift Container Platform

20.5. INSTALLING A CLUSTER ON RHV IN A RESTRICTED NETWORK

20.5.1. Prerequisites

20.5.2. About installations in restricted networks
  20.5.2.1. Additional limits
  20.5.3. Internet access for OpenShift Container Platform
20.5.4. Requirements for the RHV environment
20.5.5. Verifying the requirements for the RHV environment
20.5.6. Networking requirements for user-provisioned infrastructure
  20.5.6.1. Setting the cluster node hostnames through DHCP
  20.5.6.2. Network connectivity requirements
    NTP configuration for user-provisioned infrastructure
20.5.7. User-provisioned DNS requirements
  20.5.7.1. Example DNS configuration for user-provisioned clusters
  20.5.7.2. Load balancing requirements for user-provisioned infrastructure
    20.5.7.2.1. Example load balancer configuration for user-provisioned clusters
20.5.8. Setting up the installation machine
20.5.9. Setting up the CA certificate for RHV
20.5.10. Generating a key pair for cluster node SSH access
20.5.11. Downloading the Ansible playbooks
20.5.12. The inventory.yml file
20.5.13. Specifying the RHCOS image settings
20.5.14. Creating the install config file
20.5.15. Sample install-config.yaml file for RHV
  20.5.15.1. Configuring the cluster-wide proxy during installation
20.5.16. Customizing install-config.yaml
20.5.17. Generate manifest files
20.5.18. Making control-plane nodes non-schedulable
20.5.19. Building the Ignition files
20.5.20. Creating templates and virtual machines
20.5.21. Creating the bootstrap machine
20.5.22. Creating the control plane nodes
20.5.23. Verifying cluster status
20.5.24. Removing the bootstrap machine
20.5.25. Creating the worker nodes and completing the installation
20.5.26. Telemetry access for OpenShift Container Platform
20.5.27. Disabling the default OperatorHub sources
20.6. UNINSTALLING A CLUSTER ON RHV
  20.6.1. Removing a cluster that uses installer-provisioned infrastructure
  20.6.2. Removing a cluster that uses user-provisioned infrastructure

CHAPTER 21. INSTALLING ON VSPHERE ................................. 2826

21.1. PREPARING TO INSTALL ON VSPHERE .......................... 2826
  21.1.1. Prerequisites ............................................. 2826
  21.1.2. Choosing a method to install OpenShift Container Platform on vSphere
    21.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere
    21.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on vSphere
  21.1.3. VMware vSphere infrastructure requirements
  21.1.4. VMware vSphere CSI Driver Operator requirements
  21.1.5. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere

21.2. INSTALLING A CLUSTER ON VSPHERE ............................ 2829
  21.2.1. Prerequisites ............................................. 2829
  21.2.2. Internet access for OpenShift Container Platform
  21.2.3. VMware vSphere infrastructure requirements
  21.2.4. Network connectivity requirements
  21.2.5. VMware vSphere CSI Driver Operator requirements
  21.2.6. vCenter requirements
    Required vCenter account privileges
21.4.17.1. Image registry removed during installation 2957
21.4.17.2. Image registry storage configuration 2957
  21.4.17.2.1. Configuring registry storage for VMware vSphere 2957
  21.4.17.2.2. Configuring block registry storage for VMware vSphere 2959
21.4.18. Backing up VMware vSphere volumes 2960
21.4.19. Telemetry access for OpenShift Container Platform 2960
21.4.20. Configuring an external load balancer 2961
21.4.21. Next steps 2967

21.5. INSTALLING A CLUSTER ON VSPHERE WITH USER-PROVISIONED INFRASTRUCTURE 2967
21.5.1. Prerequisites 2967
21.5.2. Internet access for OpenShift Container Platform 2968
21.5.3. VMware vSphere infrastructure requirements 2968
21.5.4. VMware vSphere CSI Driver Operator requirements 2970
21.5.5. Requirements for a cluster with user-provisioned infrastructure 2970
  21.5.5.1. Required machines for cluster installation 2971
  21.5.5.2. Minimum resource requirements for cluster installation 2971
  21.5.5.3. Certificate signing requests management 2972
  21.5.5.4. Networking requirements for user-provisioned infrastructure 2972
    21.5.5.4.1. Setting the cluster node hostnames through DHCP 2973
    21.5.5.4.2. Network connectivity requirements 2973
    Ethernet adaptor hardware address requirements 2974
    NTP configuration for user-provisioned infrastructure 2974
  21.5.5.5. User-provisioned DNS requirements 2975
    21.5.5.5.1. Example DNS configuration for user-provisioned clusters 2977
  21.5.5.6. Load balancing requirements for user-provisioned infrastructure 2979
    21.5.5.6.1. Example load balancer configuration for user-provisioned clusters 2981
21.5.6. Preparing the user-provisioned infrastructure 2983
21.5.7. Validating DNS resolution for user-provisioned infrastructure 2984
21.5.8. Generating a key pair for cluster node SSH access 2987
21.5.9. Obtaining the installation program 2988
21.5.10. Manually creating the installation configuration file 2989
  21.5.10.1. Sample install-config.yaml file for VMware vSphere 2990
  21.5.10.2. Configuring the cluster-wide proxy during installation 2992
21.5.11. Creating the Kubernetes manifest and Ignition config files 2994
21.5.12. Extracting the infrastructure name 2995
21.5.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process 2996
21.5.14. Adding more compute machines to a cluster in vSphere 3000
21.5.15. Disk partitioning 3001
  Creating a separate /var partition 3002
21.5.16. Updating the bootloader using bootupd 3004
21.5.17. Installing the OpenShift CLI by downloading the binary 3005
  Installing the OpenShift CLI on Linux 3005
  Installing the OpenShift CLI on Windows 3006
  Installing the OpenShift CLI on macOS 3006
21.5.18. Waiting for the bootstrap process to complete 3007
21.5.19. Logging in to the cluster by using the CLI 3008
21.5.20. Approving the certificate signing requests for your machines 3008
21.5.21. Initial Operator configuration 3011
  21.5.21.1. Image registry removed during installation 3012
  21.5.21.2. Image registry storage configuration 3012
    21.5.21.2.1. Configuring registry storage for VMware vSphere 3013
    21.5.21.2.2. Configuring storage for the image registry in non-production clusters 3014
    21.5.21.2.3. Configuring block registry storage for VMware vSphere 3015
21.5.22. Completing installation on user-provisioned infrastructure
21.5.23. Configuring vSphere DRS anti-affinity rules for control plane nodes
21.5.24. Backing up VMware vSphere volumes
21.5.25. Telemetry access for OpenShift Container Platform
21.5.26. Next steps

21.6. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS
21.6.1. Prerequisites
21.6.2. Internet access for OpenShift Container Platform
21.6.3. VMware vSphere infrastructure requirements
21.6.4. VMware vSphere CSI Driver Operator requirements
21.6.5. Requirements for a cluster with user-provisioned infrastructure
  21.6.5.1. Required machines for cluster installation
  21.6.5.2. Minimum resource requirements for cluster installation
  21.6.5.3. Certificate signing requests management
  21.6.5.4. Networking requirements for user-provisioned infrastructure
    21.6.5.4.1. Setting the cluster node hostnames through DHCP
    21.6.5.4.2. Network connectivity requirements
      Ethernet adaptor hardware address requirements
      NTP configuration for user-provisioned infrastructure
  21.6.5.5. User-provisioned DNS requirements
    21.6.5.5.1. Example DNS configuration for user-provisioned clusters
  21.6.5.6. Load balancing requirements for user-provisioned infrastructure
    21.6.5.6.1. Example load balancer configuration for user-provisioned clusters
21.6.6. Preparing the user-provisioned infrastructure
21.6.7. Validating DNS resolution for user-provisioned infrastructure
21.6.8. Generating a key pair for cluster node SSH access
21.6.9. Obtaining the installation program
21.6.10. Manually creating the installation configuration file
  21.6.10.1. Sample install-config.yaml file for VMware vSphere
  21.6.10.2. Configuring the cluster-wide proxy during installation
21.6.11. Network configuration phases
21.6.12. Specifying advanced network configuration
21.6.13. Cluster Network Operator configuration
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
21.6.15. Extracting the infrastructure name
21.6.16. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
21.6.17. Adding more compute machines to a cluster in vSphere
21.6.18. Disk partitioning
  Creating a separate /var partition
21.6.19. Updating the bootloader using bootupd
21.6.20. Waiting for the bootstrap process to complete
21.6.21. Logging in to the cluster by using the CLI
21.6.22. Approving the certificate signing requests for your machines
  21.6.22.1. Initial Operator configuration
  21.6.22.2. Image registry removed during installation
  21.6.22.3. Image registry storage configuration
    21.6.22.3.1. Configuring block registry storage for VMware vSphere
21.6.23. Completing installation on user-provisioned infrastructure
21.6.24. Configuring vSphere DRS anti-affinity rules for control plane nodes 3076
21.6.25. Backing up VMware vSphere volumes 3077
21.6.26. Telemetry access for OpenShift Container Platform 3077
21.6.27. Next steps 3077

21.7. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK 3078
21.7.1. Prerequisites 3078
21.7.2. About installations in restricted networks 3078
21.7.2.1. Additional limits 3079
21.7.3. Internet access for OpenShift Container Platform 3079
21.7.4. VMware vSphere infrastructure requirements 3079
21.7.5. Network connectivity requirements 3081
21.7.6. VMware vSphere CSI Driver Operator requirements 3082
21.7.7. vCenter requirements 3083
   Required vCenter account privileges 3083
   Using OpenShift Container Platform with vMotion 3092
Cluster resources 3092
Cluster limits 3092
Networking requirements 3093
   Required IP Addresses 3093
DNS records 3093
21.7.8. Generating a key pair for cluster node SSH access 3094
21.7.9. Adding vCenter root CA certificates to your system trust 3096
21.7.10. Creating the RHCOS image for restricted network installations 3096
21.7.11. Creating the installation configuration file 3097
21.7.11.1. Installation configuration parameters 3100
   21.7.11.1.1. Required configuration parameters 3100
   21.7.11.1.2. Network configuration parameters 3101
   21.7.11.1.3. Optional configuration parameters 3103
   21.7.11.1.4. Additional VMware vSphere configuration parameters 3108
   21.7.11.1.5. Optional VMware vSphere machine pool configuration parameters 3110
21.7.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster 3111
21.7.11.3. Configuring the cluster-wide proxy during installation 3113
21.7.12. Deploying the cluster 3114
21.7.13. Installing the OpenShift CLI by downloading the binary 3115
   Installing the OpenShift CLI on Linux 3115
   Installing the OpenShift CLI on Windows 3116
   Installing the OpenShift CLI on macOS 3116
21.7.14. Logging in to the cluster by using the CLI 3117
21.7.15. Disabling the default OperatorHub sources 3118
21.7.16. Creating registry storage 3118
   21.7.16.1. Image registry removed during installation 3118
   21.7.16.2. Image registry storage configuration 3118
   21.7.16.2.1. Configuring registry storage for VMware vSphere 3118
21.7.17. Telemetry access for OpenShift Container Platform 3120
21.7.18. Configuring an external load balancer 3120
21.7.19. Next steps 3127

21.8. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE 3127
21.8.1. Prerequisites 3127
21.8.2. About installations in restricted networks 3128
   21.8.2.1. Additional limits 3128
21.8.3. Internet access for OpenShift Container Platform 3128
21.8.4. VMware vSphere infrastructure requirements 3129
21.8.5. VMware vSphere CSI Driver Operator requirements

21.8.6. Requirements for a cluster with user-provisioned infrastructure
  21.8.6.1. Required machines for cluster installation
  21.8.6.2. Minimum resource requirements for cluster installation
  21.8.6.3. Certificate signing requests management
  21.8.6.4. Networking requirements for user-provisioned infrastructure
    21.8.6.4.1. Setting the cluster node hostnames through DHCP
    21.8.6.4.2. Network connectivity requirements
      Ethernet adaptor hardware address requirements
      NTP configuration for user-provisioned infrastructure
  21.8.6.5. User-provisioned DNS requirements
    21.8.6.5.1. Example DNS configuration for user-provisioned clusters
  21.8.6.6. Load balancing requirements for user-provisioned infrastructure
    21.8.6.6.1. Example load balancer configuration for user-provisioned clusters

21.8.7. Preparing the user-provisioned infrastructure

21.8.8. Validating DNS resolution for user-provisioned infrastructure

21.8.9. Generating a key pair for cluster node SSH access

21.8.10. Manually creating the installation configuration file
  21.8.10.1. Sample install-config.yaml file for VMware vSphere
  21.8.10.2. Configuring the cluster-wide proxy during installation

21.8.11. Creating the Kubernetes manifest and Ignition config files

21.8.12. Configuring chrony time service

21.8.13. Extracting the infrastructure name

21.8.15. Adding more compute machines to a cluster in vSphere

21.8.16. Disk partitioning
  Creating a separate /var partition

21.8.17. Updating the bootloader using bootupd

21.8.18. Waiting for the bootstrap process to complete

21.8.19. Logging in to the cluster by using the CLI

21.8.20. Approving the certificate signing requests for your machines

21.8.21. Initial Operator configuration
  21.8.21.1. Disabling the default OperatorHub sources
  21.8.21.2. Image registry storage configuration
    21.8.21.2.1. Configuring registry storage for VMware vSphere
    21.8.21.2.2. Configuring storage for the image registry in non-production clusters
    21.8.21.2.3. Configuring block registry storage for VMware vSphere

21.8.22. Completing installation on user-provisioned infrastructure

21.8.23. Configuring vSphere DRS anti-affinity rules for control plane nodes

21.8.24. Backing up VMware vSphere volumes

21.8.25. Telemetry access for OpenShift Container Platform

21.9. UNINSTALLING A CLUSTER ON VSPHERE THAT USES INSTALLER-PROVISIONED INFRASTRUCTURE

21.9.1. Removing a cluster that uses installer-provisioned infrastructure

21.10. USING THE VSPHERE PROBLEM DETECTOR OPERATOR
  21.10.1. About the vSphere Problem Detector Operator
  21.10.2. Running the vSphere Problem Detector Operator checks
  21.10.3. Viewing the events from the vSphere Problem Detector Operator
  21.10.4. Viewing the logs from the vSphere Problem Detector Operator
  21.10.5. Configuration checks run by the vSphere Problem Detector Operator
  21.10.6. About the storage class configuration check
  21.10.7. Metrics for the vSphere Problem Detector Operator
CHAPTER 22. INSTALLING ON VMC

22.1. PREPARING TO INSTALL ON VMC

22.1.1. Prerequisites

22.1.2. Choosing a method to install OpenShift Container Platform on VMC

22.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on VMC

22.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on VMC

22.1.3. VMware vSphere infrastructure requirements

22.1.4. VMware vSphere CSI Driver Operator requirements

22.1.5. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on VMC

22.2. INSTALLING A CLUSTER ON VMC

22.2.1. Setting up VMC for vSphere

22.2.1.1. VMC Sizer tool

22.2.2. vSphere prerequisites

22.2.3. Internet access for OpenShift Container Platform

22.2.4. VMware vSphere infrastructure requirements

22.2.5. Network connectivity requirements

22.2.6. VMware vSphere CSI Driver Operator requirements

22.2.7. vCenter requirements

   Required vCenter account privileges

   Using OpenShift Container Platform with vMotion

   Cluster resources

   Cluster limits

   Networking requirements

   Required IP Addresses

   DNS records

22.2.8. Generating a key pair for cluster node SSH access

22.2.9. Obtaining the installation program

22.2.10. Adding vCenter root CA certificates to your system trust

22.2.11. Deploying the cluster

22.2.12. Installing the OpenShift CLI by downloading the binary

   Installing the OpenShift CLI on Linux

   Installing the OpenShift CLI on Windows

   Installing the OpenShift CLI on macOS

22.2.13. Logging in to the cluster by using the CLI

22.2.14. Creating registry storage

   22.2.14.1. Image registry removed during installation

   22.2.14.2. Image registry storage configuration

   22.2.14.2.1. Configuring registry storage for VMware vSphere

   22.2.14.2.2. Configuring block registry storage for VMware vSphere

22.2.15. Backing up VMware vSphere volumes

22.2.16. Telemetry access for OpenShift Container Platform

22.2.17. Configuring an external load balancer

22.2.18. Next steps

22.3. INSTALLING A CLUSTER ON VMC WITH CUSTOMIZATIONS

22.3.1. Setting up VMC for vSphere

   22.3.1.1. VMC Sizer tool

   22.3.2. vSphere prerequisites

   22.3.3. Internet access for OpenShift Container Platform

   22.3.4. VMware vSphere infrastructure requirements

   22.3.5. Network connectivity requirements
22.3.6. VMware vSphere CSI Driver Operator requirements

22.3.7. vCenter requirements
  Required vCenter account privileges
  Using OpenShift Container Platform with vMotion
  Cluster resources
  Cluster limits
  Networking requirements
    Required IP Addresses
    DNS records

22.3.8. Generating a key pair for cluster node SSH access

22.3.9. Obtaining the installation program

22.3.10. Adding vCenter root CA certificates to your system trust

22.3.11. Creating the installation configuration file
  22.3.11.1. Installation configuration parameters
    22.3.11.1.1. Required configuration parameters
    22.3.11.1.2. Network configuration parameters
    22.3.11.1.3. Optional configuration parameters
    22.3.11.1.4. Additional VMware vSphere configuration parameters
    22.3.11.1.5. Optional VMware vSphere machine pool configuration parameters
  22.3.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
  22.3.11.3. Configuring the cluster-wide proxy during installation
  22.3.11.4. Deploying the cluster

22.3.12. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS

22.3.13. Logging in to the cluster by using the CLI

22.3.14. Creating registry storage
  22.3.15.1. Image registry removed during installation
  22.3.15.2. Image registry storage configuration
    22.3.15.2.1. Configuring registry storage for VMware vSphere
    22.3.15.2.2. Configuring block registry storage for VMware vSphere
  22.3.16. Backing up VMware vSphere volumes

22.3.17. Telemetry access for OpenShift Container Platform

22.3.18. Configuring an external load balancer

22.3.19. Next steps

22.4. INSTALLING A CLUSTER ON VMC WITH NETWORK CUSTOMIZATIONS

22.4.1. Setting up VMC for vSphere
  22.4.1.1. VMC Sizer tool
  22.4.2. vSphere prerequisites
  22.4.3. Internet access for OpenShift Container Platform
  22.4.4. VMware vSphere infrastructure requirements
  22.4.5. Network connectivity requirements
  22.4.6. VMware vSphere CSI Driver Operator requirements
  22.4.7. vCenter requirements
    Required vCenter account privileges
    Using OpenShift Container Platform with vMotion
    Cluster resources
    Cluster limits
    Networking requirements
      Required IP Addresses
      DNS records
  22.4.8. Generating a key pair for cluster node SSH access
22.4.9. Obtaining the installation program
22.4.10. Adding vCenter root CA certificates to your system trust
22.4.11. Creating the installation configuration file
22.4.11.1. Installation configuration parameters
22.4.11.1.1. Required configuration parameters
22.4.11.1.2. Network configuration parameters
22.4.11.1.3. Optional configuration parameters
22.4.11.1.4. Additional VMware vSphere configuration parameters
22.4.11.1.5. Optional VMware vSphere machine pool configuration parameters
22.4.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
22.4.11.3. Configuring the cluster-wide proxy during installation
22.4.12. Network configuration phases
22.4.13. Specifying advanced network configuration
22.4.14. Cluster Network Operator configuration
22.4.14.1.1. defaultNetwork object configuration
22.4.14.1.2. Configuration for the OpenShift SDN CNI cluster network provider
22.4.14.1.3. Configuration for the OVN-Kubernetes CNI cluster network provider
22.4.14.1.4. kubeProxyConfig object configuration
22.4.15. Deploying the cluster
22.4.16. Installing the OpenShift CLI by downloading the binary
22.4.16.1. Installing the OpenShift CLI on Linux
22.4.16.2. Installing the OpenShift CLI on Windows
22.4.16.3. Installing the OpenShift CLI on macOS
22.4.17. Logging in to the cluster by using the CLI
22.4.18. Creating registry storage
22.4.18.1. Image registry removed during installation
22.4.18.2. Image registry storage configuration
22.4.18.2.1. Configuring registry storage for VMware vSphere
22.4.18.2.2. Configuring block registry storage for VMware vSphere
22.4.19. Backing up VMware vSphere volumes
22.4.20. Telemetry access for OpenShift Container Platform
22.4.21. Configuring an external load balancer
22.4.22. Next steps

22.5. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK
22.5.1. Setting up VMC for vSphere
22.5.1.1. VMC Sizer tool
22.5.2. vSphere prerequisites
22.5.3. About installations in restricted networks
22.5.3.1. Additional limits
22.5.4. Internet access for OpenShift Container Platform
22.5.5. VMware vSphere infrastructure requirements
22.5.6. Network connectivity requirements
22.5.7. VMware vSphere CSI Driver Operator requirements
22.5.8. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
22.5.9. Generating a key pair for cluster node SSH access
22.5.10. Adding vCenter root CA certificates to your system trust
22.5.11. Creating the RHcos image for restricted network installations
22.5.12. Creating the installation configuration file
22.5.12.1. Installation configuration parameters
  22.5.12.1.1. Required configuration parameters
  22.5.12.1.2. Network configuration parameters
  22.5.12.1.3. Optional configuration parameters
  22.5.12.1.4. Additional VMware vSphere configuration parameters
  22.5.12.1.5. Optional VMware vSphere machine pool configuration parameters
  22.5.12.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
  22.5.12.3. Configuring the cluster-wide proxy during installation
22.5.13. Deploying the cluster
22.5.14. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
22.5.15. Logging in to the cluster by using the CLI
22.5.16. Disabling the default OperatorHub sources
22.5.17. Creating registry storage
  22.5.17.1. Image registry removed during installation
  22.5.17.2. Image registry storage configuration
  22.5.17.2.1. Configuring registry storage for VMware vSphere
22.5.18. Telemetry access for OpenShift Container Platform
22.5.19. Configuring an external load balancer
22.5.20. Next steps
22.6. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE
22.6.1. Setting up VMC for vSphere
  22.6.1.1. VMC Sizer tool
22.6.2. vSphere prerequisites
22.6.3. Internet access for OpenShift Container Platform
22.6.4. VMware vSphere infrastructure requirements
22.6.5. VMware vSphere CSI Driver Operator requirements
22.6.6. Requirements for a cluster with user-provisioned infrastructure
  22.6.6.1. Required machines for cluster installation
  22.6.6.2. Minimum resource requirements for cluster installation
  22.6.6.3. Certificate signing requests management
  22.6.6.4. Networking requirements for user-provisioned infrastructure
    22.6.6.4.1. Setting the cluster node hostnames through DHCP
    22.6.6.4.2. Network connectivity requirements
      Ethernet adaptor hardware address requirements
      NTP configuration for user-provisioned infrastructure
  22.6.6.5. User-provisioned DNS requirements
    22.6.6.5.1. Example DNS configuration for user-provisioned clusters
  22.6.6.6. Load balancing requirements for user-provisioned infrastructure
    22.6.6.6.1. Example load balancer configuration for user-provisioned clusters
22.6.7. Preparing the user-provisioned infrastructure
22.6.8. Validating DNS resolution for user-provisioned infrastructure
22.6.9. Generating a key pair for cluster node SSH access
22.6.10. Obtaining the installation program
22.6.11. Manually creating the installation configuration file
  22.6.11.1. Sample install-config.yaml file for VMware vSphere
  22.6.11.2. Configuring the cluster-wide proxy during installation
22.6.12. Creating the Kubernetes manifest and Ignition config files
22.6.13. Extracting the infrastructure name
22.6.14. Installing RHCOs and starting the OpenShift Container Platform bootstrap process
22.6.15. Adding more compute machines to a cluster in vSphere
22.6.16. Disk partitioning
  Creating a separate /var partition
22.6.17. Updating the bootloader using bootupd
22.6.18. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
22.6.19. Waiting for the bootstrap process to complete
22.6.20. Logging in to the cluster by using the CLI
22.6.21. Approving the certificate signing requests for your machines
22.6.22. Initial Operator configuration
  22.6.22.1. Image registry removed during installation
  22.6.22.2. Image registry storage configuration
    22.6.22.2.1. Configuring registry storage for VMware vSphere
    22.6.22.2.2. Configuring storage for the image registry in non-production clusters
    22.6.22.2.3. Configuring block registry storage for VMware vSphere
22.6.23. Completing installation on user-provisioned infrastructure
22.6.24. Backing up VMware vSphere volumes
22.6.25. Telemetry access for OpenShift Container Platform
22.6.26. Next steps

22.7. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE AND NETWORK CUSTOMIZATIONS
22.7.1. Setting up VMC for vSphere
  22.7.1.1. VMC Sizer tool
22.7.2. vSphere prerequisites
22.7.3. Internet access for OpenShift Container Platform
22.7.4. VMware vSphere infrastructure requirements
22.7.5. VMware vSphere CSI Driver Operator requirements
22.7.6. Requirements for a cluster with user-provisioned infrastructure
  22.7.6.1. Required machines for cluster installation
  22.7.6.2. Minimum resource requirements for cluster installation
22.7.7. Certificate signing requests management
22.7.8. Networking requirements for user-provisioned infrastructure
  22.7.8.1. Setting the cluster node hostnames through DHCP
  22.7.8.2. Network connectivity requirements
    Ethernet adaptor hardware address requirements
    NTP configuration for user-provisioned infrastructure
22.7.9. User-provisioned DNS requirements
  22.7.9.1. Example DNS configuration for user-provisioned clusters
22.7.10. Load balancing requirements for user-provisioned infrastructure
  22.7.10.1. Example load balancer configuration for user-provisioned clusters
22.7.11. Preparing the user-provisioned infrastructure
22.7.12. Validating DNS resolution for user-provisioned infrastructure
22.7.13. Generating a key pair for cluster node SSH access
22.7.14. Obtaining the installation program
22.7.15. Manually creating the installation configuration file
  22.7.15.1. Sample install-config.yaml file for VMware vSphere
  22.7.15.2. Configuring the cluster-wide proxy during installation
22.7.16. Specifying advanced network configuration
22.7.17. Cluster Network Operator configuration

22.7.18. Installing the OpenShift CLI on Linux
22.7.19. Installing the OpenShift CLI on Windows
22.7.20. Installing the OpenShift CLI on macOS
22.7.21. Waiting for the bootstrap process to complete
22.7.22. Logging in to the cluster by using the CLI
22.7.23. Approving the certificate signing requests for your machines
22.7.24. Initial Operator configuration
  22.7.24.1. Image registry removed during installation
  22.7.24.2. Image registry storage configuration
    22.7.24.2.1. Configuring registry storage for VMware vSphere
    22.7.24.2.2. Configuring storage for the image registry in non-production clusters
    22.7.24.2.3. Configuring block registry storage for VMware vSphere
22.7.25. Completing installation on user-provisioned infrastructure
22.7.26. Backing up VMware vSphere volumes
22.7.27. Telemetry access for OpenShift Container Platform
22.7.28. Next steps
22.7.13.1. Cluster Network Operator configuration object
   defaultNetwork object configuration
   Configuration for the OpenShift SDN CNI cluster network provider
   Configuration for the OVN-Kubernetes CNI cluster network provider
   kubeProxyConfig object configuration
22.7.14. Creating the Ignition config files
22.7.15. Extracting the infrastructure name
22.7.16. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
22.7.17. Adding more compute machines to a cluster in vSphere
22.7.18. Disk partitioning
   Creating a separate /var partition
22.7.19. Updating the bootloader using bootupd
22.7.20. Waiting for the bootstrap process to complete
22.7.21. Logging in to the cluster by using the CLI
22.7.22. Approving the certificate signing requests for your machines
22.7.23. Initial Operator configuration
   22.7.23.1. Image registry removed during installation
   22.7.23.2. Image registry storage configuration
      22.7.23.2.1. Configuring block registry storage for VMware vSphere
22.7.24. Completing installation on user-provisioned infrastructure
22.7.25. Backing up VMware vSphere volumes
22.7.26. Telemetry access for OpenShift Container Platform
22.7.27. Next steps

22.8. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
   22.8.1. Setting up VMC for vSphere
      22.8.1.1. VMC Sizer tool
   22.8.2. vSphere prerequisites
   22.8.3. About installations in restricted networks
      22.8.3.1. Additional limits
   22.8.4. Internet access for OpenShift Container Platform
   22.8.5. VMware vSphere infrastructure requirements
   22.8.6. VMware vSphere CSI Driver Operator requirements
   22.8.7. Requirements for a cluster with user-provisioned infrastructure
      22.8.7.1. Required machines for cluster installation
      22.8.7.2. Minimum resource requirements for cluster installation
      22.8.7.3. Certificate signing requests management
      22.8.7.4. Networking requirements for user-provisioned infrastructure
         22.8.7.4.1. Setting the cluster node hostnames through DHCP
         22.8.7.4.2. Network connectivity requirements
            Ethernet adaptor hardware address requirements
            NTP configuration for user-provisioned infrastructure
      22.8.7.5. User-provisioned DNS requirements
      22.8.7.5.1. Example DNS configuration for user-provisioned clusters
      22.8.7.6. Load balancing requirements for user-provisioned infrastructure
         22.8.7.6.1. Example load balancer configuration for user-provisioned clusters
      22.8.8. Preparing the user-provisioned infrastructure
      22.8.9. Validating DNS resolution for user-provisioned infrastructure
      22.8.10. Generating a key pair for cluster node SSH access
      22.8.11. Manually creating the installation configuration file
         22.8.11.1. Sample install-config.yaml file for VMware vSphere
         22.8.11.2. Configuring the cluster-wide proxy during installation
      22.8.12. Creating the Kubernetes manifest and Ignition config files
22.8.13. Extracting the infrastructure name
22.8.15. Adding more compute machines to a cluster in vSphere
22.8.16. Disk partitioning
  Creating a separate /var partition
22.8.17. Updating the bootloader using bootupd
22.8.18. Waiting for the bootstrap process to complete
22.8.19. Logging into the cluster by using the CLI
22.8.20. Approving the certificate signing requests for your machines
22.8.21. Initial Operator configuration
  22.8.21.1. Disabling the default OperatorHub sources
  22.8.21.2. Image registry storage configuration
    22.8.21.2.1. Configuring registry storage for VMware vSphere
    22.8.21.2.2. Configuring storage for the image registry in non-production clusters
  22.8.21.3. Configuring block registry storage for VMware vSphere
22.8.22. Completing installation on user-provisioned infrastructure
22.8.23. Backing up VMware vSphere volumes
22.8.24. Telemetry access for OpenShift Container Platform
22.8.25. Next steps

22.9. UNINSTALLING A CLUSTER ON VMC
  22.9.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 23. INSTALLING ON ANY PLATFORM

23.1. INSTALLING A CLUSTER ON ANY PLATFORM
  23.1.1. Prerequisites
  23.1.2. Internet access for OpenShift Container Platform
  23.1.3. Requirements for a cluster with user-provisioned infrastructure
    23.1.3.1. Required machines for cluster installation
    23.1.3.2. Minimum resource requirements for cluster installation
    23.1.3.3. Certificate signing requests management
    23.1.3.4. Networking requirements for user-provisioned infrastructure
      23.1.3.4.1. Setting the cluster node hostnames through DHCP
      23.1.3.4.2. Network connectivity requirements
      NTP configuration for user-provisioned infrastructure
    23.1.3.5. User-provisioned DNS requirements
      23.1.3.5.1. Example DNS configuration for user-provisioned clusters
    23.1.3.6. Load balancing requirements for user-provisioned infrastructure
      23.1.3.6.1. Example load balancer configuration for user-provisioned clusters
  23.1.4. Preparing the user-provisioned infrastructure
  23.1.5. Validating DNS resolution for user-provisioned infrastructure
  23.1.6. Generating a key pair for cluster node SSH access
  23.1.7. Obtaining the installation program
  23.1.8. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
  23.1.9. Manually creating the installation configuration file
    23.1.9.1. Sample install-config.yaml file for other platforms
    23.1.9.2. Configuring the cluster-wide proxy during installation
    23.1.9.3. Configuring a three-node cluster
  23.1.10. Creating the Kubernetes manifest and Ignition config files
  23.1.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
    23.1.11.1. Installing RHCOS by using an ISO image
23.1.11.2. Installing RHCOS by using PXE or iPXE booting

23.1.11.3. Advanced RHCOS installation configuration
   23.1.11.3.1. Using advanced networking options for PXE and ISO installations
   23.1.11.3.2. Disk partitioning
      23.1.11.3.2.1. Creating a separate /var partition
      23.1.11.3.2.2. Retaining existing partitions
   23.1.11.3.3. Identifying Ignition configs
   23.1.11.3.4. Advanced RHCOS installation reference
      23.1.11.3.4.1. Networking and bonding options for ISO installations
         Configuring DHCP or static IP addresses
         Configuring an IP address without a static hostname
         Specifying multiple network interfaces
         Configuring default gateway and route
         Disabling DHCP on a single interface
         Combining DHCP and static IP configurations
         Configuring VLANs on individual interfaces
         Providing multiple DNS servers
         Bonding multiple network interfaces to a single interface
         Bonding multiple network interfaces to a single interface
         Using network teaming
      23.1.11.3.4.2. coreos-installer options for ISO and PXE installations
      23.1.11.3.4.3. coreos.inst boot options for ISO or PXE installations

23.1.11.4. Updating the bootloader using bootupd

23.1.12. Waiting for the bootstrap process to complete

23.1.13. Logging in to the cluster by using the CLI

23.1.14. Approving the certificate signing requests for your machines

23.1.15. Initial Operator configuration
   23.1.15.1. Disabling the default OperatorHub sources
   23.1.15.2. Image registry removed during installation
   23.1.15.3. Image registry storage configuration
      23.1.15.3.1. Configuring registry storage for bare metal and other manual installations
      23.1.15.3.2. Configuring storage for the image registry in non-production clusters
      23.1.15.3.3. Configuring block registry storage
   23.1.16. Completing installation on user-provisioned infrastructure
   23.1.17. Telemetry access for OpenShift Container Platform
   23.1.18. Next steps

CHAPTER 24. INSTALLATION CONFIGURATION ........................................... 3622

24.1. CUSTOMIZING NODES ...................................................... 3622
   24.1.1. Creating machine configs with Butane
      24.1.1.1. About Butane
      24.1.1.2. Installing Butane
      24.1.1.3. Creating a MachineConfig object by using Butane
   24.1.2. Adding day-1 kernel arguments
   24.1.3. Adding kernel modules to nodes
      24.1.3.1. Building and testing the kernel module container
      24.1.3.2. Provisioning a kernel module to OpenShift Container Platform
         24.1.3.2.1. Provision kernel modules via a MachineConfig object
   24.1.4. Encrypting and mirroring disks during installation
      24.1.4.1. About disk encryption
         24.1.4.1.1. Configuring an encryption threshold
      24.1.4.2. About disk mirroring
      24.1.4.3. Configuring disk encryption and mirroring
CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

1.1. ABOUT OPENSIFT CONTAINER PLATFORM INSTALLATION

You can harness the flexibility of the OpenShift Container Platform installation program to install a cluster. You can use the program in the following ways:

- Deploy a cluster on provisioned infrastructure.
- Deploy a cluster on infrastructure that you prepare and maintain.

The following list details two types of basic OpenShift Container Platform clusters:

- Installer-provisioned infrastructure clusters.
- User-provisioned infrastructure clusters.

Both cluster types have the following characteristics:

- Highly available infrastructure with no single points of failure, which is available by default.
- Administrators can control updates, such as the update mechanism and schedule.

1.1.1. About the installation program

You can use the installation program to deploy each type of cluster. The installation program generates the main assets, such as Ignition config files for the bootstrap, control plane, and compute machines. You can start an OpenShift Container Platform cluster with these three machine configurations, provided you correctly configured the infrastructure.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installations. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel with the ultimate target being a running cluster. The installation program recognizes and uses existing components instead of running commands to create them again because the program meets the dependencies.
1.1.2. About Red Hat Enterprise Linux CoreOS (RHCOS)

Post-installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. RHCOS includes the kubelet, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.11 cluster must use RHCOS, which includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure the machines. Operating system updates are delivered as a bootable container image, using OSTree as a backend, that is deployed across the cluster by the Machine Config Operator. Actual operating system changes are made in-place on each machine as an atomic operation by using rpm-ostree. Together, these technologies enable OpenShift Container Platform to manage the operating system like it manages any other application on the cluster, by in-place upgrades that keep the entire platform up to date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its components and machines, including the operating system. Because of this, only the installation program and the Machine Config Operator can change machines. The installation program uses Ignition config files to set the exact state of each machine, and the Machine Config Operator completes more changes to the machines, such as the application of new certificates or keys, after installation.

1.1.3. Glossary of common terms for OpenShift Container Platform installing

The glossary defines common terms that relate to the installation content. Read the following list of terms to better understand the installation process.

**Bootstrap node**
A temporary machine that runs a minimal Kubernetes configuration required to deploy the OpenShift Container Platform control plane.

**Control plane**
A container orchestration layer that exposes the API and interfaces to define, deploy, and manage the lifecycle of containers. Also known as control plane machines.

**Compute node**
Nodes that are responsible for executing workloads for cluster users. Also known as worker nodes.

**Disconnected installation**
In some situations, parts of a data center might not have access to the internet, even through proxy servers. You can still install the OpenShift Container Platform in these environments, but you must download the required software and images and make them available to the disconnected environment.

**The OpenShift Container Platform installation program**
A program that provisions the infrastructure and deploys a cluster.

**Installer-provisioned infrastructure**
The installation program deploys and configures the infrastructure that the cluster runs on.

**Ignition config files**
A file that the Ignition tool uses to configure Red Hat Enterprise Linux CoreOS (RHCOS) during operating system initialization. The installation program generates different Ignition configuration files to initialize bootstrap, control plane, and worker nodes.

**Kubernetes manifests**
Specifications of a Kubernetes API object in a JSON or YAML format. A configuration file can include deployments, config maps, secrets, daemonsets, and so on.

**Kubelet**
A primary node agent that runs on each node in the cluster to ensure that containers are running in a pod.

**Load balancers**
A load balancer serves as the single point of contact for clients. Load balancers for the API distribute incoming traffic across control plane nodes.

**Machine Config Operator**
An Operator that manages and applies configurations and updates of the base operating system and container runtime, including everything between the kernel and kubelet, for the nodes in the cluster.

**Operators**
The preferred method of packaging, deploying, and managing a Kubernetes application in an OpenShift Container Platform cluster. An operator takes human operational knowledge and encodes it into software that is easily packaged and shared with customers.

**User-provisioned infrastructure**
You can install OpenShift Container Platform on infrastructure that you provide. You can use the installation program to generate the assets required to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

### 1.1.4. Installation process

When you install an OpenShift Container Platform cluster, you download the installation program from the appropriate **Cluster Type** page on the OpenShift Cluster Manager Hybrid Cloud Console. This console manages:
- REST API for accounts.
- Registry tokens, which are the pull secrets that you use to obtain the required components.
- Cluster registration, which associates the cluster identity to your Red Hat account to facilitate the gathering of usage metrics.

In OpenShift Container Platform 4.11, the installation program is a Go binary file that performs a series of file transformations on a set of assets. The way you interact with the installation program differs depending on your installation type. Consider the following installation use cases:

- For clusters with installer-provisioned infrastructure, you delegate the infrastructure bootstrapping and provisioning to the installation program instead of doing it yourself. The installation program creates all of the networking, machines, and operating systems that are required to support the cluster.

- If you provision and manage the infrastructure for your cluster, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.

You use three sets of files during installation: an installation configuration file that is named `install-config.yaml`, Kubernetes manifests, and Ignition config files for your machine types.

**IMPORTANT**

You can modify Kubernetes and the Ignition config files that control the underlying RHCOS operating system during installation. However, no validation is available to confirm the suitability of any modifications that you make to these objects. If you modify these objects, you might render your cluster non-functional. Because of this risk, modifying Kubernetes and Ignition config files is not supported unless you are following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are wrapped into Ignition config files. The installation program uses these Ignition config files to create the cluster.

The installation configuration files are all pruned when you run the installation program, so be sure to back up all the configuration files that you want to use again.

**IMPORTANT**

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

The installation process with installer-provisioned infrastructure

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.
If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.

With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

**The installation process with user-provisioned infrastructure**

You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself. The following list details some of these self-managed resources:

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL compute machines to your cluster.

**Installation process details**

When a cluster is provisioned, each machine in the cluster requires information about the cluster. OpenShift Container Platform uses a temporary bootstrap machine during initial configuration to provide the required information to the permanent control plane. The temporary bootstrap machine boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:
After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- Consider using Ignition config files within 12 hours after they are generated, because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. If you provision the infrastructure, this step requires manual intervention.

2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.

3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. If you provision the infrastructure, this step requires manual intervention.
4. The temporary control plane schedules the production control plane to the production control plane machines.

5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.

6. The temporary control plane shuts down and passes control to the production control plane.

7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.

8. The installation program shuts down the bootstrap machine. If you provision the infrastructure, this step requires manual intervention.

9. The control plane sets up the compute nodes.

10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operations, including the creation of compute machines in supported environments.

1.1.5. Verifying node state after installation

The OpenShift Container Platform installation completes when the following installation health checks are successful:

- The provisioner can access the OpenShift Container Platform web console.
- All control plane nodes are ready.
- All cluster Operators are available.

NOTE

After the installation completes, the specific cluster Operators responsible for the worker nodes continuously attempt to provision all worker nodes. Some time is required before all worker nodes report as READY. For installations on bare metal, wait a minimum of 60 minutes before troubleshooting a worker node. For installations on all other platforms, wait a minimum of 40 minutes before troubleshooting a worker node. A DEGRADED state for the cluster Operators responsible for the worker nodes depends on the Operators’ own resources and not on the state of the nodes.

After your installation completes, you can continue to monitor the condition of the nodes in your cluster.

Prerequisites

- The installation program resolves successfully in the terminal.

Procedure

1. Show the status of all worker nodes:

   $ oc get nodes
Installation scope
The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

Additional resources
- See Available cluster customizations for details about OpenShift Container Platform configuration resources.

1.1.6. OpenShift Local overview
OpenShift Local supports rapid application development to get started building OpenShift Container Platform clusters. OpenShift Local is designed to run on a local computer to simplify setup and testing, and to emulate the cloud development environment locally with all of the tools needed to develop container-based applications.

Regardless of the programming language you use, OpenShift Local hosts your application and brings a minimal, preconfigured Red Hat OpenShift Container Platform cluster to your local PC without the need for a server-based infrastructure.
On a hosted environment, OpenShift Local can create microservices, convert them into images, and run them in Kubernetes-hosted containers directly on your laptop or desktop running Linux, macOS, or Windows 10 or later.

For more information about OpenShift Local, see Red Hat OpenShift Local Overview.

1.2. SUPPORTED PLATFORMS FOR OPENSHIFT CONTAINER PLATFORM CLUSTERS

In OpenShift Container Platform 4.11, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Alibaba Cloud
- Amazon Web Services (AWS)
- Bare metal
- Google Cloud Platform (GCP)
- IBM Cloud® VPC
- Microsoft Azure
- Microsoft Azure Stack Hub
- Nutanix
- Red Hat OpenStack Platform (RHOSP)
  - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the OpenShift Container Platform on RHOSP support matrix.
- VMware Cloud (VMC) on AWS
- VMware vSphere

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

**IMPORTANT**

After installation, the following changes are not supported:

- Mixing cloud provider platforms.
- Mixing cloud provider components. For example, using a persistent storage framework from another platform on the platform where you installed the cluster.

In OpenShift Container Platform 4.11, you can install a cluster that uses user-provisioned infrastructure on the following platforms:

- AWS
Azure

Azure Stack Hub

Bare metal

GCP

IBM Power

IBM Z or IBM® LinuxONE

RHOSP

- The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the OpenShift Container Platform on RHOSP support matrix.

VMware Cloud on AWS

VMware vSphere

Depending on the supported cases for the platform, you can perform installations on user-provisioned infrastructure, so that you can run machines with full internet access, place your cluster behind a proxy, or perform a disconnected installation.

In a disconnected installation, you can download the images that are required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a disconnected installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The OpenShift Container Platform 4.x Tested Integrations page contains details about integration testing for different platforms.

Additional resources

- See Supported installation methods for different platforms for more information about the types of installations that are available for each supported platform.

- See Selecting a cluster installation method and preparing it for users for information about choosing an installation method and preparing the required resources.
CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and make sure you that you have all of the required resources to prepare the cluster for users.

2.1. SELECTING A CLUSTER INSTALLATION TYPE

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Alibaba Cloud
- Amazon Web Services (AWS) on 64-bit x86 instances
- Amazon Web Services (AWS) on 64-bit ARM instances
- Microsoft Azure
- Microsoft Azure Stack Hub
- Google Cloud Platform (GCP)
- Red Hat OpenStack Platform (RHOSP)
- Red Hat Virtualization (RHV)
- IBM Cloud VPC
- IBM Z and LinuxONE
- IBM Z and LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power
- Nutanix
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same datacenter or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use
OpenShift Dedicated or OpenShift Online. You can also use OpenShift as a managed service on Azure, AWS, IBM Cloud VPC, or Google Cloud. For more information about managed services, see the OpenShift Products page. If you install an OpenShift Container Platform cluster with a cloud virtual machine as a virtual bare metal, the corresponding cloud-based storage is not supported.

2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves the Operators that package, deploy, and manage Kubernetes applications and the operating system that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines is part of the installation process for OpenShift Container Platform. See Differences between OpenShift Container Platform 3 and 4.

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see Migrating from OpenShift Container Platform 3 to 4 overview. Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called installer provisioned infrastructure installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to Alibaba Cloud, AWS, Azure, Azure Stack Hub, GCP, Nutanix, or VMC on AWS. These installation methods are the fastest way to deploy a production-capable OpenShift Container Platform cluster.

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for Alibaba Cloud, AWS, Azure, GCP, Nutanix, or VMC on AWS.

For installer-provisioned infrastructure installations, you can use an existing VPC in AWS, vNet in Azure, or VPC in GCP. You can also reuse part of your networking infrastructure so that your cluster in AWS, Azure, GCP, or VMC on AWS can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for RHOSP, RHOSP with Kuryr, RHV, vSphere, and bare metal. Additionally, for vSphere, VMC on AWS, you can also customize additional network parameters during installation.

If you want to reuse extensive cloud infrastructure, you can complete a user-provisioned infrastructure installation. With these installations, you manually deploy the machines that your cluster requires during the installation process. If you perform a user-provisioned infrastructure installation on AWS, Azure,
Azure Stack Hub, GCP, or VMC on AWS, you can use the provided templates to help you stand up all of the required components. You can also reuse a shared VPC on GCP. Otherwise, you can use the provider-agnostic installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you use RHOSP, RHV, IBM Z or LinuxONE, IBM Z or LinuxONE with RHEL KVM, IBM Power, or vSphere, use the specific installation instructions to deploy your cluster. If you use other supported hardware, follow the bare metal installation procedure. For some of these platforms, such as RHOSP, vSphere, VMC on AWS, and bare metal, you can also customize additional network parameters during installation.

2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The instructions are included in each installation procedure.

If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy a private cluster with installer-provisioned infrastructure on AWS, Azure, or GCP.

If you need to install your cluster that has limited access to the internet, such as a disconnected or restricted network cluster, you can mirror the installation packages and install the cluster from them. Follow detailed instructions for user provisioned infrastructure installations into restricted networks for AWS, GCP, IBM Z or LinuxONE, IBM Z or LinuxONE with RHEL KVM, IBM Power, vSphere, VMC on AWS, or bare metal. You can also install a cluster into a restricted network using installer-provisioned infrastructure by following detailed instructions for AWS, GCP, VMC on AWS, RHOSP, RHV, and vSphere.

If you need to deploy your cluster to an AWS GovCloud region, AWS China region, or Azure government region, you can configure those custom regions during an installer-provisioned infrastructure installation.

You can also configure the cluster machines to use FIPS Validated / Modules in Process cryptographic libraries during installation.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION

Some configuration is not required to install the cluster but recommended before your users access the cluster. You can customize the cluster itself by customizing the Operators that make up your cluster and integrate you cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- Persistent storage
- An identity provider
- Monitoring core OpenShift Container Platform components

2.3. PREPARING YOUR CLUSTER FOR WORKLOADS

Depending on your workload needs, you might need to take extra steps before you begin deploying
applications. For example, after you prepare infrastructure to support your application build strategy, you might need to make provisions for low-latency workloads or to protect sensitive workloads. You can also configure monitoring for application workloads. If you plan to run Windows workloads, you must enable hybrid networking with OVN-Kubernetes during the installation process; hybrid networking cannot be enabled after your cluster is installed.

### 2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS

You can perform different types of installations on different platforms.

**NOTE**

Not all installation options are supported for all platforms, as shown in the following tables. A checkmark indicates that the option is supported and links to the relevant section.

**CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS**
CHAPTER 3. DISCONNECTED INSTALLATION MIRRORING

3.1. ABOUT DISCONNECTED INSTALLATION MIRRORING

You can use a mirror registry to ensure that your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

3.1.1. Creating a mirror registry

If you already have a container image registry, such as Red Hat Quay, you can use it as your mirror registry. If you do not already have a registry, you can create a mirror registry using the mirror registry for Red Hat OpenShift.

3.1.2. Mirroring images for a disconnected installation

You can use one of the following procedures to mirror your OpenShift Container Platform image repository to your mirror registry:

- Mirroring images for a disconnected installation
- Mirroring images for a disconnected installation using the oc-mirror plugin

3.2. CREATING A MIRROR REGISTRY WITH MIRROR REGISTRY FOR RED HAT OPENSHIFT

The mirror registry for Red Hat OpenShift is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

If you already have a container image registry, such as Red Hat Quay, you can skip this section and go straight to Mirroring the OpenShift Container Platform image repository.

3.2.1. Prerequisites

- An OpenShift Container Platform subscription.
- Red Hat Enterprise Linux (RHEL) 8 and 9 with Podman 3.3 and OpenSSL installed.
- Fully qualified domain name for the Red Hat Quay service, which must resolve through a DNS server.
- Key-based SSH connectivity on the target host. SSH keys are automatically generated for local installs. For remote hosts, you must generate your own SSH keys.
- 2 or more vCPUs.
- 8 GB of RAM.
- About 12 GB for OpenShift Container Platform 4.11 release images, or about 358 GB for OpenShift Container Platform 4.11 release images and OpenShift Container Platform 4.11 Red Hat Operator images. Up to 1 TB per stream or more is suggested.
3.2.2. Mirror registry for Red Hat OpenShift introduction

For disconnected deployments of OpenShift Container Platform, a container registry is required to carry out the installation of the clusters. To run a production-grade registry service on such a cluster, you must create a separate registry deployment to install the first cluster. The mirror registry for Red Hat OpenShift addresses this need and is included in every OpenShift subscription. It is available for download on the OpenShift console Downloads page.

The mirror registry for Red Hat OpenShift allows users to install a small-scale version of Red Hat Quay and its required components using the mirror-registry command line interface (CLI) tool. The mirror registry for Red Hat OpenShift is deployed automatically with preconfigured local storage and a local database. It also includes auto-generated user credentials and access permissions with a single set of inputs and no additional configuration choices to get started.

The mirror registry for Red Hat OpenShift provides a pre-determined network configuration and reports deployed component credentials and access URLs upon success. A limited set of optional configuration inputs like fully qualified domain name (FQDN) services, superuser name and password, and custom TLS certificates are also provided. This provides users with a container registry so that they can easily create an offline mirror of all OpenShift Container Platform release content when running OpenShift Container Platform in restricted network environments.

Use of the mirror registry for Red Hat OpenShift is optional if another container registry is already available in the install environment.

3.2.2.1. Mirror registry for Red Hat OpenShift limitations

The following limitations apply to the mirror registry for Red Hat OpenShift:

- The mirror registry for Red Hat OpenShift is not a highly-available registry and only local file system storage is supported. It is not intended to replace Red Hat Quay or the internal image registry for OpenShift Container Platform.

- The mirror registry for Red Hat OpenShift is only supported for hosting images that are required to install a disconnected OpenShift Container Platform cluster, such as Release images or Red Hat Operator images. It uses local storage on your Red Hat Enterprise Linux (RHEL) machine, and storage supported by RHEL is supported by the mirror registry for Red Hat OpenShift.

- Support for Red Hat product images that are pushed to the mirror registry for Red Hat OpenShift for bootstrapping purposes are covered by valid subscriptions for each respective product. A list of exceptions to further enable the bootstrap experience can be found on the Self-managed Red Hat OpenShift sizing and subscription guide.

- Content built by customers should not be hosted by the mirror registry for Red Hat OpenShift.

- Using the mirror registry for Red Hat OpenShift with more than one cluster is discouraged because multiple clusters can create a single point of failure when updating your cluster fleet. It is advised to leverage the mirror registry for Red Hat OpenShift to install a cluster that can host
a production-grade, highly-available registry such as Red Hat Quay, which can serve OpenShift Container Platform content to other clusters.

### 3.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a local host using the *mirror-registry* installer tool. By doing so, users can create a local host registry running on port 443 for the purpose of storing a mirror of OpenShift Container Platform images.

**NOTE**

Installing the *mirror registry for Red Hat OpenShift* using the *mirror-registry* CLI tool makes several changes to your machine. After installation, an */etc/quay-install* directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named *init* is created with an automatically generated password. All access credentials are printed at the end of the install routine.

**Procedure**

1. Download the *mirror-registry.tar.gz* package for the latest version of the *mirror registry for Red Hat OpenShift* found on the OpenShift console **Downloads** page.

2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the *mirror-registry* tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

   ```bash
   $ ./mirror-registry install \
   --quayHostname <host_example_com> \
   --quayRoot <example_directory_name>
   ```

3. Use the user name and password generated during installation to log into the registry by running the following command:

   ```bash
   $ podman login -u init \
   -p <password> \
   <host_example_com>:8443> \
   --tls-verify=false
   ```

   You can avoid running *--tls-verify=false* by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

**NOTE**

You can also log in by accessing the UI at https://<host.example.com>:8443 after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.
NOTE
If there are issues with images stored by the mirror registry for Red Hat OpenShift due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

3.2.4. Updating mirror registry for Red Hat OpenShift from a local host

This procedure explains how to update the mirror registry for Red Hat OpenShift from a local host using the upgrade command. Updating to the latest version ensures bug fixes and security vulnerability fixes.

IMPORTANT
When updating, there is intermittent downtime of your mirror registry, as it is restarted during the update process.

Prerequisites
- You have installed the mirror registry for Red Hat OpenShift on a local host.

Procedure
- To upgrade the mirror registry for Red Hat OpenShift from localhost, enter the following command:

  $ sudo ./mirror-registry upgrade -v

NOTE
Users who upgrade the mirror registry for Red Hat OpenShift with the ./mirror-registry upgrade -v flag must include the same credentials used when creating their mirror registry. For example, if you installed the mirror registry for Red Hat OpenShift with --quayHostname <host_example_com> and --quayRoot <example_directory_name>, you must include that string to properly upgrade the mirror registry.

3.2.5. Mirroring on a remote host with mirror registry for Red Hat OpenShift

This procedure explains how to install the mirror registry for Red Hat OpenShift on a remote host using the mirror-registry tool. By doing so, users can create a registry to hold a mirror of OpenShift Container Platform images.

NOTE
Installing the mirror registry for Red Hat OpenShift using the mirror-registry CLI tool makes several changes to your machine. After installation, a /etc/quay-install directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named init is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure
1. Download the `mirror-registry.tar.gz` package for the latest version of the `mirror registry for Red Hat OpenShift` found on the OpenShift console Downloads page.

2. Install the `mirror registry for Red Hat OpenShift` on your local host with your current user account by using the `mirror-registry` tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

   ```bash
   $ ./mirror-registry install -v \
   --targetHostname <host_example_com> \
   --targetUsername <example_user> \
   -k ~/.ssh/my_ssh_key \
   --quayHostname <host_example_com> \
   --quayRoot <example_directory_name>
   ```

3. Use the user name and password generated during installation to log into the mirror registry by running the following command:

   ```bash
   $ podman login -u init \
   -p <password> \
   <host_example_com>:8443 \
   --tls-verify=false
   ```

   You can avoid running `--tls-verify=false` by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

   **NOTE**

   You can also log in by accessing the UI at `https://<host.example.com>:8443` after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

   **NOTE**

   If there are issues with images stored by the `mirror registry for Red Hat OpenShift` due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

3.2.6. Updating mirror registry for Red Hat OpenShift from a remote host

This procedure explains how to update the `mirror registry for Red Hat OpenShift` from a remote host using the `upgrade` command. Updating to the latest version ensures bug fixes and security vulnerability fixes.

   **IMPORTANT**

   When updating, there is intermittent downtime of your mirror registry, as it is restarted during the update process.
Prerequisites

- You have installed the mirror registry for Red Hat OpenShift on a remote host.

Procedure

- To upgrade the mirror registry for Red Hat OpenShift from a remote host, enter the following command:

  
  ```bash
  $ ./mirror-registry upgrade -v --targetHostname <remote_host_url> --targetUsername <user_name> -k ~/.ssh/my_ssh_key
  ```

  **NOTE**

  Users who upgrade the mirror registry for Red Hat OpenShift with the `./mirror-registry upgrade -v` flag must include the same credentials used when creating their mirror registry. For example, if you installed the mirror registry for Red Hat OpenShift with `--quayHostname <host_example_com>` and `--quayRoot <example_directory_name>`, you must include that string to properly upgrade the mirror registry.

3.2.7. Replacing mirror registry for Red Hat OpenShift SSL/TLS certificates

In some cases, you might want to update your SSL/TLS certificates for the mirror registry for Red Hat OpenShift. This is useful in the following scenarios:

- If you are replacing the current mirror registry for Red Hat OpenShift certificate.
- If you are using the same certificate as the previous mirror registry for Red Hat OpenShift installation.
- If you are periodically updating the mirror registry for Red Hat OpenShift certificate.

Use the following procedure to replace mirror registry for Red Hat OpenShift SSL/TLS certificates.

Prerequisites

- You have downloaded the ./mirror-registry binary from the OpenShift console Downloads page.

Procedure

1. Enter the following command to install the mirror registry for Red Hat OpenShift:

   ```bash
   $ ./mirror-registry install \
   --quayHostname <host_example_com> \
   --quayRoot <example_directory_name>
   
   This installs the mirror registry for Red Hat OpenShift to the $HOME/quay-install directory.
   ```

2. Prepare a new certificate authority (CA) bundle and generate new ssl.key and ssl.crt key files. For more information, see Using SSL/TLS.

3. Assign $HOME/quay-install an environment variable, for example, QUAY, by entering the following command:
$ export QUAY=$HOME/quay-install

4. Copy the new ssl.crt file to the /$HOME/quay-install directory by entering the following command:

   $ cp ~/ssl.crt $QUAY/quay-config

5. Copy the new ssl.key file to the /$HOME/quay-install directory by entering the following command:

   $ cp ~/ssl.key $QUAY/quay-config

6. Restart the quay-app application pod by entering the following command:

   $ systemctl restart quay-app

### 3.2.8. Uninstalling the mirror registry for Red Hat OpenShift

- You can uninstall the mirror registry for Red Hat OpenShift from your local host by running the following command:

   $ ./mirror-registry uninstall -v \n   --quayRoot <example_directory_name>

**NOTE**

- Deleting the mirror registry for Red Hat OpenShift will prompt the user before deletion. You can use --autoApprove to skip this prompt.

- Users who install the mirror registry for Red Hat OpenShift with the --quayRoot flag must include the --quayRoot flag when uninstalling. For example, if you installed the mirror registry for Red Hat OpenShift with --quayRoot example_directory_name, you must include that string to properly uninstall the mirror registry.

