OpenShift Container Platform 4.2

Logging

Configuring cluster logging in OpenShift Container Platform 4.2
OpenShift Container Platform 4.2 Logging

Configuring cluster logging in OpenShift Container Platform 4.2
Abstract

This document provides instructions for installing, configuring, and using cluster logging, which aggregates logs for a range of OpenShift Container Platform services.
# Table of Contents

## Chapter 15. Uninstalling Cluster Logging
CHAPTER 1. ABOUT CLUSTER LOGGING AND OPENSOURCE CONTAINER PLATFORM

As a cluster