### 3.2.9. Mirror registry for Red Hat OpenShift flags

The following flags are available for the mirror registry for Red Hat OpenShift:

<table>
<thead>
<tr>
<th>Flags</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--autoApprove</td>
<td>A boolean value that disables interactive prompts. If set to true, the quayRoot directory is automatically deleted when uninstalling the mirror registry. Defaults to false if left unspecified.</td>
</tr>
<tr>
<td>--initPassword</td>
<td>The password of the init user created during Quay installation. Must be at least eight characters and contain no whitespace.</td>
</tr>
<tr>
<td>--initUser string</td>
<td>Shows the username of the initial user. Defaults to init if left unspecified.</td>
</tr>
<tr>
<td>Flags</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--no-color, -c</td>
<td>Allows users to disable color sequences and propagate that to Ansible when running install, uninstall, and upgrade commands.</td>
</tr>
<tr>
<td>--quayHostname</td>
<td>The fully-qualified domain name of the mirror registry that clients will use to contact the registry. Equivalent to <code>SERVER_HOSTNAME</code> in the Quay <code>config.yaml</code>. Must resolve by DNS. Defaults to <code>&lt;targetHostname&gt;:8443</code> if left unspecified. [1]</td>
</tr>
<tr>
<td>--quayRoot, -r</td>
<td>The directory where container image layer and configuration data is saved, including <code>rootCA.key</code>, <code>rootCA.pem</code>, and <code>rootCA.srl</code> certificates. Requires about 12 GB for OpenShift Container Platform 4.10 Release images, or about 358 GB for OpenShift Container Platform 4.10 Release images and OpenShift Container Platform 4.10 Red Hat Operator images. Defaults to <code>/etc/quay-install</code> if left unspecified.</td>
</tr>
<tr>
<td>--ssh-key, -k</td>
<td>The path of your SSH identity key. Defaults to <code>~/.ssh/quay_installer</code> if left unspecified.</td>
</tr>
<tr>
<td>--sslCert</td>
<td>The path to the SSL/TLS public key / certificate. Defaults to <code>{quayRoot}/quay-config</code> and is auto-generated if left unspecified.</td>
</tr>
<tr>
<td>--sslCheckSkip</td>
<td>Skips the check for the certificate hostname against the <code>SERVER_HOSTNAME</code> in the <code>config.yaml</code> file. [2]</td>
</tr>
<tr>
<td>--sslKey</td>
<td>The path to the SSL/TLS private key used for HTTPS communication. Defaults to <code>{quayRoot}/quay-config</code> and is auto-generated if left unspecified.</td>
</tr>
<tr>
<td>--targetHostname, -H</td>
<td>The hostname of the target you want to install Quay to. Defaults to <code>$HOST</code>, for example, a local host, if left unspecified.</td>
</tr>
<tr>
<td>--targetUsername, -u</td>
<td>The user on the target host which will be used for SSH. Defaults to <code>$USER</code>, for example, the current user if left unspecified.</td>
</tr>
<tr>
<td>--verbose, -v</td>
<td>Shows debug logs and Ansible playbook outputs.</td>
</tr>
</tbody>
</table>

1. **--quayHostname** must be modified if the public DNS name of your system is different from the local hostname. Additionally, the **--quayHostname** flag does not support installation with an IP address. Installation with a hostname is required.

2. **--sslCheckSkip** is used in cases when the mirror registry is set behind a proxy and the exposed hostname is different from the internal Quay hostname. It can also be used when users do not want the certificates to be validated against the provided Quay hostname during installation.

3.2.10. Mirror registry for Red Hat OpenShift release notes
The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

These release notes track the development of the *mirror registry for Red Hat OpenShift* in OpenShift Container Platform.

For an overview of the *mirror registry for Red Hat OpenShift*, see Creating a mirror registry with mirror registry for Red Hat OpenShift.

3.2.10.1. Mirror registry for Red Hat OpenShift 1.3.10
Issued: 2023-12-07

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.14.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2023:7628 - mirror registry for Red Hat OpenShift 1.3.10

3.2.10.2. Mirror registry for Red Hat OpenShift 1.3.9
Issued: 2023-09-19

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.12.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2023:5241 - mirror registry for Red Hat OpenShift 1.3.9

3.2.10.3. Mirror registry for Red Hat OpenShift 1.3.8
Issued: 2023-08-16

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.11.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2023:4622 - mirror registry for Red Hat OpenShift 1.3.8

3.2.10.4. Mirror registry for Red Hat OpenShift 1.3.7
Issued: 2023-07-19

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.10.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2023:4087 - mirror registry for Red Hat OpenShift 1.3.7

3.2.10.5. Mirror registry for Red Hat OpenShift 1.3.6
Issued: 2023-05-30

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.8.
The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:3302 - mirror registry for Red Hat OpenShift 1.3.6

### 3.2.10.6. Mirror registry for Red Hat OpenShift 1.3.5

Issued: 2023-05-18

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.7.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:3225 - mirror registry for Red Hat OpenShift 1.3.5

### 3.2.10.7. Mirror registry for Red Hat OpenShift 1.3.4

Issued: 2023-04-25

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.6.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:1914 - mirror registry for Red Hat OpenShift 1.3.4

### 3.2.10.8. Mirror registry for Red Hat OpenShift 1.3.3

Issued: 2023-04-05

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.5.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:1528 - mirror registry for Red Hat OpenShift 1.3.3

### 3.2.10.9. Mirror registry for Red Hat OpenShift 1.3.2

Issued: 2023-03-21

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.4.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:1376 - mirror registry for Red Hat OpenShift 1.3.2

### 3.2.10.10. Mirror registry for Red Hat OpenShift 1.3.1

Issued: 2023-03-7

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.3.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:1086 - mirror registry for Red Hat OpenShift 1.3.1

### 3.2.10.11. Mirror registry for Red Hat OpenShift 1.3.0
Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.1.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2023:0558 - mirror registry for Red Hat OpenShift 1.3.0

3.2.10.11.1. New features

- Mirror registry for Red Hat OpenShift is now supported on Red Hat Enterprise Linux (RHEL) 9 installations.

- IPv6 support is now available on mirror registry for Red Hat OpenShift local host installations. IPv6 is currently unsupported on mirror registry for Red Hat OpenShift remote host installations.

- A new feature flag, --quayStorage, has been added. With this flag, users with root privileges can manually set the location of their Quay persistent storage.

- A new feature flag, --pgStorage, has been added. With this flag, users with root privileges can manually set the location of their Postgres persistent storage.

- Previously, users were required to have root privileges (sudo) to install mirror registry for Red Hat OpenShift. With this update, sudo is no longer required to install mirror registry for Red Hat OpenShift.

When mirror registry for Red Hat OpenShift was installed with sudo, an /etc/quay-install directory that contained installation files, local storage, and the configuration bundle was created. With the removal of the sudo requirement, installation files and the configuration bundle are now installed to $HOME/quay-install. Local storage, for example Postgres and Quay, are now stored in named volumes automatically created by Podman.

To override the default directories that these files are stored in, you can use the command line arguments for mirror registry for Red Hat OpenShift command line arguments, see "Mirror registry for Red Hat OpenShift flags".

3.2.10.11.2. Bug fixes

- Previously, the following error could be returned when attempting to uninstall mirror registry for Red Hat OpenShift: 
  ```
  ["Error: no container with name or ID "quay-postgres" found: no such container"], "stdout": "", "stdout_lines": []
  ```
  With this update, the order that mirror registry for Red Hat OpenShift services are stopped and uninstalled have been changed so that the error no longer occurs when uninstalling mirror registry for Red Hat OpenShift. For more information, see PROJQUAY-4629.

3.2.10.12. Mirror registry for Red Hat OpenShift 1.2.9

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.10.

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2022:7369 - mirror registry for Red Hat OpenShift 1.2.9

3.2.10.13. Mirror registry for Red Hat OpenShift 1.2.8

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.9.
The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2022:7065 - mirror registry for Red Hat OpenShift 1.2.8

### 3.2.10.14. Mirror registry for Red Hat OpenShift 1.2.7

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.8.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2022:6500 - mirror registry for Red Hat OpenShift 1.2.7

### 3.2.10.14.1. Bug fixes

- Previously, `getFQDN()` relied on the fully-qualified domain name (FQDN) library to determine its FQDN, and the FQDN library tried to read the `/etc/hosts` folder directly. Consequently, on some Red Hat Enterprise Linux CoreOS (RHCOS) installations with uncommon DNS configurations, the FQDN library would fail to install and abort the installation. With this update, *mirror registry for Red Hat OpenShift* uses `hostname` to determine the FQDN. As a result, the FQDN library does not fail to install. ([PROJQUAY-4139](#))

### 3.2.10.15. Mirror registry for Red Hat OpenShift 1.2.6

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.7.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2022:6278 - mirror registry for Red Hat OpenShift 1.2.6

### 3.2.10.15.1. New features

A new feature flag, `--no-color (-c)` has been added. This feature flag allows users to disable color sequences and propagate that to Ansible when running install, uninstall, and upgrade commands.

### 3.2.10.16. Mirror registry for Red Hat OpenShift 1.2.5

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.6.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2022:6071 - mirror registry for Red Hat OpenShift 1.2.5

### 3.2.10.17. Mirror registry for Red Hat OpenShift 1.2.4

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.5.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- RHBA-2022:5884 - mirror registry for Red Hat OpenShift 1.2.4

### 3.2.10.18. Mirror registry for Red Hat OpenShift 1.2.3

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.4.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:
3.2.10.19. Mirror registry for Red Hat OpenShift 1.2.2

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.3.
The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2022:5649 - mirror registry for Red Hat OpenShift 1.2.3

3.2.10.20. Mirror registry for Red Hat OpenShift 1.2.1

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.2.
The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2022:5501 - mirror registry for Red Hat OpenShift 1.2.2

3.2.10.21. Mirror registry for Red Hat OpenShift 1.2.0

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.1.
The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2022:4986 - mirror registry for Red Hat OpenShift 1.2.1

3.2.10.21.1. Bug fixes

- Previously, all components and workers running inside of the Quay pod Operator had log levels set to DEBUG. As a result, large traffic logs were created that consumed unnecessary space. With this update, log levels are set to WARN by default, which reduces traffic information while emphasizing problem scenarios. (PROJQUAY-3504)

3.2.10.22. Mirror registry for Red Hat OpenShift 1.1.0

The following advisory is available for the mirror registry for Red Hat OpenShift:

- RHBA-2022:0956 - mirror registry for Red Hat OpenShift 1.1.0

3.2.10.22.1. New features

- A new command, mirror-registry upgrade has been added. This command upgrades all container images without interfering with configurations or data.

```
NOTE

If quayRoot was previously set to something other than default, it must be passed into the upgrade command.
```

3.2.10.22.2. Bug fixes

- Previously, the absence of quayHostname or targetHostname did not default to the local hostname. With this update, quayHostname and targetHostname now default to the local hostname if they are missing. (PROJQUAY-3079)
Previously, the command "./mirror-registry --version" returned an unknown flag error. Now, running "./mirror-registry --version" returns the current version of the mirror registry for Red Hat OpenShift. (PROJQUAY-3086)

Previously, users could not set a password during installation, for example, when running "./mirror-registry install --initUser <user_name> --initPassword <password> --verbose". With this update, users can set a password during installation. (PROJQUAY-3149)

Previously, the mirror registry for Red Hat OpenShift did not recreate pods if they were destroyed. Now, pods are recreated if they are destroyed. (PROJQUAY-3261)

Additional resources

- Using SSL to protect connections to Red Hat Quay
- Configuring the system to trust the certificate authority
- Mirroring the OpenShift Container Platform image repository
- Mirroring Operator catalogs for use with disconnected clusters

3.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

You can ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

IMPORTANT

You must have access to the internet to obtain the necessary container images. In this procedure, you place your mirror registry on a mirror host that has access to both your network and the internet. If you do not have access to a mirror host, use the Mirroring Operator catalogs for use with disconnected clusters procedure to copy images to a device you can move across network boundaries with.

3.3.1. Prerequisites

- You must have a container image registry that supports Docker v2-2 in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
  - Red Hat Quay
  - JFrog Artifactory
  - Sonatype Nexus Repository
  - Harbor

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay for proof-of-concept purposes or by using the Red Hat Quay Operator. If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat support.

- If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a mirror registry for Red Hat OpenShift. The mirror
registry for Red Hat OpenShift is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

### 3.3.2. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry such as Red Hat Quay, JFrog Artifactory, Sonatype Nexus Repository, or Harbor. If you do not have access to a large-scale container registry, you can use the mirror registry for Red Hat OpenShift, a small-scale container registry included with OpenShift Container Platform subscriptions.

You can use any container registry that supports Docker v2-2, such as Red Hat Quay, the mirror registry for Red Hat OpenShift, Artifactory, Sonatype Nexus Repository, or Harbor. Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

**IMPORTANT**

The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the mirror registry for Red Hat OpenShift, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the *Trying to access* log entry in the CRI-O logs. Other methods to view the image pull source, such as using the *crictl images* command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

**NOTE**

Red Hat does not test third party registries with OpenShift Container Platform.

### Additional information

For information about viewing the CRI-O logs to view the image source, see Viewing the image pull source.

### 3.3.3. Preparing your mirror host

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.
3.3.3.1. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the **Product Variant** drop-down menu.
3. Select the appropriate version in the **Version** drop-down menu.
4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.
5. Unpack the archive:

   ```bash
   $ tar xvf <file>
   ```

6. Place the `oc` binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```bash
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```bash
  $ oc <command>
  ```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your **PATH**.
To check your PATH, open the command prompt and execute the following command:

```
C:\> path
```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.

   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  $ oc <command>
  ```

**3.3.4. Configuring credentials that allow images to be mirrored**

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.
WARNING
Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

WARNING
This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

Prerequisites
- You configured a mirror registry to use in your disconnected environment.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

Procedure
Complete the following steps on the installation host:

1. Download your `registry.redhat.io` pull secret from the Red Hat OpenShift Cluster Manager.

2. Make a copy of your pull secret in JSON format:

   ```bash
   $ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json>
   ```

   Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

The contents of the file resemble the following example:

```json
{
   "auths": {
      "cloud.openshift.com": {
         "auth": "b3BlbnNo...",
         "email": "you@example.com"
      },
      "quay.io": {
         "auth": "b3BlbnNo...",
         "email": "you@example.com"
      },
      "registry.connect.redhat.com": {
```
3. Generate the base64-encoded user name and password or token for your mirror registry:

```bash
$ echo -n '<user_name>:<password>' | base64 -w0
```

For `<user_name>` and `<password>`, specify the user name and password that you configured for your registry.

4. Edit the JSON file and add a section that describes your registry to it:

```json
"auths": {
  "<mirror_registry>": {  
    "auth": "<credentials>",  
    "email": "you@example.com"
  },
  "cloud.openshift.com": { 
    "auth": "b3BlbnNo...", 
    "email": "you@example.com"
  },
  "quay.io": { 
    "auth": "b3BlbnNo...", 
    "email": "you@example.com"
  },
  "registry.connect.redhat.com": { 
    "auth": "NTE3Njg5Nj...", 
    "email": "you@example.com"
  },
  "registry.redhat.io": { 
    "auth": "NTE3Njg5Nj...", 
    "email": "you@example.com"
  }
}
```

For `<mirror_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:8443`

For `<credentials>`, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:
3.3.5. Mirroring the OpenShift Container Platform image repository

Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

Prerequisites

- Your mirror host has access to the internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the pull secret from the Red Hat OpenShift Cluster Manager and modified it to include authentication to your mirror repository.
- If you use self-signed certificates, you have specified a Subject Alternative Name in the certificates.

Procedure

Complete the following steps on the mirror host:

1. Review the OpenShift Container Platform downloads page to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the Repository Tags page.

2. Set the required environment variables:
   a. Export the release version:

   ```
   $ OCP_RELEASE=<release_version>
   ```
   
   For `<release_version>`, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as 4.5.4.

   b. Export the local registry name and host port:

   ```
   $ LOCAL_REGISTRY=':<local_registry_host_name>:<local_registry_host_port>'
   ```
   
   For `<local_registry_host_name>`, specify the registry domain name for your mirror repository, and for `<local_registry_host_port>`, specify the port that it serves content on.

   c. Export the local repository name:

   ```
   $ LOCAL_REPOSITORY=':<local_repository_name>'
   ```
   
   For `<local_repository_name>`, specify the name of the repository to create in your registry, such as ocp4/openshift4.
d. Export the name of the repository to mirror:

```
$ PRODUCT_REPO='openshift-release-dev'
```

For a production release, you must specify `openshift-release-dev`.

e. Export the path to your registry pull secret:

```
$ LOCAL_SECRET_JSON='<path_to_pull_secret>'
```

For `<path_to_pull_secret>`, specify the absolute path to and file name of the pull secret for your mirror registry that you created.

f. Export the release mirror:

```
$ RELEASE_NAME="ocp-release"
```

For a production release, you must specify `ocp-release`.

g. Export the type of architecture for your server, such as `x86_64` or `aarch64`:

```
$ ARCHITECTURE=<server_architecture>
```

h. Export the path to the directory to host the mirrored images:

```
$ REMOVABLE_MEDIA_PATH=<path> ¹
```

¹ Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the mirror registry:

- If your mirror host does not have internet access, take the following actions:
  - i. Connect the removable media to a system that is connected to the internet.
  - ii. Review the images and configuration manifests to mirror:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE} --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} --to-release-image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE} --dry-run
```

iii. Record the entire `imageContentSources` section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the `imageContentSources` section to the `install-config.yaml` file during installation.

iv. Mirror the images to a directory on the removable media:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} --to-dir=${REMOVABLE_MEDIA_PATH}/mirror
```
Take the media to the restricted network environment and upload the images to the local container registry.

For `REMOVABLE_MEDIA_PATH`, you must use the same path that you specified when you mirrored the images.

**IMPORTANT**

Running `oc image mirror` might result in the following error: error: unable to retrieve source image. This error occurs when image indexes include references to images that no longer exist on the image registry. Image indexes might retain older references to allow users running those images an upgrade path to newer points on the upgrade graph. As a temporary workaround, you can use the `--skip-missing` option to bypass the error and continue downloading the image index. For more information, see Service Mesh Operator mirroring failed.

- If the local container registry is connected to the mirror host, take the following actions:
  1. Directly push the release images to the local registry by using following command:

     ```
     $ oc adm release mirror -a ${LOCAL_SECRET_JSON}  
     --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE}  
     --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}  
     --to-release-image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE}
     ```

     This command pulls the release information as a digest, and its output includes the `imageContentSources` data that you require when you install your cluster.

  2. Record the entire `imageContentSources` section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the `imageContentSources` section to the `install-config.yaml` file during installation.

**NOTE**

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.

4. To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:
If your mirror host does not have internet access, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --icsp-file=<file> --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}"
```

If the local container registry is connected to the mirror host, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE}"
```

**IMPORTANT**

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active internet connection.

5. For clusters using installer-provisioned infrastructure, run the following command:

```
$ openshift-install
```

### 3.3.6. The Cluster Samples Operator in a disconnected environment

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

#### 3.3.6.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named `imagestreamtag-to-image` in the `openshift-cluster-samples-operator` namespace. The `imagestreamtag-to-image` config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is `<image_stream_name>_<image_stream_tag_name>`.

During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to *Removed*. If you choose to change it to *Managed*, it installs samples.

**NOTE**

The use of samples in a network-restricted or discontinued environment may require access to services external to your network. Some example services include: Github, Maven Central, npm, RubyGems, PyPi and others. There might be additional steps to take that allow the cluster samples operator's objects to reach the services they require.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to *Removed*, you can create your mirrored registry, or determine which existing mirrored registry you want to use.
• Mirror the samples you want to the mirrored registry using the new config map as your guide.

• Add any of the image streams you did not mirror to the `skippedImagestreams` list of the Cluster Samples Operator configuration object.

• Set `samplesRegistry` of the Cluster Samples Operator configuration object to the mirrored registry.

• Then set the Cluster Samples Operator to Managed to install the image streams you have mirrored.

3.3.7. Mirroring Operator catalogs for use with disconnected clusters

You can mirror the Operator contents of a Red Hat-provided catalog, or a custom catalog, into a container image registry using the `oc adm catalog mirror` command. The target registry must support Docker v2-2. For a cluster on a restricted network, this registry can be one that the cluster has network access to, such as a mirror registry created during a restricted network cluster installation.

**IMPORTANT**

• The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

• Running `oc adm catalog mirror` might result in the following error: error: unable to retrieve source image. This error occurs when image indexes include references to images that no longer exist on the image registry. Image indexes might retain older references to allow users running those images an upgrade path to newer points on the upgrade graph. As a temporary workaround, you can use the `--skip-missing` option to bypass the error and continue downloading the image index. For more information, see Service Mesh Operator mirroring failed.

The `oc adm catalog mirror` command also automatically mirrors the index image that is specified during the mirroring process, whether it be a Red Hat-provided index image or your own custom-built index image, to the target registry. You can then use the mirrored index image to create a catalog source that allows Operator Lifecycle Manager (OLM) to load the mirrored catalog onto your OpenShift Container Platform cluster.

Additional resources

• [Using Operator Lifecycle Manager on restricted networks](#)

3.3.7.1. Prerequisites

Mirroring Operator catalogs for use with disconnected clusters has the following prerequisites:

• Workstation with unrestricted network access.

• `podman` version 1.9.3 or later.

• If you want to filter, or `prune`, an existing catalog and selectively mirror only a subset of Operators, see the following sections:
  • [Installing the opm CLI](#)
Updating or filtering a file-based catalog image

- If you want to mirror a Red Hat-provided catalog, run the following command on your workstation with unrestricted network access to authenticate with registry.redhat.io:

  $ podman login registry.redhat.io

- Access to a mirror registry that supports Docker v2-2.

- On your mirror registry, decide which repository, or namespace, to use for storing mirrored Operator content. For example, you might create an `olm-mirror` repository.

- If your mirror registry does not have internet access, connect removable media to your workstation with unrestricted network access.

- If you are working with private registries, including registry.redhat.io, set the `REG_CREDS` environment variable to the file path of your registry credentials for use in later steps. For example, for the `podman` CLI:

  $ REG_CREDS=${XDG_RUNTIME_DIR}/containers/auth.json

### 3.3.7.2. Extracting and mirroring catalog contents

The `oc adm catalog mirror` command extracts the contents of an index image to generate the manifests required for mirroring. The default behavior of the command generates manifests, then automatically mirrors all of the image content from the index image, as well as the index image itself, to your mirror registry.

Alternatively, if your mirror registry is on a completely disconnected, or airgapped, host, you can first mirror the content to removable media, move the media to the disconnected environment, then mirror the content from the media to the registry.

#### 3.3.7.2.1. Mirroring catalog contents to registries on the same network

If your mirror registry is co-located on the same network as your workstation with unrestricted network access, take the following actions on your workstation.

**Procedure**

1. If your mirror registry requires authentication, run the following command to log in to the registry:

   $ podman login <mirror_registry>

2. Run the following command to extract and mirror the content to the mirror registry:

   $ oc adm catalog mirror \
   <index_image> \  
   <mirror_registry>:<port>[/<repository>] \  
   [-a ${REG_CREDS}] \  
   [--insecure] \  
   [--index-filter-by-os='<platform>/<arch>'] \  
   [--manifests-only]
Specify the index image for the catalog that you want to mirror.

Specify the fully qualified domain name (FQDN) for the target registry to mirror the Operator contents to. The mirror registry `<repository>` can be any existing repository, or namespace, on the registry, for example `olm-mirror` as outlined in the prerequisites. If there is an existing repository found during mirroring, the repository name is added to the resulting image name. If you do not want the image name to include the repository name, omit the `<repository>` value from this line, for example `<mirror_registry>:<port>`.

Optional: If required, specify the location of your registry credentials file. `{REG_CREDS}` is required for `registry.redhat.io`.

Optional: If you do not want to configure trust for the target registry, add the `--insecure` flag.

Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are passed as `<platform>/<arch>[/<variant>]`. This does not apply to images referenced by the index. Valid values are `linux/amd64`, `linux/ppc64le`, `linux/s390x`, `linux/arm64`.

Optional: Generate only the manifests required for mirroring without actually mirroring the image content to a registry. This option can be useful for reviewing what will be mirrored, and lets you make any changes to the mapping list, if you require only a subset of packages. You can then use the `mapping.txt` file with the `oc image mirror` command to mirror the modified list of images in a later step. This flag is intended for only advanced selective mirroring of content from the catalog.

Example output

```
src image has index label for database path: /database/index.db
using database path mapping: /database/index.db:/tmp/153048078
wrote database to /tmp/153048078
...
wrote mirroring manifests to manifests-redhat-operator-index-1614211642
```

Directory for the temporary index.db database generated by the command.

Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.

**NOTE**

Red Hat Quay does not support nested repositories. As a result, running the `oc adm catalog mirror` command will fail with a 401 unauthorized error. As a workaround, you can use the `--max-components=2` option when running the `oc adm catalog mirror` command to disable the creation of nested repositories. For more information on this workaround, see the Unauthorized error thrown while using catalog mirror command with Quay registry Knowledgebase Solution.

Additional resources

- Architecture and operating system support for Operators
3.3.7.2.2. Mirroring catalog contents to airgapped registries

If your mirror registry is on a completely disconnected, or airgapped, host, take the following actions.

**Procedure**

1. Run the following command on your workstation with unrestricted network access to mirror the content to local files:

```
$ oc adm catalog mirror
  <index_image> \  
  file://local/index \  
  -a ${REG_CREDS} \  
  --insecure \  
  --index-filter-by-os='<platform>/<arch>'
```

   1. Specify the index image for the catalog that you want to mirror.
   2. Specify the content to mirror to local files in your current directory.
   3. Optional: If required, specify the location of your registry credentials file.
   4. Optional: If you do not want to configure trust for the target registry, add the --insecure flag.
   5. Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as `<platform>/<arch>[/<variant>]`. This does not apply to images referenced by the index. Valid values are `linux/amd64`, `linux/ppc64le`, `linux/s390x`, `linux/arm64`, and `*`.

**Example output**

... 
 info: Mirroring completed in 5.93s (5.915MB/s) 
 wrote mirroring manifests to manifests-my-index-1614985528

To upload local images to a registry, run:

```
oc adm catalog mirror file://local/index/myrepo/my-index:v1 REGISTRY/REPOSITORY
```

   1. Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.
   2. Record the expanded file:// path that is based on your provided index image. This path is referenced in a subsequent step.

This command creates a v2/ directory in your current directory.

2. Copy the v2/ directory to removable media.

3. Physically remove the media and attach it to a host in the disconnected environment that has access to the mirror registry.
4. If your mirror registry requires authentication, run the following command on your host in the disconnected environment to log in to the registry:

   $ podman login <mirror_registry>

5. Run the following command from the parent directory containing the v2/ directory to upload the images from local files to the mirror registry:

   $ oc adm catalog mirror \
   file://local/index/<repository>/<index_image>:<tag> \  
   <mirror_registry>::port[/<repository>] \  
   --insecure \  
   --index-filter-by-os='<platform>/<arch>'

1. Specify the file:// path from the previous command output.

2. Specify the fully qualified domain name (FQDN) for the target registry to mirror the Operator contents to. The mirror registry <repository> can be any existing repository, or namespace, on the registry, for example olm-mirror as outlined in the prerequisites. If there is an existing repository found during mirroring, the repository name is added to the resulting image name. If you do not want the image name to include the repository name, omit the <repository> value from this line, for example <mirror_registry>::port.

3. Optional: If required, specify the location of your registry credentials file.

4. Optional: If you do not want to configure trust for the target registry, add the --insecure flag.

5. Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '<platform>/<arch>[/<variant>}'. This does not apply to images referenced by the index. Valid values are linux/amd64, linux/ppc64le, linux/s390x, linux/arm64, and *.

NOTE

Red Hat Quay does not support nested repositories. As a result, running the oc adm catalog mirror command will fail with a 401 unauthorized error. As a workaround, you can use the --max-components=2 option when running the oc adm catalog mirror command to disable the creation of nested repositories. For more information on this workaround, see the Unauthorized error thrown while using catalog mirror command with Quay registry Knowledgebase Solution.

6. Run the oc adm catalog mirror command again. Use the newly mirrored index image as the source and the same mirror registry target used in the previous step:

   $ oc adm catalog mirror \
   <mirror_registry>::port/<index_image> \
   <mirror_registry>::port[/<repository>] \
   --manifests-only \  
   [-a $(REG_CREDS)] \  
   [--insecure]
The `--manifests-only` flag is required for this step so that the command does not copy all of the mirrored content again.

**IMPORTANT**

This step is required because the image mappings in the `imageContentSourcePolicy.yaml` file generated during the previous step must be updated from local paths to valid mirror locations. Failure to do so will cause errors when you create the `ImageContentSourcePolicy` object in a later step.

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the `ImageContentSourcePolicy` and `CatalogSource` objects. These objects are required to enable installation of Operators from OperatorHub.

**Additional resources**

- Architecture and operating system support for Operators

### 3.3.7.3. Generated manifests

After mirroring Operator catalog content to your mirror registry, a manifests directory is generated in your current directory.

If you mirrored content to a registry on the same network, the directory name takes the following pattern:

```
manifests-<index_image_name>-<random_number>
```

If you mirrored content to a registry on a disconnected host in the previous section, the directory name takes the following pattern:

```
manifests-index/<repository>/<index_image_name>-<random_number>
```

**NOTE**

The manifests directory name is referenced in subsequent procedures.

The manifests directory contains the following files, some of which might require further modification:

- The `catalogSource.yaml` file is a basic definition for a `CatalogSource` object that is pre-populated with your index image tag and other relevant metadata. This file can be used as is or modified to add the catalog source to your cluster.

**IMPORTANT**

If you mirrored the content to local files, you must modify your `catalogSource.yaml` file to remove any backslash (`/`) characters from the `metadata.name` field. Otherwise, when you attempt to create the object, it fails with an “invalid resource name” error.
The `imageContentSourcePolicy.yaml` file defines an `ImageContentSourcePolicy` object that can configure nodes to translate between the image references stored in Operator manifests and the mirrored registry.

**NOTE**

If your cluster uses an `ImageContentSourcePolicy` object to configure repository mirroring, you can use only global pull secrets for mirrored registries. You cannot add a pull secret to a project.

The `mapping.txt` file contains all of the source images and where to map them in the target registry. This file is compatible with the `oc image mirror` command and can be used to further customize the mirroring configuration.

**IMPORTANT**

If you used the `--manifests-only` flag during the mirroring process and want to further trim the subset of packages to mirror, see the steps in the Mirroring a package manifest format catalog image procedure of the OpenShift Container Platform 4.7 documentation about modifying your `mapping.txt` file and using the file with the `oc image mirror` command.

3.3.7.4. Postinstallation requirements

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the `ImageContentSourcePolicy` and `CatalogSource` objects. These objects are required to populate and enable installation of Operators from OperatorHub.

Additional resources

- Populating OperatorHub from mirrored Operator catalogs
- Updating or filtering a file-based catalog image

3.3.8. Next steps

- Install a cluster on infrastructure that you provision in your restricted network, such as on VMware vSphere, bare metal, or Amazon Web Services.

3.3.9. Additional resources

- See Gathering data about specific features for more information about using must-gather.

3.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUGIN

Running your cluster in a restricted network without direct internet connectivity is possible by installing the cluster from a mirrored set of OpenShift Container Platform container images in a private registry. This registry must be running at all times as long as the cluster is running. See the Prerequisites section for more information.
You can use the oc-mirror OpenShift CLI (oc) plugin to mirror images to a mirror registry in your fully or partially disconnected environments. You must run oc-mirror from a system with internet connectivity in order to download the required images from the official Red Hat registries.

The following steps outline the high-level workflow on how to use the oc-mirror plugin to mirror images to a mirror registry:

1. Create an image set configuration file.

2. Mirror the image set to the mirror registry by using one of the following methods:
   - Mirror an image set directly to the mirror registry.
   - Mirror an image set to disk, transfer the image set to the target environment, then upload the image set to the target mirror registry.

3. Configure your cluster to use the resources generated by the oc-mirror plugin.

4. Repeat these steps to update your mirror registry as necessary.

### 3.4.1. About the oc-mirror plugin

You can use the oc-mirror OpenShift CLI (oc) plugin to mirror all required OpenShift Container Platform content and other images to your mirror registry by using a single tool. It provides the following features:

- Provides a centralized method to mirror OpenShift Container Platform releases, Operators, helm charts, and other images.
- Maintains update paths for OpenShift Container Platform and Operators.
- Uses a declarative image set configuration file to include only the OpenShift Container Platform releases, Operators, and images that your cluster needs.
- Performs incremental mirroring, which reduces the size of future image sets.
- Prunes images from the target mirror registry that were excluded from the image set configuration since the previous execution.
- Optionally generates supporting artifacts for OpenShift Update Service (OSUS) usage.

When using the oc-mirror plugin, you specify which content to mirror in an image set configuration file. In this YAML file, you can fine-tune the configuration to only include the OpenShift Container Platform releases and Operators that your cluster needs. This reduces the amount of data that you need to download and transfer. The oc-mirror plugin can also mirror arbitrary helm charts and additional container images to assist users in seamlessly synchronizing their workloads onto mirror registries.

The first time you run the oc-mirror plugin, it populates your mirror registry with the required content to perform your disconnected cluster installation or update. In order for your disconnected cluster to continue receiving updates, you must keep your mirror registry updated. To update your mirror registry, you run the oc-mirror plugin using the same configuration as the first time you ran it. The oc-mirror plugin references the metadata from the storage backend and only downloads what has been released since the last time you ran the tool. This provides update paths for OpenShift Container Platform and Operators and performs dependency resolution as required.
When using the oc-mirror CLI plugin to populate a mirror registry, any further updates to the mirror registry must be made using the oc-mirror tool.

### 3.4.2. oc-mirror compatibility and support

The oc-mirror plugin supports mirroring OpenShift Container Platform payload images and Operator catalogs for OpenShift Container Platform versions 4.9 and later.

Use the latest available version of the oc-mirror plugin regardless of which versions of OpenShift Container Platform you need to mirror.

**IMPORTANT**

If you used the Technology Preview version of the oc-mirror plugin for OpenShift Container Platform 4.10, it is not possible to migrate your mirror registry to OpenShift Container Platform 4.11. You must download the new oc-mirror plugin, use a new storage back end, and use a new top-level namespace on the target mirror registry.

### 3.4.3. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry that supports Docker v2-2, such as Red Hat Quay. If you do not have access to a large-scale container registry, you can use the mirror registry for Red Hat OpenShift, which is a small-scale container registry included with OpenShift Container Platform subscriptions.

Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

**IMPORTANT**

The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the mirror registry for Red Hat OpenShift, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as connected mirroring. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as disconnected mirroring.

For mirrored registries, to view the source of pulled images, you must review the Trying to access log entry in the CRI-O logs. Other methods to view the image pull source, such as using the crictl images command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.
Red Hat does not test third party registries with OpenShift Container Platform.

Additional resources

- For information about viewing the CRI-O logs to view the image source, see Viewing the image pull source.

3.4.4. Prerequisites

- You must have a container image registry that supports Docker v2-2 in the location that will host the OpenShift Container Platform cluster, such as Red Hat Quay.

NOTE

If you use Red Hat Quay, you must use version 3.6 or later with the oc-mirror plugin. If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay for proof-of-concept purposes or by using the Red Hat Quay Operator. If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat Support.

If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a mirror registry for Red Hat OpenShift. The mirror registry for Red Hat OpenShift is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

3.4.5. Preparing your mirror hosts

Before you can use the oc-mirror plugin to mirror images, you must install the plugin and create a container image registry credentials file to allow the mirroring from Red Hat to your mirror.

3.4.5.1. Installing the oc-mirror OpenShift CLI plugin

To use the oc-mirror OpenShift CLI plugin to mirror registry images, you must install the plugin. If you are mirroring image sets in a fully disconnected environment, ensure that you install the oc-mirror plugin on the host with internet access and the host in the disconnected environment with access to the mirror registry.

Prerequisites

- You have installed the OpenShift CLI (oc).

Procedure

1. Download the oc-mirror CLI plugin.

   b. Under the OpenShift disconnected installation tools section, click Download for OpenShift Client (oc) mirror plugin and save the file.

2. Extract the archive:
3. If necessary, update the plugin file to be executable:

```bash
$ chmod +x oc-mirror
```

**NOTE**

Do not rename the `oc-mirror` file.

4. Install the `oc-mirror` CLI plugin by placing the file in your `PATH`, for example, `/usr/local/bin`:

```bash
$ sudo mv oc-mirror /usr/local/bin/
```

**Verification**

- Run `oc mirror help` to verify that the plugin was successfully installed:

```bash
$ oc mirror help
```

**Additional resources**

- Installing and using CLI plugins

### 3.4.5.2. Configuring credentials that allow images to be mirrored

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

**WARNING**

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

**WARNING**

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

**Prerequisites**

- You configured a mirror registry to use in your disconnected environment.
You identified an image repository location on your mirror registry to mirror images into.
You provisioned a mirror registry account that allows images to be uploaded to that image repository.

**Procedure**

Complete the following steps on the installation host:

1. Download your `registry.redhat.io` pull secret from the Red Hat OpenShift Cluster Manager.

2. Make a copy of your pull secret in JSON format:

   ```bash
   $ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json>
   ```

   Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

   The contents of the file resemble the following example:

   ```json
   {
     "auths": {
       "cloud.openshift.com": {
         "auth": "b3BlbnNo...",
         "email": "you@example.com"
       },
       "quay.io": {
         "auth": "b3BlbnNo...",
         "email": "you@example.com"
       },
       "registry.connect.redhat.com": {
         "auth": "NTE3Njg5Nj...",
         "email": "you@example.com"
       },
       "registry.redhat.io": {
         "auth": "NTE3Njg5Nj...",
         "email": "you@example.com"
       }
     }
   }
   ```

3. Save the file either as `~/.docker/config.json` or `$XDG_RUNTIME_DIR/containers/auth.json`.

4. Generate the base64-encoded user name and password or token for your mirror registry:

   ```bash
   $ echo -n '<user_name>:<password>' | base64 -w0
   ```

   For `<user_name>` and `<password>`, specify the user name and password that you configured for your registry.

5. Edit the JSON file and add a section that describes your registry to it:

   ```json
   "auths": {
   ```
"<mirror_registry>" : {  
  "auth": "<credentials>",  
  "email": "you@example.com"  
},

1. For `<mirror_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:8443`

2. For `<credentials>`, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{
  "auths": {
    "registry.example.com": {
      "auth": "BGVtbYk3ZHAqXs=",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

### 3.4.6. Creating the image set configuration

Before you can use the oc-mirror plugin to mirror image sets, you must create an image set configuration file. This image set configuration file defines which OpenShift Container Platform releases, Operators, and other images to mirror, along with other configuration settings for the oc-mirror plugin.

You must specify a storage backend in the image set configuration file. This storage backend can be a local directory or a registry that supports Docker v2-2. The oc-mirror plugin stores metadata in this storage backend during image set creation.
**IMPORTANT**

Do not delete or modify the metadata that is generated by the oc-mirror plugin. You must use the same storage backend every time you run the oc-mirror plugin for the same mirror registry.

**Prerequisites**

- You have created a container image registry credentials file. For instructions, see *Configuring credentials that allow images to be mirrored*.

**Procedure**

1. Use the `oc mirror init` command to create a template for the image set configuration and save it to a file called `imageset-config.yaml`:

   ```sh
   $ oc mirror init --registry example.com/mirror/oc-mirror-metadata > imageset-config.yaml
   ```

   Replace *example.com/mirror/oc-mirror-metadata* with the location of your registry for the storage backend.

2. Edit the file and adjust the settings as necessary:

   ```yaml
   kind: ImageSetConfiguration
   apiVersion: mirror.openshift.io/v1alpha2
   archiveSize: 4
   storageConfig:
     registry:
       imageURL: example.com/mirror/oc-mirror-metadata
       skipTLS: false
   mirror:
     platform:
       channels:
         - name: stable-4.11
           type: ocp
           graph: true
       operators:
         - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.11
       packages:
         - name: serverless-operator
       additionalImages:
         - name: registry.redhat.io/ubi8/ubi:latest
   helm: {}
   ```

   - **1** Add `archiveSize` to set the maximum size, in GiB, of each file within the image set.
   - **2** Set the back-end location to save the image set metadata to. This location can be a registry or local directory. It is required to specify `storageConfig` values.
   - **3** Set the registry URL for the storage backend.
4 Set the channel to retrieve the OpenShift Container Platform images from.

5 Add `graph: true` to build and push the graph-data image to the mirror registry. The graph-data image is required to create OpenShift Update Service (OSUS). The `graph: true` field also generates the `UpdateService` custom resource manifest. The `oc` command-line interface (CLI) can use the `UpdateService` custom resource manifest to create OSUS. For more information, see About the OpenShift Update Service.

6 Set the Operator catalog to retrieve the OpenShift Container Platform images from.

7 Specify only certain Operator packages to include in the image set. Remove this field to retrieve all packages in the catalog.

8 Specify only certain channels of the Operator packages to include in the image set. You must always include the default channel for the Operator package even if you do not use the bundles in that channel. You can find the default channel by running the following command: `oc mirror list operators --catalog=<catalog_name> --package=<package_name>`.

9 Specify any additional images to include in image set.

See Image set configuration parameters for the full list of parameters and Image set configuration examples for various mirroring use cases.

3. Save the updated file.
   This image set configuration file is required by the `oc mirror` command when mirroring content.

Additional resources

- Image set configuration parameters
- Image set configuration examples
- Using the OpenShift Update Service in a disconnected environment

3.4.7. Mirroring an image set to a mirror registry

You can use the oc-mirror CLI plugin to mirror images to a mirror registry in a partially disconnected environment or in a fully disconnected environment.

These procedures assume that you already have your mirror registry set up.

3.4.7.1. Mirroring an image set in a partially disconnected environment

In a partially disconnected environment, you can mirror an image set directly to the target mirror registry.

3.4.7.1.1. Mirroring from mirror to mirror

You can use the oc-mirror plugin to mirror an image set directly to a target mirror registry that is accessible during image set creation.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a Docker v2 registry. The oc-mirror plugin stores metadata in this storage backend during image set creation.
IMPORTANT

Do not delete or modify the metadata that is generated by the oc-mirror plugin. You must use the same storage backend every time you run the oc-mirror plugin for the same mirror registry.

Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (oc).
- You have installed the oc-mirror CLI plugin.
- You have created the image set configuration file.

Procedure

- Run the oc mirror command to mirror the images from the specified image set configuration to a specified registry:

  ```
  $ oc mirror --config=./imageset-config.yaml docker://registry.example:5000
  ```

  1. Pass in the image set configuration file that was created. This procedure assumes that it is named imageset-config.yaml.
  2. Specify the registry to mirror the image set file to. The registry must start with docker://. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

Verification

1. Navigate into the oc-mirror-workspace/ directory that was generated.
2. Navigate into the results directory, for example, results-1639608409/.
3. Verify that YAML files are present for the ImageContentSourcePolicy and CatalogSource resources.

Next steps

- Configure your cluster to use the resources generated by oc-mirror.

Troubleshooting

- Unable to retrieve source image.

3.4.7.2. Mirroring an image set in a fully disconnected environment

To mirror an image set in a fully disconnected environment, you must first mirror the image set to disk, then mirror the image set file on disk to a mirror.
3.4.7.2.1. Mirroring from mirror to disk

You can use the oc-mirror plugin to generate an image set and save the contents to disk. The generated image set can then be transferred to the disconnected environment and mirrored to the target registry.

**IMPORTANT**

Depending on the configuration specified in the image set configuration file, using oc-mirror to mirror images might download several hundreds of gigabytes of data to disk.

The initial image set download when you populate the mirror registry is often the largest. Because you only download the images that changed since the last time you ran the command, when you run the oc-mirror plugin again, the generated image set is often smaller.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a docker v2 registry. The oc-mirror plugin stores metadata in this storage backend during image set creation.

**IMPORTANT**

Do not delete or modify the metadata that is generated by the oc-mirror plugin. You must use the same storage backend every time you run the oc-mirror plugin for the same mirror registry.

**Prerequisites**

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (oc).
- You have installed the oc-mirror CLI plugin.
- You have created the image set configuration file.

**Procedure**

- Run the `oc mirror` command to mirror the images from the specified image set configuration to disk:

  ```
  $ oc mirror --config=./imageset-config.yaml file://<path_to_output_directory>
  ```

  1. Pass in the image set configuration file that was created. This procedure assumes that it is named `imageset-config.yaml`.

  2. Specify the target directory where you want to output the image set file. The target directory path must start with `file://`.

**Verification**

1. Navigate to your output directory:
Verify that an image set .tar file was created:

```
$ ls

Example output

mirror_seq1_000000.tar
```

Next steps

- Transfer the image set .tar file to the disconnected environment.

Troubleshooting

- Unable to retrieve source image.

3.4.7.2.2. Mirroring from disk to mirror

You can use the oc-mirror plugin to mirror the contents of a generated image set to the target mirror registry.

Prerequisites

- You have installed the OpenShift CLI (oc) in the disconnected environment.
- You have installed the oc-mirror CLI plugin in the disconnected environment.
- You have generated the image set file by using the oc mirror command.
- You have transferred the image set file to the disconnected environment.

Procedure

- Run the oc mirror command to process the image set file on disk and mirror the contents to a target mirror registry:

```
$ oc mirror --from=./mirror_seq1_000000.tar  
   docker://registry.example:5000
```

1. Pass in the image set .tar file to mirror, named mirror_seq1_000000.tar in this example. If an archiveSize value was specified in the image set configuration file, the image set might be broken up into multiple .tar files. In this situation, you can pass in a directory that contains the image set .tar files.

2. Specify the registry to mirror the image set file to. The registry must start with docker://. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

This command updates the mirror registry with the image set and generates the ImageContentSourcePolicy and CatalogSource resources.
Verification

1. Navigate into the `oc-mirror-workspace/` directory that was generated.

2. Navigate into the results directory, for example, `results-1639608409/`.

3. Verify that YAML files are present for the `ImageContentSourcePolicy` and `CatalogSource` resources.

Next steps

- Configure your cluster to use the resources generated by oc-mirror.

Troubleshooting

- Unable to retrieve source image.

3.4.8. Configuring your cluster to use the resources generated by oc-mirror

After you have mirrored your image set to the mirror registry, you must apply the generated `ImageContentSourcePolicy`, `CatalogSource`, and release image signature resources into the cluster.

The `ImageContentSourcePolicy` resource associates the mirror registry with the source registry and redirects image pull requests from the online registries to the mirror registry. The `CatalogSource` resource is used by Operator Lifecycle Manager (OLM) to retrieve information about the available Operators in the mirror registry. The release image signatures are used to verify the mirrored release images.

Prerequisites

- You have mirrored the image set to the registry mirror in the disconnected environment.
- You have access to the cluster as a user with the `cluster-admin` role.

Procedure

1. Log in to the OpenShift CLI as a user with the `cluster-admin` role.

2. Apply the YAML files from the results directory to the cluster by running the following command:

   ```bash
   $ oc apply -f ./oc-mirror-workspace/results-1639608409/
   ```

3. If you mirrored release images, apply the release image signatures to the cluster by running the following command:

   ```bash
   $ oc apply -f ./oc-mirror-workspace/results-1639608409/release-signatures/
   ```

   **NOTE**

   If you are mirroring Operators instead of clusters, you do not need to run `$ oc apply -f ./oc-mirror-workspace/results-1639608409/release-signatures/`. Running that command will return an error, as there are no release image signatures to apply.
Verification

1. Verify that the **ImageContentSourcePolicy** resources were successfully installed by running the following command:

   ```
   $ oc get imagecontentsourcepolicy --all-namespaces
   ```

2. Verify that the **CatalogSource** resources were successfully installed by running the following command:

   ```
   $ oc get catalogsource --all-namespaces
   ```

3.4.9. Keeping your mirror registry content updated

After your target mirror registry is populated with the initial image set, be sure to update it regularly so that it has the latest content. You can optionally set up a cron job, if possible, so that the mirror registry is updated on a regular basis.

Ensure that you update your image set configuration to add or remove OpenShift Container Platform and Operator releases as necessary. Any images that are removed are pruned from the mirror registry.

3.4.9.1. About updating your mirror registry content

When you run the oc-mirror plugin again, it generates an image set that only contains new and updated images since the previous execution. Because it only pulls in the differences since the previous image set was created, the generated image set is often smaller and faster to process than the initial image set.

**IMPORTANT**

Generated image sets are sequential and must be pushed to the target mirror registry in order. You can derive the sequence number from the file name of the generated image set archive file.

Adding new and updated images

Depending on the settings in your image set configuration, future executions of oc-mirror can mirror additional new and updated images. Review the settings in your image set configuration to ensure that you are retrieving new versions as necessary. For example, you can set the minimum and maximum versions of Operators to mirror if you want to restrict to specific versions. Alternatively, you can set the minimum version as a starting point to mirror, but keep the version range open so you keep receiving new Operator versions on future executions of oc-mirror. Omitting any minimum or maximum version gives you the full version history of an Operator in a channel. Omitting explicitly named channels gives you all releases in all channels of the specified Operator. Omitting any named Operator gives you the entire catalog of all Operators and all their versions ever released.

All these constraints and conditions are evaluated against the publicly released content by Red Hat on every invocation of oc-mirror. This way, it automatically picks up new releases and entirely new Operators. Constraints can be specified by only listing a desired set of Operators, which will not automatically add other newly released Operators into the mirror set. You can also specify a particular release channel, which limits mirroring to just this channel and not any new channels that have been added. This is important for Operator products, such as Red Hat Quay, that use different release channels for their minor releases. Lastly, you can specify a maximum version of a particular Operator, which causes the tool to only mirror the specified version range so that you do not automatically get any
newer releases past the maximum version mirrored. In all these cases, you must update the image set configuration file to broaden the scope of the mirroring of Operators to get other Operators, new channels, and newer versions of Operators to be available in your target registry.

It is recommended to align constraints like channel specification or version ranges with the release strategy that a particular Operator has chosen. For example, when the Operator uses a **stable** channel, you should restrict mirroring to that channel and potentially a minimum version to find the right balance between download volume and getting stable updates regularly. If the Operator chooses a release version channel scheme, for example **stable-3.7**, you should mirror all releases in that channel. This allows you to keep receiving patch versions of the Operator, for example **3.7.1**. You can also regularly adjust the image set configuration to add channels for new product releases, for example **stable-3.8**.

**Pruning images**
Images are pruned automatically from the target mirror registry if they are no longer included in the latest image set that was generated and mirrored. This allows you to easily manage and clean up unneeded content and reclaim storage resources.

If there are OpenShift Container Platform releases or Operator versions that you no longer need, you can modify your image set configuration to exclude them, and they will be pruned from the mirror registry upon mirroring. This can be done by adjusting a minimum or maximum version range setting per Operator in the image set configuration file or by deleting the Operator from the list of Operators to mirror from the catalog. You can also remove entire Operator catalogs or entire OpenShift Container Platform releases from the configuration file.

**IMPORTANT**
If there are no new or updated images to mirror, the excluded images are not pruned from the target mirror registry. Additionally, if an Operator publisher removes an Operator version from a channel, the removed versions are pruned from the target mirror registry.

### 3.4.9.2. Updating your mirror registry content

After you publish the initial image set to the mirror registry, you can use the oc-mirror plugin to keep your disconnected clusters updated.

Depending on your image set configuration, oc-mirror automatically detects newer releases of OpenShift Container Platform and your selected Operators that have been released after you completed the initial mirror. It is recommended to run oc-mirror at regular intervals, for example in a nightly cron job, to receive product and security updates on a timely basis.

**Prerequisites**
- You have used the oc-mirror plugin to mirror the initial image set to your mirror registry.
- You have access to the storage backend that was used for the initial execution of the oc-mirror plugin.

**NOTE**
You must use the same storage backend as the initial execution of oc-mirror for the same mirror registry. Do not delete or modify the metadata image that is generated by the oc-mirror plugin.

**Procedure**
1. If necessary, update your image set configuration file to pick up new OpenShift Container Platform and Operator versions. See Image set configuration examples for example mirroring use cases.

2. Follow the same steps that you used to mirror your initial image set to the mirror registry. For instructions, see Mirroring an image set in a partially disconnected environment or Mirroring an image set in a fully disconnected environment.

   **IMPORTANT**
   - You must provide the same storage backend so that only a differential image set is created and mirrored.
   - If you specified a top-level namespace for the mirror registry during the initial image set creation, then you must use this same namespace every time you run the oc-mirror plugin for the same mirror registry.

3. Configure your cluster to use the resources generated by oc-mirror.

Additional resources

- Image set configuration examples
- Mirroring an image set in a partially disconnected environment
- Mirroring an image set in a fully disconnected environment
- Configuring your cluster to use the resources generated by oc-mirror

**3.4.10. Performing a dry run**

You can use oc-mirror to perform a dry run, without actually mirroring any images. This allows you to review the list of images that would be mirrored, as well as any images that would be pruned from the mirror registry. It also allows you to catch any errors with your image set configuration early or use the generated list of images with other tools to carry out the mirroring operation.

**Prerequisites**

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (oc).
- You have installed the oc-mirror CLI plugin.
- You have created the image set configuration file.

**Procedure**

1. Run the oc mirror command with the --dry-run flag to perform a dry run:

   ```bash
   $ oc mirror --config=./imageset-config.yaml  
   docker://registry.example:5000  
   --dry-run
   ```
Pass in the image set configuration file that was created. This procedure assumes that it is named `imageset-config.yaml`.

Specify the mirror registry. Nothing is mirrored to this registry as long as you use the `--dry-run` flag.

Use the `--dry-run` flag to generate the dry run artifacts and not an actual image set file.

### Example output

```
Checking push permissions for registry.example:5000
Creating directory: oc-mirror-workspace/src/publish
Creating directory: oc-mirror-workspace/src/v2
Creating directory: oc-mirror-workspace/src/charts
Creating directory: oc-mirror-workspace/src/release-signatures
No metadata detected, creating new workspace
wrote mirroring manifests to oc-mirror-workspace/operators.1658342351/manifests-redhat-operator-index
...
info: Planning completed in 31.48s
info: Dry run complete
Writing image mapping to oc-mirror-workspace/mapping.txt
```

2. Navigate into the workspace directory that was generated:

```
$ cd oc-mirror-workspace/
```

3. Review the `mapping.txt` file that was generated. This file contains a list of all images that would be mirrored.

4. Review the `pruning-plan.json` file that was generated. This file contains a list of all images that would be pruned from the mirror registry when the image set is published.

#### NOTE

The `pruning-plan.json` file is only generated if your `oc-mirror` command points to your mirror registry and there are images to be pruned.

### 3.4.11. Image set configuration parameters

The `oc-mirror` plugin requires an image set configuration file that defines what images to mirror. The following table lists the available parameters for the `ImageSetConfiguration` resource.

#### Table 3.1. ImageSetConfiguration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>

<tr>
<td></td>
<td></td>
<td>ocp or okd. The default is ocp.</td>
</tr>
<tr>
<td>mirror.platform.graph</td>
<td>Indicates whether the OSUS graph is added to the image set and subsequently published to the mirror.</td>
<td>Boolean. The default value is false.</td>
</tr>
<tr>
<td>storageConfig</td>
<td>The back-end configuration of the image set.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### 3.4.12. Image set configuration examples

The following `ImageSetConfiguration` file examples show the configuration for various mirroring use cases.

**Use case: Including arbitrary images and helm charts**
The following `ImageSetConfiguration` file uses a registry storage backend and includes helm charts and an additional Red Hat Universal Base Image (UBI).

**Example ImageSetConfiguration file**

```yaml
apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
archiveSize: 4
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false
mirror:
  platform:
    architectures:
    - "s390x"
  channels:
    - name: stable-4.11
operators:
  - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.11
helm:
  repositories:
    - name: redhat-helm-charts
      url: https://raw.githubusercontent.com/redhat-developer/redhat-helm-charts/master
```
Use case: Including Operator versions from a minimum to the latest
The following `ImageSetConfiguration` file uses a local storage backend and includes only the Red Hat Advanced Cluster Security for Kubernetes Operator, versions starting at 3.68.0 and later in the `latest` channel.

Example `ImageSetConfiguration` file

```yaml
apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
storageConfig:
  local:
    path: /home/user/metadata
mirror:
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.11
  packages:
    - name: rhacs-operator
      channels:
        - name: latest
          minVersion: 3.68.0
```

Use case: Including the shortest OpenShift Container Platform upgrade path
The following `ImageSetConfiguration` file uses a local storage backend and includes all OpenShift Container Platform versions along the shortest upgrade path from the minimum version of 4.9.37 to the maximum version of 4.10.22.

Example `ImageSetConfiguration` file

```yaml
apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
storageConfig:
  local:
    path: /home/user/metadata
mirror:
  platform:
    channels:
      - name: stable-4.10
        minVersion: 4.9.37
        maxVersion: 4.10.22
        shortestPath: true
```

Use case: Including all versions of OpenShift Container Platform from a minimum to the latest
The following `ImageSetConfiguration` file uses a registry storage backend and includes all OpenShift Container Platform versions starting at a minimum version of 4.10.10 to the latest version in the channel.

On every invocation of oc-mirror with this image set configuration, the latest release of the `stable-4.10` channel is evaluated, so running oc-mirror at regular intervals ensures that you automatically receive the latest releases of OpenShift Container Platform images.
Example ImageSetConfiguration file

```yaml
apiVersion: mirror.openshift.io/v1alpha2
class: ImageSetConfiguration
storageConfig:
  registry:
    imageUrl: example.com/mirror/oc-mirror-metadata
  skipTLS: false
mirror:
  platform:
    channels:
      - name: stable-4.10
        minVersion: 4.10.10
```

Use case: Including Operator versions from a minimum to a maximum

The following ImageSetConfiguration file uses a local storage backend and includes only an example Operator, versions starting at 1.0.0 through 2.0.0 in the stable channel.

This allows you to only mirror a specific version range of a particular Operator. As time progresses, you can use these settings to adjust the version to newer releases, for example when you no longer have version 1.0.0 running anywhere anymore. In this scenario, you can increase the minVersion to something newer, for example 1.5.0. When oc-mirror runs again with the updated version range, it automatically detects that any releases older than 1.5.0 are no longer required and deletes those from the registry to conserve storage space.

Example ImageSetConfiguration file

```yaml
apiVersion: mirror.openshift.io/v1alpha2
class: ImageSetConfiguration
storageConfig:
  local:
    path: /home/user/metadata
mirror:
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.11
      packages:
        - name: example-operator
          channels:
            - name: stable
              minVersion: '1.0.0'
              maxVersion: '2.0.0'
```

3.4.13. Command reference for oc-mirror

The following tables describe the oc mirror subcommands and flags:

Table 3.2. oc mirror subcommands

<table>
<thead>
<tr>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>completion</td>
<td>Generate the autocompletion script for the specified shell.</td>
</tr>
<tr>
<td>describe</td>
<td>Output the contents of an image set.</td>
</tr>
</tbody>
</table>
### Subcommand Description

<table>
<thead>
<tr>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>help</td>
<td>Show help about any subcommand.</td>
</tr>
<tr>
<td>init</td>
<td>Output an initial image set configuration template.</td>
</tr>
<tr>
<td>list</td>
<td>List available platform and Operator content and their version.</td>
</tr>
<tr>
<td>version</td>
<td>Output the oc-mirror version.</td>
</tr>
</tbody>
</table>

### Table 3.3. oc mirror flags

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-c, --config &lt;string&gt;</td>
<td>Specify the path to an image set configuration file.</td>
</tr>
<tr>
<td>--continue-on-error</td>
<td>If any non image-pull related error occurs, continue and attempt to mirror as much as possible.</td>
</tr>
<tr>
<td>--dest-skip-tls</td>
<td>Disable TLS validation for the target registry.</td>
</tr>
<tr>
<td>--dest-use-http</td>
<td>Use plain HTTP for the target registry.</td>
</tr>
<tr>
<td>--dry-run</td>
<td>Print actions without mirroring images. Generates <code>mapping.txt</code> and <code>pruning-plan.json</code> files.</td>
</tr>
<tr>
<td>--from &lt;string&gt;</td>
<td>Specify the path to an image set archive that was generated by an execution of oc-mirror to load into a target registry.</td>
</tr>
<tr>
<td>-h, --help</td>
<td>Show the help.</td>
</tr>
<tr>
<td>--ignore-history</td>
<td>Ignore past mirrors when downloading images and packing layers. Disables incremental mirroring and might download more data.</td>
</tr>
<tr>
<td>--manifests-only</td>
<td>Generate manifests for <code>ImageContentSourcePolicy</code> objects to configure a cluster to use the mirror registry, but do not actually mirror any images. To use this flag, you must pass in an image set archive with the <code>--from</code> flag.</td>
</tr>
<tr>
<td>--max-per-registry &lt;int&gt;</td>
<td>Specify the number of concurrent requests allowed per registry. The default is 6.</td>
</tr>
<tr>
<td>--skip-cleanup</td>
<td>Skip removal of artifact directories.</td>
</tr>
<tr>
<td>--skip-image-pin</td>
<td>Do not replace image tags with digest pins in Operator catalogs.</td>
</tr>
</tbody>
</table>
Flag | Description
--- | ---
`--skip-metadata-check` | Skip metadata when publishing an image set. This is only recommended when the image set was created with `--ignore-history`.
`--skip-missing` | If an image is not found, skip it instead of reporting an error and aborting execution. Does not apply to custom images explicitly specified in the image set configuration.
`--skip-verification` | Skip digest verification.
`--source-skip-tls` | Disable TLS validation for the source registry.
`--source-use-http` | Use plain HTTP for the source registry.
`-v, --verbose <int>` | Specify the number for the log level verbosity. Valid values are 0 - 9. The default is 0.

### 3.4.14. Additional resources

- [About cluster updates in a disconnected environment](#)
CHAPTER 4. INSTALLING ON ALIBABA

4.1. PREPARING TO INSTALL ON ALIBABA CLOUD

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see Technology Preview Features Support Scope.

4.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

4.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud

Before installing OpenShift Container Platform on Alibaba Cloud, you must configure and register your domain, create a Resource Access Management (RAM) user for the installation, and review the supported Alibaba Cloud data center regions and zones for the installation.

4.1.3. Registering and Configuring Alibaba Cloud Domain

To install OpenShift Container Platform, the Alibaba Cloud account you use must have a dedicated public hosted zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Alibaba Cloud or another source.

   NOTE
   
   If you purchase a new domain through Alibaba Cloud, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through Alibaba Cloud, see Alibaba Cloud domains.

2. If you are using an existing domain and registrar, migrate its DNS to Alibaba Cloud. See Domain name transfer in the Alibaba Cloud documentation.

3. Configure DNS for your domain. This includes:
   - Registering a generic domain name.
• Completing real-name verification for your domain name.
• Applying for an Internet Content Provider (ICP) filing.
• Enabling domain name resolution.
  Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. If you are using a subdomain, follow the procedures of your company to add its delegation records to the parent domain.

4.1.4. Supported Alibaba regions
You can deploy an OpenShift Container Platform cluster to the regions listed in the Alibaba Regions and zones documentation.

4.1.5. Next steps
• Create the required Alibaba Cloud resources.

4.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES
Before you install OpenShift Container Platform, you must use the Alibaba Cloud console to create a Resource Access Management (RAM) user that has sufficient permissions to install OpenShift Container Platform into your Alibaba Cloud. This user must also have permissions to create new RAM users. You can also configure and use the ccoctl tool to create new credentials for the OpenShift Container Platform components with the permissions that they require.

IMPORTANT
Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see Technology Preview Features Support Scope.

4.2.1. Creating the required RAM user
You must have a Alibaba Cloud Resource Access Management (RAM) user for the installation that has sufficient privileges. You can use the Alibaba Cloud Resource Access Management console to create a new user or modify an existing user. Later, you create credentials in OpenShift Container Platform based on this user’s permissions.

When you configure the RAM user, be sure to consider the following requirements:

• The user must have an Alibaba Cloud AccessKey ID and AccessKey secret pair.
  • For a new user, you can select Open API Access for the Access Mode when creating the user. This mode generates the required AccessKey pair.
For an existing user, you can add an AccessKey pair or you can obtain the AccessKey pair for that user.

**NOTE**

When created, the AccessKey secret is displayed only once. You must immediately save the AccessKey pair because the AccessKey pair is required for API calls.

- Add the AccessKey ID and secret to the `~/.alibabacloud/credentials` file on your local computer. Alibaba Cloud automatically creates this file when you log in to the console. The Cloud Credential Operator (CCO) utility, ccoutil, uses these credentials when processing **Credential Request** objects.

For example:

```yaml
[default]                          # Default client
type = access_key                  # Certification type: access_key
access_key_id = LTAI5t8cefXKmt    # Key
access_key_secret = wYx56mszAN4Uunfh         # Secret
```

1. Add your AccessKeyId and AccessKeySecret here.

- The RAM user must have the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the OpenShift Container Platform cluster. This policy grants permissions to manage all Alibaba Cloud resources.

When you attach the **AdministratorAccess** policy to a RAM user, you grant that user full access to all Alibaba Cloud services and resources. If you do not want to create a user with full access, create a custom policy with the following actions that you can add to your RAM user for installation. These actions are sufficient to install OpenShift Container Platform.

**TIP**

You can copy and paste the following JSON code into the Alibaba Cloud console to create a custom policy. For information on creating custom policies, see **Create a custom policy** in the Alibaba Cloud documentation.

### Example 4.1. Example custom policy JSON file

```json
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "tag:ListTagResources",

"Resource": "*",
"Effect": "Allow"}
For more information about creating a RAM user and granting permissions, see Create a RAM user and Grant permissions to a RAM user in the Alibaba Cloud documentation.

4.2.2. Configuring the Cloud Credential Operator utility

To assign RAM users and policies that provide long-lived RAM AccessKeys (AKs) for each in-cluster component, extract and prepare the Cloud Credential Operator (CCO) utility (ccoctl) binary.

**NOTE**

The ccoctl utility is a Linux binary that must run in a Linux environment.

**Prerequisites**

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (oc).

**Procedure**

1. Obtain the OpenShift Container Platform release image by running the following command:

   ```bash
   $ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
   ```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

   ```bash
   $ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator' $RELEASE_IMAGE -a ~/.pull-secret)
   ```

   **NOTE**

   Ensure that the architecture of the $RELEASE_IMAGE matches the architecture of the environment in which you will use the ccoctl tool.

3. Extract the ccoctl binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

   ```bash
   $ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
   ```

4. Change the permissions to make ccoctl executable by running the following command:
To verify that ccoctl is ready to use, display the help file by running the following command:

```bash
$ chmod 775 ccoctl
$ ccoctl --help
```

### Output of ccoctl --help

OpenShift credentials provisioning tool

Usage:
ccoctl [command]

Available Commands:
- alibabacloud: Manage credentials objects for Alibaba cloud
- aws: Manage credentials objects for AWS cloud
- gcp: Manage credentials objects for Google cloud
- help: Help about any command
- ibmcloud: Manage credentials objects for IBM Cloud
- nutanix: Manage credentials objects for Nutanix

Flags:
- -h, --help: help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

### Additional resources

- [Preparing to update a cluster with manually maintained credentials](#)

### 4.2.3. Next steps

- Install a cluster on Alibaba Cloud infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:
  - **Installing a cluster quickly on Alibaba Cloud** You can install a cluster quickly by using the default configuration options.
  - **Installing a customized cluster on Alibaba Cloud** The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

### 4.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD

In OpenShift Container Platform version 4.11, you can install a cluster on Alibaba Cloud that uses the default configuration options.
IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see Technology Preview Features Support Scope.

4.3.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You registered your domain.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- You have created the required Alibaba Cloud resources.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

4.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.3.3. Generating a key pair for cluster node SSH access
During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```
3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$\$(ssh-agent -s)"
   ```

   **Example output**

   Agent pid 31874

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   4. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

   **Example output**

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

   **Next steps**

   - When you install OpenShift Container Platform, provide the SSH public key to the installation program.

   **4.3.4. Obtaining the installation program**

   Before you install OpenShift Container Platform, download the installation file on a local computer.

   **Prerequisites**

   - You have a computer that runs Linux or macOS, with 500 MB of local disk space.

   **Procedure**

   1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   `$ tar -xvf openshift-install-linux.tar.gz`

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.3.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

      ```bash
      $ ./openshift-install create install-config --dir <installation_directory>
      ```

      For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.

- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**
   
   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select **alibabacloud** as the platform to target.

iii. Select the region to deploy the cluster to.

iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

v. Provide a descriptive name for your cluster.

vi. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the `install-config.yaml` file to set the `credentialsMode` parameter to **Manual**:

   **Example install-config.yaml configuration file with credentialsMode set to Manual**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
     ...
   ```

   Add this line to set the `credentialsMode` to **Manual**.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.
4.3.6. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

**Procedure**

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   
   where:
   
   `<installation_directory>`
   
   Specifies the directory in which the installation program creates files.

4.3.7. Creating credentials for OpenShift Container Platform components with the ccoctl tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

**NOTE**

By default, `ccoctl` creates objects in the directory in which the commands are run. To create the objects in a different directory, use the `--output-dir` flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

**Prerequisites**

You must have:

- Extracted and prepared the `ccoctl` binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyId (`access_key_id`) and AccessKeySecret (`access_key_secret`) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.

**Procedure**

1. Set the `$RELEASE_IMAGE` variable by running the following command:

   ```bash
   $ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
   
   2. Extract the list of `CredentialsRequest` objects from the OpenShift Container Platform release image by running the following command:
credrequests is the directory where the list of CredentialsRequest objects is stored. This command creates the directory if it does not exist.

NOTE
This command can take a few moments to run.

3. If your cluster uses cluster capabilities to disable one or more optional components, delete the CredentialsRequest custom resources for any disabled components.

Example credrequests directory contents for OpenShift Container Platform 4.12 on Alibaba Cloud

1. The Machine API Operator CR is required.
2. The Image Registry Operator CR is required.
3. The Ingress Operator CR is required.
4. The Storage Operator CR is an optional component and might be disabled in your cluster.

4. Use the ccoctl tool to process all CredentialsRequest objects in the credrequests directory:

   a. Run the following command to use the tool:

   ```bash
   $ ccoctl alibabacloud create-ram-users \
   --name <name> \
   --region=<alibaba_region> \
   --credentials-requests-dir=
   <path_to_directory_with_list_of_credentials_requests>/credrequests \
   --output-dir=<path_to_ccoctl_output_dir>
   ```

   where:

   - `<name>` is the name used to tag any cloud resources that are created for tracking.
   - `<alibaba_region>` is the Alibaba Cloud region in which cloud resources will be created.
   - `<path_to_directory_with_list_of_credentials_requests>/credrequests` is the directory containing the files for the component CredentialsRequest objects.
• `<path_to_ccoctl_output_dir>` is the directory where the generated component credentials secrets will be placed.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set, you must include the `--enable-tech-preview` parameter.

**Example output**

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...```

**NOTE**

A RAM user can have up to two AccessKeys at the same time. If you run `ccoctt alibabacloud create-ram-users` more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

b. Verify that the OpenShift Container Platform secrets are created:

```bash
$ ls <path_to_ccoctl_output_dir>/manifests
```

**Example output:**

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

5. Copy the generated credential files to the target manifests directory:

```bash
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml ./<path_to_installation>dir>/manifests/
```
<path_to_ccocctl_output_dir>
Specifies the directory created by the `ccoctl alibabacloud create-ram-users` command.

<path_to_installation_dir>
Specifies the directory in which the installation program creates files.

4.3.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```
  $ ./openshift-install create cluster --dir <installation_directory> \
  --log-level=info
  ```

  1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
  2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
- Credential information also outputs to `<installation_directory>/openshift_install.log`.
IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.3.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.
4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:
   
   ```
   $ tar xvf <file>
   ```

6. Place the `oc` binary in a directory that is on your **PATH**.
   To check your **PATH**, execute the following command:
   
   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  $ oc <command>
  ```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  C:\> oc <command>
  ```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 macOS Client** entry and save the file.
NOTE
For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your `PATH`, open a terminal and execute the following command:
   ```
   $ echo $PATH
   ```

Verification
- After you install the OpenShift CLI, it is available using the `oc` command:
  ```
  $ oc <command>
  ```

4.3.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites
- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure
1. Export the `kubeadmin` credentials:
   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```
   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:
   ```
   $ oc whoami
   ```
   Example output
   ```
   system:admin
   ```

4.3.11. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.
Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   
   **NOTE**
   
   Alternatively, you can obtain the **kubeadmin** password from the 
   `<installation_directory>/openshift_install.log` log file on the installation host.
   
2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   
   **NOTE**
   
   Alternatively, you can obtain the OpenShift Container Platform route from the 
   `<installation_directory>/openshift_install.log` log file on the installation host.
   
   **Example output**

   ```
   console   console-openshift-console.apps.<cluster_name>..<base_domain>       console
   https   reencrypt/Redirect   None
   
   3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

4.3.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager Hybrid Cloud Console**.

After you confirm that your **OpenShift Cluster Manager Hybrid Cloud Console** inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use **subscription watch** to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See **Accessing the web console** for more details about accessing and understanding the OpenShift Container Platform web console.
- See **About remote health monitoring** for more information about the Telemetry service.
4.3.13. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

4.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.11, you can install a customized cluster on infrastructure that the installation program provisions on Alibaba Cloud. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see Technology Preview Features Support Scope.

4.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You registered your domain.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

4.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.
You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>
   ```
1 Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

**NOTE**
If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```
   Agent pid 31874
   ```

   **NOTE**
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   ```bash
   $ ssh-add <path>/<file_name> ①
   ```

   ① Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

   **Example output**
Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```sh
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.4.4.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.
Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   
   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   ```

   When specifying the directory:

   - Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.
   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.
   
   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.

      ```
      NOTE
      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.
      ```

      ii. Select `alibabacloud` as the platform to target.

      iii. Select the region to deploy the cluster to.

      iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

      v. Provide a descriptive name for your cluster.

      vi. Paste the pull secret from the Red Hat OpenShift Cluster Manager .

   2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the `install-config.yaml` file to set the `credentialsMode` parameter to `Manual`:
Example install-config.yaml configuration file with credentialsMode set to Manual

```yaml
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual
compute:
  - architecture: amd64
    hyperthreading: Enabled
...
```

1. Add this line to set the credentialsMode to Manual.

3. Modify the install-config.yaml file. You can find more information about the available parameters in the "Installation configuration parameters" section.

4. Back up the install-config.yaml file so that you can use it to install multiple clusters.

**IMPORTANT**

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 4.4.4.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

**Procedure**

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   
   Specifies the directory in which the installation program creates files.

### 4.4.4.3. Creating credentials for OpenShift Container Platform components with the ccoctl tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

**NOTE**

By default, ```ccoctl``` creates objects in the directory in which the commands are run. To create the objects in a different directory, use the ```--output-dir``` flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

**Prerequisites**
You must have:

- Extracted and prepared the `ccoctl` binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (`access_key_id`) and AccessKeySecret (`access_key_secret`) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.

**Procedure**

1. Set the `$RELEASE_IMAGE` variable by running the following command:

   ```bash
   $ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
   ```

2. Extract the list of `CredentialsRequest` objects from the OpenShift Container Platform release image by running the following command:

   ```bash
   $ oc adm release extract \
   --credentials-requests \
   --cloud=alibabacloud \
   --to=<path_to_directory_with_list_of_credentials_requests>/credrequests
   ```

   `credrequests` is the directory where the list of `CredentialsRequest` objects is stored. This command creates the directory if it does not exist.

   **NOTE**
   
   This command can take a few moments to run.

3. If your cluster uses cluster capabilities to disable one or more optional components, delete the `CredentialsRequest` custom resources for any disabled components.

**Example credrequests directory contents for OpenShift Container Platform 4.12 on Alibaba Cloud**

- `0000_30_machine-api-operator_00_credentials-request.yaml`
- `0000_50_cluster-image-registry-operator_01-registry-credentials-request-alibaba.yaml`
- `0000_50_cluster-ingress-operator_00-ingress-credentials-request.yaml`
- `0000_50_cluster-storage-operator_03_credentials_request_alibaba.yaml`

1. The Machine API Operator CR is required.
2. The Image Registry Operator CR is required.
3. The Ingress Operator CR is required.
4. The Storage Operator CR is an optional component and might be disabled in your cluster.

4. Use the `ccoctl` tool to process all `CredentialsRequest` objects in the `credrequests` directory:
a. Run the following command to use the tool:

```bash
$ ccoctl alibabacloud create-ram-users \
  --name <name> \
  --region=<alibaba_region> \
  --credentials-requests-dir=\n    <path_to_directory_with_list_of_credentials_requests>/credrequests \
  --output-dir=<path_to_ccoctl_output_dir>
```

where:

- `<name>` is the name used to tag any cloud resources that are created for tracking.
- `<alibaba_region>` is the Alibaba Cloud region in which cloud resources will be created.
- `<path_to_directory_with_list_of_credentials_requests>/credrequests` is the directory containing the files for the component `CredentialsRequest` objects.
- `<path_to_ccoctl_output_dir>` is the directory where the generated component credentials secrets will be placed.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set, you must include the `--enable-tech-preview` parameter.

**Example output**

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...```

**NOTE**

A RAM user can have up to two AccessKeys at the same time. If you run `ccoctl alibabacloud create-ram-users` more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

b. Verify that the OpenShift Container Platform secrets are created:

```bash
$ ls <path_to_ccoctl_output_dir>/manifests
```
Example output:

openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

5. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml ./<path_to_installation_dir>/manifests/
```

where:

- `<path_to_ccoctl_output_dir>` Specifies the directory created by the `ccoctl alibabacloud create-ram-users` command.
- `<path_to_installation_dir>` Specifies the directory in which the installation program creates files.

### 4.4.4.4. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### 4.4.4.4.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>. <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>nutanix</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform</code> <code>&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 4.4.4.4.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

**Table 4.2. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all-Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
4.4.4.4.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.3. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>additionalTrustBundle</strong></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><strong>capabilities</strong></td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td><strong>capabilities.baseline CapabilitySet</strong></td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent.</td>
<td>String</td>
</tr>
</tbody>
</table>

**networking.machineNetwork.cidr**

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation. For example, 10.0.0.0/16.

**NOTE**

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<p>| compute.name                                  | Required if you use compute. The name of the machine pool.                                                           | worker           |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <code>hyperthreading</code>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud</td>
<td>alibabacloud, aw, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td></td>
<td>provider that hosts the control plane machines. This parameter value must</td>
<td></td>
</tr>
<tr>
<td></td>
<td>match the compute.platform parameter value.</td>
<td></td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
<tr>
<td></td>
<td>dynamically tries to determine the capabilities of the provided credentials,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>with a preference for mint mode on the platforms where multiple modes are</td>
<td></td>
</tr>
<tr>
<td></td>
<td>supported.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is **false** (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td><strong>String</strong></td>
</tr>
</tbody>
</table>

---

**CHAPTER 4. INSTALLING ON ALIBABA**

---

181
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as</td>
<td>Internal or External. The default value is External. Setting this field to Internal is not</td>
</tr>
<tr>
<td></td>
<td>the Kubernetes API, OpenShift routes.</td>
<td>supported on non-cloud platforms and IBM Cloud VPC.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key to authenticate access to your cluster machines.</td>
<td>For example, sshKey: ssh-ed25519 AAAA...</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If the value of the field is set to Internal, the cluster will become non-functional. For more information, refer to BZ#1953035.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

---

**4.4.4.4. Additional Alibaba Cloud configuration parameters**

Additional Alibaba Cloud configuration parameters are described in the following table. The alibabacloud parameters are the configuration used when installing on Alibaba Cloud. The defaultMachinePlatform parameters are the default configuration used when installing on Alibaba Cloud for machine pools that do not define their own platform configuration.

These parameters apply to both compute machines and control plane machines where specified.

**NOTE**

If defined, the parameters compute.platform.alibabacloud and controlPlane.platform.alibabacloud will overwrite platform.alibabacloud.defaultMachinePlatform settings for compute machines and control plane machines respectively.
### Table 4.4. Optional Alibaba Cloud parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.alibabacloud.imageID</code></td>
<td>The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td><code>compute.platform.alibabacloud.instanceType</code></td>
<td>InstanceType defines the ECS instance type. Example: <code>ecs.g6.large</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>compute.platform.alibabacloud.systemDiskCategory</code></td>
<td>Defines the category of the system disk. Examples: <code>cloud_efficiency</code>, <code>cloud_ssd</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>compute.platform.alibabacloud.systemDiskSize</code></td>
<td>Defines the size of the system disk in gibibytes (GiB).</td>
<td>Integer.</td>
</tr>
<tr>
<td><code>compute.platform.alibabacloud.zones</code></td>
<td>The list of availability zones that can be used. Examples: <code>cn-hangzhou-h</code>, <code>cn-hangzhou-j</code></td>
<td>String list.</td>
</tr>
<tr>
<td><code>controlPlane.platform.alibabacloud.imageID</code></td>
<td>The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td><code>controlPlane.platform.alibabacloud.instanceType</code></td>
<td>InstanceType defines the ECS instance type. Example: <code>ecs.g6.xlarge</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>controlPlane.platform.alibabacloud.systemDiskCategory</code></td>
<td>Defines the category of the system disk. Examples: <code>cloud_efficiency</code>, <code>cloud_ssd</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>controlPlane.platform.alibabacloud.systemDiskSize</code></td>
<td>Defines the size of the system disk in gibibytes (GiB).</td>
<td>Integer.</td>
</tr>
<tr>
<td><code>controlPlane.platform.alibabacloud.zones</code></td>
<td>The list of availability zones that can be used. Examples: <code>cn-hangzhou-h</code>, <code>cn-hangzhou-j</code></td>
<td>String list.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>platform.alibaba.cloud.region</td>
<td>Required. The Alibaba Cloud region where the cluster will be created.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.resourceGroupId</td>
<td>The ID of an already existing resource group where the cluster will be installed. If empty, the installer will create a new resource group for the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.tags</td>
<td>Additional keys and values to apply to all Alibaba Cloud resources created for the cluster.</td>
<td>Object.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.vpcID</td>
<td>The ID of an already existing VPC where the cluster should be installed. If empty, the installer will create a new VPC for the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.vswitchIDs</td>
<td>The ID list of already existing VSwitches where cluster resources will be created. The existing VSwitches can only be used when also using existing VPC. If empty, the installer will create new VSwitches for the cluster.</td>
<td>String list.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.defaultMachinePlatform.imageID</td>
<td>For both compute machines and control plane machines, the image ID that should be used to create ECS instance. If set, the image ID should belong to the same region as the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.defaultMachinePlatform.instanceType</td>
<td>For both compute machines and control plane machines, the ECS instance type used to create the ECS instance. Example: <strong>ecs.g6.xlarge</strong></td>
<td>String.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.systemDiskCategory</code></td>
<td>For both compute machines and control plane machines, the category of the system disk. Examples: <code>cloud_efficiency</code>, <code>cloud_essd</code>.</td>
<td>String, for example <code>&quot;&quot;, cloud_efficiency, cloud_essd</code>.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.systemDiskSize</code></td>
<td>For both compute machines and control plane machines, the size of the system disk in gibibytes (GiB). The minimum is 120.</td>
<td>Integer.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.zones</code></td>
<td>For both compute machines and control plane machines, the list of availability zones that can be used. Examples: <code>cn-hangzhou-h, cn-hangzhou-j</code></td>
<td>String list.</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.privateZoneID</code></td>
<td>The ID of an existing private zone into which to add DNS records for the cluster’s internal API. An existing private zone can only be used when also using existing VPC. The private zone must be associated with the VPC containing the subnets. Leave the private zone unset to have the installer create the private zone on your behalf.</td>
<td>String.</td>
</tr>
</tbody>
</table>

### 4.4.4.5. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your cluster’s platform or modify the values of the required parameters.

```yaml
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
  - architecture: amd64
    hyperthreading: Enabled
    name: worker
    platform: {}
  replicas: 3
controlPlane:
```
architecture: amd64
hyperthreading: Enabled
name: master
platform: {}
replicas: 3
metadata:
creationTimestamp: null
name: test-cluster
networking:
clusterNetwork:
- cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
alibabacloud:
  defaultMachinePlatform:
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
region: ap-southeast-1
resourceGroupID: rg-acfnw6j3hyai
vpcID: vpc-0xidjerdbmaqvjob2b
vswitchIDs: 
  - vsw-0ix8yogwc8wv5rhiwdq5
  - vsw-0xiy6z2tedv009b4pz2
publish: External
pullSecret: "{"auths": {"cloud.openshift.com": {"auth": ... }}"
sshKey: |
  ssh-rsa AAAA...

1. Required. The installation program prompts you for a cluster name.
2. The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
3. Optional. Specify parameters for machine pools that do not define their own platform configuration.
4. Required. The installation program prompts you for the region to deploy the cluster to.
5. Optional. Specify an existing resource group where the cluster should be installed.
6. Required. The installation program prompts you for the pull secret.
7. Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
8. Optional. These are example vswitchID values.

4.4.4.6. Configuring the cluster-wide proxy during installation
Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ①
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ②
     noProxy: example.com ③
   additionalTrustBundle: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA_CERT>
   -----END CERTIFICATE-----
   ① A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
   ② A proxy URL to use for creating HTTPS connections outside the cluster.
   ③ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.
   ④ If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 4.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```
  $ ./openshift-install create cluster --dir <installation_directory> \
  --log-level=info 2
  ```

  1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
- Credential information also outputs to `<installation_directory>/.openshift_install.log`.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
... 
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.
IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   $ tar xvf <file>

6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

Verification

- After you install the OpenShift CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   C:\> path
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH.

   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  $ oc <command>
  ```

4.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```
1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   
   $ oc whoami

   Example output

   system:admin

4.4.8. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   $ cat <installation_directory>/auth/kubeadmin-password

   NOTE

   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   NOTE

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

Example output

   console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
   https   reencrypt/Redirect   None
3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

4.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to `OpenShift Cluster Manager Hybrid Cloud Console`.

After you confirm that your `OpenShift Cluster Manager Hybrid Cloud Console` inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See `About remote health monitoring` for more information about the Telemetry service.
- See `Accessing the web console` for more details about accessing and understanding the OpenShift Container Platform web console
- See `Accessing the web console` for more details about accessing and understanding the OpenShift Container Platform web console.

4.4.10. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

4.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform 4.11, you can install a cluster on Alibaba Cloud with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only `kubeProxy` configuration parameters in a running cluster.

**IMPORTANT**

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see `Technology Preview Features Support Scope`.
4.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You registered your domain.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

4.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.
IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   NOTE

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$($ssh-agent -s)"
   ```

   Example output
NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name>

   Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.
Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```bash
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.5.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

**Phase 1**

You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**IMPORTANT**

The CIDR range `172.17.0.0/16` is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

**Phase 2**

After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.
4.5.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:

   - Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      ii. Enter a descriptive name for your cluster.

      iii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.
IMPORTANT

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.5.5.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   Specifies the directory in which the installation program creates files.

   **NOTE**

   By default, `ccoctl` creates objects in the directory in which the commands are run. To create the objects in a different directory, use the `--output-dir` flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the `ccoctl` binary.

Procedure

1. Extract the list of `CredentialsRequest` objects from the OpenShift Container Platform release image by running the following command:

   ```
   <1> `credrequests` is the directory where the list of `CredentialsRequest` objects is stored. This command creates the directory if it does not exist.
   ```

   **NOTE**

   This command can take a few moments to run.

4.5.5.3. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.
NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 4.5.5.3.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.5. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{metadata.name}}.{{baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation:
- alibabacloud
- aws
- baremetal
- azure
- gcp
- ibmcloud
- nutanix
- openstack
- ovirt
- vsphere
- or 

For additional information about platform parameters, consult the table for your specific platform that follows.

### pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 4.5.5.3.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

### Table 4.6. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>

<table>

### 4.5.5.3.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.7. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>capabilities.baseline CapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are <strong>None</strong>, <strong>v4.11</strong> and <strong>vCurrent</strong>. <strong>v4.11</strong> enables the <strong>baremetal</strong> Operator, the <strong>marketplace</strong> Operator, and the <strong>openshift-samples</strong> content. <strong>vCurrent</strong> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <strong>vCurrent</strong>.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities.addition alEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in <strong>baselineCapabilitySet</strong>. Valid values are <strong>baremetal</strong>, <strong>marketplace</strong> and <strong>openshift-samples</strong>. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables <strong>Linux control groups version 2</strong> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
</tbody>
</table>
The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.

**NOTE**
Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**
If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>
To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>

<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. The default value is External. Setting this field to Internal is not supported on non-cloud platforms and IBM Cloud VPC. <strong>IMPORTANT</strong> If the value of the field is set to Internal, the cluster will become non-functional. For more information, refer to BZ#1953035.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key to authenticate access to your cluster machines.</td>
<td>For example, <code>sshKey: ssh-ed25519 AAAA...</code></td>
</tr>
</tbody>
</table>

### 4.5.5.4. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your cluster’s platform or modify the values of the required parameters.

```yaml
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
```
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3

controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3

metadata:
  creationTimestamp: null
  name: test-cluster

networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    - hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16

platform:
  alibabacloud:
    defaultMachinePlatform: {}
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
  region: ap-southeast-1
  resourceGroupID: rg-acfnw6j3hyai
  vpcID: vpc-0xifdjerdiobmaqtvjob2b
  vswitchIDs:
    - vsw-0x8ygwc8lwv5rhiwdq5
    - vsw-0xiy6v32tedv009b4pz2
  publish: External
  pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }}'
  sshKey: |
  ssh-rsa AAAA...

1 Required. The installation program prompts you for a cluster name.
2 The cluster network plugin to install. The supported values are OVNKubernetes and OpenShiftSDN. The default value is OVNKubernetes.
3 Optional. Specify parameters for machine pools that do not define their own platform configuration.
4 Required. The installation program prompts you for the region to deploy the cluster to.
5 Optional. Specify an existing resource group where the cluster should be installed.
6 Required. The installation program prompts you for the pull secret.
7 Optional. The installation program prompts you for the SSH key value that you use to access the
6 Optional. These are example vsSwitchID values.

4.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
     noProxy: example.com 3
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY TRUSTED_CA_CERT>
     -----END CERTIFICATE-----

   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
   2 A proxy URL to use for creating HTTPS connections outside the cluster.
   3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.
If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 4.5.6. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named `cluster`. The CR specifies the fields for the `Network API` in the `operator.openshift.io` API group.

The CNO configuration inherits the following fields during cluster installation from the `Network API` in the `Network.config.openshift.io` API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.
- **serviceNetwork**
  - IP address pool for services.
- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

#### 4.5.6.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

<table>
<thead>
<tr>
<th>Table 4.8. Cluster Network Operator configuration object</th>
<th></th>
</tr>
</thead>
</table>
### Field | Type | Description
--- | --- | ---
metadata.name | string | The name of the CNO object. This name is always **cluster**.

**spec.clusterNetwork** array |  | A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:

```yaml
spec:
  clusterNetwork:
    - cidr: 10.128.0.0/19
      hostPrefix: 23
    - cidr: 10.128.32.0/19
      hostPrefix: 23
```

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.

**spec.serviceNetwork** array |  | A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:

```yaml
spec:
  serviceNetwork:
    - 172.30.0.0/14
```

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.

**spec.defaultNetwork** object |  | Configures the Container Network Interface (CNI) cluster network provider for the cluster network.

**spec.kubeProxy Config** object |  | The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

---

defaultNetwork object configuration

The values for the defaultNetwork object are defined in the following table:

| Field | Type | Description |
--- | --- | --- |

---

CHAPTER 4. INSTALLING ON ALIBABA
Either **OpenShiftSDN** or **OVNKubernetes**. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.

**NOTE**

OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>

This object is only valid for the OpenShift SDN cluster network provider.

This object is only valid for the OVN-Kubernetes cluster network provider.

**Configuration for the OpenShift SDN CNI cluster network provider**

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 4.10. openshiftSDNConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>. The values <strong>Multitenant</strong> and <strong>Subnet</strong> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>
**mtu** | integer | The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.

This value cannot be changed after cluster installation.

**vxlanPort** | integer | The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.

If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.

**Example OpenShift SDN configuration**

```yaml
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

**Configuration for the OVN-Kubernetes CNI cluster network provider**

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

### Table 4.11. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

---

CHAPTER 4. INSTALLING ON ALIBABA

215
The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</td>
</tr>
<tr>
<td>genevePort</td>
<td>integer</td>
<td>The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>ipsecConfig</td>
<td>object</td>
<td>Specify an empty object to enable IPsec encryption.</td>
</tr>
<tr>
<td>policyAuditConfig</td>
<td>object</td>
<td>Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.</td>
</tr>
<tr>
<td>gatewayConfig</td>
<td>object</td>
<td>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</td>
</tr>
</tbody>
</table>

**NOTE**

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.</td>
</tr>
</tbody>
</table>
destination

String

One of the following additional audit log targets:

- libc
  The libc `syslog()` function of the journald process on the host.
- udp:<host>:<port>
  A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.
- unix:<file>
  A Unix Domain Socket file specified by `<file>`.
- null
  Do not send the audit logs to any additional target.

syslogFacility

String

The syslog facility, such as `kern`, as defined by RFC5424. The default value is `local0`.

### Table 4.13. gatewayConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to <code>true</code> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <code>false</code>. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <code>true</code>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

### Example OVN-Kubernetes configuration with IPSec enabled

```yaml
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

**kubeProxyConfig object configuration**

The values for the **kubeProxyConfig** object are defined in the following table:

### Table 4.14. kubeProxyConfig object
### Field | Type | Description
--- | --- | ---
| **iptablesSyncPeriod** | **string** | The refresh period for iptables rules. The default value is 30s. Valid suffixes include `s`, `m`, and `h` and are described in the Go time package documentation. **NOTE**
|  |  | Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the **iptablesSyncPeriod** parameter is no longer necessary.
| **proxyArguments.iptables-min-sync-period** | **array** | The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include `s`, `m`, and `h` and are described in the Go time package. The default value is:
|  |  | ```
kubeProxyConfig:
  proxyArguments:
    iptables-min-sync-period:
      - 0s
```  

### 4.5.7. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the **install-config.yaml** file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>  
   ```

   **<installation_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.
2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

**Specify a different VXLAN port for the OpenShift SDN network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

**Enable IPsec for the OVN-Kubernetes network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

### 4.5.8. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**

- You defined `OVNKubernetes` for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.
Procedure

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   
   Specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   EOF
   ```

   where:

   `<installation_directory>`
   
   Specifies the directory name that contains the `manifests/` directory for your cluster.

3. Open the `cluster-network-03-config.yml` file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

   **Specify a hybrid networking configuration**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnKubernetesConfig:
         hybridOverlayConfig:
           hybridClusterNetwork:
             - cidr: 10.132.0.0/14
             hostPrefix: 23
           hybridOverlayVXLANPort: 9898
   ```

   1. Specify the CIDR configuration used for nodes on the additional overlay network. The `hybridClusterNetwork` CIDR cannot overlap with the `clusterNetwork` CIDR.

   2. Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default `4789` port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.
NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom `hybridOverlayVXLANPort` value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

4.5.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```
  $ ./openshift-install create cluster --dir <installation_directory> \
  --log-level=info
  ```

  1. For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.
  2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
Credential information also outputs to `<installation_directory>/openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```plaintext
...  
INFO Install complete!  
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'  
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com  
INFO Login to the console with user: "kubeadmin", and password: "password"  
INFO Time elapsed: 36m22s
```

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 4.5.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the Product Variant drop-down menu.
3. Select the appropriate version in the **Version** drop-down menu.

4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the `oc` binary in a directory that is on your **PATH**.

To check your **PATH**, execute the following command:

```
$ echo $PATH
```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your **PATH**.

To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

**NOTE**

For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```sh
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

  ```sh
  $ oc <command>
  ```

4.5.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

   ```sh
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```sh
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

4.5.12. Logging in to the cluster by using the web console
The kubeadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubeadmin user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the kubeadmin user from the kubeadmin-password file on the installation host:

```bash
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the kubeadmin password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

```bash
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

**Example output**

```bash
console console-openshift-console.apps.<cluster_name>.<base_domain> console https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

4.5.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources
• See About remote health monitoring for more information about the Telemetry service.

• See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

• See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

4.5.14. Next steps

• Validate an installation.

• Customize your cluster.

• If necessary, you can opt out of remote health reporting.

4.6. INSTALLING A CLUSTER ON ALIBABA CLOUD INTO AN EXISTING VPC

In OpenShift Container Platform version 4.11, you can install a cluster into an existing Alibaba Virtual Private Cloud (VPC) on Alibaba Cloud Services. The installation program provisions the required infrastructure, which can then be customized. To customize the VPC installation, modify the parameters in the 'install-config.yaml' file before you install the cluster.

NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see Technology Preview Features Support Scope.

4.6.1. Prerequisites

• You reviewed details about the OpenShift Container Platform installation and update processes.

• You read the documentation on selecting a cluster installation method and preparing it for users.

• You registered your domain.

• If you use a firewall, you configured it to allow the sites that your cluster requires access to.
• If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain Resource Access Management (RAM) credentials.

### 4.6.2. Using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Virtual Private Cloud (VPC) in the Alibaba Cloud Platform. By deploying OpenShift Container Platform into an existing Alibaba VPC, you can avoid limit constraints in new accounts and more easily adhere to your organization’s operational constraints. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option. You must configure networking using vSwitches.

#### 4.6.2.1. Requirements for using your VPC

The union of the VPC CIDR block and the machine network CIDR must be non-empty. The vSwitches must be within the machine network.

The installation program does not create the following components:

- VPC
- vSwitches
- Route table
- NAT gateway

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

#### 4.6.2.2. VPC validation

To ensure that the vSwitches you provide are suitable, the installation program confirms the following data:

- All the vSwitches that you specify must exist.
- You have provided one or more vSwitches for control plane machines and compute machines.
- The vSwitches’ CIDRs belong to the machine CIDR that you specified.

#### 4.6.2.3. Division of permissions

Some individuals can create different resources in your cloud than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components, such as VPCs or vSwitches.

#### 4.6.2.4. Isolation between clusters

If you deploy OpenShift Container Platform into an existing network, the isolation of cluster services is reduced in the following ways:
• You can install multiple OpenShift Container Platform clusters in the same VPC.
• ICMP ingress is allowed to the entire network.
• TCP 22 ingress (SSH) is allowed to the entire network.
• Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
• Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.6.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

• Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

• Access Quay.io to obtain the packages that are required to install your cluster.

• Obtain the packages that are required to perform cluster updates.

    IMPORTANT

    If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.6.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

    IMPORTANT

    Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```
   
   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```bash
   Agent pid 31874
   ```
NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

   ```sh
   $ ssh-add <path>/<file_name>  
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

   ```sh
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.6.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.6.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   1. For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:

   - Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.
ii. Select **alibabacloud** as the platform to target.

iii. Select the region to deploy the cluster to.

iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

v. Provide a descriptive name for your cluster.

vi. Paste the **pull secret from the Red Hat OpenShift Cluster Manager**.

2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**.

   **Example install-config.yaml configuration file with credentialsMode set to Manual**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
   ...
   ```

   **1** Add this line to set the **credentialsMode** to **Manual**.

3. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.6.5.2. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

   **NOTE**

   After installation, you cannot modify these parameters in the **install-config.yaml** file.

4.6.5.2.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

   **Table 4.15. Required parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform. &lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
    "auths":{
        "cloud.openshift.com":{
            "auth":"b3Blb=",
            "email":"you@example.com"
        },
        "quay.io":{
            "auth":"b3Blb=",
            "email":"you@example.com"
        }
    }
}
```

### 4.6.5.2.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td></td>
</tr>
</tbody>
</table>

Table 4.16. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
### Networking Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.networkType</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all-Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>Networking:</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>Networking:</td>
</tr>
</tbody>
</table>

An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.

An array of objects. For example:

```
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23

networking:
  serviceNetwork:
    - 172.30.0.0/16

networking:
  machineNetwork:
    - cidr: 10.0.0.0/16
```
**networking.machineNetwork.cidr**

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

An IP network block in CIDR notation. For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

4.6.5.2.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.17. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>capabilities</code></td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td><code>capabilities.baseline CapabilitySet</code></td>
<td>Selects an initial set of optional capabilities to enable. Valid values are <code>None</code>, <code>v4.11</code> and <code>vCurrent</code>. <code>v4.11</code> enables the <code>baremetal</code> Operator, the <code>marketplace</code> Operator, and the <code>openshift-samples</code> content. <code>vCurrent</code> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <code>vCurrent</code>.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>capabilities.additionalEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<p>| compute.name                             | Required if you use compute. The name of the machine pool.                   | worker                      |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hypertreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>

<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td><code>alibabacloud</code>, <code>aws</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>nutanix</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code></td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is <code>3</code>, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td><code>Mint</code>, <code>Passthrough</code>, <code>Manual</code> or an empty string (<code>&quot;&quot;</code>).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
### Parameter | Description | Values
---|---|---
**fips** | Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead. | **false** or **true**

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>

</tbody>
</table>

### 4.6.5.2.4. Additional Alibaba Cloud configuration parameters

Additional Alibaba Cloud configuration parameters are described in the following table. The **alibabacloud** parameters are the configuration used when installing on Alibaba Cloud. The **defaultMachinePlatform** parameters are the default configuration used when installing on Alibaba Cloud for machine pools that do not define their own platform configuration.

These parameters apply to both compute machines and control plane machines where specified.

**NOTE**

If defined, the parameters **compute.platform.alibabacloud** and **controlPlane.platform.alibabacloud** will overwrite **platform.alibabacloud.defaultMachinePlatform** settings for compute machines and control plane machines respectively.
### Table 4.18. Optional Alibaba Cloud parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platfor m.alibabacloud.imageID</code></td>
<td>The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td><code>compute.platfor m.alibabacloud.instanceType</code></td>
<td>InstanceType defines the ECS instance type. Example: <code>ecs.g6.large</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>compute.platfor m.alibabacloud.systemDiskCate gory</code></td>
<td>Defines the category of the system disk. Examples: <code>cloud_efficiency,cloud_essd</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>compute.platfor m.alibabacloud.systemDisksize</code></td>
<td>Defines the size of the system disk in gibibytes (GiB).</td>
<td>Integer.</td>
</tr>
<tr>
<td><code>compute.platfor m.alibabacloud.zones</code></td>
<td>The list of availability zones that can be used. Examples: <code>cn-hangzhou-h, cn-hangzhou-j</code></td>
<td>String list.</td>
</tr>
<tr>
<td><code>controlPlane.pla tform.alibabacloud.imageID</code></td>
<td>The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.</td>
<td>String.</td>
</tr>
<tr>
<td><code>controlPlane.pla tform.alibabacloud.instanceTyp e</code></td>
<td>InstanceType defines the ECS instance type. Example: <code>ecs.g6.xlarge</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>controlPlane.pla tform.alibabacloud.systemDiskC ategory</code></td>
<td>Defines the category of the system disk. Examples: <code>cloud_efficiency,cloud_essd</code></td>
<td>String.</td>
</tr>
<tr>
<td><code>controlPlane.pla tform.alibabacloud.systemDisks ize</code></td>
<td>Defines the size of the system disk in gibibytes (GiB).</td>
<td>Integer.</td>
</tr>
<tr>
<td><code>controlPlane.pla tform.alibabacloud.zones</code></td>
<td>The list of availability zones that can be used. Examples: <code>cn-hangzhou-h, cn-hangzhou-j</code></td>
<td>String list.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.region</code></td>
<td>Required. The Alibaba Cloud region where the cluster will be created.</td>
<td>String</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.resource.GroupID</code></td>
<td>The ID of an already existing resource group where the cluster will be installed. If empty, the installer will create a new resource group for the cluster.</td>
<td>String</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.tags</code></td>
<td>Additional keys and values to apply to all Alibaba Cloud resources created for the cluster.</td>
<td>Object</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.vpcID</code></td>
<td>The ID of an already existing VPC where the cluster should be installed. If empty, the installer will create a new VPC for the cluster.</td>
<td>String</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.vswitchIDs</code></td>
<td>The ID list of already existing VSwitches where cluster resources will be created. The existing VSwitches can only be used when also using existing VPC. If empty, the installer will create new VSwitches for the cluster.</td>
<td>String list</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.imageID</code></td>
<td>For both compute machines and control plane machines, the image ID that should be used to create ECS instance. If set, the image ID should belong to the same region as the cluster.</td>
<td>String</td>
</tr>
<tr>
<td><code>platform.alibaba.cloud.defaultMachinePlatform.instanceType</code></td>
<td>For both compute machines and control plane machines, the ECS instance type used to create the ECS instance. Example: <code>ecs.g6.xlarge</code></td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>platform.alibaba.cloud.defaultMachinePlatform.systemDiskCategory</td>
<td>For both compute machines and control plane machines, the category of the system disk. Examples: <code>cloud_efficiency</code>, <code>cloud_essd</code>.</td>
<td>String, for example &quot;&quot;, <code>cloud_efficiency</code>, <code>cloud_essd</code>.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.defaultMachinePlatform.systemDiskSize</td>
<td>For both compute machines and control plane machines, the size of the system disk in gibibytes (GiB). The minimum is 120.</td>
<td>Integer.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.defaultMachinePlatform.zones</td>
<td>For both compute machines and control plane machines, the list of availability zones that can be used. Examples: <code>cn-hangzhou-h, cn-hangzhou-j</code></td>
<td>String list.</td>
</tr>
<tr>
<td>platform.alibaba.cloud.privateZoneID</td>
<td>The ID of an existing private zone into which to add DNS records for the cluster’s internal API. An existing private zone can only be used when also using existing VPC. The private zone must be associated with the VPC containing the subnets. Leave the private zone unset to have the installer create the private zone on your behalf.</td>
<td>String.</td>
</tr>
</tbody>
</table>

### 4.6.5.3. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (install-config.yaml) to specify more details about your cluster’s platform or modify the values of the required parameters.

```yaml
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
  - architecture: amd64
    hypethreading: Enabled
    name: worker
    platform: {}
    replicas: 3
controlPlane:
```
Required. The installation program prompts you for a cluster name.

The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

Optional. Specify parameters for machine pools that do not define their own platform configuration.

Required. The installation program prompts you for the region to deploy the cluster to.

Optional. Specify an existing resource group where the cluster should be installed.

Required. The installation program prompts you for the pull secret.

Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.

Optional. These are example vswitchID values.

4.6.5.4. Generating the required installation manifests
You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

**Procedure**

1. Generate the manifests by running the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   Specifies the directory in which the installation program creates files.

**4.6.5.5. Configuring the Cloud Credential Operator utility**

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (ccoctl) binary.

**NOTE**

The ccoctl utility is a Linux binary that must run in a Linux environment.

**Prerequisites**

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (oc).

**Procedure**

1. Obtain the OpenShift Container Platform release image by running the following command:

   ```bash
   $ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
   ```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

   ```bash
   $ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator' $RELEASE_IMAGE -a ~/.pull-secret)
   ```

   **NOTE**

   Ensure that the architecture of the $RELEASE_IMAGE matches the architecture of the environment in which you will use the ccoctl tool.

3. Extract the ccoctl binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

   ```bash
   $ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
   ```
4. Change the permissions to make `ccoctl` executable by running the following command:

```
$ chmod 775 ccoctl
```

**Verification**

- To verify that `ccoctl` is ready to use, display the help file by running the following command:

```
$ ccoctl --help
```

**Output of ccoctl --help**

```
OpenShift credentials provisioning tool

Usage:
ccoctl [command]

Available Commands:
alibabacloud Manage credentials objects for alibaba cloud
aws Manage credentials objects for AWS cloud
gcp Manage credentials objects for Google cloud
help Help about any command
ibmcloud Manage credentials objects for IBM Cloud
nutanix Manage credentials objects for Nutanix

Flags:
-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.
```

### 4.6.5.6. Creating credentials for OpenShift Container Platform components with the ccoctl tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

**NOTE**

By default, `ccoctl` creates objects in the directory in which the commands are run. To create the objects in a different directory, use the `--output-dir` flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

**Prerequisites**

You must have:

- Extracted and prepared the `ccoctl` binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyId (`access_key_id`) and AccessKeySecret (`access_key_secret`) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.
Procedure

1. Set the $RELEASE_IMAGE variable by running the following command:

   ```bash
   $ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
   ```

2. Extract the list of `CredentialsRequest` objects from the OpenShift Container Platform release image by running the following command:

   ```bash
   $ oc adm release extract \
   --credentials-requests \
   --cloud=alibabacloud \
   --to=<path_to_directory_with_list_of_credentials_requests>/credrequests \
   $RELEASE_IMAGE
   ```

   `credrequests` is the directory where the list of `CredentialsRequest` objects is stored. This command creates the directory if it does not exist.

   **NOTE**
   This command can take a few moments to run.

3. If your cluster uses cluster capabilities to disable one or more optional components, delete the `CredentialsRequest` custom resources for any disabled components.

   Example `credrequests` directory contents for OpenShift Container Platform 4.12 on Alibaba Cloud

   ```plaintext
   0000_30_machine-api-operator_00_credentials-request.yaml 1
   0000_50_cluster-image-registry-operator_01-registry-credentials-request-alibaba.yaml 2
   0000_50_cluster-ingress-operator_00-ingress-credentials-request.yaml 3
   0000_50_cluster-storage-operator_03_credentials_request_alibaba.yaml 4
   ```

   1. The Machine API Operator CR is required.
   2. The Image Registry Operator CR is required.
   3. The Ingress Operator CR is required.
   4. The Storage Operator CR is an optional component and might be disabled in your cluster.

4. Use the `ccoctl` tool to process all `CredentialsRequest` objects in the `credrequests` directory:

   a. Run the following command to use the tool:

   ```bash
   $ ccoctl alibabacloud create-ram-users \
   --name <name> \
   --region=<alibaba_region> \
   --credentials-requests-dir=\n   <path_to_directory_with_list_of_credentials_requests>/credrequests \
   --output-dir=<path_to_ccoctl_output_dir>
   ```
where:

- `<name>` is the name used to tag any cloud resources that are created for tracking.
- `<alibaba_region>` is the Alibaba Cloud region in which cloud resources will be created.
- `<path_to_directory_with_list_of_credentials_requests>/credrequests` is the directory containing the files for the component `CredentialsRequest` objects.
- `<path_to_ccoctl_output_dir>` is the directory where the generated component credentials secrets will be placed.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the `TechPreviewNoUpgrade` feature set, you must include the `--enable-tech-preview` parameter.

### Example output

2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-alibabacloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml

...  

**NOTE**

A RAM user can have up to two AccessKeys at the same time. If you run `ccocctl alibabacloud create-ram-users` more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

b. Verify that the OpenShift Container Platform secrets are created:

```bash
$ ls <path_to_ccoctl_output_dir>/manifests
```

### Example output:

- openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
- openshift-image-registry-installer-cloud-credentials-credentials.yaml
- openshift-ingress-operator-cloud-credentials-credentials.yaml
- openshift-machine-api-alibabacloud-credentials-credentials.yaml
You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

5. Copy the generated credential files to the target manifests directory:

```bash
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml ./<path_to_installation_dir>/manifests/
```

where:

- `<path_to_ccoctl_output_dir>`
  Specifies the directory created by the `ccoctl alibabacloud create-ram-users` command.

- `<path_to_installation_dir>`
  Specifies the directory in which the installation program creates files.

### 4.6.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```bash
  $ ./openshift-install create cluster --dir <installation_directory> \
  --log-level=info
  ``

  **1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

  **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

**Verification**
When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
- Credential information also outputs to `<installation_directory>/.openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.6.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   $ tar xvf <file>

6. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

  $ oc <command>

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.

   To check your PATH, open the command prompt and execute the following command:

   C:\> path

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

  C:\> oc <command>

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

   ```$ echo $PATH```

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

  ```$ oc <command>```

**4.6.8. Logging in to the cluster by using the CLI**

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.

- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

   ```$ export KUBECONFIG=<installation_directory>/auth/kubeconfig```

   **For <installation_directory>, specify the path to the directory that you stored the installation files in.**

2. Verify you can run oc commands successfully using the exported configuration:

   ```$ oc whoami```

   **Example output**

   ```-```
4.6.9. Logging in to the cluster by using the web console

The kubeadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubeadmin user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the kubeadmin user from the kubeadmin-password file on the installation host:

   $ cat <installation_directory>/auth/kubeadmin-password

   **NOTE**
   Alternatively, you can obtain the kubeadmin password from the <installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   **NOTE**
   Alternatively, you can obtain the OpenShift Container Platform route from the <installation_directory>/openshift_install.log log file on the installation host.

   Example output

   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

4.6.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use
subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.
- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

4.6.11. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

4.7. UNINSTALLING A CLUSTER ON ALIBABA CLOUD

You can remove a cluster that you deployed to Alibaba Cloud.

4.7.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- You have a copy of the installation program that you used to deploy the cluster.
- You have the files that the installation program generated when you created your cluster.

Procedure

1. On the computer that you used to install the cluster, go to the directory that contains the installation program, and run the following command:

   $ ./openshift-install destroy cluster
   --dir <installation_directory> --log-level info

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
   2 To view different details, specify `warn`, `debug`, or `error` instead of `info`. 
NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

2. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.
CHAPTER 5. INSTALLING ON AWS

5.1. PREPARING TO INSTALL ON AWS

5.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

5.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See Configuring an AWS account for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for AWS for other options, including configuring the Cloud Credential Operator (CCO) to use the Amazon Web Services Security Token Service (AWS STS).

5.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on AWS** You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on AWS** You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on AWS with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on AWS in a restricted network** You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the
installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.

- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.

- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

### 5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.

- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

### 5.1.4. Next steps

- Configuring an AWS account

### 5.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

#### 5.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.
NOTE

If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see Registering Domain Names Using Amazon Route 53 in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See Making Amazon Route 53 the DNS Service for an Existing Domain in the AWS documentation.

3. Create a public hosted zone for your domain or subdomain. See Creating a Public Hosted Zone in the AWS documentation.

   Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. Extract the new authoritative name servers from the hosted zone records. See Getting the Name Servers for a Public Hosted Zone in the AWS documentation.

5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: Adding or Changing Name Servers or Glue Records.

6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain in the AWS documentation for an example high level procedure.

5.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses us-gov-west-1 region for Route53 and tagging API clients.

The Ingress Operator uses https://tagging.us-gov-west-1.amazonaws.com as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the Service Endpoints in the AWS documentation about GovCloud (US).

IMPORTANT

Private, disconnected installations are not supported for AWS GovCloud when you install in the us-gov-east-1 region.

Example Route 53 configuration

```json
platform:
  aws:
    region: us-gov-west-1
    serviceEndpoints:
      - name: ec2
        url: https://ec2.us-gov-west-1.amazonaws.com
      - name: elasticloadbalancing
        url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
      - name: route53
```

259
Route 53 defaults to https://route53.us-gov.amazonaws.com for both AWS GovCloud (US) regions.

Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

5.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default Service Limits affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Limits</td>
<td>Varies</td>
<td>Varies</td>
<td>By default, each cluster creates the following instances:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- One bootstrap machine, which is removed after installation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three control plane nodes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three worker nodes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>These instance type counts are within a new account’s default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>In most regions, the worker machines use an m6i.large instance and the bootstrap and control plane machines use m6i.xlarge instances. In some regions, including all regions that do not support these instance types, m5.large and m5.xlarge instances are used instead.</td>
</tr>
</tbody>
</table>
## Elastic IPs (EIPs)

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic IPs</td>
<td>0 to 1</td>
<td>5 EIPs per account</td>
<td>To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each availability zone within a region. Each private subnet requires a NAT Gateway, and each NAT gateway requires a separate elastic IP. Review the AWS region map to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit. <strong>IMPORTANT</strong> To use the us-east-1 region, you must increase the EIP limit for your account.</td>
</tr>
</tbody>
</table>

## Virtual Private Clouds (VPCs)

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Private Clouds</td>
<td>5</td>
<td>5 VPCs per region</td>
<td>Each cluster creates its own VPC.</td>
</tr>
</tbody>
</table>

## Elastic Load Balancing (ELB/NLB)

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Load Balancing</td>
<td>3</td>
<td>20 per region</td>
<td>By default, each cluster creates internal and external network load balancers for the master API server and a single Classic Load Balancer for the router. Deploying more Kubernetes Service objects with type LoadBalancer will create additional load balancers.</td>
</tr>
</tbody>
</table>

## NAT Gateways

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAT Gateways</td>
<td>5</td>
<td>5 per availability zone</td>
<td>The cluster deploys one NAT gateway in each availability zone.</td>
</tr>
</tbody>
</table>

## Elastic Network Interfaces (ENIs)

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Network Interfaces</td>
<td>At least 12</td>
<td>350 per region</td>
<td>The default installation creates 21 ENIs and an ENI for each availability zone in your region. For example, the us-east-1 region contains six availability zones, so a cluster that is deployed in that zone uses 27 ENIs. Review the AWS region map to determine how many availability zones are in each region. Additional ENIs are created for additional machines and ELB load balancers that are created by cluster usage and deployed workloads.</td>
</tr>
<tr>
<td>Component</td>
<td>Number of clusters available by default</td>
<td>Default AWS limit</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------</td>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VPC Gateway</td>
<td>20</td>
<td>20 per account</td>
<td>Each cluster creates a single VPC Gateway for S3 access.</td>
</tr>
<tr>
<td>S3 buckets</td>
<td>99</td>
<td>100 buckets per account</td>
<td>Because the installation process creates a temporary bucket and the registry component in each cluster creates a bucket, you can create only 99 OpenShift Container Platform clusters per AWS account.</td>
</tr>
<tr>
<td>Security Groups</td>
<td>250</td>
<td>2,500 per account</td>
<td>Each cluster creates 10 distinct security groups.</td>
</tr>
</tbody>
</table>

### 5.2.3. Required AWS permissions for the IAM user

**NOTE**

Your IAM user must have the permission `tag:GetResources` in the region `us-east-1` to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the `AdministratorAccess` policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 5.1. Required EC2 permissions for installation**

- `ec2:AuthorizeSecurityGroupEgress`
- `ec2:AuthorizeSecurityGroupIngress`
- `ec2:CopyImage`
- `ec2:CreateNetworkInterface`
- `ec2:AttachNetworkInterface`
- `ec2:CreateSecurityGroup`
- `ec2:CreateTags`
- `ec2:CreateVolume`
- `ec2:DeleteSecurityGroup`
- `ec2:DeleteSnapshot`
- `ec2:DeleteTags`
- ec2:DeregisterImage
- ec2:DescribeAccountAttributes
- ec2:DescribeAddresses
- ec2:DescribeAvailabilityZones
- ec2:DescribeDhcpOptions
- ec2:DescribeImages
- ec2:DescribeInstanceAttribute
- ec2:DescribeInstanceCreditSpecifications
- ec2:DescribeInstances
- ec2:DescribeInstanceTypes
- ec2:DescribeInternetGateways
- ec2:DescribeKeyPairs
- ec2:DescribeNatGateways
- ec2:DescribeNetworkAcls
- ec2:DescribeNetworkInterfaces
- ec2:DescribePrefixLists
- ec2:DescribeRegions
- ec2:DescribeRouteTables
- ec2:DescribeSecurityGroups
- ec2:DescribeSubnets
- ec2:DescribeTags
- ec2:DescribeVolumes
- ec2:DescribeVpcAttribute
- ec2:DescribeVpcClassicLink
- ec2:DescribeVpcClassicLinkDnsSupport
- ec2:DescribeVpcEndpoints
- ec2:DescribeVpcs
- ec2:GetEbsDefaultKmsKeyId
- ec2:ModifyInstanceAttribute
Example 5.2. Required permissions for creating network resources during installation

- ec2:ModifyNetworkInterfaceAttribute
- ec2:RevokeSecurityGroupEgress
- ec2:RevokeSecurityGroupIngress
- ec2:RunInstances
- ec2:TerminateInstances

NOTE
If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 5.3. Required Elastic Load Balancing permissions (ELB) for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:AttachLoadBalancerToSubnets
Example 5.4. Required Elastic Load Balancing permissions (ELBv2) for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:DescribeListeners
- elasticloadbalancing:DescribeLoadBalancerAttributes
- elasticloadbalancing:DescribeLoadBalancers
- elasticloadbalancing:DescribeTargetGroupAttributes
- elasticloadbalancing:DescribeTargetHealth
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
- elasticloadbalancing:RegisterTargets
Example 5.5. Required IAM permissions for installation

- iam:AddRoleToInstanceProfile
- iam:CreateInstanceProfile
- iam:CreateRole
- iam:DeleteInstanceProfile
- iam:DeleteRole
- iam:DeleteRolePolicy
- iam:GetInstanceProfile
- iam:GetRole
- iam:GetRolePolicy
- iam:GetUser
- iam:ListInstanceProfilesForRole
- iam:ListRoles
- iam:ListUsers
- iam:PassRole
- iam:PutRolePolicy
- iam:RemoveRoleFromInstanceProfile
- iam:SimulatePrincipalPolicy
- iam:TagRole

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

Example 5.6. Required Route 53 permissions for installation

- route53:ChangeResourceRecordSets
- route53:ChangeTagsForResource
- route53:CreateHostedZone
- route53:DeleteHostedZone
- route53:GetChange
• route53:GetHostedZone
• route53:ListHostedZones
• route53:ListHostedZonesByName
• route53:ListResourceRecordSets
• route53:ListTagsForResource
• route53:UpdateHostedZoneComment

Example 5.7. Required S3 permissions for installation

• s3:CreateBucket
• s3:DeleteBucket
• s3:GetAccelerateConfiguration
• s3:GetBucketAcl
• s3:GetBucketCors
• s3:GetBucketLocation
• s3:GetBucketLogging
• s3:GetBucketPolicy
• s3:GetBucketObjectLockConfiguration
• s3:GetBucketReplication
• s3:GetBucketRequestPayment
• s3:GetBucketTagging
• s3:GetBucketVersioning
• s3:GetBucketWebsite
• s3:GetEncryptionConfiguration
• s3:GetLifecycleConfiguration
• s3:GetReplicationConfiguration
• s3:ListBucket
• s3:PutBucketAcl
• s3:PutBucketTagging
• s3:PutEncryptionConfiguration
Example 5.8. S3 permissions that cluster Operators require

- s3:DeleteObject
- s3:GetObject
- s3:GetObjectAcl
- s3:GetObjectTagging
- s3:GetObjectVersion
- s3:PutObject
- s3:PutObjectAcl
- s3:PutObjectTagging

Example 5.9. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
- ec2:DeletePlacementGroup
- ec2:DeleteNetworkInterface
- ec2:DeleteVolume
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DescribeTargetGroups
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:ListAttachedRolePolicies
- iam:ListInstanceProfiles
- iam:ListRolePolicies
- iam:ListUserPolicies
- s3:DeleteObject
- s3:ListBucketVersions
- tag:GetResources

Example 5.10. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
- ec2:DeleteRouteTable
- ec2:DeleteSubnet
- ec2:DeleteVpc
- ec2:DeleteVpcEndpoints
- ec2:DetachInternetGateway
- ec2:DisassociateRouteTable
- ec2:ReleaseAddress
- ec2:ReplaceRouteTableAssociation

**NOTE**

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the `tag:UntagResources` permission to delete network resources.

Example 5.11. Required permissions to delete a cluster with shared instance roles

- iam:UntagRole

Example 5.12. Additional IAM and S3 permissions that are required to create manifests

- iam:DeleteAccessKey
- iam:DeleteUser
- iam:DeleteUserPolicy
- iam:GetUserPolicy
- iam:ListAccessKeys
- iam:PutUserPolicy
- iam:TagUser
- s3:PutBucketPublicAccessBlock
- s3:GetBucketPublicAccessBlock
- s3:PutLifecycleConfiguration
- s3:HeadBucket
• s3:ListBucketMultipartUploads
• s3:AbortMultipartUpload

NOTE
If you are managing your cloud provider credentials with mint mode, the IAM user also requires the `iam:CreateAccessKey` and `iam:CreateUser` permissions.

Example 5.13. Optional permissions for instance and quota checks for installation

• ec2:DescribeInstanceTypeOfferings
• servicequotas:ListAWSDefaultServiceQuotas

5.2.4. Creating an IAM user

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the Creating an IAM User in Your AWS Account procedure in the AWS documentation, set the following options:

Procedure

1. Specify the IAM user name and select Programmatic access.

2. Attach the AdministratorAccess policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

   NOTE
   While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.

4. Confirm that the user name that you specified is granted the AdministratorAccess policy.

5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.
IMPORTANT

You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials.

Additional resources

- See Manually creating IAM for AWS for steps to set the Cloud Credential Operator (CCO) to manual mode prior to installation. Use this mode in environments where the cloud identity and access management (IAM) APIs are not reachable, or if you prefer not to store an administrator-level credential secret in the cluster kube-system project.

5.2.5. IAM Policies and AWS authentication

By default, the installation program creates instance profiles for the bootstrap, control plane, and compute instances with the necessary permissions for the cluster to operate.

However, you can create your own IAM roles and specify them as part of the installation process. You might need to specify your own roles to deploy the cluster or to manage the cluster after installation. For example:

- Your organization’s security policies require that you use a more restrictive set of permissions to install the cluster.
- After the installation, the cluster is configured with an Operator that requires access to additional services.

If you choose to specify your own IAM roles, you can take the following steps:

- Begin with the default policies and adapt as required. For more information, see "Default permissions for IAM instance profiles".
- Use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template that is based on the cluster’s activity. For more information see, "Using AWS IAM Analyzer to create policy templates".

5.2.5.1. Default permissions for IAM instance profiles

By default, the installation program creates IAM instance profiles for the bootstrap, control plane and worker instances with the necessary permissions for the cluster to operate.

The following lists specify the default permissions for control plane and compute machines:

Example 5.14. Default IAM role permissions for control plane instance profiles

- `ec2:AttachVolume`
- `ec2:AuthorizeSecurityGroupIngress`
- `ec2:CreateSecurityGroup`
- `ec2:CreateTags`
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteVolume
- ec2:Describe*
- ec2:DetachVolume
- ec2:ModifyInstanceAttribute
- ec2:ModifyVolume
- ec2:RevokeSecurityGroupIngress
- elasticloadbalancing:AddTags
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateLoadBalancerPolicy
- elasticloadbalancing:CreateLoadBalancerListeners
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:ConfigureHealthCheck
- elasticloadbalancing:DeleteListener
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeleteLoadBalancerListeners
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DeregisterInstancesFromLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:Describe*
- elasticloadbalancing:DetachLoadBalancerFromSubnets
- elasticloadbalancing:ModifyListener
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
Example 5.15. Default IAM role permissions for compute instance profiles

- ec2:DescribeInstances
- ec2:DescribeRegions

5.2.5.2. Specifying an existing IAM role

Instead of allowing the installation program to create IAM instance profiles with the default permissions, you can use the install-config.yaml file to specify an existing IAM role for control plane and compute instances.

Prerequisites

- You have an existing install-config.yaml file.

Procedure

1. Update compute.platform.aws.iamRole with an existing role for the control plane machines.

Sample install-config.yaml file with an IAM role for compute instances

```yaml
compute:
  - hyperthreading: Enabled
  name: worker
  platform:
    aws:
      iamRole: ExampleRole
```

2. Update controlPlane.platform.aws.iamRole with an existing role for the compute machines.

Sample install-config.yaml file with an IAM role for control plane instances

```yaml
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      iamRole: ExampleRole
```

3. Save the file and reference it when installing the OpenShift Container Platform cluster.
Additional resources

- See Deploying the cluster.

5.2.5.3. Using AWS IAM Analyzer to create policy templates

The minimal set of permissions that the control plane and compute instance profiles require depends on how the cluster is configured for its daily operation.

One way to determine which permissions the cluster instances require is to use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template:

- A policy template contains the permissions the cluster has used over a specified period of time.
- You can then use the template to create policies with fine-grained permissions.

Procedure

The overall process could be:

1. Ensure that CloudTrail is enabled. CloudTrail records all of the actions and events in your AWS account, including the API calls that are required to create a policy template. For more information, see the AWS documentation for working with CloudTrail.

2. Create an instance profile for control plane instances and an instance profile for compute instances. Be sure to assign each role a permissive policy, such as PowerUserAccess. For more information, see the AWS documentation for creating instance profile roles.

3. Install the cluster in a development environment and configure it as required. Be sure to deploy all of applications the cluster will host in a production environment.

4. Test the cluster thoroughly. Testing the cluster ensures that all of the required API calls are logged.

5. Use the IAM Access Analyzer to create a policy template for each instance profile. For more information, see the AWS documentation for generating policies based on the CloudTrail logs.

6. Create and add a fine-grained policy to each instance profile.

7. Remove the permissive policy from each instance profile.

8. Deploy a production cluster using the existing instance profiles with the new policies.

NOTE

You can add IAM Conditions to your policy to make it more restrictive and compliant with your organization security requirements.

5.2.6. Supported AWS Marketplace regions

Installing an OpenShift Container Platform cluster using an AWS Marketplace image is available to customers who purchase the offer in North America.

While the offer must be purchased in North America, you can deploy the cluster to any of the following supported partitions:

- Public
Deploying a OpenShift Container Platform cluster using an AWS Marketplace image is not supported for the AWS secret regions or China regions.

5.2.7. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following regions.

NOTE
Your IAM user must have the permission `tag:GetResources` in the region `us-east-1` to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

5.2.7.1. AWS public regions

The following AWS public regions are supported:

- `af-south-1` (Cape Town)
- `ap-east-1` (Hong Kong)
- `ap-northeast-1` (Tokyo)
- `ap-northeast-2` (Seoul)
- `ap-northeast-3` (Osaka)
- `ap-south-1` (Mumbai)
- `ap-south-2` (Hyderabad)
- `ap-southeast-1` (Singapore)
- `ap-southeast-2` (Sydney)
- `ap-southeast-3` (Jakarta)
- `ap-southeast-4` (Melbourne)
- `ca-central-1` (Central)
- `eu-central-1` (Frankfurt)
- `eu-central-2` (Zurich)
- `eu-north-1` (Stockholm)
- `eu-south-1` (Milan)
- `eu-south-2` (Spain)
- `eu-west-1` (Ireland)
5.2.7.2. AWS GovCloud regions

The following AWS GovCloud regions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

5.2.7.3. AWS SC2S and C2S secret regions

The following AWS secret regions are supported:

- **us-isob-east-1** Secret Commercial Cloud Services (SC2S)
- **us-iso-east-1** Commercial Cloud Services (C2S)

5.2.7.4. AWS China regions

The following AWS China regions are supported:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

5.2.8. Next steps

- Install an OpenShift Container Platform cluster:
  - Quickly install a cluster with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure
  - Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates

5.3. MANUALLY CREATING IAM FOR AWS
In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster `kube-system` namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

5.3.1. Alternatives to storing administrator-level secrets in the `kube-system` project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the `credentialsMode` parameter in the `install-config.yaml` file.

If you prefer not to store an administrator-level credential secret in the cluster `kube-system` project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use the Amazon Web Services Security Token Service**
  You can use the CCO utility (`ccoctl`) to configure the cluster to use the Amazon Web Services Security Token Service (AWS STS). When the CCO utility is used to configure the cluster for STS, it assigns IAM roles that provide short-term, limited-privilege security credentials to components.

  **NOTE**
  This credentials strategy is supported for only new OpenShift Container Platform clusters and must be configured during installation. You cannot reconfigure an existing cluster that uses a different credentials strategy to use this feature.

- **Manage cloud credentials manually**
  You can set the `credentialsMode` parameter for the CCO to `Manual` to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode**:
  If you are using the CCO with the `credentialsMode` parameter set to `Mint`, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

  **NOTE**
  Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

**Additional resources**
To learn how to use the CCO utility (**ccoctl**) to configure the CCO to use the AWS STS, see Using manual mode with STS.

To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see Rotating or removing cloud provider credentials.

For a detailed description of all available CCO credential modes and their supported platforms, see About the Cloud Credential Operator.

### 5.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

   ```bash
   $ openshift-install create install-config --dir <installation_directory>
   
   where `<installation_directory>` is the directory in which the installation program creates files.
   ```

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
     ...
   
   1 This line is added to set the **credentialsMode** parameter to **Manual**.
   ```

3. Generate the manifests by running the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   
   where `<installation_directory>` is the directory in which the installation program creates files.
   ```

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

   ```bash
   $ openshift-install version
   ```
Example output

release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
   --credentials-requests \
   --cloud=aws
```

This command creates a YAML file for each `CredentialsRequest` object.

Sample `CredentialsRequest` object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
        - iam:GetUser
        - iam:GetUserPolicy
        - iam:ListAccessKeys
        resource: "*"
...
```

6. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object.

Sample `CredentialsRequest` object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
        - s3:CreateBucket
```
Sample Secret object

apiVersion: v1
classKind: Secret
metadata:
  name: <component-secret>
  namespace: <component-namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

IMPORTANT

The release image includes CredentialsRequest objects for Technology Preview features that are enabled by the TechPreviewNoUpgrade feature set. You can identify these objects by their use of the release.openshift.io/feature-gate: TechPreviewNoUpgrade annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.
- If you are using any of these features, you must create secrets for the corresponding objects.

To find CredentialsRequest objects with the TechPreviewNoUpgrade annotation, run the following command:

```
$ grep "release.openshift.io/feature-gate" *
```

Example output

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate: TechPreviewNoUpgrade
```

7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir <installation_directory>
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.
Additional resources

- Updating a cluster using the web console
- Updating a cluster using the CLI

5.3.3. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform on platforms that support it. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the admin credential is stored in the kube-system namespace and then used by the CCO to process the CredentialsRequest objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires admin credential storage in a cluster kube-system secret.

5.3.4. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all CredentialsRequest objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

5.3.5. Next steps

- Install an OpenShift Container Platform cluster:
• Installing a cluster quickly on AWS with default options on installer-provisioned infrastructure
• Install a cluster with cloud customizations on installer-provisioned infrastructure
• Install a cluster with network customizations on installer-provisioned infrastructure
• Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates

5.4. INSTALLING A CLUSTER QUICKLY ON AWS

In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

5.4.1. Prerequisites

• You reviewed details about the OpenShift Container Platform installation and update processes.
• You read the documentation on selecting a cluster installation method and preparing it for users.
• You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

• If you use a firewall, you configured it to allow the sites that your cluster requires access to.
• If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials. Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

5.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

• Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
• Access Quay.io to obtain the packages that are required to install your cluster.
• Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> ¹

   ¹ Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   NOTE
   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

   Example output

```
Agent pid 31874
```

   NOTE
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>
```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

   Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

   **IMPORTANT**

   You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1. For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

When specifying the directory:

- Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Provide values at the prompts:

   a. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   b. Select `aws` as the platform to target.

   c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

      **NOTE**

      The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

   d. Select the AWS region to deploy the cluster to.

   e. Select the base domain for the Route 53 service that you configured for your cluster.
Enter a descriptive name for your cluster.

Paste the pull secret from the Red Hat OpenShift Cluster Manager.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

3. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the AdministratorAccess policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the kubeadmin user.

- Credential information also outputs to <installation_directory>/openshift_install.log.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Additional resources

- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   $ tar xvf <file>

6. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:
  
  ```
  $ oc <command>
  ```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

  ```
  C:\> path
  ```

Verification

- After you install the OpenShift CLI, it is available using the `oc` command:
  
  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.11 macOS Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your **PATH**.
   To check your **PATH**, open a terminal and execute the following command:

  ```
  $ echo $PATH
  ```

**NOTE**

For macOS arm64, choose the **OpenShift v4.11 macOS arm64 Client** entry.
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```bash
  $ oc <command>
  ```

5.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

5.4.8. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:
$ cat <installation_directory>/auth/kubeadmin-password

NOTE
Alternatively, you can obtain the **kubeadmin** password from the 
<installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

$ oc get routes -n openshift-console | grep 'console-openshift'

NOTE
Alternatively, you can obtain the OpenShift Container Platform route from the 
<installation_directory>/openshift_install.log log file on the installation host.

Example output

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>console</td>
<td>console-openshift-console.apps.&lt;cluster_name&gt;.&lt;base_domain&gt;</td>
<td>console</td>
<td>https</td>
</tr>
<tr>
<td></td>
<td>reencrypt/Redirect</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

3. Navigate to the route detailed in the output of the preceding command in a web browser and 
log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the 
OpenShift Container Platform web console.

### 5.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics 
about cluster health and the success of updates, requires internet access. If your cluster is connected to 
the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager**
**Hybrid Cloud Console**.

After you confirm that your **OpenShift Cluster Manager Hybrid Cloud Console** inventory is correct, 
either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use 
subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-
cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.4.10. Next steps

- Validating an installation.

- Customize your cluster.

- If necessary, you can **opt out of remote health reporting**.
• If necessary, you can remove cloud provider credentials.

5.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.11, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

**NOTE**

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

5.5.1. Prerequisites

• You reviewed details about the OpenShift Container Platform installation and update processes.

• You read the documentation on selecting a cluster installation method and preparing it for users.

• You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

• If you use a firewall, you configured it to allow the sites that your cluster requires access to.

• If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

• Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

• Access Quay.io to obtain the packages that are required to install your cluster.

• Obtain the packages that are required to perform cluster updates.
If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `/openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```bash
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
```

Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.5.4. Obtaining an AWS Marketplace image**
If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

**Prerequisites**

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

**Procedure**

1. Complete the OpenShift Container Platform subscription from the AWS Marketplace.

2. Record the AMI ID for your specific region. As part of the installation process, you must update the `install-config.yaml` file with this value before deploying the cluster.

**Sample install-config.yaml file with AWS Marketplace worker nodes**

```yaml
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239  
      type: m5.4xlarge
      replicas: 3
  metadata:
    name: test-cluster
  platform:
    aws:
      region: us-east-2
  sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'
```

1. The AMI ID from your AWS Marketplace subscription.

2. Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

**5.5.5. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.
1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```
For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   ![NOTE](image)

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select `AWS` as the platform to target.

   iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

   iv. Select the AWS region to deploy the cluster to.

   v. Select the base domain for the Route 53 service that you configured for your cluster.

   vi. Enter a descriptive name for your cluster.

   vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   ![IMPORTANT](image)

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.5.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for
the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 5.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>apiVersion</strong></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><strong>baseDomain</strong></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td><strong>metadata</strong></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>metadata.name</strong></td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere**, or {}. For additional information about **platform. <platform>** parameters, consult the table for your specific platform that follows.

**Table 5.2. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>platform</strong></td>
<td>The configuration for the specific platform upon which to perform the installation: <strong>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere</strong>, or {}. For additional information about <strong>platform. &lt;platform&gt;</strong> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>pullSecret</strong></td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;cloud.openshift.com&quot;:{</td>
</tr>
</tbody>
</table>
|               |                                                                             |     "auth":"b3Blb=",
|               |                                                                             |     "email":"you@example.com"
|               |                                                                             | },                                                                                                               |
|               |                                                                             | "quay.io":{                                                                                                      |
|               |                                                                             |     "auth":"b3Blb=",
|               |                                                                             |     "email":"you@example.com"
|               |                                                                             | }                                                                                                               |

5.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 5.2. Network parameters
### networking

**Description**

The configuration for the cluster network.

**Values**

Object

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.

### networking.network

**Type**

The cluster network provider

Container Network Interface (CNI) cluster network provider to install.

**Values**

Either [OpenShiftSDN](https://example.com/openshiftsdn) or [OVNKubernetes](https://example.com/ovnkubernetes). [OpenShiftSDN](https://example.com/openshiftsdn) is a CNI provider for all-Linux networks. [OVNKubernetes](https://example.com/ovnkubernetes) is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is [OpenShiftSDN](https://example.com/openshiftsdn).

### networking.clusterNetwork

**Description**

The IP address blocks for pods.

The default value is **10.128.0.0/14** with a host prefix of **/23**.

If you specify multiple IP address blocks, the blocks must not overlap.

**Values**

An array of objects. For example:

```yaml
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
```

### networking.clusterNetwork.cidr

**Description**

Required if you use `networking.clusterNetwork`. An IP address block.

An IPv4 network.

**Values**

An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between **0** and **32**.

### networking.clusterNetwork.hostPrefix

**Description**

The subnet prefix length to assign to each individual node. For example, if `hostPrefix` is set to **23** then each node is assigned a **/23** subnet out of the given `cidr`. A `hostPrefix` value of **23** provides **510** (2**(32 - 23) - 2) pod IP addresses.

**Values**

A subnet prefix.

The default value is **23**.

### networking.serviceNetwork

**Description**

The IP address block for services. The default value is **172.30.0.0/16**.

The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.

**Values**

An array with an IP address block in CIDR format. For example:

```yaml
networking:
  serviceNetwork:
    - 172.30.0.0/16
```
<table>
<thead>
<tr>

### 5.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.3. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>capabilities.baselineCapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see Supported installation methods for different platforms in Selecting a cluster installation method and preparing it for users.</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <em>hyperthreading</em>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><strong>IMPORTANT</strong></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see <a href="#">Supported installation methods for different platforms</a> in Selecting a cluster installation method and preparing it for users.</td>

<td>-----------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <em>hyperthreading</em>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
</tbody>
</table>
The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the *Cloud Credential Operator* entry in the *Cluster Operators reference content*.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the `credentialsMode` parameter to *Mint*, *Passthrough* or *Manual*.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tr>
</thead>
<tbody>
<tr>
<td><code>credentialsMode</code></td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fips</code></td>
<td>Enable or disable FIPS mode. The default is <code>false</code> (disabled). <tr>
<td>`platform.aws.serviceEndpoints.</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td><code>name</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>`platform.aws.serviceEndpoints.</td>
<td>The AWS service endpoint URL. The URL must use the <code>https</code> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td><code>url</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
platform.aws.userTags

A map of keys and values that the installation program adds as tags to all resources that it creates.

Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

platform.aws.subnets

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

Valid subnet IDs.

5.5.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- Optimizing storage

5.5.6.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.16. Machine types based on 64-bit x86 architecture

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

5.5.6.4. Tested instance types for AWS on 64-bit ARM infrastructures
The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.17. Machine types based on 64-bit ARM architecture

- c6g.*
- m6g.*

5.5.6.5. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
  metadataService:
    authentication: Optional
    type: m6i.xlarge
  replicas: 3
  compute:
    - hyperthreading: Enabled
      name: worker
      platform:
        aws:
          rootVolume:
```
- **Required.** The installation program prompts you for this value.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

3 If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, `-`, and the first line of the controlPlane section must not. Only one control plane pool is used.

5 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to Required. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to Optional. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

5.5.6.6. Configuring the cluster-wide proxy during installation
Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>
     httpsProxy: https://<username>:<pswd>@<ip>:<port>
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,s3.<region>.amazonaws.com
     additionalTrustBundle: |
       -----BEGIN CERTIFICATE-----
       <MY_TRUSTED_CA_CERT>
       -----END CERTIFICATE-----
   ```

   - **1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   - **2** A proxy URL to use for creating HTTPS connections outside the cluster.
   - **3** A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the `noProxy` field.
   - **4** If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat
Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```
1. For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```
**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

---

### 5.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the **Product Variant** drop-down menu.
3. Select the appropriate version in the **Version** drop-down menu.
4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.
5. Unpack the archive:
   ```
   $ tar xvf <file>
   ```
6. Place the oc binary in a directory that is on your **PATH**.
   To check your **PATH**, execute the following command:
   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:
  ```
  $ oc <command>
  ```
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   
   ```
   C:\> path
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:
  
  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   
   ```
   $ echo $PATH
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:
5.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1 For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

5.5.10. Logging in to the cluster by using the web console

The kubeadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubeadmin user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the kubeadmin user from the kubeadmin-password file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
NOTE
Alternatively, you can obtain the kubeadmin password from the $<installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE
Alternatively, you can obtain the OpenShift Container Platform route from the $<installation_directory>/openshift_install.log log file on the installation host.

Example output

```
  console     console-openshift-console.apps.<cluster_name>.<base_domain>      console
  https   reencrypt/Redirect   None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.5.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.5.12. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.
5.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only kubeProxy configuration parameters in a running cluster.

5.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
```

Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.
2. View the public SSH key:

$ cat <path>/<file_name>.pub

For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

$ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   $ eval "$(ssh-agent -s)"

   Example output

   Agent pid 31874

   NOTE

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

$ ssh-add <path>/<file_name>

Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.6.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

**Phase 1**

You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`
For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**IMPORTANT**

The CIDR range `172.17.0.0/16` is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

---

**Phase 2**

After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

**5.6.6. Creating the installation configuration file**

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory>
```

For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them...
b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select **AWS** as the platform to target.

iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 5.6.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 5.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 5.6. Required parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the install-config.yaml content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;, &lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}. {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmccloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### Pull Secret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 5.6.6.1.2. Network Configuration Parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

### Table 5.7. Network Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either <a href="#">OpenShiftSDN</a> or <a href="#">OVNKubernetes</a>. <strong>OpenShiftSDN</strong> is a CNI provider for all-Linux networks. <strong>OVNKubernetes</strong> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>- clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- serviceNetwork: 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- machineNetwork: cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
### networking.machine

Required if you use `networking.machineNetwork`. An IP address block. The default value is **10.0.0.0/16** for all platforms other than libvirt. For libvirt, the default value is **192.168.126.0/24**.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### 5.6.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

#### Table 5.8. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>additionalTrustBundle</strong></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><strong>capabilities</strong></td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td><strong>capabilities.baseline</strong></td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. <strong>v4.11</strong> enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. <strong>vCurrent</strong> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <strong>vCurrent</strong>.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see Supported installation methods for different platforms in Selecting a cluster installation method and preparing it for users.</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or <code>{}</code></td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see Supported installation methods for different platforms in Selecting a cluster installation method and preparing it for users.</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td><code>alibabacloud</code>, <code>aws</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>nutanix</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code></td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
</tbody>
</table>

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.
### imageContentSources
Sources and repositories for the release-image content.

**Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><strong>imageContentSources.mirrors</strong></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
</tbody>
</table>

#### publish
How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

**Internal** or **External**. To deploy a private cluster, which cannot be accessed from the internet, set publish to **Internal**. The default value is **External**.

#### sshKey
The SSH key to authenticate access to your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

For example, **sshKey: ssh-ed25519 AAAA...**

### 5.6.6.14. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

#### Table 5.9. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.platform.aws.amiID</strong></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as <strong>io1</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.kmsKeyARN</code></td>
<td>The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.</td>
<td>Valid key ID or the key ARN</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <strong>m4.2xlarge</strong>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
</tbody>
</table>
### Parameter | Description | Values
---|---|---
compute.aws.region | The AWS region that the installation program creates compute resources in. | Any valid AWS region, such as `us-east-1`. You can use the AWS CLI to access the regions available based on your selected instance type. For example:

```
aws ec2 describe-instance-type-offerings --filters Name=instance-type,Values=c7g.xlarge
```

**IMPORTANT**

When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See [Global availability map](https://aws.amazon.com/availability/global/) in the AWS documentation. Currently, AWS Graviton3 processors are only available in some regions.

controlPlane.platform.aws.amiID | The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI. | Any published or custom RHCOS AMI that belongs to the set AWS region. See [RHCOS AMIs for AWS infrastructure](https://aws.amazon.com/documentation/redhat/ami/) for available AMI IDs.

controlPlane.platform.aws.iamRole | A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role. | The name of a valid AWS IAM role.

controlPlane.platform.aws.rootVolume.kmsKeyARN | The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key. | Valid key ID and the key ARN
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>controlPlane.platform.aws.type</strong></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m6i.xlarge. See the <a href="#">Supported AWS machine types</a> table that follows.</td>
</tr>
<tr>
<td><strong>controlPlane.platform.aws.zone</strong></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td><strong>controlPlane.aws.region</strong></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td><strong>platform.aws.amiID</strong></td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td><strong>platform.aws.hostedZone</strong></td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KVV.</td>
</tr>
<tr>
<td><strong>platform.aws.serviceEndpoints.name</strong></td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
</tbody>
</table>
platform.aws.serviceEndpoints.url

The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.

Valid AWS service endpoint URL.

platform.aws.userTags

A map of keys and values that the installation program adds as tags to all resources that it creates.

Any valid YAML map, such as key value pairs in the <key>: <value> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

Valid subnet IDs.

5.6.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 5.10. Minimum resource requirements

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms
p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- Optimizing storage

5.6.6.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.18. Machine types based on 64-bit x86 architecture

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
5.6.6.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.19. Machine types based on 64-bit ARM architecture

- c6g.*
- m6g.*

5.6.6.5. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (install-config.yaml) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:  
  hyperthreading: Enabled
  name: master
  platform: 
    aws: 
      zones: 
        - us-west-2a
        - us-west-2b
      rootVolume: 
        iops: 4000
        size: 500
        type: io1
      metadataService: 
        authentication: Optional
        type: m6i.xlarge
  replicas: 3
compute: 
```
- hyperthreading: Enabled

name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1
    metadataService:
      authentication: Optional
      type: c5.4xlarge
      zones:
        - us-west-2c
    replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
  userTags:
    adminContact: jdoe
    costCenter: 7536
  amiID: ami-96c6f8f7
  serviceEndpoints:
    - name: ec2
      url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  fps: false
  sshKey: ssh-ed25519 AAAA...
  pullSecret: '{"auths": ...}'

1 Required. The installation program prompts you for this value.
2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3 If you do not provide these parameters and values, the installation program provides the default value.
4 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.
5 Whether to enable or disable simultaneous multithreading, or hyperthreading. By default,
IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

Whether to require the **Amazon EC2 Instance Metadata Service v2** (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

**NOTE**

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see **Installing the system in FIPS mode**. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

5.6.6.6. Configuring the cluster-wide proxy during installation
Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,s3.<region>.amazonaws.com 3
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   
   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   
   2 A proxy URL to use for creating HTTPS connections outside the cluster.
   
   3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the `noProxy` field.
   
   4 If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat...
Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster` Proxy object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

5.6.7. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named `cluster`. The CR specifies the fields for the `Network` API in the `operator.openshift.io` API group.

The CNO configuration inherits the following fields during cluster installation from the `Network` API in the `Network.config.openshift.io` API group and these fields cannot be changed:

- `clusterNetwork`
  - IP address pools from which pod IP addresses are allocated.
- `serviceNetwork`
  - IP address pool for services.
- `defaultNetwork.type`
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

5.6.7.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

Table 5.11. Cluster Network Operator configuration object
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always cluster.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.serviceNetwork</td>
<td>array</td>
<td>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.defaultNetwork</td>
<td>object</td>
<td>Configures the Container Network Interface (CNI) cluster network provider for the cluster network.</td>
</tr>
<tr>
<td>spec.kubeProxyConfig</td>
<td>object</td>
<td>The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.</td>
</tr>
</tbody>
</table>

defaultNetwork object configuration
The values for the defaultNetwork object are defined in the following table:

### Table 5.12. defaultNetwork object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

CHAPTER 5. INSTALLING ON AWS
Either **OpenShiftSDN** or **OVNKubernetes**. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.

**NOTE**
OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>openshiftSDNConfig</td>
<td>object</td>
<td>This object is only valid for the OpenShift SDN cluster network provider.</td>
</tr>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

### Configuration for the OpenShift SDN CNI cluster network provider
The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 5.13. openshiftSDNConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>. The values <strong>Multitenant</strong> and <strong>Subnet</strong> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>
### Field Types

#### mtu
- **Type**: integer
- **Description**: The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

  If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

  If your cluster requires different MTU values for different nodes, you must set this value to **50** less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of **9001**, and some have an MTU of **1500**, you must set this value to **1450**.

  This value cannot be changed after cluster installation.

#### vxlanPort
- **Type**: integer
- **Description**: The port to use for all VXLAN packets. The default value is **4789**.

  This value cannot be changed after cluster installation.

  If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

  On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port **9000** and port **9999**.

### Example OpenShift SDN configuration

```yaml
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

#### Table 5.14. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultNetwork</td>
<td></td>
<td></td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>OpenShiftSDN</td>
</tr>
<tr>
<td>openshiftSDNConfig</td>
<td></td>
<td></td>
</tr>
<tr>
<td>mode</td>
<td>string</td>
<td>NetworkPolicy</td>
</tr>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for VXLAN</td>
</tr>
<tr>
<td>vxlanPort</td>
<td>integer</td>
<td>The port to use for all VXLAN packets. Default</td>
</tr>
</tbody>
</table>
The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

genevePort integer

The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.

ipsecConfig object

Specify an empty object to enable IPsec encryption.

policyAuditConfig object

Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

gatewayConfig object

Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.

**NOTE**

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

**Table 5.15. policyAuditConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>string</td>
<td>One of the following additional audit log targets:</td>
</tr>
<tr>
<td>libc</td>
<td></td>
<td>The libc syslog() function of the journald process on the host.</td>
</tr>
<tr>
<td>udp:&lt;host&gt;:&lt;port&gt;</td>
<td></td>
<td>A syslog server. Replace &lt;host&gt;:&lt;port&gt; with the host and port of the syslog server.</td>
</tr>
<tr>
<td>unix:&lt;file&gt;</td>
<td></td>
<td>A Unix Domain Socket file specified by &lt;file&gt;.</td>
</tr>
<tr>
<td>null</td>
<td></td>
<td>Do not send the audit logs to any additional target.</td>
</tr>
<tr>
<td>syslogFacility</td>
<td>string</td>
<td>The syslog facility, such as kern, as defined by RFC5424. The default value is local0.</td>
</tr>
</tbody>
</table>

#### Table 5.16. gatewayConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingViaHost</td>
<td>boolean</td>
<td>Set this field to true to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is false. This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to true, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

#### Example OVN-Kubernetes configuration with IPSec enabled

```yaml
defaultNetwork:
type: OVNKubernetes
ovnKubernetesConfig:
  mtu: 1400
genevePort: 6081
ipsecConfig: {}
```

#### kubeProxyConfig object configuration

The values for the kubeProxyConfig object are defined in the following table:

#### Table 5.17. kubeProxyConfig object
## Field Type Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iptablesSyncPeriod</td>
<td>string</td>
<td>The refresh period for <code>iptables</code> rules. The default value is <strong>30s</strong>. Valid suffixes include s, m, and h and are described in the Go time package documentation.</td>
</tr>
<tr>
<td>proxyArguments.iptables-min-sync-period</td>
<td>array</td>
<td>The minimum duration before refreshing <code>iptables</code> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is: kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</td>
</tr>
</tbody>
</table>

### 5.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>  
   ```

   `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.
2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

**Specify a different VXLAN port for the OpenShift SDN network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

**Enable IPsec for the OVN-Kubernetes network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

**NOTE**

For more information on using a Network Load Balancer (NLB) on AWS, see Configuring Ingress cluster traffic on AWS using a Network Load Balancer.

### 5.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

**Prerequisites**

- Create the `install-config.yaml` file and complete any modifications to it.

**Procedure**

Create an Ingress Controller backed by an AWS NLB on a new cluster.
1. Change to the directory that contains the installation program and create the manifests:

   $ ./openshift-install create manifests --dir <installation_directory>

   For `<installation_directory>`, specify the name of the directory that contains the install-config.yaml file for your cluster.

2. Create a file that is named `cluster-ingress-default-ingresscontroller.yaml` in the `<installation_directory>/manifests/` directory:

   $ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml

   For `<installation_directory>`, specify the directory name that contains the manifests/ directory for your cluster.

   After creating the file, several network configuration files are in the manifests/ directory, as shown:

   $ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml

   Example output

   cluster-ingress-default-ingresscontroller.yaml

3. Open the `cluster-ingress-default-ingresscontroller.yaml` file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: IngressController
   metadata:
     creationTimestamp: null
     name: default
     namespace: openshift-ingress-operator
   spec:
     endpointPublishingStrategy:
       loadBalancer:
         scope: External
         providerParameters:
           type: AWS
           aws:
             type: NLB
           type: LoadBalancerService
   ```

4. Save the `cluster-ingress-default-ingresscontroller.yaml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-ingress-default-ingresscontroller.yaml` file. The installation program deletes the manifests/ directory when creating the cluster.

5.6.10. Configuring hybrid networking with OVN-Kubernetes
You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**

- You defined `OVNKubernetes` for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   where:

   `<installation_directory>`
   
   Specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   EOF
   ```

   where:

   `<installation_directory>`
   
   Specifies the directory name that contains the `manifests/` directory for your cluster.

3. Open the `cluster-network-03-config.yml` file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

   **Specify a hybrid networking configuration**

   ```
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
   ```
Specify the CIDR configuration used for nodes on the additional overlay network. The `hybridClusterNetwork` CIDR cannot overlap with the `clusterNetwork` CIDR.

Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.

NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom `hybridOverlayVXLANPort` value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

NOTE

For more information on using Linux and Windows nodes in the same cluster, see Understanding Windows container workloads.

5.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:
For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
- Credential information also outputs to `<installation_directory>/./openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
...  
INFO Install complete!  
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'  
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com  
INFO Login to the console with user: "kubeadmin", and password: "password"  
INFO Time elapsed: 36m22s  
```
Important

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**Important**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   ```

6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:

C:\> path

Verification

- After you install the OpenShift CLI, it is available using the oc command:

C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

$ echo $PATH

NOTE
For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

Verification

- After you install the OpenShift CLI, it is available using the oc command:
5.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

5.6.14. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.6.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager Hybrid Cloud Console](#).

After you confirm that your [OpenShift Cluster Manager Hybrid Cloud Console](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.6.16. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).
5.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

5.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You mirrored the images for a disconnected installation to your registry and obtained the imageContentSources data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

**NOTE**

If you are configuring a proxy, be sure to also review this site list.
If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can **manually create and maintain IAM credentials**.

### 5.7.2. About installations in restricted networks

In OpenShift Container Platform 4.11, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift image registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

#### 5.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 5.7.3. About using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.7.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the kubernetes.io/cluster/.*: owned, Name, and openshift.io/cluster tags.
  The installation program modifies your subnets to add the kubernetes.io/cluster/.*: shared tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a Name tag, because it overlaps with the EC2 Name field and the installation fails.

- You must enable the enableDnsSupport and enableDnsHostnames attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the platform.aws.hostedZone field in the install-config.yaml file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

**Option 1: Create VPC endpoints**
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

With this option, network traffic remains private between your VPC and the required AWS services.
Option 2: Create a proxy without VPC endpoints
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components
You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>AWS::EC2::VPC</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td>Public subnets</td>
<td>AWS::EC2::Subnet</td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td>Internet gateway</td>
<td>AWS::EC2::InternetGateway</td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
</tbody>
</table>

| AWS::EC2::VPCEndpoint |  |
|-----------------------|  |
| AWS::EC2::SubnetNetworkAclAssociation |  |
| AWS::EC2::NatGateway |  |
| AWS::EC2::EIP |  |
### Network access control

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

### Private subnets

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

### 5.7.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.
If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

### 5.7.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.7.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 5.7.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access **OpenShift Cluster Manager Hybrid Cloud Console** to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access **Quay.io** to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.
**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.7.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name> 1
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.7.6. Creating the installation configuration file**

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).
Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.

- Have the `imageContentSources` values that were generated during mirror registry creation.

- Obtain the contents of the certificate for your mirror registry.

- Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:

   - Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      ii. Select AWS as the platform to target.

      iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

      iv. Select the AWS region to deploy the cluster to.

      v. Select the base domain for the Route 53 service that you configured for your cluster.
vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Edit the **install-config.yaml** file to give the additional information that is required for an installation in a restricted network.

   a. Update the **pullSecret** value to contain the authentication information for your registry:

      ```yaml
      pullSecret: '{"auths": {"<mirror_host_name>:5000": {"auth": "<credentials>"}}, "email": "you@example.com"}}'
      ```

      For `<mirror_host_name>`, specify the registry domain name that you specified in the certificate for your mirror registry, and for `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

   b. Add the **additionalTrustBundle** parameter and value.

      ```yaml
      additionalTrustBundle: |
        -----BEGIN CERTIFICATE-----
        ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
        -----END CERTIFICATE-----
      ```

      The value must be the contents of the certificate file that you used for your mirror registry. The certificate file can be an existing, trusted certificate authority, or the self-signed certificate that you generated for the mirror registry.

   c. Define the subnets for the VPC to install the cluster in:

      ```yaml
      subnets:
      - subnet-1
      - subnet-2
      - subnet-3
      ```

   d. Add the image content resources, which resemble the following YAML excerpt:

      ```yaml
      imageContentSources:
      - mirrors:
        - `<mirror_host_name>:5000/<repo_name>/release`
        source: quay.io/openshift-release-dev/ocp-release
      - mirrors:
        - `<mirror_host_name>:5000/<repo_name>/release`
        source: registry.redhat.io/ocp/release
      ```

      For these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.

4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.
Important

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**Note**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.18. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {.metadata.name}.{.baseDomain}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{}</td>
</tr>
</tbody>
</table>

5.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 5.19. Network parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong> You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.networkType</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. <strong>OpenShiftSDN</strong> is a CNI provider for all-Linux networks. <strong>OVNKubernetes</strong> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is <strong>10.128.0.0/14</strong> with a host prefix of <code>/23</code>.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: <strong>10.128.0.0/14</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: <strong>23</strong></td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to <strong>23</strong> then each node is assigned a <code>/23</code> subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of <strong>23</strong> provides <strong>510</strong> (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is <strong>23</strong>.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is <strong>172.30.0.0/16</strong>.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>172.30.0.0/16</strong></td>
</tr>
</tbody>
</table>
networking.machineNetwork

The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.

An array of objects. For example:

```
networking:
  machineNetwork:
    - cidr: 10.0.0.0/16
```

networking.machineNetwork.cidr

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

An IP network block in CIDR notation. For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

5.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.20. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
</tbody>
</table>
### Parameter | Description | Values
--- | --- | ---
**capabilities.baseline** | Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent. | String |
**capabilities.addition** | Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter. | String array |
**cgroupsV2** | Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time. | true |
**compute** | The configuration for the machines that comprise the compute nodes. | Array of MachinePool objects. |
**compute.architecture** | Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see Supported installation methods for different platforms in Selecting a cluster installation method and preparing it for users. | String |

<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#).

The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>

<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key to authenticate access to your cluster machines.</td>
<td>For example, sshKey: ssh-ed25519 AAAA...</td>
</tr>
</tbody>
</table>

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your *ssh-agent* process uses.

### 5.7.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.21. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>compute.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.iops</td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.size</td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as io1.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.kmsKeyARN</td>
<td>The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.</td>
<td>Valid key ID or the key ARN</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as m4.2xlarge. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as us-east-1. You can use the AWS CLI to access the regions available based on your selected instance type. For example: <code>aws ec2 describe-instance-type-offerings --filters Name=instance-type,Values=m6i.xlarge</code></td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.rootVolume.kmsKeyARN</td>
<td>The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.</td>
<td>Valid key ID and the key ARN</td>
</tr>
<tr>
<td>controlPlane.platform.aws.type</td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m6i.xlarge. See the Supported AWS machine types table that follows.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See Global availability map in the AWS documentation. Currently, AWS Graviton3 processors are only available in some regions.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <em>RHCOS AMIs for AWS infrastructure</em> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
platform.aws.us erTags

A map of keys and values that the installation program adds as tags to all resources that it creates.

Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

platform.aws.subnets

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

Valid subnet IDs.

5.7.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 5.22. Minimum resource requirements

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>

<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- Optimizing storage

5.7.6.3. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (install-config.yaml) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1

                     mirrors: [ <local_registry>/<local_repository_name>/release
                                  source: quay.io/openshift-release-dev/ocp-v4.0-art-dev

1 Required. The installation program prompts you for this value.
2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3 If you do not provide these parameters and values, the installation program provides the default value.
4 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one
Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to Required. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to Optional. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

**NOTE**

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

Provide the contents of the certificate file that you used for your mirror registry.

Provide the `imageContentSources` section from the output of the command to mirror the repository.

5.7.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

NOTE

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>
     httpsProxy: https://<username>:<pswd>@<ip>:<port>
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,ami.<region>.amazonaws.com
   ```
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the noProxy field.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.

NOTE

If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE

Only the Proxy object named cluster is supported, and no additional proxies can be created.

5.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

   **NOTE**

   The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
- Credential information also outputs to `<installation_directory>/openshift_install.log`

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   $ tar xvf <file>
6. Place the `oc` binary in a directory that is on your `PATH`. To check your `PATH`, execute the following command:

```
$ echo $PATH
```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the `Version` drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your `PATH`. To check your `PATH`, open the command prompt and execute the following command:

```
C:\> path
```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the `Version` drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 macOS Client** entry and save the file.

   **NOTE**

   For macOS arm64, choose the **OpenShift v4.11 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   **Verification**

   - After you install the OpenShift CLI, it is available using the `oc` command:

     ```
     $ oc <command>
     ```

   **5.7.9. Logging in to the cluster by using the CLI**

   You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

   **Prerequisites**

   - You deployed an OpenShift Container Platform cluster.
   - You installed the `oc` CLI.

   **Procedure**

   1. Export the `kubeadmin` credentials:

      ```
      $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
      ```

      For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

     ```
     1
     ```

   2. Verify you can run `oc` commands successfully using the exported configuration:

      ```
      $ oc whoami
      ```

      **Example output**

      ```
      system:admin
      ```

   **5.7.10. Disabling the default OperatorHub sources**

   Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

   **Procedure**

   - Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:
$ oc patch OperatorHub cluster --type json \ 
-p 
["op": "add", "path": "/spec/disableAllDefaultSources", "value": true]}

TIP

Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Configuration → OperatorHub page, click the Sources tab, where you can create, update, delete, disable, and enable individual sources.

5.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.7.12. Next steps

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the must-gather tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.

5.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

In OpenShift Container Platform version 4.11, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

5.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

If you use a firewall, you configured it to allow the sites that your cluster requires access to.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can manually create and maintain IAM credentials.

### 5.8.2. About using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

### 5.8.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.
If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- Create a public and private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet. For an example of this type of configuration, see VPC with public and private subnets (NAT) in the AWS documentation.
  
  Record each subnet ID. Completing the installation requires that you enter these values in the platform section of the install-config.yaml file. See Finding a subnet ID in the AWS documentation.

- The VPC’s CIDR block must contain the Networking.MachineCIDR range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.

- The VPC must have a public internet gateway attached to it. For each availability zone:
  
  - The public subnet requires a route to the internet gateway.
  - The public subnet requires a NAT gateway with an EIP address.
  - The private subnet requires a route to the NAT gateway in public subnet.

- The VPC must not use the kubernetes.io/cluster/.*: owned, Name, and openshift.io/cluster tags.
  The installation program modifies your subnets to add the kubernetes.io/cluster/.*: shared tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a Name tag, because it overlaps with the EC2 Name field and the installation fails.

- You must enable the enableDnsSupport and enableDnsHostnames attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation.
  If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the platform.aws.hostedZone field in the install-config.yaml file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

**Option 1: Create VPC endpoints**
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>AWS::EC2::VPC</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td>AWS::EC2::VPCEndpoint</td>
<td></td>
</tr>
</tbody>
</table>
Internet gateway

- AWS::EC2::InternetGateway
- AWS::EC2::VPCGatewayAttachment
- AWS::EC2::RouteTable
- AWS::EC2::Route
- AWS::EC2::SubnetRouteTableAssociation
- AWS::EC2::NatGateway
- AWS::EC2::EIP

You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

Network access control

- AWS::EC2::NetworkAcl
- AWS::EC2::NetworkAclEntry

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

Private subnets

- AWS::EC2::Subnet
- AWS::EC2::RouteTable
- AWS::EC2::SubnetRouteTableAssociation

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

5.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:
• All the subnets that you specify exist.

• You provide private subnets.

• The subnet CIDRs belong to the machine CIDR that you specified.

• You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

• You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

5.8.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

• You can install multiple OpenShift Container Platform clusters in the same VPC.

• ICMP ingress is allowed from the entire network.

• TCP 22 ingress (SSH) is allowed to the entire network.

• Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

• Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:
Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

Access Quay.io to obtain the packages that are required to install your cluster.

Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The "/openshift-install gather" command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.
NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   $ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   Example output

      Agent pid 31874

   NOTE

      If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name> 1

1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

   Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps
When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

**Procedure**

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

**Prerequisites**
Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Obtain service principal permissions at the subscription level.

Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>
   ``

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:
   
   - Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.
   
   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      
      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select AWS as the platform to target.

      iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

      iv. Select the AWS region to deploy the cluster to.

      v. Select the base domain for the Route 53 service that you configured for your cluster.

      vi. Enter a descriptive name for your cluster.

      vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 5.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### 5.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform. &lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{ &quot;auths&quot;:{ &quot;cloud.openshift.com&quot;:{ &quot;auth&quot;:&quot;b3Blb=&quot;, &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot; }, &quot;quay.io&quot;:{ &quot;auth&quot;:&quot;b3Blb=&quot;, &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot; } } }</td>
</tr>
</tbody>
</table>

#### 5.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 5.24. Network parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the networking object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all–Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
</tbody>
</table>
### networking.machine Network

The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.

An array of objects. For example:

```yaml
networking:
machineNetwork:
  - cidr: 10.0.0.0/16
```

### networking.machine Network.cidr

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

An IP network block in CIDR notation. For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### 5.8.6.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

#### Table 5.25. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>capabilities.baseline</code></td>
<td>Selects an initial set of optional capabilities to enable. Valid values are <code>None</code>, <code>v4.11</code> and <code>vCurrent</code>. <code>v4.11</code> enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. <code>vCurrent</code> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <code>vCurrent</code>.</td>
<td>String</td>
</tr>
<tr>
<td><code>capabilities.addition</code></td>
<td>Extends the set of optional capabilities beyond what you specify in <code>baselineCapabilitySet</code>. Valid values are <code>baremetal</code>, <code>marketplace</code> and <code>openshift-samples</code>. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see [Supported installation methods for different platforms](Selecting a cluster installation method and preparing it for users).</td>
<td>String</td>
</tr>

<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
fips

Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<tr>
<td><code>platform.aws.amiID</code></td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td><code>platform.aws.hostedZone</code></td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <code>Z3URY6TWQ91KV</code>.</td>
</tr>
<tr>
<td><code>platform.aws.serviceEndpoints.name</code></td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td><code>platform.aws.serviceEndpoints.url</code></td>
<td>The AWS service endpoint URL. The URL must use the HTTPS protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
5.8.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.aws.usertoolsTags</td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the <code>&lt;key&gt;: &lt;value&gt;</code> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
<tr>
<td>platform.aws.subnets</td>
<td>If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.</td>
<td>Valid subnet IDs.</td>
</tr>
</tbody>
</table>

<table>

<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- Optimizing storage

### 5.8.6.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.20. Machine types based on 64-bit x86 architecture**

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

### 5.8.6.4. Tested instance types for AWS on 64-bit ARM infrastructures
The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.21. Machine types based on 64-bit ARM architecture

- c6g.*
- m6g.*

5.8.6.5. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (`install-config.yaml`) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
platform:
  aws:
    zones:
      - us-west-2a
      - us-west-2b
    rootVolume:
      iops: 4000
      size: 500
      type: io1
  metadataService:
    authentication: Optional
    type: m6i.xlarge
replicas:
compute:
  - hyperthreading: Enabled
  name: worker
platform:
  aws:
    rootVolume:
```
iops: 2000
size: 500
type: io1
metadataService:
  authentication: Optional
  type: c5.4xlarge
  zones:
    - us-west-2c
  replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
      networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: [subnet-1, subnet-2, subnet-3]
    amiID: ami-96c6f8f7
    serviceEndpoints:
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
        hostedZone: Z3URY6TWQ91KVV
    fips: false
    sshKey: ssh-ed25519 AAAA...
pullSecret: "{"auths": ...}"

1. Required. The installation program prompts you for this value.
2. Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3. If you do not provide these parameters and values, the installation program provides the default value.
4. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.
5. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default,
IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to Required. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to Optional. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.
5.8.6.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

NOTE

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (`169.254.169.254`).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ①
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ②
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,s3.<region>.amazonaws.com ③
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   ① A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   ② A proxy URL to use for creating HTTPS connections outside the cluster.
   ③ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For
   ④ If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the
trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 5.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   **1** For `<installation_directory>`, specify the location of your customized ./install-config.yaml file.
To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   $$

6. Place the `oc` binary in a directory that is on your PATH.
   
   To check your PATH, execute the following command:

   ```
   $ echo $PATH
   $$

Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   $$
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.

To check your PATH, open the command prompt and execute the following command:

C:\> path

Verification

- After you install the OpenShift CLI, it is available using the oc command:

C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.

To check your PATH, open a terminal and execute the following command:

$ echo $PATH

Verification

- After you install the OpenShift CLI, it is available using the oc command:

For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.
5.8.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   `system:admin`

5.8.10. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**Example output**

```
case       console-openshift-console.apps.<cluster_name>.<base_domain>   console
http       reencrypt/Redirect               None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager Hybrid Cloud Console**.

After you confirm that your **OpenShift Cluster Manager Hybrid Cloud Console** inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use **subscription watch** to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.8.12. Next steps

- **Validating an installation**.
- **Customize your cluster**.
- If necessary, you can **opt out of remote health reporting**.
- If necessary, you can **remove cloud provider credentials**.
5.9. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.11, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

### 5.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 5.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

**IMPORTANT**

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
Deploy from a machine that has access to:

- The API services for the cloud to which you provision.
- The hosts on the network that you provision.
- The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.9.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the baseDomain for the cluster

The installation program does use the baseDomain that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.9.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with kubernetes.io/cluster/<cluster-infra-id>: shared so that AWS can use them to create public load balancers.

5.9.3. About using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.
Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

### 5.9.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned`, `Name`, and `openshift.io/cluster` tags.
  The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a `Name` tag, because it overlaps with the EC2 Name field and the installation fails.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing
hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using
the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for
EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during
the installation, the following configuration options are available:

**Option 1: Create VPC endpoints**
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

With this option, network traffic remains private between your VPC and the required AWS services.

**Option 2: Create a proxy without VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet
traffic goes through the proxy to reach the required AWS services.

**Option 3: Create a proxy with VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints.
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field.
With this option, the proxy prevents the cluster from accessing the internet directly. However, network
traffic remains private between your VPC and the required AWS services.

**Required VPC components**
You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>

</tr>
</tbody>
</table>
5.9.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

5.9.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.9.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.
You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>
   ```
1. Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

**NOTE**
If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   Agent pid 31874

   **NOTE**
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   ```bash
   $ ssh-add <path>/<file_name>  
   ```

   **Example output**
Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.9.7. Manually creating the installation configuration file
For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   $ mkdir <installation_directory>

   **IMPORTANT**
   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**
   You must name this configuration file `install-config.yaml`.

   **NOTE**
   For some platform types, you can alternatively run `./openshift-install create install-config --dir <installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**
   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for
the required parameters through the command line. If you customize your cluster, you can modify the
`install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 5.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform. <platform> parameters, consult the table for your specific platform that follows.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform. &lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td></td>
</tr>
</tbody>
</table>

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 5.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 5.29. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>
The configuration for the cluster network.

**NOTE**
You cannot modify parameters specified by the `networking` object after installation.

### networking

- **Type**: The cluster network provider
  - Contain Network Interface (CNI) cluster network provider to install.
  - Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all–Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.

### networking.clusterNetwork

- **The IP address blocks for pods.**
  - The default value is 10.128.0.0/14 with a host prefix of /23.
  - If you specify multiple IP address blocks, the blocks must not overlap.

### networking.clusterNetwork.cidr

- **Required if you use**
  - networking.clusterNetwork. An IP address block.
  - An IPv4 network.

### networking.clusterNetwork.hostPrefix

- **The subnet prefix length to assign to each individual node.**
  - For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^8(32 - 23) - 2) pod IP addresses.
  - A subnet prefix.
  - The default value is 23.

### networking.serviceNetwork

- **The IP address block for services.**
  - The default value is 172.30.0.0/16.
  - The OpenShift SDN and OVN–Kubernetes network providers support only a single IP address block for the service network.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
<td></td>
</tr>
</tbody>
</table>
### 5.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.30. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>capabilities.baselineCapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 and arm64. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see Supported installation methods for different platforms in Selecting a cluster installation method and preparing it for users.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere</code>, or <code>{}</code></td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to <strong>2</strong>. The default value is <strong>3</strong>.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see <code>Supported installation methods for different platforms</code> in <code>Selecting a cluster installation method and preparing it for users</code>.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
**FIPS**

Enable or disable FIPS mode. The default is **false** (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fips</strong></td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td><strong>String</strong></td>
</tr>
</tbody>
</table>
5.9.7.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

### Table 5.31. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <strong>4000</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The type of the root volume.</td>
<td>Valid AWS EBS volume type, such as <strong>io1</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.kmsKeyARN</code></td>
<td>The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.</td>
<td>Valid key ID or the key ARN</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <strong>m4.2xlarge</strong>. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
</tbody>
</table>
| `compute.aws.region` | The AWS region that the installation program creates compute resources in. | Any valid AWS region, such as **us-east-1**. You can use the AWS CLI to access the regions available based on your selected instance type. For example:  

```shell
aws ec2 describe-instance-type-offerings --filters Name=instance-type,Values=c7g.xlarge
```

<p>| IMPORTANT | When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="https://aws.amazon.com">Global availability map</a> in the AWS documentation. Currently, AWS Graviton3 processors are only available in some regions. |
|-----------|-------------|--------|
| <code>controlPlane.platform.aws.amiID</code> | The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI. | Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="https://docs.aws.amazon.com/rhel/latest/for-amazon-linux-2/platform-images.html">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs. |
| <code>controlPlane.platform.aws.iamRole</code> | A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role. | The name of a valid AWS IAM role. |
| <code>controlPlane.platform.aws.rootVolume.kmsKeyARN</code> | The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key. | Valid key ID and the key ARN |
| <code>controlPlane.platform.aws.type</code> | The EC2 instance type for the control plane machines. | Valid AWS instance type, such as <strong>m6i.xlarge</strong>. See the <a href="https://aws.amazon.com/documentation/ec2/instance-types/">Supported AWS machine types</a> table that follows. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.plat form.aws.zone s</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="https://aws.amazon.com/rhcos/amis/">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
**platform.aws.userTags**

A map of keys and values that the installation program adds as tags to all resources that it creates. Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

**platform.aws.subnets**

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone. Valid subnet IDs.

---

### 5.9.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.32. Minimum resource requirements**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: `(threads per core × cores) × sockets = vCPUs`.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- Optimizing storage

5.9.7.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.22. Machine types based on 64-bit x86 architecture

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

5.9.7.4. Tested instance types for AWS on 64-bit ARM infrastructures
The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.23. Machine types based on 64-bit ARM architecture**

- c6g.*
- m6g.*

**5.9.7.5. Sample customized install-config.yaml file for AWS**

You can customize the installation configuration file (*install-config.yaml*) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your *install-config.yaml* file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
  metadataService:
    authentication: Optional
    type: m6i.xlarge
replicas: 3
compute:
  - hyperthreading: Enabled
    name: worker
    platform:
      aws:
        rootVolume:
```
Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.
Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to Required. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to Optional. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

**NOTE**

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.
NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

How to publish the user-facing endpoints of your cluster. Set publish to Internal to deploy a private cluster, which cannot be accessed from the internet. The default value is External.

5.9.7.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

NOTE
The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>  
     httpsProxy: https://<username>:<pswd>@<ip>:<port>  
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,amazonaws.com,s3.<region>.amazonaws.com  
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   
   A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations. If you have added the Amazon EC2, Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the noProxy field.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy readinessEndpoints field.

NOTE
If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

```bash
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

5.9.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT
You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites
- Configure an account with the cloud platform that hosts your cluster.
• Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \  
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

   **NOTE**

   The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

Verification

When the cluster deployment completes successfully:

• The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

• Credential information also outputs to `<installation_directory>/openshift_install.log`.

   **IMPORTANT**

   Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```bash
... INFO Install complete! INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig' INFO Access the OpenShift web-console here: https://console-openshift-`
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.9.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   ```

6. Place the `oc` binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   ```
   $ echo $PATH
   ```
Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```
  $ oc <command>
  ```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
   
   To check your **PATH**, open the command prompt and execute the following command:
   ```
   C:\> path
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```
  C:\> oc <command>
  ```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 macOS Client** entry and save the file.

4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your **PATH**.
   
   To check your **PATH**, open a terminal and execute the following command:
   ```
   $ echo $PATH
   ```

**NOTE**

For macOS arm64, choose the **OpenShift v4.11 macOS arm64 Client** entry.
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  $ oc <command>
  ```

5.9.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

5.9.11. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:
2. List the OpenShift Container Platform web console route:

```bash
$ oc get routes -n openshift-console | grep 'console-openshift'
```

```
console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
https   reencrypt/Redirect   None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.9.13. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
5.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) into a government region. To configure the region, modify parameters in the `install-config.yaml` file before you install the cluster.

5.10.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.10.2. AWS government regions

OpenShift Container Platform supports deploying a cluster to an AWS GovCloud (US) region.

The following AWS GovCloud partitions are supported:

- `us-gov-east-1`
- `us-gov-west-1`

5.10.3. Installation requirements

Before you can install the cluster, you must:

- Provide an existing private AWS VPC and subnets to host the cluster. Public zones are not supported in Route 53 in AWS GovCloud. As a result, clusters must be private when you deploy to an AWS government region.
- Manually create the installation configuration file (`install-config.yaml`).
5.10.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

NOTE
Public zones are not supported in Route 53 in an AWS GovCloud Region. Therefore, clusters must be private if they are deployed to an AWS GovCloud Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

IMPORTANT
If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.10.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the `baseDomain` for the cluster
The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

### 5.10.4.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

### 5.10.5. About using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.10.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.
If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the `kubernetes.io/cluster/.*: owned`, `Name`, and `openshift.io/cluster` tags.
  The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a `Name` tag, because it overlaps with the EC2 `Name` field and the installation fails.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation.
  If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

**Option 1: Create VPC endpoints**
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

With this option, network traffic remains private between your VPC and the required AWS services.

**Option 2: Create a proxy without VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

**Option 3: Create a proxy with VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:
When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>- AWS::EC2::VPC</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
</tbody>
</table>
### 5.10.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

### 5.10.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different
resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.10.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.10.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.10.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.
After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   $ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.
a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add /path/to/file_name
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/you/path/to/file_name (computer_name)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.10.8. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

**Prerequisites**

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

**Procedure**

2. Record the AMI ID for your specific region. As part of the installation process, you must update the `install-config.yaml` file with this value before deploying the cluster.

**Sample install-config.yaml file with AWS Marketplace worker nodes**

```yaml
apiVersion: v1
baseDomain: example.com
```
The AMI ID from your AWS Marketplace subscription.

Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

5.10.9. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```bash
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.10.10. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

```bash
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.
IMPORTANT

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.10.10.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.10.10.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.33. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### metadata.name

The name of the cluster. DNS records for the cluster are all subdomains of 

\[ {{.metadata.name}} \cdot {{.baseDomain}} \].

String of lowercase letters, hyphens (-), and periods (.), such as dev.

### platform

The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform, consult the table for your specific platform that follows.

### pullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 5.10.10.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

### Table 5.34. Network parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network.type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all–Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
</tbody>
</table>
### Networking Machine Network

**The IP address blocks for machines.**

If you specify multiple IP address blocks, the blocks must not overlap.

An array of objects. For example:

```
      networking:
        machineNetwork:
          - cidr: 10.0.0.0/16
```

### Networking Machine Network.cidr

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

An IP network block in CIDR notation. For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

---

### 5.10.10.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.35. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>

</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>
Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zone.s</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <strong>us-east-1c</strong>, in a <strong>YAML sequence</strong>.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <strong>us-east-1</strong>.</td>
</tr>
<tr>
<td>platform.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See <strong>RHCOS AMIs for AWS infrastructure</strong> for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KVV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the <strong>https</strong> protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
</tbody>
</table>
platform.aws.userTags  
A map of keys and values that the installation program adds as tags to all resources that it creates.

Any valid YAML map, such as key-value pairs in the `<key>: <value>` format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.

platform.aws.subnets  
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

Valid subnet IDs.

## 5.10.10.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

### Table 5.37. Minimum resource requirements

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core x cores) x sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.
Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- Optimizing storage

5.10.10.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.24. Machine types based on 64-bit x86 architecture

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

5.10.10.4. Tested instance types for AWS on 64-bit ARM infrastructures
The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

*Example 5.25. Machine types based on 64-bit ARM architecture*

- c6g.*
- m6g.*

### 5.10.10.5. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file ([install-config.yaml](#)) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hyperthreading: Enabled
  name: master
platform:
  aws:
    zones:
    - us-gov-west-1a
    - us-gov-west-1b
    rootVolume:
      iops: 4000
      size: 500
      type: io1
    metadataService:
      authentication: Optional
      type: m6i.xlarge
replicas: 3
compute: 
  - hyperthreading: Enabled
  name: worker
platform:
  aws:
    rootVolume:
```
iops: 2000
size: 500

type: io1

metadataService:
  authentication: Optional
    type: c5.4xlarge
    zones:
      - us-gov-west-1c
    replicas: 3

metadata:
  name: test-cluster

networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16

platform:
  aws:
    region: us-gov-west-1
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets:
      - subnet-1
      - subnet-2
      - subnet-3
    amiID: ami-96c6f8f7
    serviceEndpoints:
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KV

fips: false

sshKey: ssh-ed25519 AAAA...
publish: Internal

pullSecret: {"auths": ...} Required.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.
Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as `m4.2xlarge` or `m5.2xlarge`, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as `io1` and set `iops` to `2000`.

Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to `Required`. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to `Optional`. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

**NOTE**

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the `https` protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see *Installing the system in FIPS mode*. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

How to publish the user-facing endpoints of your cluster. Set publish to Internal to deploy a private cluster, which cannot be accessed from the internet. The default value is External.

5.10.10.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ①
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ②
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,amazonaws.com,s3.<region>.amazonaws.com ③
     additionalTrustBundle: | ④
       -----BEGIN CERTIFICATE-----
       <MY_TRUSTED_CA_CERT>
       -----END CERTIFICATE-----

   ① A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.
A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the noProxy field.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**
The installation program does not support the proxy readinessEndpoints field.

**NOTE**
If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**
Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 5.10.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**
You can run the create cluster command of the installation program only once, during initial installation.

**Prerequisites**
- Configure an account with the cloud platform that hosts your cluster.
• Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

   **NOTE**

   The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

Verification

When the cluster deployment completes successfully:

• The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubadmin` user.

• Credential information also outputs to `<installation_directory>/.openshift_install.log`.

   **IMPORTANT**

   Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
```
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for **Recovering from expired control plane certificates** for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 5.10.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the **Product Variant** drop-down menu.

3. Select the appropriate version in the **Version** drop-down menu.

4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:

   ```shell
   $ tar xvf <file>
   ```

6. Place the **oc** binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```shell
   $ echo $PATH
   ```
Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```
  $ oc <command>
  ```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.11 macOS Client** entry and save the file.
   
   **NOTE**
   
   For macOS arm64, choose the **OpenShift v4.11 macOS arm64 Client** entry.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.
   To check your **PATH**, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```
### Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```bash
  $ oc <command>
  ```

#### 5.10.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

#### Procedure

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

#### 5.10.14. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:
$ cat <installation_directory>/auth/kubeadmin-password

NOTE
Alternatively, you can obtain the kubeadmin password from the <installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

$ oc get routes -n openshift-console | grep 'console-openshift'

$ cat <installation_directory>/auth/kubeadmin-password

NOTE
Alternatively, you can obtain the OpenShift Container Platform route from the <installation_directory>/openshift_install.log log file on the installation host.

Example output

<table>
<thead>
<tr>
<th>console</th>
<th>console-openshift-console.apps.&lt;cluster_name&gt;.&lt;base_domain&gt;</th>
<th>console</th>
</tr>
</thead>
<tbody>
<tr>
<td>https</td>
<td>reencrypt/Redirect</td>
<td>None</td>
</tr>
</tbody>
</table>

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.10.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

5.10.16. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
If necessary, you can remove cloud provider credentials.

5.11. INSTALLING A CLUSTER ON AWS INTO A SECRET OR TOP SECRET REGION

In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) into the following secret regions:

- Secret Commercial Cloud Services (SC2S)
- Commercial Cloud Services (C2S)

To configure a cluster in either region, you change parameters in the install config.yaml file before you install the cluster.

5.11.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multifactor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.11.2. AWS secret regions

The following AWS secret partitions are supported:

- **us-isob-east-1** (SC2S)
- **us-iso-east-1** (C2S)
NOTE

The maximum supported MTU in an AWS SC2S and C2S Regions is not the same as AWS commercial. For more information about configuring MTU during installation, see the Cluster Network Operator configuration object section in Installing a cluster on AWS with network customizations

5.11.3. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image for the AWS Secret and Top Secret Regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (install-config.yaml).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

IMPORTANT

You must also define a custom CA certificate in the additionalTrustBundle field of the install-config.yaml file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the AWS_CA_BUNDLE environment variable, or define the CA bundle in the ca_bundle field of the AWS config file.

5.11.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

NOTE

Public zones are not supported in Route 53 in an AWS Top Secret Region. Therefore, clusters must be private if they are deployed to an AWS Top Secret Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.
To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 5.11.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets

- Public load balancers, which support public ingress

- A public Route 53 zone that matches the `baseDomain` for the cluster

The installation program does use the `baseDomain` that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

### 5.11.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

### 5.11.5. About using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new
accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.11.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the kubernetes.io/cluster/.*: owned, Name, and openshift.io/cluster tags.
  The installation program modifies your subnets to add the kubernetes.io/cluster/.*: shared tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a Name tag, because it overlaps with the EC2 Name field and the installation fails.
- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See `DNS Support in Your VPC` in the AWS documentation.

If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

A cluster in an SC2S or C2S Region is unable to reach the public IP addresses for the EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

**Option 1: Create VPC endpoints**
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

**SC2S**
- `elasticloadbalancing.<region>.sc2s.sgov.gov`
- `ec2.<region>.sc2s.sgov.gov`
- `s3.<region>.sc2s.sgov.gov`

**C2S**
- `elasticloadbalancing.<region>.c2s.ic.gov`
- `ec2.<region>.c2s.ic.gov`
- `s3.<region>.c2s.ic.gov`

With this option, network traffic remains private between your VPC and the required AWS services.

**Option 2: Create a proxy without VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

**Option 3: Create a proxy with VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

**SC2S**
- `elasticloadbalancing.<region>.sc2s.sgov.gov`
- `ec2.<region>.sc2s.sgov.gov`
- `s3.<region>.sc2s.sgov.gov`

**C2S**
- `elasticloadbalancing.<region>.c2s.ic.gov`
- `ec2.<region>.c2s.ic.gov`
- `s3.<region>.c2s.ic.gov`
When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td>Public subnets</td>
<td></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td>Internet gateway</td>
<td></td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td>Network access control</td>
<td></td>
<td>You must allow the VPC to access the following ports:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Port</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>80</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>443</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>22</strong></td>
</tr>
</tbody>
</table>
### Component | AWS type | Description
--- | --- | ---
| 1024 - 65535 | Inbound ephemeral traffic | 0 - 65535 | Outbound ephemeral traffic |
| Private subnets | AWS::EC2::Subnet | Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them. |
| | AWS::EC2::RouteTable | |
| | AWS::EC2::SubnetRouteTableAssociation | |

#### 5.11.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

#### 5.11.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application
resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

5.11.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

5.11.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.11.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

**Prerequisites**

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
• You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

Procedure

1. Export your AWS profile as an environment variable:

   ```bash
   $ export AWS_PROFILE=<aws_profile>
   ```

2. Export the region to associate with your custom AMI as an environment variable:

   ```bash
   $ export AWS_DEFAULT_REGION=<aws_region>
   ```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

   ```bash
   $ export RHCOS_VERSION=<version>
   ```

   The RHCOS VMDK version, like 4.11.0.

4. Export the Amazon S3 bucket name as an environment variable:

   ```bash
   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
   ```

5. Create the `containers.json` file and define your RHCOS VMDK file:

   ```bash
   $ cat <<EOF > containers.json
   {
   "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
   "Format": "vmdk",
   "UserBucket": {
   "S3Bucket": "${VMIMPORT_BUCKET_NAME}"
   "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
   }
   }
   EOF
   ```

6. Import the RHCOS disk as an Amazon EBS snapshot:

   ```bash
   $ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
   --description "<description>" \
   --disk-container "file://<file_path>/containers.json"
   ```

   The description of your RHCOS disk being imported, like `rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64`.

   The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

   ```bash
   $ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
   ```
Example output

```json
{
   "ImportSnapshotTasks": [
      {
         "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
         "ImportTaskId": "import-snap-fh6i8uil",
         "SnapshotTaskDetail": {
            "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
            "DiskImageSize": 819056640.0,
            "Format": "VMDK",
            "SnapshotId": "snap-06331325870076318",
            "Status": "completed",
            "UserBucket": {
               "S3Bucket": "external-images",
               "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
            }
         }
      }
   ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RH COS AMI from the RH COS snapshot:

```bash
$ aws ec2 register-image --region ${AWS_DEFAULT_REGION} \
   --architecture x86_64 \
   --description "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \
   --ena-support \
   --name "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \
   --virtualization-type hvm \
   --root-device-name '/dev/xvda' \
   --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
   {DeleteOnTermination=true,SnapshotId=<snapshot_ID>}'
```

1. The RH COS VMDK architecture type, like x86_64, aarch64, s390x, or ppc64le.
2. The **Description** from the imported snapshot.
3. The name of the RH COS AMI.
4. The **SnapshotId** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-snapshots-import.html) and [creating EBS-backed AMIs](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-ami.html).

### 5.11.8. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RH COS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added
to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ``

   Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ``

   For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ``

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

   $ eval "$(ssh-agent -s)"

Example output

   Agent pid 31874

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name> ①

   ① Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.11.9. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   
   $ mkdir <installation_directory>
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

**5.11.10. Manually creating the installation configuration file**

Installing the cluster requires that you manually generate the installation configuration file.

**Prerequisites**

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

   ```
   $ mkdir <installation_directory>
   ```
IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

NOTE

You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.11.10.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.11.10.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.38. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### Pull Secret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
    "auths":{
        "cloud.openshift.com":{
            "auth":"b3Blb=",
            "email":"you@example.com"
        },
        "quay.io":{
            "auth":"b3Blb=",
            "email":"you@example.com"
        }
    }
}
```

### 5.11.10.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 5.39. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking.network Type</strong></td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. <strong>OpenShiftSDN</strong> is a CNI provider for all-Linux networks. <strong>OVNKubernetes</strong> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td><strong>networking.clusterNetwork</strong></td>
<td>The IP address blocks for pods. The default value is <strong>10.128.0.0/14</strong> with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
| | | ```json
 networking:
 clusterNetwork:
 - cidr: 10.128.0.0/14
 hostPrefix: 23
``` |
| **networking.clusterNetwork.cidr** | Required if you use **networking.clusterNetwork**. An IP address block. An IPv4 network. | An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32. |
| **networking.clusterNetwork.hostPrefix** | The subnet prefix length to assign to each individual node. For example, if **hostPrefix** is set to 23 then each node is assigned a /23 subnet out of the given **cidr**. A **hostPrefix** value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses. | A subnet prefix. The default value is 23. |
| **networking.serviceNetwork** | The IP address block for services. The default value is **172.30.0.0/16**. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network. | An array with an IP address block in CIDR format. For example: |
| | | ```json
 networking:
 serviceNetwork:
 - 172.30.0.0/16
``` |
| **networking.machineNetwork** | The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap. | An array of objects. For example: |
| | | ```json
 networking:
 machineNetwork:
 - cidr: 10.0.0.0/16
``` |
### networking.machinNetwork.cidr

Required if you use `networking.machinNetwork`. An IP address block. The default value is **10.0.0.0/16** for all platforms other than libvirt. For libvirt, the default value is **192.168.126.0/24**.

An IP network block in CIDR notation. For example, **10.0.0.0/16**.

**NOTE**

Set the `networking.machinNetwork` to match the CIDR that the preferred NIC resides in.

### 5.11.10.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.40. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>additionalTrustBundle</strong></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><strong>capabilities</strong></td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td><strong>capabilities.baseline</strong></td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. <strong>v4.11</strong> enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. <strong>vCurrent</strong> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <strong>vCurrent</strong>.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>capabilities.additionEnabledCapabilities</code></td>
<td>Extends the set of optional capabilities beyond what you specify in <code>baselineCapabilitySet</code>. Valid values are <code>baremetal</code>, <code>marketplace</code> and <code>openshift-samples</code>. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><code>true</code></td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> and <code>arm64</code>. Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see Supported installation methods for different platforms in Selecting a cluster installation method and preparing it for users.</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or [hyperthreading](#), on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td></td>
<td>dynamically tries to determine the capabilities of the provided credentials,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT
To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

### NOTE
If you are using Azure File storage, you cannot enable FIPS mode.

<table>

5.10.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.41. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>compute.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.iops</td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.size</td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The type of the root volume.</td>
<td>Valid <a href="#">AWS EBS volume type</a>, such as <code>io1</code>.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.kmsKeyARN</td>
<td>The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.</td>
<td>Valid key ID or the key ARN.</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <code>m4.2xlarge</code>. See the <a href="#">Supported AWS machine types</a> table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <strong>us-east-1</strong>. You can use the AWS CLI to access the regions available based on your selected instance type. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td></td>
<td>aws ec2 describe-instance-type-offerings --filters Name=instance-type,Values=c7g.xlarge</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>IMPORTANT</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See Global availability map in the AWS documentation. Currently, AWS Graviton3 processors are only available in some regions.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.rootVolume.kmsKeyARN</td>
<td>The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.</td>
<td>Valid key ID and the key ARN</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>controlPlane.plat</td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m6i.xlarge. See the Supported AWS machine types table that follows.</td>
</tr>
<tr>
<td>controlPlane.plat</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region. See RHCOS AMIs for AWS infrastructure for available AMI IDs.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KV.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
</tbody>
</table>
### platform.aws.serviceEndpoints.url

The AWS service endpoint URL. The URL must use the **https** protocol and the host must trust the certificate.

#### Valid AWS service endpoint URL.

### platform.aws.userTags

A map of keys and values that the installation program adds as tags to all resources that it creates.

#### Any valid YAML map, such as key value pairs in the `<key>: <value>` format. For more information about AWS tags, see [Tagging Your Amazon EC2 Resources](https://aws.amazon.com/documentation/ec2/) in the AWS documentation.

### platform.aws.subnets

If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

#### Valid subnet IDs.

---

### 5.11.10.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.26. Machine types based on 64-bit x86 architecture for secret regions

- c4.*
- c5.*
- i3.*
- m4.*
- m5.*
- r4.*
5.11.10.3. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (install-config.yaml) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  hypethreading: Enabled
  name: master
  platform:
    aws:
      zones:
      - us-iso-east-1a
      - us-iso-east-1b

1 Required.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as `m4.2xlarge` or `m5.2xlarge`, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as `io1` and set `iops` to 2000.

Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to `Required`. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to `Optional`. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the `https` protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see `Installing the system in FIPS mode`. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.
How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the internet. The default value is `External`.

The custom CA certificate. This is required when deploying to the SC2S or C2S Regions because the AWS API requires a custom CA trust bundle.

5.11.10.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ①
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ②
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,s3.<region>.amazonaws.com ③
   additionalTrustBundle: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA_CERT>
   -----END CERTIFICATE-----
   ① A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   ② A proxy URL to use for creating HTTPS connections outside the cluster.
3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For

4. If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.11.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**
1. Change to the directory that contains the installation program and initialize the cluster deployment:

   $ ./openshift-install create cluster --dir <installation_directory> \ 
   --log-level=info

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.11.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   ```

6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   ```
   $ echo $PATH
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:

  ```
  $ oc <command>
  ```
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your PATH.
   - To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the **oc** command:
  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.
   - **NOTE**
   - For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
   - To check your PATH, open a terminal and execute the following command:
   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the **oc** command:
5.11.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

5.11.14. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   **Example output**

   console   console-openshift-console.apps.<cluster_name>.<base_domain>   console
   https   reencrypt/Redirect   None

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- Accessing the web console

### 5.11.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager Hybrid Cloud Console**.

After you confirm that your **OpenShift Cluster Manager Hybrid Cloud Console** inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, **use subscription watch** to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- About remote health monitoring

### 5.11.16. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can **opt out of remote health reporting**.
- If necessary, you can **remove cloud provider credentials**.
5.12. INSTALLING A CLUSTER ON AWS CHINA

In OpenShift Container Platform version 4.11, you can install a cluster to the following Amazon Web Services (AWS) China regions:

- cn-north-1 (Beijing)
- cn-northwest-1 (Ningxia)

5.12.1. Prerequisites

- You have an Internet Content Provider (ICP) license.
- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

5.12.2. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) for the AWS China regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (install-config.yaml).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

5.12.3. Internet access for OpenShift Container Platform
In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access **OpenShift Cluster Manager Hybrid Cloud Console** to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access **Quay.io** to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.12.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

**IMPORTANT**

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network.
5.12.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the `baseDomain` for the cluster

The installation program does use the `baseDomain` that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.12.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

5.12.5. About using a custom VPC

In OpenShift Container Platform 4.11, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

5.12.5.1. Requirements for using your VPC

The installation program no longer creates the following components:
Internet gateways
NAT gateways
Subnets
Route tables
VPCs
VPC DHCP options
VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See Amazon VPC console wizard configurations and Work with VPCs and subnets in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See VPC networking components and Route tables for your VPC for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the kubernetes.io/cluster/*: owned, Name, and openshift.io/cluster tags. The installation program modifies your subnets to add the kubernetes.io/cluster/*: shared tag, so your subnets must have at least one free tag slot available for it. See Tag Restrictions in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a Name tag, because it overlaps with the EC2 Name field and the installation fails.

- You must enable the enableDnsSupport and enableDnsHostnames attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the platform.aws.hostedZone field in the install-config.yaml file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com.cn
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

With this option, network traffic remains private between your VPC and the required AWS services.

**Option 2: Create a proxy without VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

**Option 3: Create a proxy with VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com.cn
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

**Required VPC components**
You must provide a suitable VPC and subnets that allow communication to your machines.

|                 | 22   | Inbound SSH traffic         |                                                                                                                                           |
|                 | 1024 - 65535 | Inbound ephemeral traffic |                                                                                                                                           |
|                 | 0 - 65535 | Outbound ephemeral traffic |                                                                                                                                           |
| Private subnets | • AWS::EC2::Subnet  
• AWS::EC2::RouteTable  
• AWS::EC2::SubnetRouteTableAssociation | Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them. |

5.12.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:
All the subnets that you specify exist.

- You provide private subnets.

- The subnet CIDRs belong to the machine CIDR that you specified.

- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

### 5.12.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.12.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.

- ICMP ingress is allowed from the entire network.

- TCP 22 ingress (SSH) is allowed to the entire network.

- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 5.12.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.
After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.
a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add /path/to/file
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/path/to/file (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.12.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

**Prerequisites**

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

**Procedure**

1. Export your AWS profile as an environment variable:
1. The AWS profile name that holds your AWS credentials, like beijingadmin.

2. Export the region to associate with your custom AMI as an environment variable:

   ```bash
   $ export AWS_DEFAULT_REGION=<aws_region>
   ``

   The AWS region, like cn-north-1.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

   ```bash
   $ export RHCOS_VERSION=<version>
   ``

   The RHCOS VMDK version, like 4.11.0.

4. Export the Amazon S3 bucket name as an environment variable:

   ```bash
   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
   ``

5. Create the `containers.json` file and define your RHCOS VMDK file:

   ```bash
   $ cat <<EOF > containers.json
   {
     "Description": "rhcos-$[RHCOS_VERSION]-x86_64-aws.x86_64",
     "Format": "vmdk",
     "UserBucket": {
       "S3Bucket": "$[VMIMPORT_BUCKET_NAME]",
       "S3Key": "rhcos-$[RHCOS_VERSION]-x86_64-aws.x86_64.vmdk"
     }
   }
   EOF
   ``

6. Import the RHCOS disk as an Amazon EBS snapshot:

   ```bash
   $ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
     --description "<description>" \
     --disk-container "file://<file_path>/containers.json"
   ``

   The description of your RHCOS disk being imported, like rhcos-$[RHCOS_VERSION]-x86_64-aws.x86_64.

   The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

   ```bash
   $ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
   ```
Example output

```json
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs={DeleteOnTermination=true,SnapshotId=<snapshot_ID>}'
```

1. The RHCOS VMDK architecture type, like **x86_64**, **aarch64**, **s390x**, or **ppc64le**.
2. The **Description** from the imported snapshot.
3. The name of the RHCOS AMI.
4. The **SnapshotId** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for importing snapshots and creating EBS-backed AMIs.

### 5.12.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**
You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.12.9. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites

- You have uploaded a custom RHCOS AMI.

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure
1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.12.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

   **NOTE**

   After installation, you cannot modify these parameters in the `install-config.yaml` file.

5.12.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>nutanix</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform</code>, <code>&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td><code>{ &quot;auths&quot;:{ &quot;cloud.openshift.com&quot;:{ &quot;auth&quot;:&quot;b3Blb=&quot;, &quot;email&quot;:&quot;you@example.com&quot; }, &quot;quay.io&quot;:{ &quot;auth&quot;:&quot;b3Blb=&quot;, &quot;email&quot;:&quot;you@example.com&quot; } } }</code></td>
</tr>
</tbody>
</table>
5.12.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. <strong>OpenShiftSDN</strong> is a CNI provider for all-Linux networks. <strong>OVNKubernetes</strong> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
</tbody>
</table>
| networking.clusterNetwork | The IP address blocks for pods. The default value is **10.128.0.0/14** with a host prefix of **/23**. If you specify multiple IP address blocks, the blocks must not overlap. | An array of objects. For example:  

```
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
```

| networking.clusterNetwork.cidr | Required if you use `networking.clusterNetwork`. An IP address block. An IPv4 network. | An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between **0** and **32**. |
### networking.clusterNetwork.hostPrefix
- **Description:** The subnet prefix length to assign to each individual node. For example, if `hostPrefix` is set to 23 then each node is assigned a /23 subnet out of the given `cidr`. A `hostPrefix` value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.
- **Values:** A subnet prefix. The default value is 23.

### networking.serviceNetwork
- **Description:** The IP address block for services. The default value is `172.30.0.0/16`.
- **Values:** An array with an IP address block in CIDR format. For example:

```yaml
networking:
  serviceNetwork:
  - 172.30.0.0/16
```

### networking.machineNetwork
- **Description:** The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.
- **Values:** An array of objects. For example:

```yaml
networking:
  machineNetwork:
  - cidr: 10.0.0.0/16
```

### networking.machineNetwork.cidr
- **Description:** Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.
- **Values:** An IP network block in CIDR notation. For example, `10.0.0.0/16`.

#### NOTE
Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

5.12.9.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.44. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>capabilities.baselineCapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are <strong>None</strong>, <strong>v4.11</strong> and <strong>vCurrent</strong>. <strong>v4.11</strong> enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. <strong>vCurrent</strong> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <strong>vCurrent</strong>.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities.additionalEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><strong>true</strong></td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#).

The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageContentSources</code></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter | Description | Values
--- | --- | ---
imageContentSources.mirrors | Specify one or more repositories that may also contain the same images. | Array of strings
publish | How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes. | Internal or External. The default value is External. Setting this field to Internal is not supported on non-cloud platforms and IBM Cloud VPC.

**IMPORTANT**
If the value of the field is set to Internal, the cluster will become non-functional. For more information, refer to BZ#1953035.

| sshKey | The SSH key to authenticate access to your cluster machines. | For example, sshKey: ssh-ed25519 AAAA...

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 5.12.9.2. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**
This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:  
  
  hyperthreading: Enabled
  
  name: master
  
  platform:
    aws:
      
      zones:
        - cn-north-1a
        - cn-north-1b
      
      rootVolume:
        
        iops: 4000
        
        size: 500
        
        type: io1
        
      metadataService:
        
        authentication: Optional
        
        type: m6i.xlarge
      
      replicas: 3
      
      compute:  
        
        hyperthreading: Enabled
        
        name: worker
        
        platform:
          
          aws:
            
            rootVolume:
              
              iops: 2000
              
              size: 500
              
              type: io1
              
            metadataService:
              
              authentication: Optional
              
              type: c5.4xlarge
            
            zones:
              - cn-north-1a
            
            replicas: 3
            
            metadata:
              
              name: test-cluster
              
              networking:
                
                clusterNetwork:
                  
                  cidr: 10.128.0.0/14
                  
                  hostPrefix: 23
                
                machineNetwork:
                  
                  cidr: 10.0.0.0/16
                  
                networkType: OpenShiftSDN
                
                serviceNetwork:
                  
                  - 172.30.0.0/16
                  
              platform:
                
                aws:
                  
                  region: cn-north-1
                  
                  userTags:
                    
                    adminContact: jdoe
                    
                    costCenter: 7536
                  
                  subnets:  
                    - subnet-1
                    
                    - subnet-2
- subnet-3
  - amiID: ami-96c6f8f7
  - serviceEndpoints: 17
    - name: ec2
      url: https://vpce-id.ec2.cn-north-1.vpce.amazonaws.com.cn
    - hostedZone: Z3URY6TW691KV
  - fips: false
  - sshKey: ssh-ed25519 AAAA...
  - publish: Internal
  - pullSecret: '{"auths": ...}'

1. Required.
2. Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
3. If you do not provide these parameters and values, the installation program provides the default value.
4. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.
5. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

   **IMPORTANT**

   If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

6. To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.
7. Whether to require the Amazon EC2 Instance Metadata Service v2 (IMDSv2). To require IMDSv2, set the parameter value to Required. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to Optional. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

   **NOTE**

   The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using machine sets.

8. If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
9. The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same
The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see *Installing the system in FIPS mode*. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

How to publish the user-facing endpoints of your cluster. Set publish to Internal to deploy a private cluster, which cannot be accessed from the internet. The default value is External.

### 5.12.9.3. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

#### Table 5.45. Minimum resource requirements

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>
1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources
   - Optimizing storage

5.12.9.4. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.27. Machine types based on 64-bit x86 architecture
   - c4.*
   - c5.*
   - c5a.*
   - i3.*
   - m4.*
   - m5.*
   - m5a.*
   - m6i.*
   - r4.*
   - r5.*
5.12.9.5. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.28. Machine types based on 64-bit ARM architecture**

- c6g.*
- m6g.*

5.12.9.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).
**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>  
     httpsProxy: https://<username>:<pswd>@<ip>:<port>
     noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.
     <region>.amazonaws.com,s3.<region>.amazonaws.com
   additionalTrustBundle: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA_CERT>
   -----END CERTIFICATE-----
   
   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   2 A proxy URL to use for creating HTTPS connections outside the cluster.
   3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the `noProxy` field.
   4 If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

   **NOTE**

   The installation program does not support the proxy `readinessEndpoints` field.

   **NOTE**

   If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

   ```bash
   $ ./openshift-install wait-for install-complete --log-level debug
   
   2. Save the file and reference it when installing OpenShift Container Platform.

   The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.
5.12.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
   ```

   1. For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

**Verification**

When the cluster deployment completes successfully:
The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.

- Credential information also outputs to `<installation_directory>/.openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 5.12.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**
2. Select the architecture in the Product Variant drop-down menu.
3. Select the appropriate version in the Version drop-down menu.
4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.
5. Unpack the archive:

   $ tar xvf <file>

6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

Verification

- After you install the OpenShift CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   C:\> path

Verification

- After you install the OpenShift CLI, it is available using the oc command:

   C:\> oc <command>

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  $ oc <command>
  ```

**5.12.12. Logging in to the cluster by using the CLI**

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

**Example output**

-
5.12.13. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ``

   **NOTE**

   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/.openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/.openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

5.12.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use...
subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.
- See About remote health monitoring for more information about the Telemetry service.

5.12.15. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

5.13. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) that uses infrastructure that you provide.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company’s policies.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

5.13.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.
**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or UNIX) in the AWS documentation.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

### 5.13.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.13.3. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 5.13.3.1. Required machines for cluster installation
The smallest OpenShift Container Platform clusters require the following hosts:

**Table 5.46. Minimum required hosts**

<table>
<thead>
<tr>
<th>Hosts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One temporary bootstrap machine</td>
<td>The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.</td>
</tr>
<tr>
<td>Three control plane machines</td>
<td>The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.</td>
</tr>
<tr>
<td>At least two compute machines, which are also known as worker machines.</td>
<td>The workloads requested by OpenShift Container Platform users run on the compute machines.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.6 and later.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

### 5.13.3.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.47. Minimum resource requirements**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources
- Optimizing storage

5.13.3.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE
Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.29. Machine types based on 64-bit x86 architecture
- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
5.13.3.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.30. Machine types based on 64-bit ARM architecture

- c6g.*
- m6g.*

5.13.3.5. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The `kube-controller-manager` only approves the kubelet client CSRs. The `machine-approver` cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

5.13.4. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the OpenShift Container Platform 4.x Tested Integrations page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

5.13.4.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

**Option 1: Create VPC endpoints**
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

With this option, network traffic remains private between your VPC and the required AWS services.

**Option 2: Create a proxy without VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

**Option 3: Create a proxy with VPC endpoints**
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.
### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>• AWS::EC2::VPC</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td>• AWS::EC2::VPC Endpoint</td>
<td></td>
</tr>
<tr>
<td>Public subnets</td>
<td>• AWS::EC2::Subnet</td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>

</tbody>
</table>

### Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster’s infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for `api.<cluster_name>.<domain>` must point to the external load balancer, and an entry for `api-int.<cluster_name>.<domain>` must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>AWS::Route 53::HostedZone</td>
<td>The hosted zone for your internal DNS.</td>
</tr>
<tr>
<td>Public load balancer</td>
<td>AWS::ElasticLoadBalancingV2::LoadBalancer</td>
<td>The load balancer for your public subnets.</td>

</tr>
</tbody>
</table>

### Security groups

The control plane and worker machines require access to the following ports:

<table>
<thead>
<tr>
<th>Group</th>
<th>AWS type</th>
<th>IP Protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>6443</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22623</td>
</tr>
<tr>
<td>WorkerSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>
<td>0</td>
</tr>
</tbody>
</table>
### Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a `AWS::EC2::SecurityGroupIngress` resource.

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MasterIngress Etcld</strong></td>
<td>etcd</td>
<td>tcp</td>
<td>2379-2380</td>

</tr>
<tr>
<td>Master Ingress WorkerIngressServicesUDP</td>
<td>Kubernetes Ingress services</td>
<td>udp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a AWS::EC2::SecurityGroupIngress resource.
<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>WorkerIngress Vxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>

<td>Kubernetes Ingress services</td>
<td>udp</td>
<td>30000 - 32767</td>
</tr>
<tr>
<td>MasterIngressServicesUDP</td>
<td>Kubernetes Ingress services</td>
<td>udp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

### Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following `AWS::IAM::Role` objects and provide a `AWS::IAM::InstanceProfile` for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

<table>
<thead>
<tr>
<th>Role</th>
<th>Effect</th>
<th>Action</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master</td>
<td>Allow</td>
<td>ec2:*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>elasticloadbalancing:*</td>
<td>*</td>
</tr>
<tr>
<td></td>

<td>ec2:Describe*</td>
<td>*</td>
</tr>
<tr>
<td>Bootstrap</td>
<td>Allow</td>
<td>ec2:Describe*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>ec2:AttachVolume</td>
<td>*</td>
</tr>
</tbody>
</table>
5.13.4.2. Cluster machines

You need AWS::EC2::Instance objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

5.13.4.3. Required AWS permissions for the IAM user

NOTE

Your IAM user must have the permission tag:GetResources in the region us-east-1 to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the AdministratorAccess policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

Example 5.31. Required EC2 permissions for installation

- ec2:AuthorizeSecurityGroupEgress
- ec2:AuthorizeSecurityGroupIngress
- ec2:CopyImage
- ec2:CreateNetworkInterface
- ec2:AttachNetworkInterface
- ec2:CreateSecurityGroup
- ec2:CreateTags
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteSnapshot
- ec2:DeleteTags
- ec2:DeregisterImage
- ec2:DescribeAccountAttributes
- ec2:DescribeAddresses
- ec2:DescribeAvailabilityZones
- ec2:DescribeDhcpOptions
- ec2:DescribeImages
- ec2:DescribeInstanceAttribute
- ec2:DescribeInstanceCreditSpecifications
- ec2:DescribeInstances
- ec2:DescribeInstanceTypes
- ec2:DescribeInternetGateways
- ec2:DescribeKeyPairs
- ec2:DescribeNatGateways
- ec2:DescribeNetworkAcls
- ec2:DescribeNetworkInterfaces
- ec2:DescribePrefixLists
- ec2:DescribeRegions
- ec2:DescribeRouteTables
- ec2:DescribeSecurityGroups
- ec2:DescribeSubnets
- ec2:DescribeTags
- ec2:DescribeVolumes
- ec2:DescribeVpcAttribute
- ec2:DescribeVpcClassicLink
- ec2:DescribeVpcClassicLinkDnsSupport
- ec2:DescribeVpcEndpoints
- ec2:DescribeVpcs
- ec2:GetEbsDefaultKmsKeyId
- ec2:ModifyInstanceAttribute
- ec2:ModifyNetworkInterfaceAttribute
- ec2:RevokeSecurityGroupEgress
- ec2:RevokeSecurityGroupIngress
- ec2:RunInstances
- ec2:TerminateInstances

Example 5.32. Required permissions for creating network resources during installation

- ec2:AllocateAddress
- ec2:AssociateAddress
- ec2:AssociateDhcpOptions
- ec2:AssociateRouteTable
- ec2:AttachInternetGateway
- ec2:CreateDhcpOptions
- ec2:CreateInternetGateway
- ec2:CreateNatGateway
- ec2:CreateRoute
- ec2:CreateRouteTable
- ec2:CreateSubnet
- ec2:CreateVpc
- ec2:CreateVpcEndpoint
- ec2:ModifySubnetAttribute
- ec2:ModifyVpcAttribute

NOTE

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 5.33. Required Elastic Load Balancing permissions (ELB) for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ConfigureHealthCheck
• elasticloadbalancing:CreateLoadBalancer
• elasticloadbalancing:CreateLoadBalancerListeners
• elasticloadbalancing:DeleteLoadBalancer
• elasticloadbalancing:DeregisterInstancesFromLoadBalancer
• elasticloadbalancing:DescribeInstanceHealth
• elasticloadbalancing:DescribeLoadBalancerAttributes
• elasticloadbalancing:DescribeLoadBalancers
• elasticloadbalancing:DescribeTags
• elasticloadbalancing:ModifyLoadBalancerAttributes
• elasticloadbalancing:RegisterInstancesWithLoadBalancer
• elasticloadbalancing:SetLoadBalancerPoliciesOfListener

Example 5.34. Required Elastic Load Balancing permissions (ELBv2) for installation

• elasticloadbalancing:AddTags
• elasticloadbalancing:CreateListener
• elasticloadbalancing:CreateLoadBalancer
• elasticloadbalancing:CreateTargetGroup
• elasticloadbalancing:DeleteLoadBalancer
• elasticloadbalancing:DeregisterTargets
• elasticloadbalancing:DescribeListeners
• elasticloadbalancing:DescribeLoadBalancerAttributes
• elasticloadbalancing:DescribeLoadBalancers
• elasticloadbalancing:DescribeTargetGroupAttributes
• elasticloadbalancing:DescribeTargetHealth
• elasticloadbalancing:ModifyLoadBalancerAttributes
• elasticloadbalancing:ModifyTargetGroup
• elasticloadbalancing:ModifyTargetGroupAttributes
• elasticloadbalancing:RegisterTargets

Example 5.35. Required IAM permissions for installation
- iam:AddRoleToInstanceProfile
- iam:CreateInstanceProfile
- iam:CreateRole
- iam:DeleteInstanceProfile
- iam:DeleteRole
- iam:DeleteRolePolicy
- iam:GetInstanceProfile
- iam:GetRole
- iam:GetRolePolicy
- iam:GetUser
- iam:ListInstanceProfilesForRole
- iam:ListRoles
- iam:ListUsers
- iam:PassRole
- iam:PutRolePolicy
- iam:RemoveRoleFromInstanceProfile
- iam:SimulatePrincipalPolicy
- iam:TagRole

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

**Example 5.36. Required Route 53 permissions for installation**

- route53:ChangeResourceRecordSets
- route53:ChangeTagsForResource
- route53:CreateHostedZone
- route53:DeleteHostedZone
- route53:GetChange
- route53:GetHostedZone
- route53:ListHostedZones
- route53:ListHostedZonesByName
- route53:ListResourceRecordSets
- route53:ListTagsForResource
- route53:UpdateHostedZoneComment

Example 5.37. Required S3 permissions for installation

- s3:CreateBucket
- s3:DeleteBucket
- s3:GetAccelerateConfiguration
- s3:GetBucketAcl
- s3:GetBucketCors
- s3:GetBucketLocation
- s3:GetBucketLogging
- s3:GetBucketPolicy
- s3:GetBucketObjectLockConfiguration
- s3:GetBucketReplication
- s3:GetBucketRequestPayment
- s3:GetBucketTagging
- s3:GetBucketVersioning
- s3:GetBucketWebsite
- s3:GetEncryptionConfiguration
- s3:GetLifecycleConfiguration
- s3:GetReplicationConfiguration
- s3:ListBucket
- s3:PutBucketAcl
- s3:PutBucketTagging
- s3:PutEncryptionConfiguration

Example 5.38. S3 permissions that cluster Operators require

- s3:DeleteObject
Example 5.39. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
- ec2:DeletePlacementGroup
- ec2:DeleteNetworkInterface
- ec2:DeleteVolume
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DescribeTargetGroups
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:ListAttachedRolePolicies
- iam:ListInstanceProfiles
- iam:ListRolePolicies
- iam:ListUserPolicies
- s3:DeleteObject
- s3:ListBucketVersions
- tag:GetResources

Example 5.40. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
• ec2:DeleteRouteTable
• ec2:DeleteSubnet
• ec2:DeleteVpc
• ec2:DeleteVpcEndpoints
• ec2:DetachInternetGateway
• ec2:DisassociateRouteTable
• ec2:ReleaseAddress
• ec2:ReplaceRouteTableAssociation

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the `tag:UntagResources` permission to delete network resources.

Example 5.41. Required permissions to delete a cluster with shared instance roles

• iam:UntagRole

Example 5.42. Additional IAM and S3 permissions that are required to create manifests

• iam:DeleteAccessKey
• iam:DeleteUser
• iam:DeleteUserPolicy
• iam:GetUserPolicy
• iam:ListAccessKeys
• iam:PutUserPolicy
• iam:TagUser
• s3:PutBucketPublicAccessBlock
• s3:GetBucketPublicAccessBlock
• s3:PutLifecycleConfiguration
• s3:HeadBucket
• s3:ListBucketMultipartUploads
• s3:AbortMultipartUpload
NOTE
If you are managing your cloud provider credentials with mint mode, the IAM user also requires the `iam:CreateAccessKey` and `iam:CreateUser` permissions.

Example 5.43. Optional permissions for instance and quota checks for installation
- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

5.13.5. Obtaining an AWS Marketplace image
If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

Prerequisites
- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure
1. Complete the OpenShift Container Platform subscription from the AWS Marketplace.
2. Record the AMI ID for your specific region. If you use the CloudFormation template to deploy your worker nodes, you must update the `worker0.type.properties.ImageID` parameter with this value.

5.13.6. Obtaining the installation program
Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites
- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure
1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.
The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.13.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N " -f <path>/<file_name>
```

Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>
```

```
Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

### 5.13.8. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `var` partition during the preparation phases of installation.

#### 5.13.8.1. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- `/var/lib/containers`: Holds container-related content that can grow as more images and containers are added to a system.
- `/var/lib/etcd`: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- `/var`: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a `/var` directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because `/var` must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate `/var` partition by creating a machine config manifest that is inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.
Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

   $ mkdir $HOME/clusterconfig

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   $ openshift-install create manifests --dir $HOME/clusterconfig

   **Example output**

   ? SSH Public Key ...
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: $HOME/clusterconfig/manifests and $HOME/clusterconfig/openshift

3. Optional: Confirm that the installation program created manifests in the `clusterconfig/openshift` directory:

   $ ls $HOME/clusterconfig/openshift/

   **Example output**

   99_kubeadmin-password-secret.yaml
   99_openshift-cluster-api_master-machines-0.yaml
   99_openshift-cluster-api_master-machines-1.yaml
   99_openshift-cluster-api_master-machines-2.yaml
   ...

4. Create a Butane config that configures the additional partition. For example, name the file `$HOME/clusterconfig/98-var-partition.bu`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This example places the `/var` directory on a separate partition:

   ```yaml
   variant: openshift
   version: 4.11.0
   metadata:
     labels:
       machineconfiguration.openshift.io/role: worker
       name: 98-var-partition
   storage:
     disks:
       - device: /dev/<device_name>  
         partitions:
           - label: var
             start_mib: <partition_start_offset>
             size_mib: <partition_size>
         filesystems:
           - device: /dev/disk/by-partlabel/var
             path: /var
   ```
The storage device name of the disk that you want to partition.

When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinals of RHCOS might overwrite the beginning of the data partition.

The size of the data partition in mebibytes.

The \texttt{prjquota} mount option must be enabled for filesystems used for container storage.

\textbf{NOTE}

When creating a separate \texttt{/var} partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the \texttt{clusterconfig/openshift} directory. For example, run the following command:

\begin{verbatim}
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
\end{verbatim}

6. Run \texttt{openshift-install} again to create Ignition configs from a set of files in the \texttt{manifest} and \texttt{openshift} subdirectories:

\begin{verbatim}
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
\end{verbatim}

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

5.13.8.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

\textbf{Prerequisites}

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster.

- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the \texttt{install-config.yaml} file manually.
Procedure

1. Create the `install-config.yaml` file.
   
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select `aws` as the platform to target.

   iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

   **NOTE**

   The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

   iv. Select the AWS region to deploy the cluster to.

   v. Select the base domain for the Route 53 service that you configured for your cluster.

   vi. Enter a descriptive name for your cluster.

   vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.
2. Optional: Back up the `install-config.yaml` file.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

**Additional resources**

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

### 5.13.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
  noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,s3.<region>.amazonaws.com
  additionalTrustBundle:
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
```

OpenShift Container Platform 4.11 Installing
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the noProxy field.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy readinessEndpoints field.

NOTE
If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

$ ./openshift-install wait-for install-complete --log-level debug

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

5.13.8.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.
IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the install-config.yaml installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the installation directory that contains the install-config.yaml file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the mastersSchedulable parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to false. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the mastersSchedulable parameter and ensure that it is set to false.
c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the privateZone and publicZone sections from the <installation_directory>/manifests/cluster-dns-02-config.yml DNS configuration file:

```yaml
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone:
    id: mycluster-100419-private-zone
  publicZone:
    id: example.openshift.com
status: {}
```

1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory>  
```

For <installation_directory>, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The kubeadm-password and kubeconfig files are created in the ./<installation_directory>/auth directory:

```
├── auth
│   ├── kubeadm-password
│   └── kubeconfig
└── bootstrap.ign
    ├── master.ign
    └── metadata.json
```

5.13.9. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

Prerequisites
You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

You generated the Ignition config files for your cluster.

You installed the `jq` package.

**Procedure**

To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

**Example output**

```
openshift-vw9j6
```

The output of this command is your cluster name and a random string.

### 5.13.10. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:
The CIDR block for the VPC.

Specify a CIDR block in the format \textit{x.x.x.x/16-24}.

The number of availability zones to deploy the VPC in.

Specify an integer between 1 and 3.

The size of each subnet in each availability zone.

Specify an integer between 5 and 13, where 5 is /27 and 13 is /19.

2. Copy the template from the \textbf{CloudFormation template for the VPC} section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

\textbf{IMPORTANT}

You must enter the command on a single line.

\$ aws cloudformation create-stack --stack-name \texttt{<name>} \texttt{1}  
\hspace{2cm} --template-body file://\texttt{<template>}.yaml \texttt{2}  
\hspace{2cm} --parameters file://\texttt{<parameters>}.json \texttt{3}

\texttt{<name>} is the name for the CloudFormation stack, such as \texttt{cluster-vpc}. You need the name of this stack if you remove the cluster.

\texttt{<template>} is the relative path to and name of the CloudFormation template YAML file that you saved.

\texttt{<parameters>} is the relative path to and name of the CloudFormation parameters JSON file.

Example output
Confirm that the template components exist:

```bash
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of your VPC.</td>
</tr>
<tr>
<td>PublicSubnetIds</td>
<td>The IDs of the new public subnets.</td>
</tr>
<tr>
<td>PrivateSubnetIds</td>
<td>The IDs of the new private subnets.</td>
</tr>
</tbody>
</table>

5.13.10.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

**Example 5.44. CloudFormation template for the VPC**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:

VpcCidr:

  AllowedPattern: ^((\[0-9]\[1-9]\[0-9]\[0-9]\[2]\[0-4]\[0-9]\[25\[0-5]\])\.){3}(\[0-9]\[1-9]\[0-9]\[0-9]\[1]\[0-9]\[2]\[0-4]\[0-9]\[25\[0-5]\])(/((1\[6-9]\[2]\[0-4])))$

  ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.

  Default: 10.0.0.0/16

  Description: CIDR block for VPC.

  Type: String

AvailabilityZoneCount:

  ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"

  MinValue: 1

  MaxValue: 3

  Default: 1

  Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"

  Type: Number

SubnetBits:

  ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.

  MinValue: 5

  MaxValue: 13

  Default: 12

  Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"

  Type: Number
```

    ]

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

5.13.11. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of
AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the `install-config.yaml` file for your cluster. You can obtain details about your hosted zone by running the following command:

   ```shell
   $ aws route53 list-hosted-zones-by-name --dns-name <route53_domain>
   ```

   Note for `<route53_domain>`:

   For the `<route53_domain>`, specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster.

   **Example output**

   In the example output, the hosted zone ID is `Z21IXYZABC2A4`.

2. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   {
   "ParameterKey": "ClusterName",  
   "ParameterValue": "mycluster"
   },
   {
   "ParameterKey": "InfrastructureName",  
   "ParameterValue": "mycluster-<random_string>"
   }
   ]
   ```
A short, representative cluster name to use for hostnames, etc.

Specify the cluster name that you used when you generated the `install-config.yaml` file for the cluster.

The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

The Route 53 public zone ID to register the targets with.

Specify the Route 53 public zone ID, which as a format similar to `Z21IXYZABCZ2A4`. You can obtain this value from the AWS console.

The Route 53 zone to register the targets with.

Specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

The public subnets that you created for your VPC.

Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.
Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

3. Copy the template from the CloudFormation template for the network and load balancers section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

   **IMPORTANT**

   If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

   **IMPORTANT**

   You must enter the command on a single line.

   $ aws cloudformation create-stack --stack-name <name>  
   --template-body file:///<template>.yaml  
   --parameters file:///<parameters>.json  
   --capabilities CAPABILITY_NAMED_IAM

   1. `<name>` is the name for the CloudFormation stack, such as `cluster-dns`. You need the name of this stack if you remove the cluster.

   2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   4. You must explicitly declare the **CAPABILITY_NAMED_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

   **Example output**

   ```
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
   ```

5. Confirm that the template components exist:

   $ aws cloudformation describe-stacks --stack-name <name>

   After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrivateHostedZoneId</td>
<td>Hosted zone ID for the private DNS.</td>
</tr>
<tr>
<td>ExternalApiLoadBalancerName</td>
<td>Full name of the external API load balancer.</td>
</tr>
<tr>
<td>InternalApiLoadBalancerName</td>
<td>Full name of the internal API load balancer.</td>
</tr>
<tr>
<td>ApiServerDnsName</td>
<td>Full hostname of the API server.</td>
</tr>
<tr>
<td>RegisterNlbIpTargetArn</td>
<td>Lambda ARN useful to help register/deregister IP targets for these load balancers.</td>
</tr>
<tr>
<td>ExternalApiTargetGroupArn</td>
<td>ARN of external API target group.</td>
</tr>
<tr>
<td>InternalApiTargetGroupArn</td>
<td>ARN of internal API target group.</td>
</tr>
<tr>
<td>InternalServiceTargetGroupArn</td>
<td>ARN of internal service target group.</td>
</tr>
</tbody>
</table>

### 5.13.11.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

**Example 5.45. CloudFormation template for the network and load balancers**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
ClusterName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, representative cluster name to use for host names and other identifying
```
names.
Type: String
InfrastructureName:
AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]([a-zA-Z0-9]{0,26})$ MaxLength: 27
MinLength: 1
ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
Type: String
HostedZoneId:
Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCR24.
Type: String
HostedZoneName:
Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.
Type: String
Default: "example.com"
PublicSubnets:
Description: The internet-facing subnets.
Type: List<AWS::EC2::Subnet::Id>
PrivateSubnets:
Description: The internal subnets.
Type: List<AWS::EC2::Subnet::Id>
VpcId:
Description: The VPC-scoped resources will belong to this VPC.
Type: AWS::EC2::VPC::Id

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: default: "Cluster Information"
Parameters:
  - ClusterName
  - InfrastructureName
- Label: default: "Network Configuration"
Parameters:
  - VpcId
  - PublicSubnets
  - PrivateSubnets
- Label: default: "DNS"
Parameters:
  - HostedZoneName
  - HostedZoneId
ParameterLabels:
ClusterName:
  default: "Cluster Name"

              Action:
                - "ec2:DeleteTags"
                - "ec2:CreateTags"
          Resource: "arn:aws:ec2:*:*:subnet/*"
            - Effect: "Allow"
              Action:
                - "ec2:DescribeSubnets"
                - "ec2:DescribeTags"
          Resource: "*"

RegisterSubnetTags:
Type: "AWS::Lambda::Function"
Properties:
  Handler: "index.handler"
  Role:
import json
import boto3
import cfnresponse
def handler(event, context):
    ec2_client = boto3.client('ec2')
    if event['RequestType'] == 'Delete':
        for subnet_id in event['ResourceProperties']['Subnets']:
            ec2_client.delete_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' + event['ResourceProperties']['InfrastructureName']}])
    elif event['RequestType'] == 'Create':
        for subnet_id in event['ResourceProperties']['Subnets']:
            ec2_client.create_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' + event['ResourceProperties']['InfrastructureName'], 'Value': 'shared'}])
    responseData ={}
    cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData, event['ResourceProperties']['InfrastructureName'] + event['ResourceProperties']['Subnets'][0])
Runtime: "python3.7"
Timeout: 120
IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the InternalApiServerRecord to use CNAME records. Records of type ALIAS are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
  - !GetAtt IntApiElb.DNSName
```

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.
- You can view details about your hosted zones by navigating to the AWS Route 53 console.
- See Listing public hosted zones in the AWS documentation for more information about listing public hosted zones.

5.13.12. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   {  
   "ParameterKey": "InfrastructureName",  
   "ParameterValue": "mycluster-<random_string>"  
   },
   {  
   "ParameterKey": "VpcCidr",  
   "ParameterValue": "10.0.0.0/16"  
   },
   {  
   "ParameterKey": "PrivateSubnets",  
   "ParameterValue": "subnet-<random_string>"  
   },
   {  
   "ParameterKey": "VpcId",  
   "ParameterValue": "vpc-<random_string>"  
   }
   ]
   ``

   1. The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
   2. Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.
   3. The CIDR block for the VPC.
   4. Specify the CIDR block parameter that you used for the VPC that you defined in the form `x.x.x.x/16-24`.
   5. The private subnets that you created for your VPC.
   6. Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.
   7. The VPC that you created for the cluster.
   8. Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

2. Copy the template from the CloudFormation template for security objects section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:
IMPORTANT

You must enter the command on a single line.

```bash
$ aws cloudformation create-stack --stack-name <name>  
   --template-body file://<template>.yaml  
   --parameters file://<parameters>.json  
   --capabilities CAPABILITY_NAMED_IAM
```

1. `<name>` is the name for the CloudFormation stack, such as `cluster-sec`. You need the name of this stack if you remove the cluster.

2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```bash
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroupId</td>
<td>Master Security Group ID</td>
</tr>
<tr>
<td>WorkerSecurityGroupId</td>
<td>Worker Security Group ID</td>
</tr>
<tr>
<td>MasterInstanceProfile</td>
<td>Master IAM Instance Profile</td>
</tr>
<tr>
<td>WorkerInstanceProfile</td>
<td>Worker IAM Instance Profile</td>
</tr>
</tbody>
</table>
5.13.12.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

Example 5.46. CloudFormation template for security objects

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^((\[0-9\]((\[0-9\]|\[1-9]\[0-9\]|1[0-9]\[0-9\]|2[0-4]\\[0-9\]|25[0-5])\.)\[0-9\]|1|2[0-4]\[0-4])|25[0-5])$/
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  PrivateSubnets:
    Description: The internal subnets.
    Type: List<AWS::EC2::Subnet::Id>

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
    - Label: "Cluster Information"
      Parameters:
        - InfrastructureName
          - Label: "Network Configuration"
            Parameters:
              - VpcId
              - VpcCidr
              - PrivateSubnets
        ParameterLabels:
          InfrastructureName:
            default: "Infrastructure Name"
          VpcId:
            default: "VPC ID"
          VpcCidr:
            default: "VPC CIDR"
          PrivateSubnets:
            default: "Private Subnets"
```

OpenShift Container Platform 4.11 Installing
Resources:

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.
5.13.13. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, stream metadata provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the `coreos print-stream-json` sub-command of `openshift-install` to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the `openshift-install` binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official `stream-metadata-go` library at https://github.com/coreos/stream-metadata-go. You can also view example code in the library.

- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.

- From a command-line utility that handles JSON data, such as `jq`:
  - Print the current x86_64 or aarch64 AMI for an AWS region, such as `us-west-1`:

    For x86_64

    ```
    $ openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.images.aws.regions["us-west-1"].image'
    
    Example output
    
    ami-0d3e625f84626bbda
    ```

    For aarch64

    ```
    $ openshift-install coreos print-stream-json | jq -r '.architectures.aarch64.images.aws.regions["us-west-1"].image'
    
    Example output
    
    ami-0af1d3b7fa5be2131
    ```

The output of this command is the AWS AMI ID for your designated architecture and the `us-west-1` region. The AMI must belong to the same region as the cluster.

5.13.14. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.
By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

5.13.14.1. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you can upload a custom AMI prior to installing the cluster.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the us-east-1 AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the install-config.yaml file.

5.13.14.2. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

Procedure

1. Export your AWS profile as an environment variable:

   $ export AWS_PROFILE=<aws_profile>  

2. Export the region to associate with your custom AMI as an environment variable:

   $ export AWS_DEFAULT_REGION=<aws_region>  

---

<table>
<thead>
<tr>
<th>AWS zone</th>
<th>AWS AMI</th>
</tr>
</thead>
<tbody>
<tr>
<td>us-east-2</td>
<td>ami-028a3d23312630036</td>
</tr>
<tr>
<td>us-west-1</td>
<td>ami-05356b8fece665cf1</td>
</tr>
<tr>
<td>us-west-2</td>
<td>ami-0e6473997df31eb0f</td>
</tr>
</tbody>
</table>
3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

   $ export RHCOS_VERSION=<version>  

   The RHCOS VMDK version, like 4.11.0.

4. Export the Amazon S3 bucket name as an environment variable:

   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>

5. Create the containers.json file and define your RHCOS VMDK file:

   $ cat <<EOF > containers.json
   {
     "Description": "rhcos-$\{RHCOS_VERSION\}-x86_64-aws.x86_64",
     "Format": "vmdk",
     "UserBucket": {
       "S3Bucket": "$\{VMIMPORT_BUCKET_NAME\}",
       "S3Key": "rhcos-$\{RHCOS_VERSION\}-x86_64-aws.x86_64.vmdk"
     }
   }
   EOF

6. Import the RHCOS disk as an Amazon EBS snapshot:

   $ aws ec2 import-snapshot --region $\{AWS_DEFAULT_REGION\} \
      --description "<description>" \
      --disk-container "file://<file_path>/containers.json"

   The description of your RHCOS disk being imported, like rhcos-$\{RHCOS_VERSION\}-x86_64-aws.x86_64.

   The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

   $ watch -n 5 aws ec2 describe-import-snapshot-tasks --region $\{AWS_DEFAULT_REGION\}

   Example output

   

   {  
     "ImportSnapshotTasks": [  
       {  
         "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
         "ImportTaskId": "import-snap-fh6i8uil",
         "SnapshotTaskDetail": {  
           "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
           "DiskImageSize": 819056640.0,
           "Format": "VMDK",
           "SnapshotId": "snap-06331325870076318",
           "Status": "completed",
         }  
       }  
     ]  
   }
Copy the SnapshotId to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \  
  --description "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \  
  --ena-support \ 
  --name "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \ 
  --virtualization-type hvm \ 
  --root-device-name '/dev/xvda' \ 
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs={DeleteOnTermination=true,SnapshotId=<snapshot_ID>}'
```

1. The RHCOS VMDK architecture type, like x86_64, aarch64, s390x, or ppc64le.
2. The Description from the imported snapshot.
3. The name of the RHCOS AMI.
4. The SnapshotId from the imported snapshot.

To learn more about these APIs, see the AWS documentation for importing snapshots and creating EBS-backed AMIs.

5.13.15. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization. You do this by:

- Providing a location to serve the bootstrap.ign Ignition config file to your cluster. This file is located in your installation directory. The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

- Using the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.
NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

Procedure

1. Create the bucket by running the following command:

```
$ aws s3 mb s3://<cluster-name>-infra
```

<cluster-name>-infra is the bucket name. When creating the `install-config.yaml` file, replace `<cluster-name>` with the name specified for the cluster.

You must use a presigned URL for your S3 bucket, instead of the `s3:` schema, if you are:

- Deploying to a region that has endpoints that differ from the AWS SDK.
- Deploying a proxy.
- Providing your own custom endpoints.

2. Upload the `bootstrap.ign` Ignition config file to the bucket by running the following command:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

3. Verify that the file uploaded by running the following command:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

Example output

```
2019-04-03 16:15:16   314878 bootstrap.ign
```
NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

4. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroupId", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcId", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  },
  {
    "ParameterKey": "RegisterNlbIpTargetsLambdaArn", 17
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:<dns_stack_name>-RegisterNlbIpTargets-<random_string>" 18
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 19
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
  }
]
```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name><random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node based on your selected architecture.

Specify a valid `AWS::EC2::Image::Id` value.

CIDR block to allow SSH access to the bootstrap node.

Specify a CIDR block in the format `x.x.x.x/16-24`.

The public subnet that is associated with your VPC to launch the bootstrap node into.

Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The master security group ID (for registering temporary rules)

Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The VPC created resources will belong to.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

Location to fetch bootstrap Ignition config file from.

Specify the S3 bucket and file name in the form `s3://<bucket_name>/bootstrap.ign`.

Whether or not to register a network load balancer (NLB).

Specify `yes` or `no`. If you specify `yes`, you must provide a Lambda Amazon Resource Name (ARN) value.

The ARN for NLB IP target registration lambda group.

Specify the `RegisterNlbIpTargetsLambda` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.
The ARN for external API load balancer target group.

Specify the `ExternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal API load balancer target group.

Specify the `InternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal service load balancer target group.

Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

5. Copy the template from the CloudFormation template for the bootstrap machine section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.

6. Optional: If you are deploying the cluster with a proxy, you must update the ignition in the template to add the `ignition.config.proxy` fields. Additionally, if you have added the Amazon EC2, Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the `noProxy` field.

7. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

   IMPORTANT
   You must enter the command on a single line.

   ```
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   --capabilities CAPABILITY_NAMED_IAM 4
   ```

   1 `<name>` is the name for the CloudFormation stack, such as `cluster-bootstrap`. You need the name of this stack if you remove the cluster.

   2 `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   3 `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   4 You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

Example output
8. Confirm that the template components exist:

```bash
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap InstanceId</td>
<td>The bootstrap Instance ID.</td>
</tr>
<tr>
<td>Bootstrap PublicIp</td>
<td>The bootstrap node public IP address.</td>
</tr>
<tr>
<td>Bootstrap PrivateIp</td>
<td>The bootstrap node private IP address.</td>
</tr>
</tbody>
</table>

### 5.13.15.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

**Example 5.47. CloudFormation template for the bootstrap machine**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
- InfrastructureName:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
  Type: String
  RhcosAmi:
  Description: The public subnet to launch the bootstrap node into.
  Type: String
```
Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
    Description: The master security group ID for registering temporary rules.
    Type: AWS::EC2::SecurityGroup::Id
VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
BootstrapIgnitionLocation:
    Default: s3://my-s3-bucket/bootstrap.ign
    Description: Ignition config file location.
    Type: String
AutoRegisterELB:
    Default: "yes"
    AllowedValues:
        - "yes"
        - "no"
    Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
    Type: String
RegisterNlbIpTargetsLambdaArn:
    Description: ARN for NLB IP target registration lambda.
    Type: String
ExternalApiTargetGroupArn:
    Description: ARN for external API load balancer target group.
    Type: String
InternalApiTargetGroupArn:
    Description: ARN for internal API load balancer target group.
    Type: String
InternalServiceTargetGroupArn:
    Description: ARN for internal service load balancer target group.
    Type: String
BootstrapInstanceType:
    Default: "i3.large"
    Description: Instance type for the bootstrap EC2 instance
    Type: String

Metadata:
AWS::CloudFormation::Interface:
    ParameterGroups:
        - Label: default: "Cluster Information"
            Parameters:
                - InfrastructureName
                - Label: default: "Host Information"
                    Parameters:
                        - RhcosAmi
                        - BootstrapIgnitionLocation
                        - MasterSecurityGroupId
                        - Label: default: "Network Configuration"
                            Parameters:
                                - VpcId
                                - AllowedBootstrapSshCidr
                                - PublicSubnet
                                - Label: default: "Load Balancer Automation"
Parameters:
- AutoRegisterELB
- RegisterNlbIpTargetsLambdaArn
- ExternalApiTargetGroupArn
- InternalApiTargetGroupArn
- InternalServiceTargetGroupArn

ParameterLabels:
InfrastructureName:
  default: "Infrastructure Name"
VpcId:
  default: "VPC ID"
AllowedBootstrapSshCidr:
  default: "Allowed SSH Source"
PublicSubnet:
  default: "Public Subnet"
RhcosAmi:
  default: "Red Hat Enterprise Linux CoreOS AMI ID"
BootstrapIgnitionLocation:
  default: "Bootstrap Ignition Source"
MasterSecurityGroupId:
  default: "Master Security Group ID"
AutoRegisterELB:
  default: "Use Provided ELB Automation"

Conditions:
DoRegistration: !Equals ["yes", !Ref AutoRegisterELB]

Resources:
BootstrapIamRole:
  Type: AWS::IAM::Role
  Properties:
    AssumeRolePolicyDocument:
      Version: "2012-10-17"
      Statement:
        - Effect: "Allow"
          Principal:
            Service:
              - "ec2.amazonaws.com"
          Action:

RegisterBootstrapInternalApiTarget:
Condition: DoRegistration
Type: Custom::NLBRegister
You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

See RHCOS AMIs for the AWS infrastructure for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

5.13.16. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites
You configured an AWS account.

You added your AWS keys and region to your local AWS profile by running `aws configure`.

You generated the Ignition config files for your cluster.

You created and configured a VPC and associated subnets in AWS.

You created and configured DNS, load balancers, and listeners in AWS.

You created the security groups and roles required for your cluster in AWS.

You created the bootstrap machine.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZonId", 7
    "ParameterValue": "<random_string>" 8
  },
  {
    "ParameterKey": "PrivateHostedZoneName", 9
    "ParameterValue": "mycluster.example.com" 10
  },
  {
    "ParameterKey": "Master0Subnet", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "Master1Subnet", 13
    "ParameterValue": "subnet-<random_string>" 14
  },
  {
    "ParameterKey": "Master2Subnet", 15
    "ParameterValue": "subnet-<random_string>" 16
  },
  {
    "ParameterKey": "MasterSecurityGroupId", 17
    "ParameterValue": "sg-<random_string>" 18
  }
]```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines based on your selected architecture.
Specify an **AWS::EC2::Image::Id** value.

Whether or not to perform DNS etcd registration.

Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.

The Route 53 private zone ID to register the etcd targets with.

Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.

The Route 53 zone to register the targets with.

Specify `<cluster_name>.-<domain_name>` where `<domain_name>` is the Route 53 base domain that you used when you generated install-config.yaml file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

A subnet, preferably private, to launch the control plane machines on.

Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.

The master security group ID to associate with control plane nodes.

Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.

The location to fetch control plane Ignition config file from.

Specify the generated Ignition config file location, `https://api-int.<cluster_name>.-<domain_name>.-22623/config/master`.

The base64 encoded certificate authority string to use.

Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC...yZ==`.

The IAM profile to associate with control plane nodes.

Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.

The type of AWS instance to use for the control plane machines based on your selected architecture.

The instance type value corresponds to the minimum resource requirements for control plane machines. For example `m6i.xlarge` is a type for AMD64, and `m6g.xlarge` is a type for ARM64.

Whether or not to register a network load balancer (NLB).

Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.

The ARN for NLB IP target registration lambda group.

Specify the **RegisterNlbIpTargetsLambda** value from the output of the CloudFormation
The ARN for external API load balancer target group.

Specify the `ExternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal API load balancer target group.

Specify the `InternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal service load balancer target group.

Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

2. Copy the template from the CloudFormation template for control plane machines section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.

3. If you specified an m5 instance type as the value for `MasterInstanceType`, add that instance type to the `MasterInstanceType.AllowedValues` parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

   **IMPORTANT**

   You must enter the command on a single line.

   ```bash
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   ```

   **1** `<name>` is the name for the CloudFormation stack, such as `cluster-control-plane`. You need the name of this stack if you remove the cluster.

   **2** `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   **3** `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   **Example output**

   ```text
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
   ```
NOTE

The CloudFormation template creates a stack that represents three control plane
nodes.

5. Confirm that the template components exist:

   $ aws cloudformation describe-stacks --stack-name <name>

5.13.16.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need
for your OpenShift Container Platform cluster.

Example 5.48. CloudFormation template for control plane machines

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
InfrastructureName:
   AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
   MaxLength: 27
   MinLength: 1
   ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
   maximum of 27 characters.
   Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
   Type: String
RhcosAmi:
   Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
   Type: AWS::EC2::Image::Id
AutoRegisterDNS:
   Default: ""
   Description: unused
   Type: String
PrivateHostedZoneld:
   Default: ""
   Description: unused
   Type: String
PrivateHostedZoneName:
   Default: ""
   Description: unused
   Type: String
Master0Subnet:
   Description: The subnets, recommend private, to launch the master nodes into.
   Type: AWS::EC2::Subnet::Id
Master1Subnet:
   Description: The subnets, recommend private, to launch the master nodes into.
   Type: AWS::EC2::Subnet::Id
Master2Subnet:
   Description: The subnets, recommend private, to launch the master nodes into.
   Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
   Description: The master security group ID to associate with master nodes.
   Type: AWS::EC2::SecurityGroup::Id
IGNITIONLOCATION:
Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master
Description: Ignition config file location.
Type: String

CERTIFICATEAUTHORITIES:
Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
Description: Base64 encoded certificate authority string to use.
Type: String

MASTERINSTANCEPROFILENAME:
Description: IAM profile to associate with master nodes.
Type: String

MASTERINSTANCETYPE:
Default: m5.xlarge
Type: String

AUTOREGISTERELB:
Default: "yes"
AllowedValues:
- "yes"
- "no"
Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
Type: String

REGISTERNLISTARGETGROUPARNM:
Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

EXTERNALAPITARGETGROUPARN:
Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

INTERNALAPITARGETGROUPARN:
Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

INTERNALSERVICETARGETGROUPARN:
Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

METADATA:
AWS::CloudFormation::Interface:
ParameterGroups:

You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

5.13.17. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.
You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

IMPORTANT
The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

NOTE
If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

   ```json
   [
     {
       "ParameterKey": "InfrastructureName", 1
       "ParameterValue": "mycluster-<random_string>" 2
     },
     {
       "ParameterKey": "RhcosAmi", 3
       "ParameterValue": "ami-<random_string>" 4
     },
     {
       "ParameterKey": "Subnet", 5
       "ParameterValue": "subnet-<random_string>" 6
     },
     {
       "ParameterKey": "WorkerSecurityGroupId", 7
       "ParameterValue": "sg-<random_string>" 8
     }
   ]
   ```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes based on your selected architecture.

Specify an AWS::EC2::Image::Id value.

A subnet, preferably private, to start the worker nodes on.

Specify a subnet from the PrivateSubnets value from the output of the CloudFormation template for DNS and load balancing.

The worker security group ID to associate with worker nodes.

Specify the WorkerSecurityGroupId value from the output of the CloudFormation template for the security group and roles.

The location to fetch the bootstrap Ignition config file from.

Specify the generated Ignition config location, `https://api-int.<cluster_name>.<domain_name>:22623/config/worker`.

Base64 encoded certificate authority string to use.

Specify the value from the worker.ign file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC…xYz==`.

The IAM profile to associate with worker nodes.

Specify the WorkerInstanceProfile parameter value from the output of the CloudFormation template for the security group and roles.
The type of AWS instance to use for the compute machines based on your selected architecture.

The instance type value corresponds to the minimum resource requirements for compute machines. For example, `m6i.large` is a type for AMD64, and `m6g.large` is a type for ARM64.

2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

3. Optional: If you specified an `m5` instance type as the value for `WorkerInstanceType`, add that instance type to the `WorkerInstanceType.AllowedValues` parameter in the CloudFormation template.

4. Optional: If you are deploying with an AWS Marketplace image, update the `Worker0.type.properties.ImageID` parameter with the AMI ID that you obtained from your subscription.

5. Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

   IMPORTANT
   You must enter the command on a single line.

   ```bash
   $ aws cloudformation create-stack --stack-name <name>  
   --template-body file://<template>.yaml  
   --parameters file://<parameters>.json
   ```

   1. `<name>` is the name for the CloudFormation stack, such as `cluster-worker-1`. You need the name of this stack if you remove the cluster.

   2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   **Example output**

   ```bash
   ```

   **NOTE**

   The CloudFormation template creates a stack that represents one worker node.

6. Confirm that the template components exist:

   ```bash
   $ aws cloudformation describe-stacks --stack-name <name>
   ```
7. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

### 5.13.17.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

**Example 5.49. CloudFormation template for worker machines**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
  InfrastructureName:
    AllowedPattern: ^[a-zA-Z][a-zA-Z0-9-]{0,26}$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  WorkerSecurityGroupId:
    Description: The master security group ID to associate with master nodes.
    Type: AWS::EC2::SecurityGroup::Id
  IgnitionLocation:
    Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
    Description: Ignition config file location.
    Type: String
  CertificateAuthorities:
    Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
    Description: Base64 encoded certificate authority string to use.
    Type: String
  WorkerInstanceProfileName:
    Description: IAM profile to associate with master nodes.
    Type: String
  WorkerInstanceType:
    Default: m5.large
    Type: String

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
```

```
- Label:
  default: "Cluster Information"
Parameters:
- InfrastructureName

- Label:
  default: "Host Information"
Parameters:
- WorkerInstanceType
- RhcosAmi
- IgnitionLocation
- CertificateAuthorities
- WorkerSecurityGroupId
- WorkerInstanceProfileName

- Label:
  default: "Network Configuration"
Parameters:
- Subnet

ParameterLabels:
- Subnet: default: "Subnet"
- InfrastructureName: default: "Infrastructure Name"
- WorkerInstanceType: default: "Worker Instance Type"
- WorkerInstanceProfileName: default: "Worker Instance Profile Name"
- RhcosAmi: default: "Red Hat Enterprise Linux CoreOS AMI ID"
- IgnitionLocation: default: "Worker Ignition Source"
- CertificateAuthorities: default: "Ignition CA String"
- WorkerSecurityGroupId: default: "Worker Security Group ID"

Resources:
Worker0:
Type: AWS::EC2::Instance
Properties:
  ImageId: !Ref RhcosAmi
  BlockDeviceMappings:
    - DeviceName: /dev/xvda
      Ebs:
        VolumeSize: "120"
        VolumeType: "gp2"
  IamInstanceProfile: !Ref WorkerInstanceProfileName
  InstanceType: !Ref WorkerInstanceType
  NetworkInterfaces:
    - AssociatePublicIpAddress: "false"
      DeviceIndex: "0"
      GroupSet:

      SubnetId: !Ref "Subnet"
  UserData:
    Fn::Base64: !Sub
      - '{"ignition":{"config":{"merge:[{"source": "${SOURCE}"}]},"security":{"tls":'
5.13.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

   ```bash
   $ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \   --log-level=info
   ```
1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at https://api.mycluster.example.com:6443...
INFO API v1.24.0 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a `FATAL` warning, your OpenShift Container Platform control plane has initialized.

**NOTE**

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

Additional resources

- See Monitoring installation progress for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.

- See Gathering bootstrap node diagnostic data for information about troubleshooting issues related to the bootstrap process.

- You can view details about the running instances that are created by using the AWS EC2 console.

### 5.13.19. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the Product Variant drop-down menu.
3. Select the appropriate version in the **Version** drop-down menu.

4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:

   ```bash
   $ tar xvf <file>
   ```

6. Place the **oc** binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```bash
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```bash
  $ oc <command>
  ```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.11 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.

   To check your **PATH**, open the command prompt and execute the following command:

   ```cmd
   C:\> path
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```cmd
  C:\> oc <command>
  ```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the **Version** drop-down menu.

   ```bash
   $ tar xvf <file>
   ```

   ```bash
   $ echo $PATH
   ```

   ```bash
   C:\> oc <command>
   ```
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

**NOTE**
For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   
   ```
   $ echo $PATH
   ```

**Verification**
- After you install the OpenShift CLI, it is available using the oc command:
  
  ```
  $ oc <command>
  ```

5.13.20. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**
- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:
   
   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**
   
   system:admin

5.13.21. Approving the certificate signing requests for your machines
When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

**Prerequisites**
- You added machines to your cluster.

**Procedure**

1. Confirm that the cluster recognizes the machines:

   ```
   $ oc get nodes
   ```

   **Example output**
   
<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>64m</td>
<td>v1.24.0</td>
</tr>
</tbody>
</table>

   The output lists all of the machines that you created.

   **NOTE**
   
   The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

   ```
   $ oc get csr
   ```

   **Example output**
   
<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-8b2br</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-8vnps</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

   In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:
Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the machine Approver if the Kubelet requests a new certificate with identical parameters.

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the oc exec, oc rsh, and oc logs commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the node-bootstrapper service account in the system:node or system:admin groups, and confirm the identity of the node.

To approve them individually, run the following command for each valid CSR:

```bash
$ oc adm certificate approve <csr_name> ①
```

① <csr_name> is the name of a CSR from the list of current CSRs.

To approve all pending CSRs, run the following command:

```bash
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```bash
$ oc get csr
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
</tbody>
</table>
5. If the remaining CSRs are not approved, and are in the Pending status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

  $ oc adm certificate approve <csr_name>  

  `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

  $ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}" | xargs oc adm certificate approve

6. After all client and server CSRs have been approved, the machines have the Ready status. Verify this by running the following command:

  $ oc get nodes

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>74m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.24.0</td>
</tr>
</tbody>
</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the Ready status.

**Additional information**

- For more information on CSRs, see Certificate Signing Requests.

### 5.13.22. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

**Prerequisites**

- Your control plane has initialized.

**Procedure**

1. Watch the cluster components come online:

   $ watch -n5 oc get clusteroperators
2. Configure the Operators that are not available.

5.13.22.1. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the Recreate rollout strategy during upgrades.

You can configure registry storage for user-provisioned infrastructure in AWS to deploy OpenShift Container Platform to hidden regions. See Configuring the registry for AWS user-provisioned infrastructure for more information.
5.13.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - `REGISTRY_STORAGE_S3_ACCESSKEY`
  - `REGISTRY_STORAGE_S3_SECRETKEY`

Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a Bucket Lifecycle Policy to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in `configs.imageregistry.operator.openshift.io/cluster`:

   ```bash
   $ oc edit configs.imageregistry.operator.openshift.io/cluster
   ```

   **Example configuration**

   ```yaml
   storage:
     s3:
       bucket: <bucket-name>
       region: <region-name>
   ```

   **WARNING**

   To secure your registry images in AWS, block public access to the S3 bucket.

5.13.22.1.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

Procedure

- To set the image registry storage to an empty directory:

  ```bash
  $ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec":
  {
  "storage":{
  "emptyDir":{}}}}'
  ```
If you run this command before the Image Registry Operator initializes its components, the `oc patch` command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

### 5.13.23. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

**Prerequisites**

- You completed the initial Operator configuration for your cluster.

**Procedure**

1. Delete the bootstrap resources. If you used the CloudFormation template, delete its stack:

   ```
   $ aws cloudformation delete-stack --stack-name <name>
   ```

   - `<name>` is the name of your bootstrap stack.

2. Delete the stack by using the AWS CloudFormation console.

### 5.13.24. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.

- You installed the OpenShift CLI (`oc`).

- You installed the `jq` package.
You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix).

**Procedure**

1. **Determine the routes to create.**
   - To create a wildcard record, use `*.apps.<cluster_name>.<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.
   - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host} {"\n"}[end][end]' routes
```

**Example output**

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

2. **Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the EXTERNAL-IP column:**

```
$ oc -n openshift-ingress get service router-default
```

**Example output**

```
NAME             TYPE           CLUSTER-IP      EXTERNAL-IP                            PORT(S)       AGE
router-default   LoadBalancer   172.30.62.215   ab3...28.us-east-2.elb.amazonaws.com 80:31499/TCP,443:30693/TCP   5m
```

3. **Locate the hosted zone ID for the load balancer:**

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>").CanonicalHostedZoneNameID'
```

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

**Example output**

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. **Obtain the public hosted zone ID for your cluster’s domain:**
For `<domain_name>`, specify the Route 53 base domain for your OpenShift Container Platform cluster.

**Example output**

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is `Z3URY6TWQ91KVV`.

5. Add the alias records to your private zone:

```
$ aws route53 list-hosted-zones-by-name \
   --dns-name "<domain_name>" \
   --query 'HostedZones[? Config.PrivateZone != `true` && Name == `<domain_name>.`].Id' --output text
```

For `<domain_name>`, specify the Route 53 base domain for your OpenShift Container Platform cluster.

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --change-batch '{
   "Changes": [
     {
       "Action": "CREATE",
       "ResourceRecordSet": {
         "Name": ".\052.apps.<cluster_domain>" ,
         "Type": "A",
         "AliasTarget": {
           "HostedZoneId": "<hosted_zone_id>",
           "DNSName": "<external_ip>",
           "EvaluateTargetHealth": false
         }
       }
     }
   ]
}'
```

For `<private_hosted_zone_id>`, specify the value from the output of the CloudFormation template for DNS and load balancing.

For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --change-batch '{
```

For `<public_hosted_zone_id>`, specify the public hosted zone ID for your OpenShift Container Platform cluster.
For `<public_hosted_zone_id>`, specify the public hosted zone for your domain.

For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

5.13.25. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

**Prerequisites**

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.

- You installed the `oc` CLI.

**Procedure**

- From the directory that contains the installation program, complete the cluster installation:

  ```bash
  $ ./openshift-install --dir <installation_directory> wait-for install-complete
  ```

  For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

**Example output**

```bash
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
```
IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

5.13.26. Logging in to the cluster by using the web console

The kubeadmin user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the kubeadmin user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the kubeadmin user from the kubeadmin-password file on the installation host:

   $ cat <installation_directory>/auth/kubeadmin-password

   **NOTE**
   
   Alternatively, you can obtain the kubeadmin password from the <installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'
NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

Example output

```
console     console-openshift-console.apps.<cluster_name>.<base_domain>     console
https     reencrypt/Redirect     None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

5.13.27. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager Hybrid Cloud Console](#).

After you confirm that your [OpenShift Cluster Manager Hybrid Cloud Console](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use [subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

5.13.28. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

5.13.29. Next steps

- [Validating an installation](#).

- [Customize your cluster](#).

- If necessary, you can [opt out of remote health reporting](#).

- If necessary, you can [remove cloud provider credentials](#).

5.14. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
In OpenShift Container Platform version 4.11, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

**IMPORTANT**

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company’s policies.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 5.14.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You created a mirror registry on your mirror host and obtained the `imageContentSources` data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.
If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 5.14.2. About installations in restricted networks

In OpenShift Container Platform 4.11, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift image registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

**IMPORTANT**

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

#### 5.14.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The `ClusterVersion` status includes an **Unable to retrieve available updates** error.

- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 5.14.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:
- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

5.14.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

5.14.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 5.50. Minimum required hosts**

<table>
<thead>
<tr>
<th>Hosts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One temporary bootstrap machine</td>
<td>The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.</td>
</tr>
<tr>
<td>Three control plane machines</td>
<td>The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.</td>
</tr>
<tr>
<td>At least two compute machines, which are also known as worker machines.</td>
<td>The workloads requested by OpenShift Container Platform users run on the compute machines.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.6 and later.
Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See Red Hat Enterprise Linux technology capabilities and limits.

Additional resources

- Optimizing storage

5.14.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 5.51. Minimum resource requirements

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

5.14.4.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".
Example 5.50. Machine types based on 64-bit x86 architecture

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

5.14.4.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 5.51. Machine types based on 64-bit ARM architecture

- c6g.*
- m6g.*

5.14.4.5. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The kube-controller-manager only approves the kubelet client CSRs. The
machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

5.14.5. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure. For more information about the integration testing for different platforms, see the OpenShift Container Platform 4.x Tested Integrations page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

5.14.5.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints
Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com
Option 2: Create a proxy without VPC endpoints
As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints
As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- ec2.<region>.amazonaws.com
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

When configuring the proxy in the `install-config.yaml` file, add these endpoints to the `noProxy` field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
</table>
| VPC       | • AWS::EC2::VPC  
           | • AWS::EC2::VPCEndpoint | You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3. |
| Public subnets | • AWS::EC2::Subnet  
                | • AWS::EC2::SubnetNetworkAclAssociation | Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules. |
### Required Components

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet gateway</td>
<td>• AWS::EC2::InternetGateway&lt;br&gt;• AWS::EC2::VPCGatewayAttachment&lt;br&gt;• AWS::EC2::RouteTable&lt;br&gt;• AWS::EC2::Route&lt;br&gt;• AWS::EC2::SubnetRouteTableAssociation&lt;br&gt;• AWS::EC2::NatGateway&lt;br&gt;• AWS::EC2::EIP</td>
<td>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td>Network access control</td>
<td>• AWS::EC2::NetworkAcl&lt;br&gt;• AWS::EC2::NetworkAclEntry</td>
<td>You must allow the VPC to access the following ports:</td>
</tr>
<tr>
<td>Port</td>
<td>Reason</td>
<td></td>
</tr>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
<td></td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
<td></td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
<td></td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
<td></td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
<td></td>
</tr>
<tr>
<td>Private subnets</td>
<td>• AWS::EC2::Subnet&lt;br&gt;• AWS::EC2::RouteTable&lt;br&gt;• AWS::EC2::SubnetRouteTableAssociation</td>
<td>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</td>
</tr>
</tbody>
</table>

**Required DNS and load balancing components**

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster’s infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for `api`. 

---

**CHAPTER 5. INSTALLING ON AWS**

691
<cluster_name>.<domain> must point to the external load balancer, and an entry for api-int. <cluster_name>.<domain> must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>AWS::Route 53::HostedZone</td>
<td>The hosted zone for your internal DNS.</td>
</tr>
<tr>
<td>Public load balancer</td>
<td>AWS::ElasticLoadBalancingV2::LoadBalancer</td>
<td>The load balancer for your public subnets.</td>
</tr>
<tr>
<td>External API server record</td>
<td>AWS::Route 53::RecordSetGroup</td>
<td>Alias records for the external API server.</td>
</tr>
<tr>
<td>External listener</td>
<td>AWS::ElasticLoadBalancingV2::Listener</td>
<td>A listener on port 6443 for the external load balancer.</td>
</tr>
<tr>
<td>External target group</td>
<td>AWS::ElasticLoadBalancingV2::TargetGroup</td>
<td>The target group for the external load balancer.</td>
</tr>
<tr>
<td>Private load balancer</td>
<td>AWS::ElasticLoadBalancingV2::LoadBalancer</td>
<td>The load balancer for your private subnets.</td>
</tr>
<tr>
<td>Internal API server record</td>
<td>AWS::Route 53::RecordSetGroup</td>
<td>Alias records for the internal API server.</td>
</tr>
<tr>
<td>Internal listener</td>
<td>AWS::ElasticLoadBalancingV2::Listener</td>
<td>A listener on port 22623 for the internal load balancer.</td>
</tr>
</tbody>
</table>
### Security groups

The control plane and worker machines require access to the following ports:

<table>
<thead>
<tr>
<th>Group</th>
<th>Type</th>
<th>IP Protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>

</table>
Workers and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

<table>
<thead>
<tr>

5.14.5.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.
5.14.5.3. Required AWS permissions for the IAM user

NOTE

Your IAM user must have the permission `tag:GetResources` in the region `us-east-1` to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 5.52. Required EC2 permissions for installation**

- `ec2:AuthorizeSecurityGroupEgress`
- `ec2:AuthorizeSecurityGroupIngress`
- `ec2:CopyImage`
- `ec2:CreateNetworkInterface`
- `ec2:AttachNetworkInterface`
- `ec2:CreateSecurityGroup`
- `ec2:CreateTags`
- `ec2:CreateVolume`
- `ec2:DeleteSecurityGroup`
- `ec2:DeleteSnapshot`
- `ec2:DeleteTags`
- `ec2:DeregisterImage`
- `ec2:DescribeAccountAttributes`
- `ec2:DescribeAddresses`
- `ec2:DescribeAvailabilityZones`
- `ec2:DescribeDhcpOptions`
- `ec2:DescribeImages`
- `ec2:DescribeInstanceAttribute`
- `ec2:DescribeInstanceCreditSpecifications`
- `ec2:DescribeInstances`
- `ec2:DescribeInstanceTypes`
- `ec2:DescribeInternetGateways`
Example 5.53. Required permissions for creating network resources during installation

- ec2:DescribeKeyPairs
- ec2:DescribeNatGateways
- ec2:DescribeNetworkAcls
- ec2:DescribeNetworkInterfaces
- ec2:DescribePrefixLists
- ec2:DescribeRegions
- ec2:DescribeRouteTables
- ec2:DescribeSecurityGroups
- ec2:DescribeSubnets
- ec2:DescribeTags
- ec2:DescribeVolumes
- ec2:DescribeVpcAttribute
- ec2:DescribeVpcClassicLink
- ec2:DescribeVpcClassicLinkDnsSupport
- ec2:DescribeVpcEndpoints
- ec2:DescribeVpcs
- ec2:GetEbsDefaultKmsKeyId
- ec2:ModifyInstanceAttribute
- ec2:ModifyNetworkInterfaceAttribute
- ec2:RevokeSecurityGroupEgress
- ec2:RevokeSecurityGroupIngress
- ec2:RunInstances
- ec2:TerminateInstances

- ec2:AllocateAddress
- ec2:AssociateAddress
- ec2:AssociateDhcpOptions
- ec2:AssociateRouteTable
- ec2:AttachInternetGateway
- ec2:CreateDhcpOptions
- ec2:CreateInternetGateway
- ec2:CreateNatGateway
- ec2:CreateRoute
- ec2:CreateRouteTable
- ec2:CreateSubnet
- ec2:CreateVpc
- ec2:CreateVpcEndpoint
- ec2:ModifySubnetAttribute
- ec2:ModifyVpcAttribute

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

**Example 5.54. Required Elastic Load Balancing permissions (ELB) for installation**

- elasticloadbalancing:AddTags
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ConfigureHealthCheck
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateLoadBalancerListeners
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeregisterInstancesFromLoadBalancer
- elasticloadbalancing:DescribeInstanceHealth
- elasticloadbalancing:DescribeLoadBalancerAttributes
- elasticloadbalancing:DescribeLoadBalancers
- elasticloadbalancing:DescribeTags
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:RegisterInstancesWithLoadBalancer
- elasticloadbalancing:SetLoadBalancerPoliciesOfListener
Example 5.55. Required Elastic Load Balancing permissions (ELBv2) for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:DescribeListeners
- elasticloadbalancing:DescribeLoadBalancerAttributes
- elasticloadbalancing:DescribeLoadBalancers
- elasticloadbalancing:DescribeTargetGroupAttributes
- elasticloadbalancing:DescribeTargetHealth
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
- elasticloadbalancing:RegisterTargets

Example 5.56. Required IAM permissions for installation

- iam:AddRoleToInstanceProfile
- iam:CreateInstanceProfile
- iam:CreateRole
- iam:DeleteInstanceProfile
- iam:DeleteRole
- iam:DeleteRolePolicy
- iam:GetInstanceProfile
- iam:GetRole
- iam:GetRolePolicy
- iam:GetUser
• `iam:ListInstanceProfilesForRole`
• `iam:ListRoles`
• `iam:ListUsers`
• `iam:PassRole`
• `iam:PutRolePolicy`
• `iam:RemoveRoleFromInstanceProfile`
• `iam:SimulatePrincipalPolicy`
• `iam:TagRole`

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

**Example 5.57. Required Route 53 permissions for installation**

• `route53:ChangeResourceRecordSets`
• `route53:ChangeTagsForResource`
• `route53:CreateHostedZone`
• `route53:DeleteHostedZone`
• `route53:GetChange`
• `route53:GetHostedZone`
• `route53:GetHostedZones`
• `route53:GetHostedZonesByName`
• `route53:ListHostedZones`
• `route53:ListResourceRecordSets`
• `route53:ListTagsForResource`
• `route53:UpdateHostedZoneComment`

**Example 5.58. Required S3 permissions for installation**

• `s3:CreateBucket`
• `s3:DeleteBucket`
• `s3:GetAccelerateConfiguration`
• `s3:GetBucketAcl`
Example 5.59. S3 permissions that cluster Operators require

- s3:DeleteObject
- s3:GetObject
- s3:GetObjectAcl
- s3:GetObjectTagging
- s3:GetObjectVersion
- s3:PutObject
- s3:PutObjectAcl
- s3:PutObjectTagging
- s3:PutEncryptionConfiguration

Example 5.60. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
Example 5.61. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
- ec2:DeleteRouteTable
- ec2:DeleteSubnet
- ec2:DeleteVpc
- ec2:DeleteVpcEndpoints
- ec2:DetachInternetGateway
- ec2:DisassociateRouteTable
- ec2:ReleaseAddress
- ec2:ReplaceRouteTableAssociation

NOTE
NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the `tag:UntagResources` permission to delete network resources.

Example 5.62. Required permissions to delete a cluster with shared instance roles

- `iam:UntagRole`

Example 5.63. Additional IAM and S3 permissions that are required to create manifests

- `iam:DeleteAccessKey`
- `iam:DeleteUser`
- `iam:DeleteUserPolicy`
- `iam:GetUserPolicy`
- `iam:ListAccessKeys`
- `iam:PutUserPolicy`
- `iam:TagUser`
- `s3:PutBucketPublicAccessBlock`
- `s3:GetBucketPublicAccessBlock`
- `s3:PutLifecycleConfiguration`
- `s3:HeadBucket`
- `s3:ListBucketMultipartUploads`
- `s3:AbortMultipartUpload`

NOTE

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the `iam:CreateAccessKey` and `iam:CreateUser` permissions.

Example 5.64. Optional permissions for instance and quota checks for installation

- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

5.14.6. Generating a key pair for cluster node SSH access
During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```
3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

      ```bash
      $ eval "$(ssh-agent -s)"
      
      Example output
      
      Agent pid 31874
      
      **NOTE**

      If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name>
   
   Example output
   
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   
   ![Image of SSH agent configuration]
   
   **Next steps**

   - When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

5.14.7. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `var` partition during the preparation phases of installation.

5.14.7.1. Optional: Creating a separate `/var` partition
It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- `/var/lib/containers`: Holds container-related content that can grow as more images and containers are added to a system.
- `/var/lib/etcd`: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- `/var`: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a `/var` directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because `/var` must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate `/var` partition by creating a machine config manifest that is inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Procedure**

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```
   $ mkdir $HOME/clusterconfig
   ```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   ```
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ```

   **Example output**

   ```
   ? SSH Public Key ...
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: $HOME/clusterconfig/manifests and
   $HOME/clusterconfig/openshift
   ```

3. Optional: Confirm that the installation program created manifests in the `clusterconfig/openshift` directory:

   ```
   $ ls $HOME/clusterconfig/openshift/
   ```
Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file `$HOME/clusterconfig/98-var-partition.bu`, change the disk device name to the name of the storage device on the worker systems, and set the storage size as appropriate. This example places the `/var` directory on a separate partition:

```
variant: openshift
version: 4.11.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name>  
  partitions:
    - label: var
      start_mib: <partition_start_offset>  
      size_mib: <partition_size>  
  filesystems:
    - device: /dev/disk/by-partlabel/var
      path: /var
      format: xfs
      mount_options: [defaults, prjquota]  
      with_mount_unit: true
```

1. The storage device name of the disk that you want to partition.

2. When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

3. The size of the data partition in mebibytes.

4. The `prjquota` mount option must be enabled for filesystems used for container storage.

**NOTE**

When creating a separate `/var` partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the `clusterconfig/openshift` directory. For example, run the following command:
Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

```bash
$ openshift-install create ignition-configs --dir $HOME/clusterconfig/auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 5.14.7.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.

- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the `install-config.yaml` file manually.

**Procedure**

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory>
```

   1. For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your *ssh-agent* process uses.

ii. Select *aws* as the platform to target.

iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Edit the *install-config.yaml* file to give the additional information that is required for an installation in a restricted network.

   a. Update the *pullSecret* value to contain the authentication information for your registry:

   ```yaml
   pullSecret: {"auths":{"<local_registry>": {"auth": "<credentials>","email": "you@example.com"}}}
   ```

   For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

   b. Add the *additionalTrustBundle* parameter and value. The value must be the contents of the certificate file that you used for your mirror registry. The certificate file can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

   ```yaml
   additionalTrustBundle: |
   -----BEGIN CERTIFICATE-----
   ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
   -----END CERTIFICATE-----
   ```
c. Add the image content resources:

```yaml
imageContentSources:
  - mirrors:
    - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-release
    - mirrors:
      - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-v4.0-art-dev
```

Use the `imageContentSources` section from the output of the command to mirror the repository or the values that you used when you mirrored the content from the media that you brought into your restricted network.

d. Optional: Set the publishing strategy to `Internal`:

```yaml
publish: Internal
```

By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Optional: Back up the `install-config.yaml` file.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

### 5.14.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE
The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>  
  httpsProxy: https://<username>:<pswd>@<ip>:<port>  
noProxy: ec2.<region>.amazonaws.com,elasticloadbalancing.<region>.amazonaws.com,s3.<region>.amazonaws.com
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations. If you have added the Amazon EC2 Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the noProxy field.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy readinessEndpoints field.
If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.14.7.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.

- You created the `install-config.yaml` installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:
For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
   
   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
   
   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
   name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone:  
       id: mycluster-100419-private-zone
     publicZone:  
       id: example.openshift.com
   status: {}
   ```

   Remove this section completely.

   If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```
5.14.8. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the `jq` package.

**Procedure**

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

  ```bash
  $ jq -r .infraID <installation_directory>/metadata.json
  ```

  For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

  **Example output**

  ```text
  openshift-vw9j6
  ```

  The output of this command is your cluster name and a random string.

5.14.9. Creating a VPC in AWS
You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
     {
       "ParameterKey": "VpcCidr", 1
       "ParameterValue": "10.0.0.0/16" 2
     },
     {
       "ParameterKey": "AvailabilityZoneCount", 3
       "ParameterValue": "1" 4
     },
     {
       "ParameterKey": "SubnetBits", 5
       "ParameterValue": "12" 6
     }
   ]
   ``

   1. The CIDR block for the VPC.
   2. Specify a CIDR block in the format `x.x.x.x/16-24`.
   3. The number of availability zones to deploy the VPC in.
   4. Specify an integer between 1 and 3.
   5. The size of each subnet in each availability zone.
   6. Specify an integer between 5 and 13, where 5 is /27 and 13 is /19.
2. Copy the template from the CloudFormation template for the VPC section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

   ![IMPORTANT]
   You must enter the command on a single line.

   ```bash
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   
   1 <name> is the name for the CloudFormation stack, such as cluster-vpc. You need the name of this stack if you remove the cluster.
   2 <template> is the relative path to and name of the CloudFormation template YAML file that you saved.
   3 <parameters> is the relative path to and name of the CloudFormation parameters JSON file.
   
   Example output
   
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
   
   4. Confirm that the template components exist:

   ```bash
   $ aws cloudformation describe-stacks --stack-name <name>
   
   After the StackStatus displays CREATE_COMPLETE, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of your VPC.</td>
</tr>
<tr>
<td>PublicSubnetIds</td>
<td>The IDs of the new public subnets.</td>
</tr>
<tr>
<td>PrivateSubnetIds</td>
<td>The IDs of the new private subnets.</td>
</tr>
</tbody>
</table>

5.14.9.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.
Example 5.65. CloudFormation template for the VPC

AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^((\[0-9]\[1-9]\[0-9]\[1-9]\[0-9]\[0-9]\[0-4]\[0-9]\[25]\[0-5]\\.\\.)\\(.\\[3]\[0-9]\[1-9]\[0-9]\[1-9]\[0-9]\[2]\[0-4]\[0-9]\[25]\[0-5]\))(\(16-9\)[0-4]))\$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number
  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label: default: "Network Configuration"
    Parameters:
      - VpcCidr
      - SubnetBits
    - Label: default: "Availability Zones"
      Parameters:
        - AvailabilityZoneCount
  ParameterLabels:
    AvailabilityZoneCount:
      default: "Availability Zone Count"
    VpcCidr:
      default: "VPC CIDR"
    SubnetBits:
      default: "Bits Per Subnet"

5.14.10. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the `install-config.yaml` file for your cluster. You can obtain details about your hosted zone by running the following command:

   ```
   $ aws route53 list-hosted-zones-by-name --dns-name <route53_domain>
   ```
1 For the `<route53_domain>`, specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster.

Example output

mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10

In the example output, the hosted zone ID is `Z21IXYZABCZ2A4`.

2. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  },
  {
    "ParameterKey": "InfrastructureName", 3
    "ParameterValue": "mycluster-<random_string>" 4
  },
  {
    "ParameterKey": "HostedZoneId", 5
    "ParameterValue": "<random_string>" 6
  },
  {
    "ParameterKey": "HostedZoneName", 7
    "ParameterValue": "example.com" 8
  },
  {
    "ParameterKey": "PublicSubnets", 9
    "ParameterValue": "subnet-<random_string>" 10
  },
  {
    "ParameterKey": "PrivateSubnets", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "VpcId", 13
    "ParameterValue": "vpc-<random_string>" 14
  }
]
```

1 A short, representative cluster name to use for hostnames, etc.

2 Specify the cluster name that you used when you generated the `install-config.yaml` file for the cluster.

3 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

4
Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

5. The Route 53 public zone ID to register the targets with.

6. Specify the Route 53 public zone ID, which has a format similar to `Z21IXYZABCZ2A4`. You can obtain this value from the AWS console.

7. The Route 53 zone to register the targets with.

8. Specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

9. The public subnets that you created for your VPC.

10. Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

11. The private subnets that you created for your VPC.

12. Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

13. The VPC that you created for the cluster.

14. Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

3. Copy the template from the CloudFormation template for the network and load balancers section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

**IMPORTANT**

If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` in the CloudFormation template to use CNAME records. Records of type ALIAS are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   --capabilities CAPABILITY_NAMED_IAM 4
```

1. `<name>` is the name for the CloudFormation stack, such as `cluster-dns`. You need the name of this stack if you remove the cluster.
<template> is the relative path to and name of the CloudFormation template YAML file that you saved.

<parameters> is the relative path to and name of the CloudFormation parameters JSON file.

You must explicitly declare the CAPABILITY_NAMED_IAM capability because the provided template creates some AWS::IAM::Role resources.

Example output

```
arnt:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the StackStatus displays CREATE_COMPLETE, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrivateHostedZoneId</td>
<td>Hosted zone ID for the private DNS.</td>
</tr>
<tr>
<td>ExternalApiLoadBalancerName</td>
<td>Full name of the external API load balancer.</td>
</tr>
<tr>
<td>InternalApiLoadBalancerName</td>
<td>Full name of the internal API load balancer.</td>
</tr>
<tr>
<td>ApiServerDnsName</td>
<td>Full hostname of the API server.</td>
</tr>
<tr>
<td>RegisterNlbIpTargetsLambda</td>
<td>Lambda ARN useful to help register/deregister IP targets for these load balancers.</td>
</tr>
<tr>
<td>ExternalApiTargetGroupArn</td>
<td>ARN of external API target group.</td>
</tr>
<tr>
<td>InternalApiTargetGroupArn</td>
<td>ARN of internal API target group.</td>
</tr>
</tbody>
</table>
5.14.10.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

Example 5.66. CloudFormation template for the network and load balancers

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
ClusterName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, representative cluster name to use for host names and other identifying names.
  Type: String
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String
HostedZoneId:
  Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCDZ2A4.
  Type: String
HostedZoneName:
  Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.
  Type: String
  Default: "example.com"
PublicSubnets:
  Description: The internet-facing subnets.
  Type: List<AWS::EC2::Subnet::Id>
PrivateSubnets:
  Description: The internal subnets.
  Type: List<AWS::EC2::Subnet::Id>
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
```

Metadata:

        ec2_client = boto3.client('ec2')
        if event['RequestType'] == 'Delete':
          for subnet_id in event['ResourceProperties']['Subnets']:
            ec2_client.delete_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' + event['ResourceProperties']['InfrastructureName']}])
        elif event['RequestType'] == 'Create':
          for subnet_id in event['ResourceProperties']['Subnets']:
            ec2_client.create_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' + event['ResourceProperties']['InfrastructureName'], 'Value': 'shared'}])
          responseData = {}
          cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData, event['ResourceProperties']['InfrastructureName'] + event['ResourceProperties']['Subnets'][0])
      Runtime: "python3.7"
      Timeout: 120

RegisterPublicSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PublicSubnets
IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` to use CNAME records. Records of type ALIAS are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
  - !GetAtt IntApiElb.DNSName
```

Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

5.14.11. Creating security group and roles in AWS
You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
     {
       "ParameterKey": "InfrastructureName",  
       "ParameterValue": "mycluster-<random_string>"  
     },
     {
       "ParameterKey": "VpcCidr",            
       "ParameterValue": "10.0.0.0/16"  
     },
     {
       "ParameterKey": "PrivateSubnets",  
       "ParameterValue": "subnet-<random_string>"  
     },
     {
       "ParameterKey": "VpcId",            
       "ParameterValue": "vpc-<random_string>"  
     }
   ]
   
   1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
   2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.
   3 The CIDR block for the VPC.
Specify the CIDR block parameter that you used for the VPC that you defined in the form x.x.x.x/16-24.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

2. Copy the template from the CloudFormation template for security objects section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

   **IMPORTANT**
   You must enter the command on a single line.

   ```
   $ aws cloudformation create-stack --stack-name <name> 1
      --template-body file://<template>.yaml 2
      --parameters file://<parameters>.json 3
      --capabilities CAPABILITY_NAMED_IAM 4
   ```

   1. `<name>` is the name for the CloudFormation stack, such as `cluster-sec`. You need the name of this stack if you remove the cluster.

   2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

   **Example output**

   ```
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
   ```

4. Confirm that the template components exist:

   ```
   $ aws cloudformation describe-stacks --stack-name <name>
   ```
After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroupId</td>
<td>Master Security Group ID</td>
</tr>
<tr>
<td>WorkerSecurityGroupId</td>
<td>Worker Security Group ID</td>
</tr>
<tr>
<td>MasterInstanceProfile</td>
<td>Master IAM Instance Profile</td>
</tr>
<tr>
<td>WorkerInstanceProfile</td>
<td>Worker IAM Instance Profile</td>
</tr>
</tbody>
</table>

### 5.14.11.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

**Example 5.67. CloudFormation template for security objects**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{{0,26}})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String
VpcCidr:
  AllowedPattern: ^((0|1)[0-9]|1[0-9][0-9]|1[0-9][0-9]|2[0-4][0-9]|255[0-5])/(\3)$(
  ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
  Default: 10.0.0.0/16
  Description: CIDR block for VPC.
  Type: String
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
PrivateSubnets:
  Description: The internal subnets.
  Type: List<AWS::EC2::Subnet::Id>
```
CHAPTER 5. INSTALLING ON AWS

Outputs:
5.14.12. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, stream metadata provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the coreos print-stream-json sub-command of openshift-install to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the openshift-install binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

**Procedure**

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official stream-metadata-go library at `https://github.com/coreos/stream-metadata-go`. You can also view example code in the library.

- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.

- From a command-line utility that handles JSON data, such as `jq`:
  - Print the current x86_64 or aarch64 AMI for an AWS region, such as `us-west-1`:

    For x86_64

    ```
    $ openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.images.aws.regions["us-west-1"].image'
    ```

    Example output

    ```
    ami-0d3e625f84626bbda
    ```

    For aarch64

    ```
    ```
5.14.13. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.

NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization. You do this by:

- Providing a location to serve the `bootstrap.ign` Ignition config file to your cluster. This file is located in your installation directory. The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

- Using the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

**NOTE**

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.

- You added your AWS keys and region to your local AWS profile by running `aws configure`.  

<table>

</tr>
</tbody>
</table>
• You generated the Ignition config files for your cluster.
• You created and configured a VPC and associated subnets in AWS.
• You created and configured DNS, load balancers, and listeners in AWS.
• You created the security groups and roles required for your cluster in AWS.

**Procedure**

1. Create the bucket by running the following command:

   ```bash
   $ aws s3 mb s3://<cluster-name>-infra
   ```

   `<cluster-name>-infra` is the bucket name. When creating the `install-config.yaml` file, replace `<cluster-name>` with the name specified for the cluster.

   You must use a presigned URL for your S3 bucket, instead of the `s3://` schema, if you are:

   • Deploying to a region that has endpoints that differ from the AWS SDK.
   • Deploying a proxy.
   • Providing your own custom endpoints.

2. Upload the `bootstrap.ign` Ignition config file to the bucket by running the following command:

   ```bash
   $ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

3. Verify that the file uploaded by running the following command:

   ```bash
   $ aws s3 ls s3://<cluster-name>-infra/
   ```

   **Example output**

   ```plaintext
   2019-04-03 16:15:16     314878 bootstrap.ign
   ```

   **NOTE**

   The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

4. Create a JSON file that contains the parameter values that the template requires:
{ "ParameterKey": "InfrastructureName",  "ParameterValue": "mycluster-<random_string>",  
} ,
{ "ParameterKey": "RhcosAmi",  "ParameterValue": "ami-<random_string>"  
} ,
{ "ParameterKey": "AllowedBootstrapSshCidr",  "ParameterValue": "0.0.0.0/0"  
} ,
{ "ParameterKey": "PublicSubnet",  "ParameterValue": "subnet-<random_string>"  
} ,
{ "ParameterKey": "MasterSecurityGroupId",  "ParameterValue": "sg-<random_string>"  
} ,
{ "ParameterKey": "VpcId",  "ParameterValue": "vpc-<random_string>"  
} ,
{ "ParameterKey": "BootstrapIgnitionLocation",  "ParameterValue": "s3://<bucket_name>/bootstrap.ign"  
} ,
{ "ParameterKey": "AutoRegisterELB",  "ParameterValue": "yes"  
} ,
{ "ParameterKey": "RegisterNlbIpTargetsLambdaArn",  "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:<dns_stack_name>-RegisterNlbIpTargets-<random_string>"  
} ,
{ "ParameterKey": "ExternalApiTargetGroupArn",  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>"  
} ,
{ "ParameterKey": "InternalApiTargetGroupArn",  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>"  
} ,
{ "ParameterKey": "InternalServiceTargetGroupArn",  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>"  
} }
1. The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

2. Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

3. Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node based on your selected architecture.

4. Specify a valid AWS::EC2::Image::Id value.

5. CIDR block to allow SSH access to the bootstrap node.

6. Specify a CIDR block in the format `x.x.x/16-24`.

7. The public subnet that is associated with your VPC to launch the bootstrap node into.

8. Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

9. The master security group ID (for registering temporary rules)

10. Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

11. The VPC created resources will belong to.

12. Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

13. Location to fetch bootstrap Ignition config file from.

14. Specify the S3 bucket and file name in the form `s3://<bucket_name>/bootstrap.ign`.

15. Whether or not to register a network load balancer (NLB).

16. Specify `yes` or `no`. If you specify `yes`, you must provide a Lambda Amazon Resource Name (ARN) value.

17. The ARN for NLB IP target registration lambda group.

18. Specify the `RegisterNlbIpTargetsLambda` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

19. The ARN for external API load balancer target group.

20. Specify the `ExternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

21. The ARN for internal API load balancer target group.

22. Specify the `InternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

23. The ARN for internal service load balancer target group.
Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying.

5. Copy the template from the CloudFormation template for the bootstrap machine section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.

6. Optional: If you are deploying the cluster with a proxy, you must update the ignition in the template to add the `ignition.config.proxy` fields. Additionally, If you have added the Amazon EC2, Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the `noProxy` field.

7. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

```
$ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   --capabilities CAPABILITY_NAMED_IAM 4
```

- `<name>` is the name for the CloudFormation stack, such as `cluster-bootstrap`. You need the name of this stack if you remove the cluster.
- `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.
- `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.
- You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

8. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:
### Bootstrap InstanceId
The bootstrap Instance ID.

### Bootstrap PublicIp
The bootstrap node public IP address.

### Bootstrap PrivateIp
The bootstrap node private IP address.

---

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

**Example 5.68. CloudFormation template for the bootstrap machine**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AllowedBootstrapSshCidr:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
    Default: 0.0.0.0/0
    Description: CIDR block to allow SSH access to the bootstrap node.
    Type: String
  PublicSubnet:
    Description: The public subnet to launch the bootstrap node into.
    Type: AWS::EC2::Subnet::Id
  MasterSecurityGroupId:
    Description: The master security group ID for registering temporary rules.
    Type: AWS::EC2::SecurityGroup::Id
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  BootstrapIgnitionLocation:
    Description: Ignition config file location.
    Type: String
    Default: s3://my-s3-bucket/bootstrap.ign
  AutoRegisterELB:
```

---
Default: "yes"
AllowedValues:
- "yes"
- "no"
Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
Type: String
RegisterNlbIpTargetsLambdaArn:
Description: ARN for NLB IP target registration lambda.
Type: String
ExternalApiTargetGroupArn:
Description: ARN for external API load balancer target group.
Type: String
InternalApiTargetGroupArn:
Description: ARN for internal API load balancer target group.
Type: String
InternalServiceTargetGroupArn:
Description: ARN for internal service load balancer target group.
Type: String
BootstrapInstanceType:
Description: Instance type for the bootstrap EC2 instance
Default: "i3.large"
Type: String

  - Value: !GetAtt BootstrapInstance.PrivateIp

Additional resources

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

5.14.15. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZoneld", 7
    "ParameterValue": "<random_string>" 8
  },
  {
    "ParameterKey": "PrivateHostedZoneName", 9
    "ParameterValue": "mycluster.example.com" 10
  },
  {
    "ParameterKey": "Master0Subnet", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "Master1Subnet", 13
    "ParameterValue": "subnet-<random_string>" 14
  },
  {
    "ParameterKey": "Master2Subnet", 15
    "ParameterValue": "subnet-<random_string>" 16
  },
  {
    "ParameterKey": "MasterSecurityGroupId", 17
    "ParameterValue": "sg-<random_string>" 18
  },
  {
    "ParameterKey": "IgnitionLocation", 19
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master" 20
  },
  {
    "ParameterKey": "CertificateAuthorities", 21
    "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz=" 22
  },
  {
    "ParameterKey": "MasterInstanceProfileName", 23
    "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
  }
]```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`. Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines based on your selected architecture.

Specify an `AWS::EC2::Image::Id` value.

Whether or not to perform DNS etcd registration.

Specify `yes` or `no`. If you specify `yes`, you must provide hosted zone information.

The Route 53 private zone ID to register the etcd targets with.

Specify the `PrivateHostedZoneId` value from the output of the CloudFormation template for DNS and load balancing.

The Route 53 zone to register the targets with.

Specify `<cluster_name>.<domain_name>` where `<domain_name>` is the Route 53 base domain that you used when you generated `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
include the trailing period (.) that is displayed in the AWS console.

11 13 15 A subnet, preferably private, to launch the control plane machines on.

12 14 16 Specify a subnet from the PrivateSubnets value from the output of the CloudFormation template for DNS and load balancing.

17 The master security group ID to associate with control plane nodes.

18 Specify the MasterSecurityGroupId value from the output of the CloudFormation template for the security group and roles.

19 The location to fetch control plane Ignition config file from.

20 Specify the generated Ignition config file location, https://api-int.<cluster_name>.<domain_name>:22623/config/master.

21 The base64 encoded certificate authority string to use.

22 Specify the value from the master.ign file that is in the installation directory. This value is the long string with the format data:text/plain;charset=utf-8;base64,ABC…xYz==.

23 The IAM profile to associate with control plane nodes.

24 Specify the MasterInstanceProfile parameter value from the output of the CloudFormation template for the security group and roles.

25 The type of AWS instance to use for the control plane machines based on your selected architecture.

26 The instance type value corresponds to the minimum resource requirements for control plane machines. For example m6i.xlarge is a type for AMD64 and m6g.xlarge is a type for ARM64.

27 Whether or not to register a network load balancer (NLB).

28 Specify yes or no. If you specify yes, you must provide a Lambda Amazon Resource Name (ARN) value.

29 The ARN for NLB IP target registration lambda group.

30 Specify the RegisterNlbIpTargetsLambda value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

31 The ARN for external API load balancer target group.

32 Specify the ExternalApiTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

33 The ARN for internal API load balancer target group.

34 Specify the InternalApiTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

35 The ARN for internal service load balancer target group.
Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying.

2. Copy the template from the CloudFormation template for control plane machines section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.

3. If you specified an `m5` instance type as the value for `MasterInstanceType`, add that instance type to the `MasterInstanceType.AllowedValues` parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

   ```
   IMPORTANT

   You must enter the command on a single line.
   
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   
   1 <name> is the name for the CloudFormation stack, such as `cluster-control-plane`. You need the name of this stack if you remove the cluster.
   
   2 <template> is the relative path to and name of the CloudFormation template YAML file that you saved.
   
   3 <parameters> is the relative path to and name of the CloudFormation parameters JSON file.
   
   Example output
   
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
   
   NOTE

   The CloudFormation template creates a stack that represents three control plane nodes.
   
   5. Confirm that the template components exist:

   ```
   $ aws cloudformation describe-stacks --stack-name <name>
   ```

5.14.15.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

Example 5.69. CloudFormation template for control plane machines
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
  Type: String
RhcosAmi:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
  Type: AWS::EC2::Image::Id
AutoRegisterDNS:
  Default: ""
  Description: unused
  Type: String
PrivateHostedZoneId:
  Default: ""
  Description: unused
  Type: String
PrivateHostedZoneName:
  Default: ""
  Description: unused
  Type: String
Master0Subnet:
  Description: The subnets, recommend private, to launch the master nodes into.
  Type: AWS::EC2::Subnet::Id
Master1Subnet:
  Description: The subnets, recommend private, to launch the master nodes into.
  Type: AWS::EC2::Subnet::Id
Master2Subnet:
  Description: The subnets, recommend private, to launch the master nodes into.
  Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
  Description: The master security group ID to associate with master nodes.
  Type: AWS::EC2::SecurityGroup::Id
IgnitionLocation:
  Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master
  Description: Ignition config file location.
  Type: String
CertificateAuthorities:
  Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
  Description: Base64 encoded certificate authority string to use.
  Type: String
MasterInstanceProfileName:
  Description: IAM profile to associate with master nodes.
  Type: String
MasterInstanceType:
  Default: m5.xlarge
  Type: String
AutoRegisterELB:
  Default: "yes"
AllowedValues:
- "yes"
- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter? Type: String

RegisterNlbIpTargetsLambdaArn:
  Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
  Type: String

ExternalApiTargetGroupArn:
  Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
  Type: String

InternalApiTargetGroupArn:
  Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
  Type: String

InternalServiceTargetGroupArn:
  Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
  Type: String

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label: "Cluster Information"
    Parameters:
    - InfrastructureName
  - Label: "Host Information"
    Parameters:
    - MasterInstanceType
    - RHCOSAmi
    - IgnitionLocation
    - Certificate Authorities
    - MasterSecurityGroupId
    - MasterInstanceProfileName
  - Label: "Network Configuration"
    Parameters:
    - VpcId
    - AllowedBootstrapSshCidr
    - Master0Subnet
    - Master1Subnet
    - Master2Subnet
  - Label: "Load Balancer Automation"
    Parameters:
    - AutoRegisterELB
    - RegisterNlbIpTargetsLambdaArn
    - ExternalApiTargetGroupArn
    - InternalApiTargetGroupArn
    - InternalServiceTargetGroupArn

ParameterLabels:

5.14.16. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

**IMPORTANT**

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

**NOTE**

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
You generated the Ignition config files for your cluster.

You created and configured a VPC and associated subnets in AWS.

You created and configured DNS, load balancers, and listeners in AWS.

You created the security groups and roles required for your cluster in AWS.

You created the bootstrap machine.

You created the control plane machines.

Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```json
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "WorkerSecurityGroupId", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker" 10
  },
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  },
  {
    "ParameterKey": "WorkerInstanceProfileName", 13
    "ParameterValue": "" 14
  },
  {
    "ParameterKey": "WorkerInstanceType", 15
    "ParameterValue": "" 16
  }
]
```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes based on your selected architecture.

Specify an AWS::EC2::Image::Id value.

A subnet, preferably private, to start the worker nodes on.

Specify a subnet from the `PrivateSubnets` value from the output of the CloudFormation template for DNS and load balancing.

The worker security group ID to associate with worker nodes.

Specify the `WorkerSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The location to fetch the bootstrap Ignition config file from.

Specify the generated Ignition config location, `https://api-int.<cluster_name>.-<domain_name>:22623/config/worker`.

Base64 encoded certificate authority string to use.

Specify the value from the `worker.ign` file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC…xYz==`.

The IAM profile to associate with worker nodes.

Specify the `WorkerInstanceProfile` parameter value from the output of the CloudFormation template for the security group and roles.

The type of AWS instance to use for the compute machines based on your selected architecture.

The instance type value corresponds to the minimum resource requirements for compute machines. For example `m6i.large` is a type for AMD64, and `m6g.large` is a type for ARM64.

2. Copy the template from the CloudFormation template for worker machines section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

3. Optional: If you specified an `m5` instance type as the value for `WorkerInstanceType`, add that instance type to the `WorkerInstanceType.AllowedValues` parameter in the CloudFormation template.

4. Optional: If you are deploying with an AWS Marketplace image, update the `Worker0.type.properties.ImageID` parameter with the AMI ID that you obtained from your subscription.

5. Use the CloudFormation template to create a stack of AWS resources that represent a worker node:
IMPORTANT

You must enter the command on a single line.

```bash
$ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml \ 2
   --parameters file://<parameters>.json 3

<name> is the name for the CloudFormation stack, such as cluster-worker-1. You need
the name of this stack if you remove the cluster.

<template> is the relative path to and name of the CloudFormation template YAML file
that you saved.

<parameters> is the relative path to and name of the CloudFormation parameters JSON
file.
```

Example output

```bash
```

NOTE

The CloudFormation template creates a stack that represents one worker node.

6. Confirm that the template components exist:

```bash
$ aws cloudformation describe-stacks --stack-name <name>
```

7. Continue to create worker stacks until you have created enough worker machines for your
cluster. You can create additional worker stacks by referencing the same template and
parameter files and specifying a different stack name.

IMPORTANT

You must create at least two worker machines, so you must create at least two
stacks that use this CloudFormation template.

5.14.16.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for
your OpenShift Container Platform cluster.

Example 5.70. CloudFormation template for worker machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
InfrastructureName:
```
CHAPTER 5. INSTALLING ON AWS

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
MaxLength: 27
MinLength: 1
ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
Description: A short, unique cluster ID used to tag nodes for the kubectl cloud provider.
Type: String
RhcosAmi:
Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
Type: AWS::EC2::Image::Id
Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id
WorkerSecurityGroupId:
Description: The master security group ID to associate with master nodes.
Type: AWS::EC2::SecurityGroup::Id
IgnitionLocation:
Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
Description: Ignition config file location.
Type: String
CertificateAuthorities:
Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
Description: Base64 encoded certificate authority string to use.
Type: String
WorkerInstanceProfileName:
Description: IAM profile to associate with master nodes.
Type: String
WorkerInstanceType:
Default: m5.large
Type: String
Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: "Cluster Information"
Parameters:
  - InfrastructureName
- Label: "Host Information"
Parameters:
  - WorkerInstanceType
  - RhcosAmi
  - IgnitionLocation
  - CertificateAuthorities
  - WorkerSecurityGroupId
  - WorkerInstanceProfileName
- Label: "Network Configuration"
Parameters:
  - Subnet
ParameterLabels:
Subnet:
  default: "Subnet"
InfrastructureName:
  default: "Infrastructure Name"
WorkerInstanceType:
  default: "Worker Instance Type"
WorkerInstanceProfileName:
  default: "Worker Instance Profile Name"
RhcosAmi:
  default: "Red Hat Enterprise Linux CoreOS AMI ID"
IgnitionLocation:
  default: "Worker Ignition Source"
CertificateAuthorities:
  default: "Ignition CA String"
WorkerSecurityGroupId:
  default: "Worker Security Group ID"

Resources:
Worker0:

        Value: "shared"

Outputs:
PrivateIP:
  Description: The compute node private IP address.
  Value: !GetAtt Worker0.PrivateIp

5.14.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.
Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

   ```
   $ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at https://api.mycluster.example.com:6443...
INFO API v1.24.0 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

**NOTE**

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
• See Gathering bootstrap node diagnostic data for information about troubleshooting issues related to the bootstrap process.

5.14.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

• You deployed an OpenShift Container Platform cluster.

• You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1 For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   Example output

   system:admin

5.14.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

• You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

   ```bash
   $ oc get nodes
   ```

   Example output
NAME    STATUS   ROLES   AGE  VERSION
master-0 Ready  master  63m  v1.24.0
master-1 Ready  master  63m  v1.24.0
master-2 Ready  master  64m  v1.24.0

The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```bash
$ oc get csr
```

**Example output**

```
<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-8b2br</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-8vnps</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the `machine-approver` if the Kubelet requests a new certificate with identical parameters.
NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the `oc exec`, `oc rsh`, and `oc logs` commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the `node-bootstrapper` service account in the `system:node` or `system:admin` groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  $ oc adm certificate approve <csr_name> ①

  ① `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

  $ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}" | xargs --no-run-if-empty oc adm certificate approve

NOTE

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

    $ oc get csr

Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. If the remaining CSRs are not approved, and are in the `Pending` status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

  $ oc adm certificate approve <csr_name> ①

  ① `<csr_name>` is the name of a CSR from the list of current CSRs.
To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>74m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.24.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.24.0</td>
</tr>
</tbody>
</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

**Additional information**

- For more information on CSRs, see [Certificate Signing Requests](#).

### 5.14.20. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

**Prerequisites**

- Your control plane has initialized.

**Procedure**

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>VERSION</th>
<th>AVAILABLE</th>
<th>PROGRESSING</th>
<th>DEGRADED</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication</td>
<td>4.11.0</td>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>baremetal</td>
<td>4.11.0</td>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>cloud-credential</td>
<td>4.11.0</td>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>cluster-autoscaler</td>
<td>4.11.0</td>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>config-operator</td>
<td>4.11.0</td>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
</tbody>
</table>
2. Configure the Operators that are not available.

5.14.20.1. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:

  ```sh
  $ oc patch OperatorHub cluster --type json -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
  ```

  **TIP**

  Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Configuration → OperatorHub page, click the Sources tab, where you can create, update, delete, disable, and enable individual sources.

5.14.20.2. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.
Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the `Recreate` rollout strategy during upgrades.

5.14.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

**Prerequisites**

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - `REGISTRY_STORAGE_S3_ACCESSKEY`
  - `REGISTRY_STORAGE_S3_SECRETKEY`

**Procedure**

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a *Bucket Lifecycle Policy* to abort incomplete multipart uploads that are one day old.

2. Fill in the storage configuration in `configs.imageregistry.operator.openshift.io/cluster`:

   ```
   $ oc edit configs.imageregistry.operator.openshift.io/cluster
   ```

   **Example configuration**

   ```yaml
   storage:
   s3:
   bucket: <bucket-name>
   region: <region-name>
   ```

   **WARNING**

   To secure your registry images in AWS, *block public access* to the S3 bucket.

5.14.20.2.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.
Procedure

- To set the image registry storage to an empty directory:

```sh
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec":
{"storage":{"emptyDir":{}}}'}
```

**WARNING**

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the `oc patch` command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

5.14.21. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

**Prerequisites**

- You completed the initial Operator configuration for your cluster.

**Procedure**

1. Delete the bootstrap resources. If you used the CloudFormation template, delete its stack:

   - Delete the stack by using the AWS CLI:

     ```sh
     $ aws cloudformation delete-stack --stack-name <name>  
     ```

     `<name>` is the name of your bootstrap stack.

   - Delete the stack by using the AWS CloudFormation console.

5.14.22. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

**Prerequisites**
- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.

- You installed the OpenShift CLI (oc).

- You installed the jq package.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix).

**Procedure**

1. Determine the routes to create.
   - To create a wildcard record, use `*.apps.<cluster_name>..<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.
   - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

     ```
     $ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host} 
     "\n"{end}{end}' routes
     ```

     **Example output**

     ```
     oauth-openshift.apps.<cluster_name>..<domain_name>
     console-openshift-console.apps.<cluster_name>..<domain_name>
     downloads-openshift-console.apps.<cluster_name>..<domain_name>
     alertmanager-main-openshift-monitoring.apps.<cluster_name>..<domain_name>
     prometheus-k8s-openshift-monitoring.apps.<cluster_name>..<domain_name>
     ```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

   ```
   $ oc -n openshift-ingress get service router-default
   ```

   **Example output**

   ```
   NAME             TYPE           CLUSTER-IP      EXTERNAL-IP                            PORT(S)   AGE
   router-default   LoadBalancer   172.30.62.215   ab3...28.us-east-2.elb.amazonaws.com 80:31499/TCP,443:30693/TCP   5m
   ```

3. Locate the hosted zone ID for the load balancer:

   ```
   $ aws elb describe-load-balancers | jq -r ".LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>" ).CanonicalHostedZoneNameID` 1`
   ```

   **Example output**

   ```
   For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.
   ```

   **Example output**
The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster’s domain:

```bash
$ aws route53 list-hosted-zones-by-name
   --dns-name "<domain_name>"
   --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
   `<domain_name>`].Id'
   --output text
```

For `<domain_name>`, specify the Route 53 base domain for your OpenShift Container Platform cluster.

Example output

```
/hostedzone/Z3URY6TWQ91KV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is `Z3URY6TWQ91KV`.

5. Add the alias records to your private zone:

```bash
$ aws route53 change-resource-record-sets
   --hosted-zone-id "<private_hosted_zone_id>"
   --change-batch '{
     "Changes": [
       {
         "Action": "CREATE",
         "ResourceRecordSet": {
           "Name": "\052.apps.<cluster_domain>" ,
           "Type": "A",
           "AliasTarget":{
             "HostedZoneId": "<hosted_zone_id>",
             "DNSName": "<external_ip>.",
             "EvaluateTargetHealth": false
           }
         }
       }
     ]
   }'
```

For `<private_hosted_zone_id>`, specify the value from the output of the CloudFormation template for DNS and load balancing.

For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.
6. Add the records to your public zone:

```bash
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --change-batch '{
   "Changes": [
   {
      "Action": "CREATE",
      "ResourceRecordSet": {
         "Name": "\052.apps.<cluster_domain>",
         "Type": "A",
         "AliasTarget": {
            "HostedZoneId": "<hosted_zone_id>",
            "DNSName": "<external_ip>",
            "EvaluateTargetHealth": false
         }
      }
   }]
}
```

1. For `<public_hosted_zone_id>`, specify the public hosted zone for your domain.
2. For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
3. For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.
4. For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

5.14.23. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the `oc` CLI.

Procedure

1. From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete
```

1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 1s
```

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Register your cluster on the [Cluster registration](#) page.

### 5.14.24. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
NOTE
Alternatively, you can obtain the kubeadmin password from the <installation_directory>/openshift_install.log log file on the installation host.

2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   Example output

   console  console-openshift-console.apps.<cluster_name>.<base_domain>  console
   https  reencrypt/Redirect  None

   Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

Additional resources
- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

5.14.25. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources
- See About remote health monitoring for more information about the Telemetry service

5.14.26. Additional resources
- See Working with stacks in the AWS documentation for more information about AWS CloudFormation stacks.

5.14.27. Next steps
- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can **opt out of remote health reporting**.
- If necessary, see **Registering your disconnected cluster**
- If necessary, you can **remove cloud provider credentials**.

## 5.15. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

### 5.15.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

**NOTE**

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

**Prerequisites**

- You have a copy of the installation program that you used to deploy the cluster.
- You have the files that the installation program generated when you created your cluster.

**Procedure**

1. On the computer that you used to install the cluster, go to the directory that contains the installation program, and run the following command:

   ```bash
   $ ./openshift-install destroy cluster \
   --dir <installation_directory> --log-level info
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
   2. To view different details, specify **warn**, **debug**, or **error** instead of **info**.

   **NOTE**

   You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.
2. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.

### 5.15.2. Deleting AWS resources with the Cloud Credential Operator utility

To clean up resources after uninstalling an OpenShift Container Platform cluster with the Cloud Credential Operator (CCO) in manual mode with STS, you can use the CCO utility (`ccoctl`) to remove the AWS resources that `ccoctl` created during installation.

#### Prerequisites
- Extract and prepare the `ccoctl` binary.
- Install an OpenShift Container Platform cluster with the CCO in manual mode with STS.

#### Procedure
- Delete the AWS resources that `ccoctl` created:

  ```bash
  $ ccoctl aws delete \
  --name=<name> \  
  --region=<aws_region>
  ```

  1. `<name>` matches the name that was originally used to create and tag the cloud resources.
  2. `<aws_region>` is the AWS region in which to delete cloud resources.

#### Example output:

```
2021/04/08 17:50:41 Identity Provider object .well-known/openid-configuration deleted from the bucket <name>-oidc
2021/04/08 17:50:42 Identity Provider object keys.json deleted from the bucket <name>-oidc
2021/04/08 17:50:43 Identity Provider bucket <name>-oidc deleted
2021/04/08 17:51:05 Policy <name>-openshift-cloud-credential-operator-cloud-credential-o associated with IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o deleted
2021/04/08 17:51:05 IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o deleted
2021/04/08 17:51:07 IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials deleted
2021/04/08 17:51:08 Policy <name>-openshift-image-registry-installer-cloud-credentials associated with IAM Role <name>-openshift-image-registry-installer-cloud-credentials deleted
2021/04/08 17:51:08 IAM Role <name>-openshift-image-registry-installer-cloud-credentials deleted
2021/04/08 17:51:10 IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
```
To verify that the resources are deleted, query AWS. For more information, refer to AWS documentation.
CHAPTER 6. INSTALLING ON AZURE

6.1. PREPARING TO INSTALL ON AZURE

6.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

6.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See Configuring an Azure account for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for Azure for other options.

6.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

6.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when
creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

### 6.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

### 6.1.4. Next steps

- Configuring an Azure account

### 6.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

### 6.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default Azure subscription and service limits, quotas, and constraints affect your ability to install OpenShift Container Platform clusters.

**IMPORTANT**

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.
<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
</table>
| vCPU               | 40                                       | 20 per region      | A default cluster requires 40 vCPUs, so you must increase the account limit. By default, each cluster creates the following instances:  
  ● One bootstrap machine, which is removed after installation  
  ● Three control plane machines  
  ● Three compute machines  
  Because the bootstrap machine uses **Standard_D4s_v3** machines, which use 4 vCPUs, the control plane machines use **Standard_D8s_v3** virtual machines, which use 8 vCPUs, and the worker machines use **Standard_D4s_v3** virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.  
  To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require. |
| OS Disk            | 7                                        |                    | Each cluster machine must have a minimum of 100 GB of storage and 300 IOPS. While these are the minimum supported values, faster storage is recommended for production clusters and clusters with intensive workloads. For more information about optimizing storage for performance, see the page titled "Optimizing storage" in the "Scalability and performance" section. |
| VNet               | 1                                        | 1000 per region    | Each default cluster requires one Virtual Network (VNet), which contains two subnets.                                                                                                                                 |
| Network interfaces | 7                                        | 65,536 per region  | Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.                                         |
Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:

- **control plane**: Allows the control plane machines to be reached on port 6443 from anywhere
- **node**: Allows worker nodes to be reached from the internet on ports 80 and 443

Each cluster creates the following load balancers:

- **default**: Public IP address that load balances requests to ports 80 and 443 across worker machines
- **internal**: Private IP address that load balances requests to ports 6443 and 22623 across control plane machines
- **external**: Public IP address that load balances requests to port 6443 across control plane machines

If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.

Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.

The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.
If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node. This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.

Using spot VMs for control plane nodes is not recommended.

### Additional resources

- Optimizing storage.

### 6.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

   **NOTE**
   
   For more information about purchasing domains through Azure, see Buy a custom domain name for Azure App Service in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See Migrate an active DNS name to Azure App Service in the Azure documentation.

3. Configure DNS for your domain. Follow the steps in the Tutorial: Host your domain in Azure DNS in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.

   Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain.

### 6.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.
NOTE
You can increase only one type of quota per support request.

Procedure

1. From the Azure portal, click Help + support in the lower left corner.

2. Click New support request and then select the required values:
   a. From the Issue type list, select Service and subscription limits (quotas)
   b. From the Subscription list, select the subscription to modify.
   c. From the Quota type list, select the quota to increase. For example, select Compute-VM (cores-vCPUs) subscription limit increases to increase the number of vCPUs, which is required to install a cluster.
   d. Click Next: Solutions.

3. On the Problem Details page, provide the required information for your quota increase:
   a. Click Provide details and provide the required details in the Quota details window.
   b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.

4. Click Next: Review + create and then click Create.

6.2.4. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, review the following information:

Your Azure account subscription must have the following roles:

- User Access Administrator
- Contributor

Your Azure Active Directory (AD) must have the following permission:

- "microsoft.directory/servicePrincipals/createAsOwner"

To set roles on the Azure portal, see the Manage access to Azure resources using RBAC and the Azure portal in the Azure documentation.

6.2.5. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

Prerequisites

- Install or update the Azure CLI.
- Your Azure account has the required roles for the subscription that you use.
Procedure

1. Log in to the Azure CLI:

   ```bash
   $ az login
   ```

2. If your Azure account uses subscriptions, ensure that you are using the right subscription:

   a. View the list of available accounts and record the `tenantId` value for the subscription you want to use for your cluster:

   ```bash
   $ az account list --refresh
   ```

   **Example output**

   ```json
   [  
     {  
       "cloudName": "AzureCloud",  
       "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",  
       "isDefault": true,  
       "name": "Subscription Name",  
       "state": "Enabled",  
       "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",  
       "user": {  
         "name": "you@example.com",  
         "type": "user"  
       }  
     }  
   ]
   ```

   b. View your active account details and confirm that the `tenantId` value matches the subscription you want to use:

   ```bash
   $ az account show
   ```

   **Example output**

   ```json
   {  
     "environmentName": "AzureCloud",  
     "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",  
     "isDefault": true,  
     "name": "Subscription Name",  
     "state": "Enabled",  
     "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",  
     "user": {  
       "name": "you@example.com",  
       "type": "user"
     }
   }
   ```

   Ensure that the value of the `tenantId` parameter is the correct subscription ID.

   c. If you are not using the right subscription, change the active subscription:
Specify the subscription ID.

Verify the subscription ID update:

```bash
$ az account set -s <subscription_id>
```

Example output

```bash

```

3. Record the `tenantId` and `id` parameter values from the output. You need these values during the OpenShift Container Platform installation.

4. Create the service principal for your account:

```bash
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \
   --scopes /subscriptions/<subscription_id> \n   --years <years>
```

1 Specify the service principal name.
2 Specify the subscription ID.
3 Specify the number of years. By default, a service principal expires in one year. By using the `--years` option you can extend the validity of your service principal.

Example output

Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not include these credentials in your code or check the credentials into your source control. For more information, see https://aka.ms/azadsp-cli

```json
{
   "appId": "ac461d78-bf4b-4387-ad16-7e32e328aecd6",
   "displayName": <service_principal>",
   "password": "00000000-0000-0000-0000-000000000000",
   "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}
```
5. Record the values of the `appId` and `password` parameters from the previous output. You need these values during OpenShift Container Platform installation.

6. Assign the **User Access Administrator** role by running the following command:

   ```bash
   $ az role assignment create --role "User Access Administrator" \
   --assignee-object-id $(az ad sp show --id <appId> --query id -o tsv)
   ```

   Specify the `appId` parameter value for your service principal.

---

### Additional resources

- For more information about CCO modes, see *About the Cloud Credential Operator*.

---

### 6.2.6. Supported Azure Marketplace regions

Installing a cluster using the Azure Marketplace image is available to customers who purchase the offer in North America and EMEA.

While the offer must be purchased in North America or EMEA, you can deploy the cluster to any of the Azure public partitions that OpenShift Container Platform supports.

**NOTE**

Deploying a cluster using the Azure Marketplace image is not supported for the Azure Government regions.

---

### 6.2.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

#### Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- francecentral (France Central)
- germanywestcentral (Germany West Central)
- israelcentral (Israel Central)
- italynorth (Italy North)
- japaneast (Japan East)
- japanwest (Japan West)
- koreacentral (Korea Central)
- koreasouth (Korea South)
- northcentralus (North Central US)
- northeurope (North Europe)
- norwayeast (Norway East)
- polandcentral (Poland Central)
- qatarcentral (Qatar Central)
- southafricannorth (South Africa North)
- southcentralus (South Central US)
- southeastasia (Southeast Asia)
- southindia (South India)
- swedencentral (Sweden Central)
- switzerlandnorth (Switzerland North)
- uanorth (UAE North)
- uksouth (UK South)
- ukwest (UK West)
- westcentralus (West Central US)
- westerurope (West Europe)
- westindia (West India)
- westus (West US)
- westus2 (West US 2)
- westus3 (West US 3)

Supported Azure Government regions
Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- usgovtexas (US Gov Texas)
- usgovvirginia (US Gov Virginia)

You can reference all available MAG regions in the Azure documentation. Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 6.2.8. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can install a customized cluster or quickly install a cluster with default options.

### 6.3. MANUALLY CREATING IAM FOR AZURE

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster kube-system namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

#### 6.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the credentialsMode parameter in the install-config.yaml file.

If you prefer not to store an administrator-level credential secret in the cluster kube-system project, you can set the credentialsMode parameter for the CCO to Manual when installing OpenShift Container Platform and manage your cloud credentials manually.

Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

#### Additional resources

- For a detailed description of all available CCO credential modes and their supported platforms, see About the Cloud Credential Operator.

#### 6.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster kube-system namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the install-config.yaml file by running the following command:
1. Where `<installation_directory>` is the directory in which the installation program creates files.

2. Edit the `install-config.yaml` configuration file so that it contains the `credentialsMode` parameter set to `Manual`.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
   ...
   ``

   This line is added to set the `credentialsMode` parameter to `Manual`.

3. Generate the manifests by running the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir <installation_directory>
   ``

   Where `<installation_directory>` is the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use by running the following command:

   ```bash
   $ openshift-install version
   ``

   **Example output**

   ```bash
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ``

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on by running the following command:

   ```bash
   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   --credentials-requests
   --cloud=azure
   ``

   This command creates a YAML file for each `CredentialsRequest` object.

   **Sample CredentialsRequest object**

   ```yaml
   apiVersion: cloudcredential.openshift.io/v1
   kind: CredentialsRequest
   metadata:
     name: <component-credentials-request>
     namespace: openshift-cloud-credential-operator
   ```
6. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object.

**Sample CredentialsRequest object with secrets**

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
namespace: openshift-cloud-credential-operator
...  
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
  ...  
  secretRef:
    name: <component-secret>
    namespace: <component-namespace>

...  
```

**Sample Secret object**

```yaml
apiVersion: v1
kind: Secret
metadata:
  name: <component-secret>
namespace: <component-namespace>
data:
  azure_subscription_id: <base64_encoded_azure_subscription_id>
  azure_client_id: <base64_encoded_azure_client_id>
  azure_client_secret: <base64_encoded_azure_client_secret>
  azure_tenant_id: <base64_encoded_azure_tenant_id>
  azure_resource_prefix: <base64_encoded_azure_resource_prefix>
  azure_resourcegroup: <base64_encoded_azure_resourcegroup>
  azure_region: <base64_encoded_azure_region>
```
The release image includes **CredentialsRequest** objects for Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set. You can identify these objects by their use of the `release.openshift.io/feature-gate: TechPreviewNoUpgrade` annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.
- If you are using any of these features, you must create secrets for the corresponding objects.

To find **CredentialsRequest** objects with the **TechPreviewNoUpgrade** annotation, run the following command:

```bash
$ grep "release.openshift.io/feature-gate" *
```

**Example output**

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate: TechPreviewNoUpgrade
```

7. From the directory that contains the installation program, proceed with your cluster creation:

```bash
$ openshift-install create cluster --dir <installation_directory>
```

**IMPORTANT**

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

**Additional resources**

- Updating a cluster using the web console
- Updating a cluster using the CLI

**6.3.3. Next steps**

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on Azure with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure

**6.4. ENABLING USER-MANAGED ENCRYPTION FOR AZURE**
In OpenShift Container Platform version 4.11, you can install a cluster with a user-managed encryption key in Azure. To enable this feature, you can prepare an Azure DiskEncryptionSet before installation, modify the `install-config.yaml` file, and then perform post-installation steps.

### 6.4.1. Preparing an Azure Disk Encryption Set

The OpenShift Container Platform installer can use an existing Disk Encryption Set with a user-managed key. To enable this feature, you can create a Disk Encryption Set in Azure and provide the key to the installer.

#### Procedure

1. Set the following environment variables for the Azure resource group by running the following command:

   ```bash
   $ export RESOURCEGROUP="<resource_group>" \\
   LOCATION="<location>"
   ```

   1. Specifies the name of the Azure resource group where you will create the Disk Encryption Set and encryption key. To avoid losing access to your keys after destroying the cluster, you should create the Disk Encryption Set in a different resource group than the resource group where you install the cluster.
   2. Specifies the Azure location where you will create the resource group.

2. Set the following environment variables for the Azure Key Vault and Disk Encryption Set by running the following command:

   ```bash
   $ export KEYVAULT_NAME="<keyvault_name>" \\
   KEYVAULT_KEY_NAME="<keyvault_key_name>" \\
   DISK_ENCRYPTION_SET_NAME="<disk_encryption_set_name>"
   ```

   1. Specifies the name of the Azure Key Vault you will create.
   2. Specifies the name of the encryption key you will create.
   3. Specifies the name of the disk encryption set you will create.

3. Set the environment variable for the ID of your Azure Service Principal by running the following command:

   ```bash
   $ export CLUSTER_SP_ID="<service_principal_id>"
   ```

   1. Specifies the ID of the service principal you will use for this installation.

4. Enable host-level encryption in Azure by running the following commands:

   ```bash
   $ az feature register --namespace "Microsoft.Compute" --name "EncryptionAtHost"
   $ az feature show --namespace Microsoft.Compute --name EncryptionAtHost
   ```
Create an Azure Resource Group to hold the disk encryption set and associated resources by running the following command:

```bash
$ az group create --name $RESOURCEGROUP --location $LOCATION
```

Create an Azure key vault by running the following command:

```bash
$ az keyvault create -n $KEYVAULT_NAME -g $RESOURCEGROUP -l $LOCATION --enable-purge-protection true
```

Create an encryption key in the key vault by running the following command:

```bash
$ az keyvault key create --vault-name $KEYVAULT_NAME -n $KEYVAULT_KEY_NAME --protection software
```

Capture the ID of the key vault by running the following command:

```bash
$ KEYVAULT_ID=$(az keyvault show --name $KEYVAULT_NAME --query "[id]" -o tsv)
```

Capture the key URL in the key vault by running the following command:

```bash
$ KEYVAULT_KEY_URL=$(az keyvault key show --vault-name $KEYVAULT_NAME --name $KEYVAULT_KEY_NAME --query "[key.kid]" -o tsv)
```

Create a disk encryption set by running the following command:

```bash
$ az disk-encryption-set create -n $DISK_ENCRYPTION_SET_NAME -l $LOCATION -g $RESOURCEGROUP --source-vault $KEYVAULT_ID --key-url $KEYVAULT_KEY_URL
```

Grant the DiskEncryptionSet resource access to the key vault by running the following commands:

```bash
$ DES_IDENTITY=$(az disk-encryption-set show -n $DISK_ENCRYPTION_SET_NAME -g $RESOURCEGROUP --query "[identity.principalId]" -o tsv)

$ az keyvault set-policy -n $KEYVAULT_NAME -g $RESOURCEGROUP --object-id $DES_IDENTITY --key-permissions wrapkey unwrapkey get
```

Grant the Azure Service Principal permission to read the DiskEncryptionSet by running the following commands:

```bash
$ DES_RESOURCE_ID=$(az disk-encryption-set show -n $DISK_ENCRYPTION_SET_NAME -g $RESOURCEGROUP --query "[id]" -o tsv)

$ az role assignment create --assignee $CLUSTER_SP_ID --role "<reader_role>" --scope $DES_RESOURCE_ID -o jsonc
```
Specifies an Azure role with read permissions to the disk encryption set. You can use the Owner role or a custom role with the necessary permissions.

6.4.2. Next steps

- Install an OpenShift Container Platform cluster:
  - Install a cluster with customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure
  - Install a cluster into an existing VNet on installer-provisioned infrastructure
  - Install a private cluster on installer-provisioned infrastructure
  - Install a cluster into a government region on installer-provisioned infrastructure

6.5. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.11, you can install a cluster on Microsoft Azure that uses the default configuration options.

6.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH into the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH into your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name> 1

   Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   $ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   $ eval "$(ssh-agent -s)"

   Example output

   Agent pid 31874

   NOTE
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name> 1

   1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

   Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.5.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   $ ./openshift-install create cluster --dir <installation_directory> \  
   --log-level=info

   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   When specifying the directory:

   • Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

   • Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Provide values at the prompts:

   a. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   b. Select `azure` as the platform to target.

   c. If the installation program cannot locate the `osServicePrincipal.json` configuration file, which contains Microsoft Azure profile information, in the `~/.azure/` directory on your computer, the installer prompts you to specify the following Azure parameter values for your subscription and service principal.

      • `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.

      • `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.

      • `azure service principal client id` The value of the `appId` parameter for the service principal.

      • `azure service principal client secret` The value of the `password` parameter for the service principal.
After you enter values for the previously listed parameters, the installation program creates a `osServicePrincipal.json` configuration file and stores this file in the `~/.azure/` directory on your computer. These actions ensure that the installation program can load the profile when it is creating an OpenShift Container Platform cluster on the target platform.

d. Select the region to deploy the cluster to.

e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

f. Enter a descriptive name for your cluster.

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

g. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
```
**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 6.5.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the **Product Variant** drop-down menu.

3. Select the appropriate version in the **Version** drop-down menu.

4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   ```

6. Place the `oc` binary in a directory that is on your **PATH**.
   To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:
  
  ```
  $ oc <command>
  ```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your PATH.
   
   To check your PATH, open the command prompt and execute the following command:
   
   ```
   C:\> path
   ```

Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH.
   
   To check your PATH, open a terminal and execute the following command:
   
   ```
   $ echo $PATH
   ```
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  $ oc <command>

6.5.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadm` credentials:

   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   $ oc whoami

   Example output

   system:admin

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

6.5.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.
Additional resources

- See About remote health monitoring for more information about the Telemetry service

6.5.9. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.6. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.11, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

6.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.
- If you use customer-managed encryption keys, you prepared your Azure environment for encryption.

6.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `/openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

##### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ``

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ``

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ``

   **Example output**

   ```bash
   Agent pid 31874
   ``

   **NOTE**

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name> 1
   ``

   1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

   **Example output**

   ```bash
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.6.4. Selecting an Azure Marketplace image**
If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify `redhat` as the publisher. If you are located in EMEA, specify `redhat-limited` as the publisher.

- The offer includes a `rh-ocp-worker` SKU and a `rh-ocp-worker-gen1` SKU. The `rh-ocp-worker` SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the `rh-ocp-worker-gen1` SKU. The `rh-ocp-worker-gen1` SKU represents a Hyper-V version 1 VM image.

**Prerequisites**

- You have installed the Azure CLI client (`az`).

- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

**Procedure**

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

   - **North America:**
     ```
     $ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
     ```

   **Example output**

   ```
   Offer          Publisher       Sku                 Urn                                                             Version
   -------------  --------------  ------------------  ----------------------------------------------------------
   ```

   - **EMEA:**
     ```
     $ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
     ```

   **Example output**

   ```
   Offer          Publisher       Sku                 Urn                                                             Version
   -------------  --------------  ------------------  ----------------------------------------------------------
   ```
NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:
   - North America:
     ```
     $ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
     ```
   - EMEA:
     ```
     $ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
     ```

3. Review the terms of the offer by running one of the following commands:
   - North America:
     ```
     $ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
     ```
   - EMEA:
     ```
     $ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
     ```

4. Accept the terms of the offering by running one of the following commands:
   - North America:
     ```
     $ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
     ```
   - EMEA:
     ```
     $ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
     ```

5. Record the image details of your offer. You must update the `compute` section in the `install-config.yaml` file with values for `publisher`, `offer`, `sku`, and `version` before deploying the cluster.

**Sample install-config.yaml file with the Azure Marketplace worker nodes**

```yaml
apiVersion: v1
baseDomain: example.com
compute:
  - hyperthreading: Enabled
    name: worker
    platform:
      azure:
        type: Standard_DS_v5
    osImage:
      publisher: redhat
      offer: rh-ocp-worker
```
6.6.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**
   
   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**
   
   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.6.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.
   
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:
   
   - Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.
   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select `azure` as the platform to target.

   iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

      - **azure subscription id** The subscription ID to use for the cluster. Specify the `id` value in your account output.
      - **azure tenant id** The tenant ID. Specify the `tenantId` value in your account output.
      - **azure service principal client id** The value of the `appId` parameter for the service principal.
      - **azure service principal client secret** The value of the `password` parameter for the service principal.
iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.6.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 6.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>baseDomain</strong></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td><strong>metadata</strong></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>metadata.name</strong></td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td><strong>platform</strong></td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>nutanix</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about platform. <code>&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 6.6.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 6.2. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>
| **networking** | The configuration for the cluster network. | **Object**  

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all-Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td>The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>- 172.30.0.0/16</td>
</tr>
</tbody>
</table>

An array of objects. For example:
networking.machine Network.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation.
For example, 10.0.0.0/16.

NOTE
Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

6.6.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.3. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>capabilities.baseline CapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td><code>capabilities.additionEnabledCapabilities</code></td>
<td>Extends the set of optional capabilities beyond what you specify in <code>baselineCapabilitySet</code>. Valid values are <code>baremetal</code>, <code>marketplace</code> and <code>openshift-samples</code>. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td><code>cgroupsV2</code></td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><code>true</code></td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <code>hyperthreading</code>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td><code>Enabled</code> or <code>Disabled</code></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <strong>compute</strong>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <strong>controlPlane.platform</strong> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hypertreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <strong>controlPlane</strong>. The name of the machine pool.</td>
<td><strong>master</strong></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (“”).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see *Installing the system in FIPS mode*. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fips</code></td>
<td>Enable or disable FIPS mode. The default is <code>false</code> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
</tbody>
</table>

| `imageContentSources`      | Sources and repositories for the release-image content.                     | Array of objects. Includes a `source` and, optionally, `mirrors`, as described in the following rows of this table. |
| `imageContentSources.source` | Required if you use `imageContentSources`. Specify the repository that users refer to, for example, in image pull specifications. | String |
6.6.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

**NOTE**

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key to authenticate access to your cluster machines.</td>
<td>For example, sshKey: ssh-ed25519 AAAA...</td>
</tr>
</tbody>
</table>

</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

**IMPORTANT**

You are required to use Azure virtual machines that have the `premiumIO` parameter set to `true`.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

**Additional resources**

- Optimizing storage

### 6.6.6.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

**Example 6.1. Machine types**

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*
6.6.6.4. Sample customized install-config.yaml file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane: 
  hyperthreading: Enabled
  name: master
  platform: azure:
    encryptionAtHost: true
    ultraSSDCapability: Enabled
  osDisk:
    diskSizeGB: 1024
    diskType: Premium_LRS
    diskEncryptionSet:
      resourceGroup: disk_encryption_set_resource_group
      name: disk_encryption_set_name
    subscriptionId: secondary_subscription_id
    type: Standard_D8s_v3
  replicas: 3
compute:
  - hyperthreading: Enabled
    name: worker
    platform: azure:
      ultraSSDCapability: Enabled
      type: Standard_D2s_v3
      encryptionAtHost: true
    osDisk:
      diskSizeGB: 512
      diskType: Standard_LRS
      diskEncryptionSet:
        resourceGroup: disk_encryption_set_resource_group
        name: disk_encryption_set_name
        subscriptionId: secondary_subscription_id
      type: Standard_D2s_v3
      replicas: 5
zones:
  - "1"
  - "2"
  - "3"
metadata:
  name: test-cluster
networking:
```
clusterNetwork:
  - cidr: 10.128.0.0/14
hostPrefix: 23
machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    defaultMachinePlatform:
      ultraSSDCapability: Enabled
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
    pullSecret: '{"auths": ...}'
    fips: false
    sshKey: ssh-ed25519 AAAA...

1. Required. The installation program prompts you for this value.
2. If you do not provide these parameters and values, the installation program provides the default value.
3. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.
4. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
5. IMPORTANT
   If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.
6. You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
7. Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
8. Specify the name of the resource group that contains the DNS zone for your base domain.
9. Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
10. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography suite that is available for FIPS-compliant use.
Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 6.6.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

**Prerequisites**

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your install-config.yaml file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
   ```
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.

A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `. ` to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

The installation program does not support the proxy `readinessEndpoints` field.

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.
6.6.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```
  $ ./openshift-install create cluster --dir <installation_directory> \
   --log-level=info
  ```

  **1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

  **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
... INFO Install complete!
```
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

6.6.8. Finalizing user-managed encryption after installation

If you installed OpenShift Container Platform using a user-managed encryption key, you can complete the installation by creating a new storage class and granting write permissions to the Azure cluster resource group.

Procedure

1. Obtain the identity of the cluster resource group used by the installer:
   a. If you specified an existing resource group in `install-config.yaml`, obtain its Azure identity by running the following command:

   ```
   $ az identity list --resource-group "<existing_resource_group>"
   ```

   b. If you did not specify an existing resource group in `install-config.yaml`, locate the resource group that the installer created, and then obtain its Azure identity by running the following commands:

   ```
   $ az group list
   $ az identity list --resource-group "<installer_created_resource_group>"
   ```

2. Grant a role assignment to the cluster resource group so that it can write to the Disk Encryption Set by running the following command:

   ```
   $ az role assignment create --role "<privileged_role>" 1
   --assignee "<resource_group_identity>" 2
   ```
1. Specifies an Azure role that has read/write permissions to the disk encryption set. You can use the **Owner** role or a custom role with the necessary permissions.

2. Specifies the identity of the cluster resource group.

3. Obtain the **id** of the disk encryption set you created prior to installation by running the following command:

   ```bash
   $ az disk-encryption-set show -n <disk_encryption_set_name> --resource-group <resource_group_name>
   ```

   1. Specifies the name of the disk encryption set.
   2. Specifies the resource group that contains the disk encryption set. The **id** is in the format of "/subscriptions/.../resourceGroups/.../providers/Microsoft.Compute/diskEncryptionSets/...".

4. Obtain the identity of the cluster service principal by running the following command:

   ```bash
   $ az identity show -g <cluster_resource_group> -n <cluster_service_principal_name> --query principalId --out tsv
   ```

   1. Specifies the name of the cluster resource group created by the installation program.
   2. Specifies the name of the cluster service principal created by the installation program. The identity is in the format of 12345678-1234-1234-1234-1234567890.

5. Create a role assignment that grants the cluster service principal **Contributor** privileges to the disk encryption set by running the following command:

   ```bash
   $ az role assignment create --assignee <cluster_service_principal_id> --role 'Contributor' --scope <disk_encryption_set_id>
   ```

   1. Specifies the ID of the cluster service principal obtained in the previous step.
   2. Specifies the ID of the disk encryption set.

6. Create a storage class that uses the user-managed disk encryption set:

   a. Save the following storage class definition to a file, for example `storage-class-definition.yaml`:

   ```yaml
   kind: StorageClass
   apiVersion: storage.k8s.io/v1
   metadata:
     name: managed-premium
   provisioner: kubernetes.io/azure-disk
   parameters:
     skuname: Premium_LRS
   ```
Specifies the ID of the disk encryption set that you created in the prerequisite steps, for example \\

2 Specifies the name of the resource group used by the installer. This is the same resource group from the first step.

b. Create the storage class **managed-premium** from the file you created by running the following command:

   ```bash
   $ oc create -f storage-class-definition.yaml
   ```

7. Select the **managed-premium** storage class when you create persistent volumes to use encrypted storage.

6.6.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the **Product Variant** drop-down menu.

3. Select the appropriate version in the **Version** drop-down menu.

4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:

   ```bash
   $ tar xvf <file>
   ```

6. Place the **oc** binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
After you install the OpenShift CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 6.6.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.6.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to **OpenShift Cluster Manager Hybrid Cloud Console**.

After you confirm that your **OpenShift Cluster Manager Hybrid Cloud Console** inventory is correct,
either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

6.6.12. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.7. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.11, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only kubeProxy configuration parameters in a running cluster.

6.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials. Manual mode can also be used in environments where the cloud IAM APIs are not reachable.
- If you use customer-managed encryption keys, you prepared your Azure environment for encryption.

6.7.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
Access Quay.io to obtain the packages that are required to install your cluster.

Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.7.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.
NOTE
If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   $ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

      Example output

      Agent pid 31874

      NOTE
      If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   $ ssh-add <path>/<file_name> 1

   1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

   Example output

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps
6.7.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

**Procedure**

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.7.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

**Prerequisites**
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

**Procedure**

1. Create the `install-config.yaml` file.
   
a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>  
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:

   - Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select `azure` as the platform to target.

      iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

         - `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.
         - `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.
         - `azure service principal client id` The value of the `appId` parameter for the service principal.
         - `azure service principal client secret` The value of the `password` parameter for the service principal.
iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.7.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 6.7.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

#### Table 6.6. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>. <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>. <code>{.baseDomain}</code>.</td>
<td>String of lowercase letters, hyphens (¬), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>alibabacloud</code>, <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>gcp</code>, <code>ibmcloud</code>, <code>nutanix</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code>. For additional information about <code>platform</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td><code>{  &quot;auths&quot;:{    &quot;cloud.openshift.com&quot;:{      &quot;auth&quot;:&quot;b3Blb=&quot;,      &quot;email&quot;:&quot;you@example.com&quot;    },    &quot;quay.io&quot;:{      &quot;auth&quot;:&quot;b3Blb=&quot;,      &quot;email&quot;:&quot;you@example.com&quot;    }  }  }</code></td>
</tr>
</tbody>
</table>
### 6.7.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

#### Table 6.7. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all-Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
Parameter | Description | Values
---|---|---
**networking.machineNetwork.cidr** | Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24. | An IP network block in CIDR notation. For example, 10.0.0.0/16.

**NOTE**

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

### 6.7.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.8. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>additionalTrustBundle</strong></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><strong>capabilities</strong></td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td><strong>capabilities.baselineCapabilitySet</strong></td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the `credentialsMode` parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#).

The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

### NOTE

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fips</strong></td>
<td>Enable or disable FIPS mode. The default is <code>false</code> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
</tbody>
</table>
Specifying one or more repositories that may also contain the same images.

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

To deploy a private cluster, which cannot be accessed from the internet, set `publish` to `Internal`. The default value is `External`.

The SSH key to authenticate access to your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

For example, `sshKey: ssh-ed25519 AAAA...`

### 6.7.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

**NOTE**

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

Table 6.9. Additional Azure parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSourc es.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key to authenticate access to your cluster machines.</td>
<td>For example, <code>sshKey: ssh-ed25519 AAAA...</code></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>compute.platform.azure.encryptionAtHost</td>
<td>Enables host-level encryption for compute machines. You can enable this encryption alongside user-managed server-side encryption. This feature encrypts temporary, ephemeral, cached and un-managed disks on the VM host. This is not a prerequisite for user-managed server-side encryption.</td>
<td>true or false. The default is false.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskSize GB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 128.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>standard_LRS, premium_LRS, or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>

<td>Enabled, Disabled. The default is Disabled.</td>
</tr>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.azure.controlPlaneSubnet</code></td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example <strong>10.0.0.0/16</strong>.</td>
</tr>
<tr>
<td><code>platform.azure.computeSubnet</code></td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example <strong>10.0.0.0/16</strong>.</td>
</tr>
<tr>
<td><code>platform.azure.cloudName</code></td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <strong>AzurePublicCloud</strong> is used.</td>
<td>Any valid cloud environment, such as <strong>AzurePublicCloud</strong> or <strong>AzureUSGovernmentCloud</strong>.</td>
</tr>
<tr>
<td><code>platform.azure.defaul'tMachinePlatform.vmNetworkingType</code></td>
<td>Enables accelerated networking. Accelerated networking enables single root I/O virtualization (SR-IOV) to a VM, improving its networking performance.</td>
<td><strong>Accelerated</strong> or <strong>Basic</strong>. If instance type of control plane and compute machines support <strong>Accelerated</strong> networking, by default, the installer enables <strong>Accelerated</strong> networking, otherwise the default networking type is <strong>Basic</strong>.</td>
</tr>
</tbody>
</table>

### NOTE

You cannot customize **Azure Availability Zones** or **Use tags to organize your Azure resources** with an Azure cluster.

### 6.7.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.10. Minimum resource requirements**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>

<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

**IMPORTANT**

You are required to use Azure virtual machines that have the `premiumIO` parameter set to `true`.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

**Additional resources**

- Optimizing storage

**6.7.5.3. Tested instance types for Azure**

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

**Example 6.2. Machine types**

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*
6.7.5.4. Sample customized install-config.yaml file for Azure

You can customize the install-config.yaml file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:  
  hyperthreading: Enabled
  name: master
  platform: azure:
    encryptionAtHost: true
    ultraSSDCapability: Enabled
  osDisk:
    diskSizeGB: 1024
    diskType: Premium_LRS
    diskEncryptionSet:
      resourceGroup: disk_encryption_set_resource_group
      name: disk_encryption_set_name
      subscriptionId: secondary_subscription_id
    type: Standard_D8s_v3
  replicas: 3
compute:  
  - hyperthreading: Enabled
  name: worker
  platform: azure:
    ultraSSDCapability: Enabled
    type: Standard_D2s_v3
    encryptionAtHost: true
    osDisk:
      diskSizeGB: 512
      diskType: Standard_LRS
      diskEncryptionSet:
        resourceGroup: disk_encryption_set_resource_group
        name: disk_encryption_set_name
        subscriptionId: secondary_subscription_id
  zones: 
    - "1"
    - "2"
    - "3"
  replicas: 5
metadata:
  name: test-cluster
networking:
```
clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    defaultMachinePlatform:
      ultraSSDCapability: Enabled
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
    pullSecret: '{"auths": ...}'
    fips: false
    sshKey: ssh-ed25519 AAAA...

---

1. Required. The installation program prompts you for this value.

2. If you do not provide these parameters and values, the installation program provides the default value.

3. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.

4. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

   **IMPORTANT**

   If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

5. You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

6. Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

7. Specify the name of the resource group that contains the DNS zone for your base domain.

8. Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

9. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography provided by the Red Hat Cryptography Service.
Platform runs on by default, bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

6.7.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

**Prerequisites**

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

**NOTE**

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your install-config.yaml file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
```
httpProxy: http://<username>:<pswd>@<ip>:<port> \[1\]  
httpsProxy: https://<username>:<pswd>@<ip>:<port> \[2\]  
noProxy: example.com \[3\]  
additionalTrustBundle: | \[4\]  

-----BEGIN CERTIFICATE-----  
<MY_TRUSTED_CA_CERT>  
-----END CERTIFICATE-----  

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

```bash
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 6.7.6. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.
Phase 1
You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**
Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**IMPORTANT**
The CIDR range `172.17.0.0/16` is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

Phase 2
After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 6.7.7. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**
Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**
- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```
<installation_directory> specifies the name of the directory that contains the install-config.yaml file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named cluster-network-03-config.yml in the <installation_directory>/manifests/ directory:

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

3. Specify the advanced network configuration for your cluster in the cluster-network-03-config.yml file, such as in the following examples:

Specify a different VXLAN port for the OpenShift SDN network provider

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

Enable IPsec for the OVN-Kubernetes network provider

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the manifests/cluster-network-03-config.yml file. The installation program consumes the manifests/ directory when you create the Ignition config files.

6.7.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named cluster. The CR specifies the fields for the Network API in the operator.openshift.io API group.

The CNO configuration inherits the following fields during cluster installation from the Network API in the Network.config.openshift.io API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.
- **serviceNetwork**
IP address pool for services.

**defaultNetwork.type**
Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

### 6.7.8.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 6.11. Cluster Network Operator configuration object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <code>cluster</code>.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>spec.serviceNetwork</td>
<td>array</td>
<td>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/14</td>
</tr>
</tbody>
</table>

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.

<table>
<thead>
<tr>
<th>spec.defaultNetwork</th>
<th>object</th>
<th>Configures the Container Network Interface (CNI) cluster network provider for the cluster network.</th>
</tr>
</thead>
<tbody>
<tr>
<td>spec.kubeProxyConfig</td>
<td>object</td>
<td>The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.</td>
</tr>
</tbody>
</table>
defaultNetwork object configuration

The values for the defaultNetwork object are defined in the following table:

Table 6.12. defaultNetwork object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>openshiftSDNConfig</td>
<td>object</td>
<td>This object is only valid for the OpenShift SDN cluster network provider.</td>
</tr>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 6.13. openshiftSDNConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>
The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.

This value cannot be changed after cluster installation.

The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.

If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.

Example OpenShift SDN configuration

```yaml
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 6.14. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultNetwork:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>type:</td>
<td>OpenShiftSDN</td>
<td></td>
</tr>
<tr>
<td>openshiftSDNConfig:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>mode:</td>
<td>NetworkPolicy</td>
<td></td>
</tr>
<tr>
<td>mtu:</td>
<td>1450</td>
<td></td>
</tr>
<tr>
<td>vxlanPort:</td>
<td>4789</td>
<td></td>
</tr>
</tbody>
</table>
The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.

Specify an empty object to enable IPsec encryption.

Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.

While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.

### Table 6.15. policyAuditConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.</td>
</tr>
</tbody>
</table>
One of the following additional audit log targets:

- **libc**
  The libc `syslog()` function of the journald process on the host.

- **udp:<host>:<port>**
  A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.

- **unix:<file>**
  A Unix Domain Socket file specified by `<file>`.

- **null**
  Do not send the audit logs to any additional target.

The syslog facility, such as `kern`, as defined by RFC5424. The default value is `local0`.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>destination</strong></td>
<td>string</td>
<td>One of the following additional audit log targets:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>libc</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The libc <code>syslog()</code> function of the journald process on the host.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>udp:&lt;host&gt;:&lt;port&gt;</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A syslog server. Replace <code>&lt;host&gt;:&lt;port&gt;</code> with the host and port of the syslog server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>unix:&lt;file&gt;</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A Unix Domain Socket file specified by <code>&lt;file&gt;</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>null</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Do not send the audit logs to any additional target.</td>
</tr>
<tr>
<td><strong>syslogFacility</strong></td>
<td>string</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The syslog facility, such as <code>kern</code>, as defined by RFC5424. The default value is <code>local0</code>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>routingViaHost</strong></td>
<td>boolean</td>
<td>Set this field to <code>true</code> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <code>false</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <code>true</code>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</td>
</tr>
</tbody>
</table>

**Example OVN-Kubernetes configuration with IPSec enabled**

```yaml
defaultNetwork:
  type: OVNKubernetes
ovnKubernetesConfig:
  mtu: 1400
  genevePort: 6081
  ipsecConfig: {}

kubeProxyConfig object configuration
The values for the `kubeProxyConfig` object are defined in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>defaultNetwork</code></td>
<td></td>
</tr>
<tr>
<td><code>type</code></td>
<td>OVNKubernetes</td>
</tr>
<tr>
<td><code>ovnKubernetesConfig</code></td>
<td></td>
</tr>
<tr>
<td><code>mtu</code></td>
<td>1400</td>
</tr>
<tr>
<td><code>genevePort</code></td>
<td>6081</td>
</tr>
<tr>
<td><code>ipsecConfig</code></td>
<td>{}</td>
</tr>
</tbody>
</table>
```

### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>iptablesSyncPeriod</code></td>
<td>string</td>
<td>The refresh period for <code>iptables</code> rules. The default value is <strong>30s</strong>. Valid suffixes include <strong>s, m, and h</strong> and are described in the Go time package documentation.</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td></td>
<td>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <code>iptablesSyncPeriod</code> parameter is no longer necessary.</td>
</tr>
<tr>
<td><code>proxyArguments.iptables-min-sync-period</code></td>
<td>array</td>
<td>The minimum duration before refreshing <code>iptables</code> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <strong>s, m, and h</strong> and are described in the Go time package. The default value is:</td>
</tr>
</tbody>
</table>

```yaml
kubeProxyConfig:
  proxyArguments:
    iptables-min-sync-period:
      - 0s
```

---

### 6.7.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

### Prerequisites

- You defined `OVNKubernetes` for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

### Procedure

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory>
   ```

   where:
<installation_directory>
Specifies the name of the directory that contains the install-config.yaml file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named cluster-network-03-config.yml in the <installation_directory>/manifests/ directory:

```bash
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

where:

<installation_directory>
Specifies the directory name that contains the manifests/ directory for your cluster.

3. Open the cluster-network-03-config.yml file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

**Specify a hybrid networking configuration**

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
defaultNetwork:
  ovnKubernetesConfig:
    hybridOverlayConfig:
      hybridClusterNetwork:
        cidr: 10.132.0.0/14
        hostPrefix: 23
        hybridOverlayVXLANPort: 9898
```

1. Specify the CIDR configuration used for nodes on the additional overlay network. The hybridClusterNetwork CIDR cannot overlap with the clusterNetwork CIDR.

2. Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.

**NOTE**

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom hybridOverlayVXLANPort value because this Windows server version does not support selecting a custom VXLAN port.
4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

   **NOTE**

   For more information on using Linux and Windows nodes in the same cluster, see Understanding Windows container workloads.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

6.7.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```bash
  $ ./openshift-install create cluster --dir <installation_directory> \
  --log-level=info
  ```

  **1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

  **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:
The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.

Credential information also outputs to `<installation_directory>/.openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```text
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for **Recovering from expired control plane certificates** for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**6.7.11. Finalizing user-managed encryption after installation**

If you installed OpenShift Container Platform using a user-managed encryption key, you can complete the installation by creating a new storage class and granting write permissions to the Azure cluster resource group.

**Procedure**

1. Obtain the identity of the cluster resource group used by the installer:
   a. If you specified an existing resource group in **install-config.yaml**, obtain its Azure identity by running the following command:

```
$ az identity list --resource-group "<existing_resource_group>"
```
b. If you did not specify a existing resource group in `install-config.yaml`, locate the resource group that the installer created, and then obtain its Azure identity by running the following commands:

```
$ az group list
$ az identity list --resource-group "<installer_created_resource_group>"
```

2. Grant a role assignment to the cluster resource group so that it can write to the Disk Encryption Set by running the following command:

```
$ az role assignment create --role "<privileged_role>" --assignee "<resource_group_identity>
```

1. Specifies an Azure role that has read/write permissions to the disk encryption set. You can use the `Owner` role or a custom role with the necessary permissions.

2. Specifies the identity of the cluster resource group.

3. Obtain the id of the disk encryption set you created prior to installation by running the following command:

```
$ az disk-encryption-set show -n <disk_encryption_set_name> --resource-group <resource_group_name>
```

1. Specifies the name of the disk encryption set.

2. Specifies the resource group that contains the disk encryption set. The id is in the format of "/subscriptions/…/resourceGroups/…/providers/Microsoft.Compute/diskEncryptionSets/…".

4. Obtain the identity of the cluster service principal by running the following command:

```
$ az identity show -g <cluster_resource_group> -n <cluster_service_principal_name> --query principalId --out tsv
```

1. Specifies the name of the cluster resource group created by the installation program.

2. Specifies the name of the cluster service principal created by the installation program. The identity is in the format of 12345678-1234-1234-1234-1234567890.

5. Create a role assignment that grants the cluster service principal Contributor privileges to the disk encryption set by running the following command:

```
$ az role assignment create --assignee <cluster_service_principal_id> --role 'Contributor' --scope <disk_encryption_set_id>
```

1. Specifies the ID of the cluster service principal obtained in the previous step.
Specifies the ID of the disk encryption set.

6. Create a storage class that uses the user-managed disk encryption set:

   a. Save the following storage class definition to a file, for example `storage-class-definition.yaml`:

   ```yaml
   kind: StorageClass
   apiVersion: storage.k8s.io/v1
   metadata:
     name: managed-premium
   provisioner: kubernetes.io/azure-disk
   parameters:
     skuname: Premium_LRS
     kind: Managed
diskEncryptionSetID: "<disk_encryption_set_ID>"  # 1
   resourceGroup: "<resource_group_name>"  # 2
   reclaimPolicy: Delete
   allowVolumeExpansion: true
   volumeBindingMode: WaitForFirstConsumer
   
   1. Specifies the ID of the disk encryption set that you created in the prerequisite steps, for example "/subscriptions/xxxxxx-xxxxx-xxxxx/resourceGroups/test-encryption/providers/Microsoft.Compute/diskEncryptionSets/disk-encryption-set-xxxxxx".
   
   2. Specifies the name of the resource group used by the installer. This is the same resource group from the first step.

   b. Create the storage class `managed-premium` from the file you created by running the following command:

   ```bash
   $ oc create -f storage-class-definition.yaml
   
   7. Select the `managed-premium` storage class when you create persistent volumes to use encrypted storage.

6.7.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   ```

6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the oc command:

   ```
   C:\> oc <command>
   ```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   
   To check your PATH, open a terminal and execute the following command:
   
   ```
   $ echo $PATH
   ```

   **Verification**
   
   - After you install the OpenShift CLI, it is available using the oc command:
   
   ```
   $ oc <command>
   ```

6.7.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**
   
   -
Additional resources

- See Accessing the web console for more details about accessing and understanding the
  OpenShift Container Platform web console.

6.7.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics
about cluster health and the success of updates, requires internet access. If your cluster is connected to
the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager
Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either
maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use
subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-
cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

6.7.15. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.8. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

In OpenShift Container Platform version 4.11, you can install a cluster into an existing Azure Virtual
Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required
infrastructure, which you can further customize. To customize the installation, you modify parameters in
the install-config.yaml file before you install the cluster.

6.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update
  processes.
- You read the documentation on selecting a cluster installation method and preparing it for
  users.
- You configured an Azure account to host the cluster and determined the tested and validated
  region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment,
  or if you do not want to store an administrator-level credential secret in the kube-system
  namespace, you can manually create and maintain IAM credentials.
If you use customer-managed encryption keys, you prepared your Azure environment for encryption.

6.8.2. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.11, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

6.8.2.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- V Nets
- Network Security Groups

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.

- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.
NOTE

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

6.8.2.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 6.18. Required ports

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows internal communication to the machine config server for provisioning machines</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>
IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

Additional resources

- About the OpenShift SDN network plugin

6.8.2.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

6.8.2.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

6.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> ¹

   ¹ Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

$ cat <path>/<file_name>.pub

For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

$ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the /openshift-install gather command.

**NOTE**

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

$ eval "$(ssh-agent -s)"

**Example output**

Agent pid 31874

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

$ ssh-add <path>/<file_name>  

Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

**Example output**

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.8.5. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.
Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the **Infrastructure Provider** page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation **pull secret** from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

- Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.
   a. Change to the directory that contains the installation program and run the following
command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the `execute` permission. This permission is required to run Terraform binaries under the installation directory.

- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**  
   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select `azure` as the platform to target.

iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

   - **azure subscription id** The subscription ID to use for the cluster. Specify the `id` value in your account output.
   - **azure tenant id** The tenant ID. Specify the `tenantId` value in your account output.
   - **azure service principal client id** The value of the `appId` parameter for the service principal.
   - **azure service principal client secret** The value of the `password` parameter for the service principal.

iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.
vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

### 6.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
</tbody>
</table>
### Parameter | Description | Values
--- | --- | ---
**baseDomain** | The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the `<baseDomain>` format. | A fully-qualified domain or subdomain name, such as example.com.

**metadata** | Kubernetes resource ObjectMeta, from which only the `name` parameter is consumed. | Object

**metadata.name** | The name of the cluster. DNS records for the cluster are all subdomains of `{{.metadata.name}}. {{.baseDomain}}`. | String of lowercase letters, hyphens (-), and periods (.), such as dev.

**platform** | The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform parameters, consult the table for your specific platform that follows. | Object
6.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all-Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>

### 6.8.6.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.21. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>capabilities.baseline</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are <code>None</code>, <code>v4.11</code> and <code>vCurrent</code>. <code>v4.11</code> enables the <code>baremetal</code> Operator, the <code>marketplace</code> Operator, and the <code>openshift-samples</code> content. <code>vCurrent</code> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <code>vCurrent</code>.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are <code>baremetal</code>, <code>marketplace</code> and <code>openshift-samples</code>. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <code>hyperthreading</code>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

| compute.name | Required if you use `compute`. The name of the machine pool. | worker |
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</code></td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><strong>controlPlane.hypertreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><strong>controlPlane.name</strong></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td><code>master</code></td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td><code>credentialsMode</code></td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (&quot;&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the `credentialsMode` parameter to Mint, Passthrough or Manual.
Enable or disable FIPS mode. The default is **false** (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT
To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

### NOTE
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fips</strong></td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td><strong>String</strong></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.</td>
</tr>
<tr>
<td>sshKey</td>
<td>The SSH key to authenticate access to your cluster machines.</td>
<td>For example, sshKey: ssh-ed25519 AAAA...</td>
</tr>
</tbody>
</table>

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

### 6.8.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

**NOTE**

By default, if you specify availability zones in the install-config.yaml file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

**IMPORTANT**

You are required to use Azure virtual machines that have the `premiumIO` parameter set to `true`.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### Additional resources

- Optimizing storage

### 6.8.6.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

#### Example 6.3. Machine types

- c4.*

- t3a.*
6.8.6.4. Sample customized install-config.yaml file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1

          networking:
```

OpenShift Container Platform 4.11 Installing
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.
Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

6.8.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.
The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration. For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>  
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 
     noProxy: example.com
   additionalTrustBundle:
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   
   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.
   2 A proxy URL to use for creating HTTPS connections outside the cluster.
   3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use * to bypass the proxy for all destinations.
   4 If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.
NOTE
If the installer times out, restart and then complete the deployment by using the
wait-for command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE
Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

6.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT
You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \
     --log-level=info
```

1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.
NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

6.8.8. Finalizing user-managed encryption after installation

If you installed OpenShift Container Platform using a user-managed encryption key, you can complete the installation by creating a new storage class and granting write permissions to the Azure cluster resource group.

Procedure
1. Obtain the identity of the cluster resource group used by the installer:
   a. If you specified an existing resource group in `install-config.yaml`, obtain its Azure identity by running the following command:

   ```bash
   $ az identity list --resource-group "<existing_resource_group>"
   ```

   b. If you did not specify a existing resource group in `install-config.yaml`, locate the resource group that the installer created, and then obtain its Azure identity by running the following commands:

   ```bash
   $ az group list
   $ az identity list --resource-group "<installer_created_resource_group>"
   ```

2. Grant a role assignment to the cluster resource group so that it can write to the Disk Encryption Set by running the following command:

   ```bash
   $ az role assignment create --role "<privileged_role>" 1
   --assignee "<resource_group_identity>" 2
   ```

   1 Specifies an Azure role that has read/write permissions to the disk encryption set. You can use the **Owner** role or a custom role with the necessary permissions.

   2 Specifies the identity of the cluster resource group.

3. Obtain the **id** of the disk encryption set you created prior to installation by running the following command:

   ```bash
   $ az disk-encryption-set show -n <disk_encryption_set_name> 1
   --resource-group <resource_group_name> 2
   ```

   1 Specifies the name of the disk encryption set.

   2 Specifies the resource group that contains the disk encryption set. The **id** is in the format of `"/subscriptions/.../resourceGroups/.../providers/Microsoft.Compute/diskEncryptionSets/..."`.

4. Obtain the identity of the cluster service principal by running the following command:

   ```bash
   $ az identity show -g <cluster_resource_group> 1
   -n <cluster_service_principal_name> 2
   --query principalId --out tsv
   ```

   1 Specifies the name of the cluster resource group created by the installation program.

   2 Specifies the name of the cluster service principal created by the installation program. The identity is in the format of `12345678-1234-1234-1234-1234567890`.

5. Create a role assignment that grants the cluster service principal **Contributor** privileges to the disk encryption set by running the following command:
$ az role assignment create --assignee <cluster_service_principal_id> 
  --role 'Contributor' \
  --scope <disk_encryption_set_id>

1. Specifies the ID of the cluster service principal obtained in the previous step.
2. Specifies the ID of the disk encryption set.

6. Create a storage class that uses the user-managed disk encryption set:

a. Save the following storage class definition to a file, for example `storage-class-definition.yaml`:

```yaml
kind: StorageClass
apiVersion: storage.k8s.io/v1
metadata:
  name: managed-premium
provisioner: kubernetes.io/azure-disk
parameters:
  skuname: Premium_LRS
  kind: Managed
diskEncryptionSetID: "<disk_encryption_set_ID>"  
resourceGroup: "<resource_group_name>"
reclaimPolicy: Delete
allowVolumeExpansion: true
volumeBindingMode: WaitForFirstConsumer
```

1. Specifies the ID of the disk encryption set that you created in the prerequisite steps, for example "/subscriptions/xxxxxx-xxxx-xxxx/resourceGroups/test-encryption/providers/Microsoft.Compute/diskEncryptionSets/disk-encryption-set-xxxxxx".
2. Specifies the name of the resource group used by the installer. This is the same resource group from the first step.

b. Create the storage class `managed-premium` from the file you created by running the following command:

```bash
$ oc create -f storage-class-definition.yaml
```

7. Select the `managed-premium` storage class when you create persistent volumes to use encrypted storage.

6.8.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of `oc`. 
Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.
3. Select the appropriate version in the Version drop-down menu.
4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.
5. Unpack the archive:
   ```bash
   $ tar xvf <file>
   ```
6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:
   ```bash
   $ echo $PATH
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:
  ```bash
  $ oc <command>
  ```

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   ```cmd
   C:\> path
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:
  ```cmd
  C:\> oc <command>
  ```
Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure
2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   NOTE
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   
   ```
   $ echo $PATH
   ```

Verification
- After you install the OpenShift CLI, it is available using the oc command:
  
  ```
  $ oc <command>
  ```

6.8.10. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites
- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure
1. Export the kubeadm credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1 For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:
$ oc whoami

Example output

system:admin

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

6.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

6.8.12. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.9. INSTALLING A PRIVATE CLUSTER ON AZURE

In OpenShift Container Platform version 4.11, you can install a private cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

6.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

- If you use customer-managed encryption keys, you prepared your Azure environment for encryption.

### 6.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

**IMPORTANT**

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

#### 6.9.2.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster’s private DNS records. The cluster’s machines use 168.63.129.16 internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:
• A **BaseDomainResourceGroup**, since the cluster does not create public records

• Public IP addresses

• Public DNS records

• Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

### 6.9.2.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

### 6.9.2.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the `install-config.yaml` file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

• Outbound rules for access to the internet.

• Public IPs for the public load balancer.

• Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

• Egress to the internet is possible to pull container images, unless using an OpenShift image registry mirror.

• The cluster can access Azure APIs.

• Various allowlist endpoints are configured. You can reference these endpoints in the `Configuring your firewall` section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

**Private cluster with network address translation**

You can use **Azure VNET network address translation (NAT)** to provide outbound internet access for the subnets in your cluster. You can reference **Create a NAT gateway using Azure CLI** in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.
Private cluster with Azure Firewall
You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about providing user-defined routing with Azure Firewall in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

Private cluster with a proxy configuration
You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with 0.0.0.0/0 populated automatically by Azure, all Azure API requests are routed over Azure’s internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

Private cluster with no internet access
You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An OpenShift image registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

6.9.3. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.11, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

6.9.3.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups
NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

NOTE

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for.

NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

6.9.3.1.1. Network security group requirements
The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows internal communication to the machine config server for provisioning machines</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

**IMPORTANT**

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

Additional resources

- [About the OpenShift SDN network plugin](#)

### 6.9.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as V Nets, subnet, or ingress rules.
The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

6.9.3.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

6.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   
   ```
   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name> 1
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   NOTE

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

      ```
      $ eval "$(ssh-agent -s)"
      ```

   Example output

      ```
      Agent pid 31874
      ```
NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name>  
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`.

**NOTE**

For some platform types, you can alternatively run `./openshift-install create install-config --dir <installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.
3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

### 6.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### 6.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 6.25. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apiVersion</code></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><code>baseDomain</code></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td><code>metadata</code></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform. &lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{  &quot;auths&quot;:{  &quot;cloud.openshift.com&quot;:{  &quot;auth&quot;:&quot;b3Blb=&quot;;  &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;  },  &quot;quay.io&quot;:{  &quot;auth&quot;:&quot;b3Blb=&quot;;  &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;  }  }  }</td>
</tr>
</tbody>
</table>

6.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 6.26. Network parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td>NOTE</td>
<td>You cannot modify parameters specified by the networking object after installation.</td>
</tr>
<tr>
<td>networking.networkType</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. OpenShiftSDN is a CNI provider for all-Linux networks. OVNKubernetes is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^{(32 - 23) - 2}) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td>The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>serviceNetwork:</td>
<td>- 172.30.0.0/16</td>
</tr>
</tbody>
</table>
### networking.machin

**Network**

The IP address blocks for machines.

If you specify multiple IP address blocks, the blocks must not overlap.

An array of objects. For example:

```
networking:
  machineNetwork:
    - cidr: 10.0.0.0/16
```

### networking.machineNetwork.cidr

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

An IP network block in CIDR notation. For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

#### 6.9.7.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.27. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>capabilities.baseline CapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are <strong>None</strong>, <strong>v4.11</strong> and <strong>vCurrent</strong>. <strong>v4.11</strong> enables the <em>baremetal</em> Operator, the <em>marketplace</em> Operator, and the <em>openshift-samples</em> content. <strong>vCurrent</strong> installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is <strong>vCurrent</strong>.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities.enabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in <code>baselineCapabilitySet</code>. Valid values are <em>baremetal</em>, <em>marketplace</em> and <em>openshift-samples</em>. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables <a href="https://en.wikipedia.org/wiki/Linux_Control_Groups">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td><strong>true</strong></td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <strong>MachinePool</strong> objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
</tbody>
</table>
| controlPlane.architecture| Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default). | String }
### controlPlane.hypertreading

Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (“”).</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.</td>
<td></td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>
IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

NOTE

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.</td>
</tr>
</tbody>
</table>
### sshKey

The SSH key to authenticate access to your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

For example, `sshKey: ssh-ed25519 AAAA...`

---

### 6.9.7.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

**NOTE**

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.azure.encryptionAtHost</code></td>
<td>Enables host-level encryption for compute machines. You can enable this encryption alongside user-managed server-side encryption. This feature encrypts temporary, ephemeral, cached and un-managed disks on the VM host. This is not a prerequisite for user-managed server-side encryption.</td>
<td><code>true</code> or <code>false</code>. The default is <code>false</code>.</td>
</tr>
<tr>
<td><code>compute.platform.azure.osDisk.diskSize GB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is <code>128</code>.</td>
</tr>
<tr>
<td><code>compute.platform.azure.osDisk.diskType</code></td>
<td>Defines the type of disk.</td>
<td><code>standard_LRS</code>, <code>premium_LRS</code>, or <code>standardSSD_LRS</code>. The default is <code>premium_LRS</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------</td>

</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

**IMPORTANT**

You are required to use Azure virtual machines that have the `premiumIO` parameter set to `true`.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

**Additional resources**

- Optimizing storage

**6.9.7.3. Tested instance types for Azure**

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

**Example 6.4. Machine types**

- c4.*
- c5.*
- c5a.*
- i3.*
You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    azure:
      encryptionAtHost: true
      ultraSSDCapability: Enabled
      osDisk:
        diskSizeGB: 1024
        diskType: Premium_LRS
        diskEncryptionSet:
          resourceGroup: disk_encryption_set_resource_group
          name: disk_encryption_set_name
          subscriptionId: secondary_subscription_id
        type: Standard_D8s_v3
    replicas: 3
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    azure:
```

6.9.7.4. Sample customized install-config.yaml file for Azure
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The `controlPlane` section is a single mapping, but the `compute` section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the `compute` section must begin with a hyphen, `-`, and the first line of the `controlPlane` section must not. Only one control plane pool is used.
Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.
How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the internet. The default value is `External`.

### 6.9.7.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

#### Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

#### Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>
     httpsProxy: https://<username>:<pswd>@<ip>:<port>
   noProxy: example.com
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   ```

   **1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`.

   **2** A proxy URL to use for creating HTTPS connections outside the cluster.

   **3** A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.

### 6.9.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

- Change to the directory that contains the installation program and initialize the cluster deployment:
$ ./openshift-install create cluster --dir <installation_directory> \  
  --log-level=info  

1  For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

2  To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.
- Credential information also outputs to `<installation_directory>/openshift_install.log`.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...  
INFO Install complete!  
INFO To access the cluster as the system:admin user when using `oc`, run `export KUBECONFIG=\!\!/home/myuser/install_dir/auth/kubeconfig`  
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com  
INFO Login to the console with user: "kubeadmin", and password: "password"  
INFO Time elapsed: 36m22s
```
**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kublet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 6.9.9. Finalizing user-managed encryption after installation

If you installed OpenShift Container Platform using a user-managed encryption key, you can complete the installation by creating a new storage class and granting write permissions to the Azure cluster resource group.

**Procedure**

1. Obtain the identity of the cluster resource group used by the installer:
   
   a. If you specified an existing resource group in `install-config.yaml`, obtain its Azure identity by running the following command:

   ```bash
   $ az identity list --resource-group "<existing_resource_group>"
   ```

   b. If you did not specify a existing resource group in `install-config.yaml`, locate the resource group that the installer created, and then obtain its Azure identity by running the following commands:

   ```bash
   $ az group list
   $ az identity list --resource-group "<installer_created_resource_group>"
   ```

2. Grant a role assignment to the cluster resource group so that it can write to the Disk Encryption Set by running the following command:

   ```bash
   $ az role assignment create --role "<privileged_role>"  
   --assignee "<resource_group_identity>"
   ```

   1. Specifies an Azure role that has read/write permissions to the disk encryption set. You can use the *Owner* role or a custom role with the necessary permissions.

   2. Specifies the identity of the cluster resource group.

3. Obtain the id of the disk encryption set you created prior to installation by running the following command:
4. Obtain the identity of the cluster service principal by running the following command:

```bash
$ az identity show -g <cluster_resource_group> \
  -n <cluster_service_principal_name> \
  --query principalId --out tsv
```

1. Specifies the name of the cluster resource group created by the installation program.
2. Specifies the name of the cluster service principal created by the installation program. The identity is in the format of `12345678-1234-1234-1234-1234567890`.

5. Create a role assignment that grants the cluster service principal `Contributor` privileges to the disk encryption set by running the following command:

```bash
$ az role assignment create --assignee <cluster_service_principal_id> \
  --role 'Contributor' \
  --scope <disk_encryption_set_id>
```

1. Specifies the ID of the cluster service principal obtained in the previous step.
2. Specifies the ID of the disk encryption set.

6. Create a storage class that uses the user-managed disk encryption set:

   a. Save the following storage class definition to a file, for example `storage-class-definition.yaml`:

   ```yaml
   kind: StorageClass
   apiVersion: storage.k8s.io/v1
   metadata:
     name: managed-premium
   provisioner: kubernetes.io/azure-disk
   parameters:
     skuname: Premium_LRS
     kind: Managed
     diskEncryptionSetID: "<disk_encryption_set_ID>" 1
     resourceGroup: "<resource_group_name>" 2
   reclaimPolicy: Delete
   allowVolumeExpansion: true
   volumeBindingMode: WaitForFirstConsumer
   ```
1. Specifies the ID of the disk encryption set that you created in the prerequisite steps, for example 
   
   `/subscriptions/xxxxxx-xxxxx-xxxxx/resourceGroups/test-

2. Specifies the name of the resource group used by the installer. This is the same resource group from the first step.

   b. Create the storage class **managed-premium** from the file you created by running the following command:

   ```
   $ oc create -f storage-class-definition.yaml
   ```

7. Select the **managed-premium** storage class when you create persistent volumes to use encrypted storage.

### 6.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   ```
   $ tar xvf <file>
   ```

6. Place the **oc** binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```

**Verification**

- After you install the OpenShift CLI, it is available using the **oc** command:

  ```
  $ oc <command>
  ```
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:
  ```
  C:\> oc <command>
  ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.
3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

   **NOTE**
   For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.

4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   ```
   $ echo $PATH
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:
  ```
  $ oc <command>
  ```
6.9.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:
   
   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```
   
   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:
   
   ```
   $ oc whoami
   ```
   
   **Example output**
   
   system:admin

**Additional resources**

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

6.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service

6.9.13. Next steps
Customize your cluster.

If necessary, you can opt out of remote health reporting.

6.10. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.11, you can install a cluster on Microsoft Azure into a government region. To configure the government region, you modify parameters in the `install-config.yaml` file before you install the cluster.

6.10.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated government region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.
- If you use customer-managed encryption keys, you prepared your Azure environment for encryption.

6.10.2. Azure government regions

OpenShift Container Platform supports deploying a cluster to Microsoft Azure Government (MAG) regions. MAG is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure. MAG is composed of government-only data center regions, all granted an Impact Level 5 Provisional Authorization.

Installing to a MAG region requires manually configuring the Azure Government dedicated cloud instance and region in the `install-config.yaml` file. You must also update your service principal to reference the appropriate government environment.

NOTE

The Azure government region cannot be selected using the guided terminal prompts from the installation program. You must define the region manually in the `install-config.yaml` file. Remember to also set the dedicated cloud instance, like `AzureUSGovernmentCloud`, based on the region specified.

6.10.3. Private clusters
You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

**IMPORTANT**

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 6.10.3.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster’s private DNS records. The cluster’s machines use 168.63.129.16 internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints
The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

6.10.3.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

6.10.3.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the `install-config.yaml` file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an OpenShift image registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the Configuring your firewall section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

**Private cluster with network address translation**

You can use Azure VNET network address translation (NAT) to provide outbound internet access for the subnets in your cluster. You can reference Create a NAT gateway using Azure CLI in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with Azure Firewall**

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about providing user-defined routing with Azure Firewall in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with a proxy configuration**
You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with 0.0.0.0/0 populated automatically by Azure, all Azure API requests are routed over Azure’s internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

**Private cluster with no internet access**
You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An OpenShift image registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

### 6.10.4. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.11, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

#### 6.10.4.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.
The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.

- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

**NOTE**

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.

- There are two private subnets, one for the control plane machines and one for the compute machines.

- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

**NOTE**

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

### 6.10.4.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.
Table 6.30. Required ports

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows internal communication to the machine config server for provisioning machines</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

**IMPORTANT**

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

**Additional resources**

- [About the OpenShift SDN network plugin](#)

**6.10.4.2. Division of permissions**

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNs, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNs and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

**6.10.4.3. Isolation between clusters**
Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

6.10.5. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.10.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name> 1
   ```

   Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**
   
   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

   ```bash
   $ cat ~/.ssh/id_ed25519.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**
   
   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   Example output

   ```text
   Agent pid 31874
   ```

   **NOTE**
   
   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name> 1
   ```
Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.10.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

   IMPORTANT

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   IMPORTANT

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar -xvf openshift-install-linux.tar.gz

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform.
components.

6.10.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure into a government region, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

6.10.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.
6.10.8.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.31. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: 

- alibabacloud
- aws
- baremetal
- azure
- gcp
- ibmcloud
- nutanix
- openstack
- ovirt
- vsphere

or {}. For additional information about platform. <platform> parameters, consult the table for your specific platform that follows.

### PullSecret

Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{  "auths":{    "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"    },    "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"    }  }}
```

#### 6.10.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

### Table 6.32. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: alibabacloud, aws, baremetal, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}. For additional information about platform. &lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from the Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td><code>{  &quot;auths&quot;:{    &quot;cloud.openshift.com&quot;:{       &quot;auth&quot;:&quot;b3Blb=&quot;,       &quot;email&quot;:&quot;you@example.com&quot;    },    &quot;quay.io&quot;:{       &quot;auth&quot;:&quot;b3Blb=&quot;,       &quot;email&quot;:&quot;you@example.com&quot;    }  }}</code></td>
</tr>
</tbody>
</table>

976
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network.Type</td>
<td>The cluster network provider Container Network Interface (CNI) cluster network provider to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. <strong>OpenShiftSDN</strong> is a CNI provider for all-Linux networks. <strong>OVNKubernetes</strong> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
</tbody>
</table>
| networking.clusterNetwork | The IP address blocks for pods. The default value is **10.128.0.0/14** with a host prefix of **/23**. If you specify multiple IP address blocks, the blocks must not overlap. | An array of objects. For example: **networking:** clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23 |
| networking.clusterNetwork.cidr | Required if you use **networking.clusterNetwork**. An IP address block. An IPv4 network. | An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32. |
| networking.clusterNetwork.hostPrefix | The subnet prefix length to assign to each individual node. For example, if **hostPrefix** is set to **23** then each node is assigned a **/23** subnet out of the given **cidr**. A **hostPrefix** value of **23** provides **510** (2^(32 - 23) - 2) pod IP addresses. | A subnet prefix. The default value is **23**. |
| networking.serviceNetwork | The IP address block for services. The default value is **172.30.0.0/16**. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network. | An array with an IP address block in CIDR format. For example: **networking:** serviceNetwork:
  - 172.30.0.0/16 |
### networking.machineNetwork

The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.machineNetwork</td>
<td>An array of objects. For example:</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>

| networking.machineNetwork.cidr | Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24. | An IP network block in CIDR notation. For example, 10.0.0.0/16. |

**NOTE**

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

### 6.10.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.33. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities</td>
<td>Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components.</td>
<td>String array</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>capabilities.baseline CapabilitySet</td>
<td>Selects an initial set of optional capabilities to enable. Valid values are None, v4.11 and vCurrent. v4.11 enables the baremetal Operator, the marketplace Operator, and the openshift-samples content. vCurrent installs the recommended set of capabilities for the current version of OpenShift Container Platform. The default value is vCurrent.</td>
<td>String</td>
</tr>
<tr>
<td>capabilities.additionEnabledCapabilities</td>
<td>Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet. Valid values are baremetal, marketplace and openshift-samples. You may specify multiple capabilities in this parameter.</td>
<td>String array</td>
</tr>
<tr>
<td>cgroupsV2</td>
<td>Enables Linux control groups version 2 (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.</td>
<td>true</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or *hyperthreading*, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <em>hyperthreading</em>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual or an empty string (“”).</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Cluster Operators reference content.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If your AWS account has service control policies (SCP) enabled, you must configure the credentialsMode parameter to Mint, Passthrough or Manual.</td>
<td></td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>
IMPORTANT
To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
</tbody>
</table>
### How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

- **Internal** or **External**. To deploy a private cluster, which cannot be accessed from the internet, set `publish` to **Internal**. The default value is **External**.

### sshKey

The SSH key to authenticate access to your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

For example, `sshKey: ssh-ed25519 AAAA...`

---

**6.10.8.1.4. Additional Azure configuration parameters**

Additional Azure configuration parameters are described in the following table.

**NOTE**

By default, if you specify availability zones in the `install-config.yaml` file, the installation program distributes the control plane machines and the compute machines across these availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

**Table 6.34. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.azure.encryptionAtHost</code></td>
<td>Enables host-level encryption for compute machines. You can enable this encryption alongside user-managed server-side encryption. This feature encrypts temporary, ephemeral, cached and un-managed disks on the VM host. This is not a prerequisite for user-managed server-side encryption.</td>
<td><code>true</code> or <code>false</code>. The default is <code>false</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskSize GB</td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The default is 128.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskType</td>
<td>Defines the type of disk.</td>
<td>standard_LRS, premium_LRS, or standardSSD_LRS. The default is premium_LRS.</td>
</tr>
<tr>
<td>compute.platform.azure.ultraSSDCapability</td>
<td>Enables the use of Azure ultra disks for persistent storage on compute nodes. This requires that your Azure region and zone have ultra disks available.</td>
<td>Enabled, Disabled. The default is Disabled.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskEncryptionSet.resourceGroup</td>
<td>The name of the Azure resource group that contains the disk encryption set from the installation prerequisites. This resource group should be different than the resource group where you install the cluster to avoid deleting your Azure encryption key when the cluster is destroyed. This value is only necessary if you intend to install the cluster with user-managed disk encryption.</td>
<td>String, for example production_encryption_resource_group.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskEncryptionSet.name</td>
<td>The name of the disk encryption set that contains the encryption key from the installation prerequisites.</td>
<td>String, for example production_disk_encryption_set.</td>
</tr>
<tr>
<td>compute.platform.azure.osDisk.diskEncryptionSet.subscriptionId</td>
<td>Defines the Azure subscription of the disk encryption set where the disk encryption set resides. This secondary disk encryption set is used to encrypt compute machines.</td>
<td>String, in the format 00000000-0000-0000-0000-000000000000.</td>
</tr>
<tr>
<td>compute.platform.azure.vmNetworkingType</td>
<td>Enables accelerated networking. Accelerated networking enables single root I/O virtualization (SR-IOV) to a VM, improving its networking performance. If instance type of compute machines support Accelerated networking, by default, the installer enables Accelerated networking, otherwise the default networking type is Basic.</td>
<td>Accelerated or Basic.</td>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: \((\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}\).

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

IMPORTANT
You are required to use Azure virtual machines that have the premiumIO parameter set to true.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources
- Optimizing storage

6.10.8.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.
Example 6.5. Machine types

- c4.*
- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

6.10.8.4. Sample customized install-config.yaml file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
name: master
platform:
  azure:
    encryptionAtHost: true
    ultraSSDCapability: Enabled
osDisk:
  diskSizeGB: 1024 5
  diskType: Premium_LRS
  diskEncryptionSet:
    resourceGroup: disk_encryption_set_resource_group
```
name: disk_encryption_set
subscriptionId: secondary_subscription_id
type: Standard_D8s_v3
replicas: 3
compute: 6
- hyperthreading: Enabled
name: worker
platform:
  azure:
    ultraSSDCapability: Enabled
type: Standard_D2s_v3
encryptionAtHost: true
osDisk:
  diskSizeGB: 512
  diskType: Standard_LRS
diskEncryptionSet:
  resourceGroup: disk_encryption_set_resource_group
  name: disk_encryption_set_name
  subscriptionId: secondary_subscription_id
zones: 3
  - "1"
  - "2"
  - "3"
replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    defaultMachinePlatform:
      ultraSSDCapability: Enabled
    baseDomainResourceGroupName: resource_group
    region: usgovviginia
    resourceGroupName: existing_resource_group
    networkResourceGroupName: vnet_resource_group
    virtualNetwork: vnet
    controlPlaneSubnet: control_plane_subnet
    computeSubnet: compute_subnet
    outboundType: UserDefinedRouting
    cloudName: AzureUSGovernmentCloud
    pullSecret: '{"auths": ...}'
fips: false
sshKey: ssh-ed25519 AAAA...
publish: Internal
Required.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

Specify the name of the Azure cloud environment to deploy your cluster to. Set AzureUSGovernmentCloud to deploy to a Microsoft Azure Government (MAG) region. The default value is AzurePublicCloud.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.
IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the \texttt{x86\_64} architecture.

You can optionally provide the \texttt{sshKey} value that you use to access the machines in your cluster.

\textbf{NOTE}

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your \texttt{ssh-agent} process uses.

How to publish the user-facing endpoints of your cluster. Set \texttt{publish} to \texttt{Internal} to deploy a private cluster, which cannot be accessed from the internet. The default value is \texttt{External}.

6.10.8.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the \texttt{install-config.yaml} file.

Prerequisites

- You have an existing \texttt{install-config.yaml} file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the \texttt{Proxy} object’s \texttt{spec.noProxy} field to bypass the proxy if necessary.

\textbf{NOTE}

The \texttt{Proxy} object \texttt{status.noProxy} field is populated with the values of the \texttt{networking.machineNetwork[]}\texttt{.cidr}, \texttt{networking.clusterNetwork[]}\texttt{.cidr}, and \texttt{networking.serviceNetwork[]} fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the \texttt{Proxy} object \texttt{status.noProxy} field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your \texttt{install-config.yaml} file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
```
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

A proxy URL to use for creating HTTPS connections outside the cluster.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE
The installation program does not support the proxy readinessEndpoints field.

NOTE
If the installer times out, restart and then complete the deployment by using the wait-for command of the installer. For example:

```bash
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

Additional resources

- For more details about Accelerated Networking, see Accelerated Networking for Microsoft Azure VMs.
6.10.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

- Change to the directory that contains the installation program and initialize the cluster deployment:

  ```
  $ ./openshift-install create cluster --dir <installation_directory> \  
  --log-level=info
  ``

  1. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

  2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

**Verification**

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the `kubeadmin` user.

- Credential information also outputs to `<installation_directory>/openshift_install.log`.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**Example output**

```
... INFO Install complete!
```
6.10.10. Finalizing user-managed encryption after installation

If you installed OpenShift Container Platform using a user-managed encryption key, you can complete the installation by creating a new storage class and granting write permissions to the Azure cluster resource group.

Procedure

1. Obtain the identity of the cluster resource group used by the installer:
   a. If you specified an existing resource group in install-config.yaml, obtain its Azure identity by running the following command:

   ```bash
   $ az identity list --resource-group "<existing_resource_group>"
   ```

   b. If you did not specify an existing resource group in install-config.yaml, locate the resource group that the installer created, and then obtain its Azure identity by running the following commands:

   ```bash
   $ az group list
   $ az identity list --resource-group "<installer_created_resource_group>"
   ```

2. Grant a role assignment to the cluster resource group so that it can write to the Disk Encryption Set by running the following command:

   ```bash
   $ az role assignment create --role "<privileged_role>" 1 --assignee "<resource_group_identity>" 2
   ```
1. Specifies an Azure role that has read/write permissions to the disk encryption set. You can use the **Owner** role or a custom role with the necessary permissions.

2. Specifies the identity of the cluster resource group.

3. Obtain the **id** of the disk encryption set you created prior to installation by running the following command:

   ```bash
   $ az disk-encryption-set show -n <disk_encryption_set_name> \
   --resource-group <resource_group_name>
   ```

   1. Specifies the name of the disk encryption set.
   2. Specifies the resource group that contains the disk encryption set. The **id** is in the format of `”/subscriptions/…/resourceGroups/…/providers/Microsoft.Compute/diskEncryptionSets/…”`.

4. Obtain the identity of the cluster service principal by running the following command:

   ```bash
   $ az identity show -g <cluster_resource_group> \
   -n <cluster_service_principal_name> \
   --query principalId --out tsv
   ```

   1. Specifies the name of the cluster resource group created by the installation program.
   2. Specifies the name of the cluster service principal created by the installation program. The identity is in the format of **12345678-1234-1234-1234-1234567890**.

5. Create a role assignment that grants the cluster service principal **Contributor** privileges to the disk encryption set by running the following command:

   ```bash
   $ az role assignment create --assignee <cluster_service_principal_id> \
   --role 'Contributor' \
   --scope <disk_encryption_set_id>
   ```

   1. Specifies the ID of the cluster service principal obtained in the previous step.
   2. Specifies the ID of the disk encryption set.

6. Create a storage class that uses the user-managed disk encryption set:

   a. Save the following storage class definition to a file, for example **storage-class-definition.yaml**:

   ```yaml
   kind: StorageClass
   apiVersion: storage.k8s.io/v1
   metadata:
     name: managed-premium
   provisioner: kubernetes.io/azure-disk
   parameters:
     skuname: Premium_LRS
   ```
Specifies the ID of the disk encryption set that you created in the prerequisite steps, for example "/subscriptions/xxxxxx-xxxxx-xxxxx/resourceGroups/test-encryption/providers/Microsoft.Compute/diskEncryptionSets/disk-encryption-set-xxxxxx".

Specifies the name of the resource group used by the installer. This is the same resource group from the first step.

b. Create the storage class **managed-premium** from the file you created by running the following command:

```bash
$ oc create -f storage-class-definition.yaml
```

7. Select the **managed-premium** storage class when you create persistent volumes to use encrypted storage.

### 6.10.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

2. Select the architecture in the **Product Variant** drop-down menu.

3. Select the appropriate version in the **Version** drop-down menu.

4. Click **Download Now** next to the **OpenShift v4.11 Linux Client** entry and save the file.

5. Unpack the archive:

   ```bash
   $ tar xvf <file>
   ```

6. Place the **oc** binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 Windows Client entry and save the file.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```bash
   C:\> path
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:

   ```bash
   C:\> oc <command>
   ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

2. Select the appropriate version in the Version drop-down menu.

3. Click Download Now next to the OpenShift v4.11 macOS Client entry and save the file.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```bash
   $ echo $PATH
   $ oc <command>
   ```

Verification

- After you install the OpenShift CLI, it is available using the oc command:

   ```bash
   C:\> oc <command>
   ```

NOTE

For macOS arm64, choose the OpenShift v4.11 macOS arm64 Client entry.
Verification

- After you install the OpenShift CLI, it is available using the `oc` command:

  ```bash
  $ oc <command>
  ```

### 6.10.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   **Example**
   
   - For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**
   
   - `system:admin`

**Additional resources**

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.10.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.11, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to OpenShift Cluster Manager Hybrid Cloud Console.

After you confirm that your OpenShift Cluster Manager Hybrid Cloud Console inventory is correct,
either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service

---

### 6.10.14. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

---

### 6.11. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES

In OpenShift Container Platform version 4.11, you can install a cluster on Microsoft Azure by using infrastructure that you provide.

Several Azure Resource Manager (ARM) templates are provided to assist in completing these steps or to help model your own.

---

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

---

### 6.11.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See Install the Azure CLI in the Azure documentation. The documentation below was last tested using version 2.38.0 of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.
NOTE
Be sure to also review this site list if you are configuring a proxy.

6.11.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.11, you require access to the internet to install your cluster.

You must have internet access to:

- Access OpenShift Cluster Manager Hybrid Cloud Console to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitites your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT
If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

6.11.3. Configuring your Azure project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

IMPORTANT
All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

6.11.3.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default Azure subscription and service limits, quotas, and constraints affect your ability to install OpenShift Container Platform clusters.

IMPORTANT
Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.
The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vCPU</td>
<td>40</td>
<td>20 per region</td>
<td>A default cluster requires 40 vCPUs, so you must increase the account limit. By default, each cluster creates the following instances:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- One bootstrap machine, which is removed after installation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three control plane machines</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three compute machines</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Because the bootstrap machine uses <strong>Standard_D4s_v3</strong> machines, which use 4 vCPUs, the control plane machines use <strong>Standard_D8s_v3</strong> virtual machines, which use 8 vCPUs, and the worker machines use <strong>Standard_D4s_v3</strong> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</td>
</tr>
<tr>
<td>OS Disk</td>
<td>7</td>
<td></td>
<td>Each cluster machine must have a minimum of 100 GB of storage and 300 IOPS. While these are the minimum supported values, faster storage is recommended for production clusters and clusters with intensive workloads. For more information about optimizing storage for performance, see the page titled &quot;Optimizing storage&quot; in the &quot;Scalability and performance&quot; section.</td>
</tr>
<tr>
<td>VNet</td>
<td>1</td>
<td>1000 per region</td>
<td>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</td>
</tr>
<tr>
<td>Network interfaces</td>
<td>7</td>
<td>65,536 per region</td>
<td>Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</td>
</tr>
<tr>
<td>Component</td>
<td>Number of components required by default</td>
<td>Default Azure limit</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>------------------------------------------</td>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Network security groups</td>
<td>2</td>
<td>5000</td>
<td>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>control plane</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>node</strong></td>
</tr>
<tr>
<td>Network load balancers</td>
<td>3</td>
<td>1000 per region</td>
<td>Each cluster creates the following load balancers:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>default</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>internal</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>external</strong></td>
</tr>
<tr>
<td>Public IP addresses</td>
<td>3</td>
<td></td>
<td>If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.</td>
</tr>
<tr>
<td>Private IP addresses</td>
<td>7</td>
<td></td>
<td>Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.</td>
</tr>
</tbody>
</table>

- [Optimizing storage](#).

### 6.11.3.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

   **NOTE**

   For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.

3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.

   Use an appropriate root domain, such as `openshiftcorp.com`, or subdomain, such as `clusters.openshiftcorp.com`.

4. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain.

You can view Azure’s DNS solution by visiting this [example for creating DNS zones](#).

### 6.11.3.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.
NOTE
You can increase only one type of quota per support request.

Procedure

1. From the Azure portal, click Help + support in the lower left corner.

2. Click New support request and then select the required values:
   a. From the Issue type list, select Service and subscription limits (quotas)
   b. From the Subscription list, select the subscription to modify.
   c. From the Quota type list, select the quota to increase. For example, select Compute-VM (cores-vCPUs) subscription limit increases to increase the number of vCPUs, which is required to install a cluster.
   d. Click Next: Solutions.

3. On the Problem Details page, provide the required information for your quota increase:
   a. Click Provide details and provide the required details in the Quota details window.
   b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.

4. Click Next: Review + create and then click Create.

6.11.3.4. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The kube-controller-manager only approves the kubelet client CSRs. The machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

6.11.3.5. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, review the following information:

Your Azure account subscription must have the following roles:

- User Access Administrator
- Contributor

Your Azure Active Directory (AD) must have the following permission:

- "microsoft.directory/servicePrincipals/createAsOwner"

To set roles on the Azure portal, see the Manage access to Azure resources using RBAC and the Azure portal in the Azure documentation.
6.11.3.6. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

Prerequisites

- Install or update the Azure CLI.
- Your Azure account has the required roles for the subscription that you use.

Procedure

1. Log in to the Azure CLI:

   ```bash
   $ az login
   
   $ az account list --refresh
   ```

2. If your Azure account uses subscriptions, ensure that you are using the right subscription:
   a. View the list of available accounts and record the tenantId value for the subscription you want to use for your cluster:

   ```bash
   $ az account list --refresh
   ```

   **Example output**

   ```json
   
   
   
   
   ```

   b. View your active account details and confirm that the tenantId value matches the subscription you want to use:

   ```bash
   $ az account show
   ```

   **Example output**

   ```json
   
   
   ```
"tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",  
"user": {  
"name": "you@example.com",
"type": "user"
}
}

1. Ensure that the value of the **tenantId** parameter is the correct subscription ID.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id>  
```

1. Specify the subscription ID.

d. Verify the subscription ID update:

```
$ az account show
```

**Example output**

```json
{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

3. Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.

4. Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \  
--scopes /subscriptions/<subscription_id>  
--years <years>
```

1. Specify the service principal name.

2. Specify the subscription ID.

3. Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

**Example output**
5. Record the values of the `appId` and `password` parameters from the previous output. You need these values during OpenShift Container Platform installation.

6. Assign the **User Access Administrator** role by running the following command:

   ```bash
   $ az role assignment create --role "User Access Administrator" \
   --assignee-object-id $(az ad sp show --id <appId> --query id -o tsv)
   ```

   Specify the `appId` parameter value for your service principal.

---

**Additional resources**

- For more information about CCO modes, see [About the Cloud Credential Operator](https://aka.ms/azadsp-cli).

---

**6.11.3.7. Supported Azure regions**

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

**Supported Azure public regions**

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **israelcentral** (Israel Central)
- **italynorth** (Italy North)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **polandcentral** (Poland Central)
- **qatarcentral** (Qatar Central)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **swedencentral** (Sweden Central)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)
- **westus3** (West US 3)

**Supported Azure Government regions**
Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:
You can reference all available MAG regions in the Azure documentation. Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 6.11.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines. This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 6.11.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 6.36. Minimum required hosts**

<table>
<thead>
<tr>
<th>Hosts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One temporary bootstrap machine</td>
<td>The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.</td>
</tr>
<tr>
<td>Three control plane machines</td>
<td>The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.</td>
</tr>
<tr>
<td>At least two compute machines, which are also known as worker machines.</td>
<td>The workloads requested by OpenShift Container Platform users run on the compute machines.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.6 and later.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See Red Hat Enterprise Linux technology capabilities and limits.

#### 6.11.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.37. Minimum resource requirements**
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS, RHEL 8.6 and later [3]</td>
<td>2</td>
<td>8 GB</td>
<td>100 GB</td>
<td>300</td>
</tr>
</tbody>
</table>

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

**IMPORTANT**

You are required to use Azure virtual machines that have the `premiumIO` parameter set to `true`.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

**Additional resources**

- Optimizing storage

**6.11.4.3. Tested instance types for Azure**

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

**Example 6.6. Machine types**

- c4.*
- c5.*
- c5a.*
- i3.*
6.11.5. Selecting an Azure Marketplace image

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify `redhat` as the publisher. If you are located in EMEA, specify `redhat-limited` as the publisher.

- The offer includes a `rh-ocp-worker` SKU and a `rh-ocp-worker-gen1` SKU. The `rh-ocp-worker` SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the `rh-ocp-worker-gen1` SKU. The `rh-ocp-worker-gen1` SKU represents a Hyper-V version 1 VM image.

Prerequisites

- You have installed the Azure CLI client (`az`).

- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

   - North America:
     
     ```
     $ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
     ```

     Example output
Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

   - North America:
     
     $ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>

   - EMEA:
     
     $ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>

3. Review the terms of the offer by running one of the following commands:

   - North America:
     
     $ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>

   - EMEA:
     
     $ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>

4. Accept the terms of the offering by running one of the following commands:

   - North America:
5. Record the image details of your offer. If you use the Azure Resource Manager (ARM) template to deploy your worker nodes:

a. Update `storageProfile.imageReference` by deleting the `id` parameter and adding the `offer`, `publisher`, `sku`, and `version` parameters by using the values from your offer.

b. Specify a plan for the virtual machines (VMs).

Example 06_workers.json ARM template with an updated `storageProfile.imageReference` object and a specified plan

```json
...
"plan": {
  "name": "rh-ocp-worker",
  "product": "rh-ocp-worker",
  "publisher": "redhat"
},
"dependsOn": [
  "[concat('Microsoft.Network/networkInterfaces/',
           concat(variables('vmNames'),
                    '-nic'))]
],
"properties": {
  ...
  "storageProfile": {
    "imageReference": {
      "offer": "rh-ocp-worker",
      "publisher": "redhat",
      "sku": "rh-ocp-worker",
      "version": "4.8.2021122100"
    }
  }
}
...
```

6.11.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

**Procedure**

1. Access the Infrastructure Provider page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar -xvf openshift-install-linux.tar.gz
   ```

5. Download your installation pull secret from the Red Hat OpenShift Cluster Manager. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.11.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>

   1 Specify the path and file name, such as ~/.ssh/id_ed25519, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE
   If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_ed25519.pub public key:

   $ cat ~/.ssh/id_ed25519.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   Example output

      Agent pid 31874
NOTE
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the ssh-agent:

   ```
   $ ssh-add <path>/<file_name>  
   ```

   Specify the path and file name for your SSH private key, such as ~/.ssh/id_ed25519

   **Example output**

   ```
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

   **Next steps**

   - When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

6.11.8. Creating the installation files for Azure

To install OpenShift Container Platform on Microsoft Azure using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate /var partition during the preparation phases of installation.

6.11.8.1. Optional: Creating a separate /var partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the /var partition or a subdirectory of /var. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.

- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.

- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a /var directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because /var must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate /var partition by creating a machine config manifest that is
inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Procedure**

1. Create a directory to hold the OpenShift Container Platform installation files:
   
   ```bash
   $ mkdir $HOME/clusterconfig
   ```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:
   
   ```bash
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ```

   **Example output**
   
   ```bash
   ? SSH Public Key ...
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: $HOME/clusterconfig/manifests and $HOME/clusterconfig/openshift
   ```

3. Optional: Confirm that the installation program created manifests in the `clusterconfig/openshift` directory:
   
   ```bash
   $ ls $HOME/clusterconfig/openshift/
   ```

   **Example output**
   
   ```bash
   99_kubeadmin-password-secret.yaml
   99_openshift-cluster-api_master-machines-0.yaml
   99_openshift-cluster-api_master-machines-1.yaml
   99_openshift-cluster-api_master-machines-2.yaml
   ```

4. Create a Butane config that configures the additional partition. For example, name the file `$HOME/clusterconfig/98-var-partition.bu`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This example places the `/var` directory on a separate partition:

   ```yaml
   variant: openshift
   version: 4.11.0
   metadata:
     labels:
       machineconfiguration.openshift.io/role: worker
     name: 98-var-partition
   storage:
   ```
The storage device name of the disk that you want to partition.

When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

The size of the data partition in mebibytes.

The prjquota mount option must be enabled for filesystems used for container storage.

NOTE
When creating a separate /var partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the clusterconfig/openshift directory. For example, run the following command:

```bash
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run openshift-install again to create Ignition configs from a set of files in the manifest and openshift subdirectories:

```bash
$ openshift-install create ignition-configs --dir $HOME/clusterconfig/$ ls $HOME/clusterconfig/auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

**6.11.8.2. Creating the installation configuration file**

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

**Prerequisites**
Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Obtain service principal permissions at the subscription level.

Procedure

1. Create the **install-config.yaml** file.

   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir <installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   When specifying the directory:

   - Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.

   - Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      ![NOTE]

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

      ii. Select **azure** as the platform to target.

      iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

      - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.

      - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.

      - **azure service principal client id** The value of the **appId** parameter for the service principal.

      - **azure service principal client secret** The value of the **password** parameter for the service principal.
iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

vii. Paste the pull secret from the Red Hat OpenShift Cluster Manager.

c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting `install-config.yaml` file to set `replicas` to 0 for the compute pool:

```
compute:
  - hyperthreading: Enabled
    name: worker
    platform: {}
    replicas: 0 ①
```

① Set to 0.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.11.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
  noProxy: example.com
additionalTrustBundle:
  ----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  ----END CERTIFICATE-----
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http.

2. A proxy URL to use for creating HTTPS connections outside the cluster.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle.

NOTE

The installation program does not support the proxy readinessEndpoints field.
NOTE

If the installer times out, restart and then complete the deployment by using the `wait-for` command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

6.11.8.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure.

NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Export common variables found in the `install-config.yaml` to be used by the provided ARM templates:

   ```
   $ export CLUSTER_NAME=<cluster_name>  
   $ export AZURE_REGION=<azure_region>  
   $ export SSH_KEY=<ssh_key>  
   $ export BASE_DOMAIN=<base_domain>  
   $ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group>
   ```

   1. The value of the `.metadata.name` attribute from the `install-config.yaml` file.
   2. The region to deploy the cluster into, for example `centralus`. This is the value of the `.platform.azure.region` attribute from the `install-config.yaml` file.
   3. The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the `.sshKey` attribute from the `install-config.yaml` file.
4. The base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster. This is the value of the `baseDomain` attribute.

5. The resource group where the public DNS zone exists. This is the value of the `platform.azuresdk.baseDomainResourceGroupName` attribute from the `install-config.yaml` file.

For example:

```bash
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster
```

2. Export the kubeadm credentials:

```bash
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

### 6.11.8.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program.
- You created the `install-config.yaml` installation configuration file.
Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```bash
   $ ./openshift-install create manifests --dir <installation_directory> ①
   ```

   For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
     name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone: ①
       id: mycluster-100419-private-zone
     publicZone: ②
       id: example.openshift.com
   status: {}
   ```

   ① ② Remove this section completely.
If you do so, you must add ingress DNS records manually in a later step.

6. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:

a. Export the infrastructure ID by using the following command:

```
$ export INFRA_ID=<infra_id> 1
```

The OpenShift Container Platform cluster has been assigned an identifier (**INFRA_ID**) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the `.status.infrastructureName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

b. Export the resource group by using the following command:

```
$ export RESOURCE_GROUP=<resource_group> 1
```

All resources created in this Azure deployment exist as part of a resource group. The resource group name is also based on the **INFRA_ID**, in the form of `<cluster_name>-<random_string>-rg`. This is the value of the `.status.platformStatus.azure.resourceGroupName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

7. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

```
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

### 6.11.9. Creating the Azure resource group

You must create a Microsoft Azure resource group and an identity for that resource group. These are both used during the installation of your OpenShift Container Platform cluster on Azure.
Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Create the resource group in a supported Azure region:

   ```bash
   $ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
   ```

2. Create an Azure identity for the resource group:

   ```bash
   $ az identity create -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity
   ```

   This is used to grant the required access to Operators in your cluster. For example, this allows
   the Ingress Operator to create a public IP and its load balancer. You must assign the Azure
   identity to a role.

3. Grant the Contributor role to the Azure identity:

   a. Export the following variables required by the Azure role assignment:

      ```bash
      $ export PRINCIPAL_ID=`az identity show -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity --query principalId --out tsv`
      
      $ export RESOURCE_GROUP_ID=`az group show -g ${RESOURCE_GROUP} --query id --out tsv`
      ```

   b. Assign the Contributor role to the identity:

      ```bash
      $ az role assignment create --assignee "${PRINCIPAL_ID}" --role 'Contributor' --scope "${RESOURCE_GROUP_ID}"
      ```

6.11.10. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally. You must copy and store
the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage
container so they are accessible during deployment.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

Procedure

1. Create an Azure storage account to store the VHD cluster image:

   ```bash
   $ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
   ```
WARNING

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your CLUSTER_NAME variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see Resolve errors for storage account names in the Azure documentation.

2. Export the storage account key as an environment variable:

   ```bash
   $ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query '[0].value' -o tsv`
   
3. Export the URL of the RHCOS VHD to an environment variable:

   ```bash
   $ export VHD_URL=`openshift-install coreos print-stream-json | jq -r \.architectures.x86_64."rhel-coreos-extensions"."azure-disk".url`
   
   IMPORTANT

   The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Create the storage container for the VHD:

   ```bash
   $ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
   
   5. Copy the local VHD to a blob:

   ```bash
   $ az storage blob copy start --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --destination-blob "rhcos.vhd" --destination-container vhd --source-uri "$[VHD_URL]"
   
   6. Create a blob storage container and upload the generated bootstrap.ign file:

   ```bash
   $ az storage container create --name files --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
   
   $ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"

6.11.11. Example for creating DNS zones
DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, Azure’s DNS solution is used, so you will create a new public DNS zone for external (internet) visibility and a private DNS zone for internal cluster resolution.

**NOTE**

The public DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the public DNS zone; be sure the installation config you generated earlier reflects that scenario.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Create the new public DNS zone in the resource group exported in the `BASE_DOMAIN_RESOURCE_GROUP` environment variable:

   ```bash
   $ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
   ```

   You can skip this step if you are using a public DNS zone that already exists.

2. Create the private DNS zone in the same resource group as the rest of this deployment:

   ```bash
   $ az network private-dns zone create -g ${RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
   ```

   You can learn more about configuring a public DNS zone in Azure by visiting that section.

**6.11.12. Creating a VNet in Azure**

You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
Procedure

1. Copy the template from the ARM template for the VNet section of this topic and save it as 01_vnet.json in your cluster’s installation directory. This template describes the VNet that your cluster requires.

2. Create the deployment by using the az CLI:

   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/01_vnet.json" \
   --parameters baseName="${INFRA_ID}" 1

   The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

3. Link the VNet template to the private DNS zone:

   $ az network private-dns link vnet create -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n ${INFRA_ID}-network-link -v ${INFRA_ID}-vnet -e false

6.11.12.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

Example 6.7. 01_vnet.json ARM template

```json
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {
    "baseName": {
      "type": "string",
      "minLength": 1,
      "metadata": {
        "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
  },
  "variables": {
    "location": "[resourceGroup().location]",
    "virtualNetworkName": "[concat(parameters('baseName'), '-vnet')]",
    "addressPrefix": "10.0.0.0/16",
    "masterSubnetName": "[concat(parameters('baseName'), '-master-subnet')]",
    "masterSubnetPrefix": "10.0.0.0/24",
    "nodeSubnetName": "[concat(parameters('baseName'), '-worker-subnet')]",
    "nodeSubnetPrefix": "10.0.1.0/24",
    "clusterNsgName": "[concat(parameters('baseName'), '-nsg')]"
  },
  "resources": [
    {
      "apiVersion": "2018-12-01",
      "type": "Microsoft.Network/virtualNetworks",
```
"name" : "[variables('virtualNetworkName')]",
"location" : "[variables('location')]",
"dependsOn" : [
    "[concat('Microsoft.Network/networkSecurityGroups/', variables('clusterNsgName'))]"
],
"properties" : {
    "addressSpace" : {
        "addressPrefixes" : [
            "[variables('addressPrefix')]"
        ],
    },
    "subnets" : [
        {
            "name" : "[variables('masterSubnetName')]",
            "properties" : {
                "addressPrefix" : "[variables('masterSubnetPrefix')]",
                "serviceEndpoints" : [],
                "networkSecurityGroup" : {
                    "id" : "[resourceId('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))]"
                }
            }
        },
        {
            "name" : "[variables('nodeSubnetName')]",
            "properties" : {
                "addressPrefix" : "[variables('nodeSubnetPrefix')]",
                "serviceEndpoints" : [],
                "networkSecurityGroup" : {
                    "id" : "[resourceId('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))]"
                }
            }
        }
    ]
},
"name" : "[variables('clusterNsgName')]",
"apiVersion" : "2018-10-01",
"location" : "[variables('location')]",
"properties" : {
    "securityRules" : [
        {
            "name" : "apiserver_in",
            "properties" : {
                "protocol" : "Tcp",
                "sourcePortRange" : "*",
                "destinationPortRange" : "6443",
                "sourceAddressPrefix" : "*",
                "destinationAddressPrefix" : "*",
                "access" : "Allow",
                "priority" : 101,
                "direction" : "Inbound"
            }
        }
    ]
}
6.11.13. Deploying the RHCOS cluster image for the Azure infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure for your OpenShift Container Platform nodes.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

Procedure

1. Copy the template from the ARM template for image storage section of this topic and save it as 02_storage.json in your cluster’s installation directory. This template describes the image storage that your cluster requires.

2. Export the RHCOS VHD blob URL as a variable:

   ```
   $ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
   ```

3. Deploy the cluster image:

   ```
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/02_storage.json" \
   --parameters vhdBlobURL="${VHD_BLOB_URL}" \ 1
   --parameters baseName="${INFRA_ID}" 2
   ```

   1 The blob URL of the RHCOS VHD to be used to create master and worker machines.
   2 The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

6.11.13.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

Example 6.8. 02_storage.json ARM template
6.11.14. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in initramfs during boot to fetch their Ignition config files.

6.11.14.1. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

**IMPORTANT**

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.38. Ports used for all-machine to all-machine communications

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Description</th>
</tr>

6.11.15. Creating networking and load balancing components in Azure

You must configure networking and load balancing in Microsoft Azure for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.

Procedure

1. Copy the template from the ARM template for the network and load balancers section of this topic and save it as 03_infra.json in your cluster’s installation directory. This template describes the networking and load balancing objects that your cluster requires.

   $ az deployment group create -g ${RESOURCE_GROUP} \

2. Create the deployment by using the az CLI:
The name of the private DNS zone.

The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Create an **api** DNS record in the public zone for the API public load balancer. The **${BASE_DOMAINRESOURCE_GROUP}** variable must point to the resource group where the public DNS zone exists.

   a. Export the following variable:

   ```
   $ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?name=="${INFRA_ID}-master-pip"] | [0].ipAddress" -o tsv`
   ```

   b. Create the **api** DNS record in a new public zone:

   ```
   $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
   ```

   If you are adding the cluster to an existing public zone, you can create the **api** DNS record in it instead:

   ```
   $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
   ```

6.11.15.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

**Example 6.9. 03_infra.json ARM template**

```json
{
   "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
   "contentVersion": "1.0.0.0",
   "parameters": {
      "baseName": {
         "type": "string",
         "minLength": 1,
         "metadata": {
            "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
         }
      },
      "vnetBaseName": {
         "type": "string",
         "defaultValue": "",

    ]
}
You must create the bootstrap machine in Microsoft Azure to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.

**Procedure**

1. Copy the template from the ARM template for the bootstrap machine section of this topic and save it as `04_bootstrap.json` in your cluster’s installation directory. This template describes the bootstrap machine that your cluster requires.
2. Export the bootstrap URL variable:

   $ bootstrap_url_expiry=`date -u -d "10 hours" '+%Y-%m-%dT%H:%MZ'`

   $ export BOOTSTRAP_URL=`az storage blob generate-sas -c 'files' -n 'bootstrap.ign' --https-only --full-uri --permissions r --expiry $bootstrap_url_expiry --account-name $(CLUSTER_NAME)sa --account-key $(ACCOUNT_KEY) -o tsv`

3. Export the bootstrap ignition variable:

   $ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d '
'`

4. Create the deployment by using the `az` CLI:

   $ az deployment group create -g ${RESOURCE_GROUP} \ 
   --template-file "<installation_directory>/04_bootstrap.json" \
   --parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \ 
   --parameters baseName="${INFRA_ID}"

1. The bootstrap Ignition content for the bootstrap cluster.

2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

6.11.16.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

Example 6.10. 04_bootstrap.json ARM template

```json
{
    "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
    "contentVersion": "1.0.0.0",
    "parameters": {
        "baseName": {
            "type": "string",
            "minLength": 1,
            "metadata": {
                "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
            }
        },
        "vnetBaseName": {
            "type": "string",
            "defaultValue": "",
            "metadata": {
                "description": "The specific customer vnet's base name (optional)"
            }
        },
        "bootstrapIgnition": {
            "type": "string",
            "minLength": 1,
```
"metadata": {
  "description": "Bootstrap ignition content for the bootstrap cluster"
},
"sshKeyData": {
  "type": "securestring",
  "defaultValue": "Unused",
  "metadata": {
    "description": "Unused"
  }
},
"bootstrapVMSize": {
  "type": "string",
  "defaultValue": "Standard_D4s_v3",
  "metadata": {
    "description": "The size of the Bootstrap Virtual Machine"
  }
},
"variables": {
  "location": "[resourceGroup().location]",
  "virtualNetworkName": "[concat(if(not(empty(parameters('vnetBaseName')))),
    parameters('vnetBaseName'), parameters('baseName')), '-vnet')]",

}
6.11.17. Creating the control plane machines in Azure

You must create the control plane machines in Microsoft Azure for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

By default, Microsoft Azure places control plane machines and compute machines in a pre-set availability zone. You can manually set an availability zone for a compute node or control plane node. To do this, modify a vendor’s Azure Resource Manager (ARM) template by specifying each of your availability zones in the `zones` parameter of the virtual machine resource.

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, consider contacting Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

**Procedure**

1. Copy the template from the **ARM template for control plane machines** section of this topic and save it as **05_masters.json** in your cluster’s installation directory. This template describes the control plane machines that your cluster requires.

2. Export the following variable needed by the control plane machine deployment:

   ```bash
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d '
'`

3. Create the deployment by using the **az** CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/05_masters.json" \
   --parameters masterIgnition="${MASTER_IGNITION}" ① \
   --parameters baseName="${INFRA_ID}" ②
   ```

   ① The Ignition content for the control plane nodes.
   ② The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

6.11.17.1. ARM template for control plane machines
You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

**Example 6.11. 05_masters.json ARM template**

```json
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {
    "baseName": {
      "type": "string",
      "minLength": 1,
      "metadata": {
        "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "vnetBaseName": {
      "type": "string",
      "defaultValue": "",
      "metadata": {
        "description": "The specific customer vnet's base name (optional)"
      }
    },
    "masterIgnition": {
      "type": "string",
      "metadata": {
        "description": "Ignition content for the master nodes"
      }
    },
    "numberOfMasters": {
      "type": "int",
      "defaultValue": 3,
      "minValue": 2,
      "maxValue": 30,
      "metadata": {
        "description": "Number of OpenShift masters to deploy"
      }
    },
    "sshKeyData": {
      "type": "securestring",
      "defaultValue": "Unused",
      "metadata": {
        "description": "Unused"
      }
    },
    "privateDNSZoneName": {
      "type": "string",
      "defaultValue": "",
      "metadata": {
        "description": "unused"
      }
    },
    "masterVMSize": {
      "type": "string",
      "defaultValue": "Standard_D8s_v3",
      "metadata": {
        "description": "VMS size for the master nodes""
      }
    }
  }
}
```
"metadata" : {
    "description" : "The size of the Master Virtual Machines"
}
}
"diskSizeGB" : {
    "type" : "int",
    "defaultValue" : 1024,
    "metadata" : {
        "description" : "Size of the Master VM OS disk, in GB"
    }
}
},
"variables" : {
    "location" : "[resourceGroup().location],
    "virtualNetworkName" : "[concat(if(not(empty(parameters('vnetBaseName')))),
        parameters('vnetBaseName'), parameters('baseName'), '-vnet')],
    "virtualNetworkID" : "[resourceId('Microsoft.Network/virtualNetworks',
        variables('virtualNetworkName'))],
    "masterSubnetName" : "[concat(if(not(empty(parameters('vnetBaseName')))),
        parameters('vnetBaseName'), parameters('baseName'), '-master-subnet')],
    "masterSubnetRef" : "[concat(variables('virtualNetworkID'), '/subnets/',
        variables('masterSubnetName'))],
    "masterLoadBalancerName" : "[concat(parameters('baseName'), '-public-lb')],
    "internalLoadBalancerName" : "[concat(parameters('baseName'), '-internal-lb')],
    "sshKeyPath" : "'/home/core/.ssh/authorized_keys",
    "identityName" : "[concat(parameters('baseName'), '-identity')],
    "imageName" : "[concat(parameters('baseName'), '-image')],
    "copy" : [
        {
            "name" : "vmNames",
            "count" : "[parameters('numberOfMasters')]",
            "input" : "[concat(parameters('baseName'), '-master-', copyIndex('vmNames'))]"
        }
    ],

6.11.18. Wait for bootstrap completion and remove bootstrap resources in Azure

After you create all of the required infrastructure in Microsoft Azure, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \\ 1
   --log-level info 2
   ```
For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

   ```bash
   $ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --name bootstrap_ssh_in
   $ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
   $ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
   $ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap_OSDisk --yes
   $ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --yes
   $ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name ${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
   $ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-ssh-pip
   ```

   **NOTE**
   
   If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

### 6.11.19. Creating additional worker machines in Azure

You can create worker machines in Microsoft Azure for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM) template. Additional instances can be launched by including additional resources of type `06_workers.json` in the file.

**NOTE**

By default, Microsoft Azure places control plane machines and compute machines in a pre-set availability zone. You can manually set an availability zone for a compute node or control plane node. To do this, modify a vendor’s ARM template by specifying each of your availability zones in the `zones` parameter of the virtual machine resource.

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, consider contacting Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
Generate the Ignition config files for your cluster.

Create and configure a VNet and associated subnets in Azure.

Create and configure networking and load balancers in Azure.

Create control plane and compute roles.

Create the bootstrap machine.

Create the control plane machines.

**Procedure**

1. Copy the template from the ARM template for worker machines section of this topic and save it as `06_workers.json` in your cluster's installation directory. This template describes the worker machines that your cluster requires.

2. Export the following variable needed by the worker machine deployment:

   ```bash
   $ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d 'n'
   ```

3. Create the deployment by using the `az` CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/06_workers.json" \
   --parameters workerIgnition="${WORKER_IGNITION}" \  
   --parameters baseName="${INFRA_ID}"
   ```

   1. The Ignition content for the worker nodes.
   2. The base name to be used in resource names; this is usually the cluster's infrastructure ID.

**6.11.19.1. ARM template for worker machines**

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

**Example 6.12. 06_workers.json ARM template**

```json
{
    "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
    "contentVersion": "1.0.0.0",
    "parameters": {
        "baseName": {
            "type": "string",
            "minLength": 1,
            "metadata": {
                "description": "Base name to be used in resource names (usually the cluster’s Infra ID)"
            }
        },
        "vnetBaseName": {
            "type": "string",
```
"defaultValue": "",
"metadata": {
  "description": "The specific customer vnet's base name (optional)"
}
},
"workerIgnition": {
  "type": "string",
  "metadata": {
    "description": "Ignition content for the worker nodes"
  }
},
"numberOfNodes": {
  "type": "int",
  "defaultValue": 3,
  "minValue": 2,
  "maxValue": 30,
  "metadata": {
    "description": "Number of OpenShift compute nodes to deploy"
  }
},
"sshKeyData": {
  "type": "securestring",
  "defaultValue": "Unused",
  "metadata": {
    "description": "Unused"
  }
},
"nodeVMSize": {
  "type": "string",
  "defaultValue": "Standard_D4s_v3",
  "metadata": {
    "description": "The size of the each Node Virtual Machine"
  }
}
},
"variables": {
  "location": "[resourceGroup().location]",
  "virtualNetworkName": "[concat(if(not(empty(parameters('vnetBaseName')))), parameters('vnetBaseName'), parameters('baseName')), '-vnet')]",
  "virtualNetworkID": "[resourceId('Microsoft.Network/virtualNetworks', variables('virtualNetworkName'))]",
  "nodeSubnetName": "[concat(if(not(empty(parameters('vnetBaseName')))), parameters('vnetBaseName'), parameters('baseName')), '-worker-subnet')]",
  "nodeSubnetRef": "[concat(variables('virtualNetworkID'), '/subnets/', variables('nodeSubnetName'))]",
  "infraLoadBalancerName": "[parameters('baseName')]",
  "sshKeyPath": "'/home/capi/.ssh/authorized_keys",
  "identityName": "[concat(parameters('baseName'), '-identity')]",
  "imageName": "[concat(parameters('baseName'), '-image')]",
  "copy": [
    {
      "name": "vmNames",
      "count": "[parameters('numberOfNodes')]",
      "input": "[concat(parameters('baseName'), '-worker-', variables('location'), ':-', copyIndex('vmNames', 1))]
    }
  ]
"resources" : [
{
 "apiVersion" : "2019-05-01",
 "name" : "[concat('node', copyIndex())]",
 "type" : "Microsoft.Resources/deployments",
 "copy" : {
 "name" : "nodeCopy",
 "count" : "[length(variables('vmNames'))]"
 },
 "properties" : {
 "mode" : "Incremental",

 variables('identityName'))]" : {}
 }
 },
 "dependsOn" : [
 "[concat('Microsoft.Network/networkInterfaces/',
 concat(variables('vmNames')[copyIndex()], '-nic'))]"
 ]
 }
}
You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.
IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.11. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

2. Select the architecture in the Product Variant drop-down menu.

3. Select the appropriate version in the Version drop-down menu.

4. Click Download Now next to the OpenShift v4.11 Linux Client entry and save the file.

5. Unpack the archive:

   $ tar xvf <file>

6. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

Verification
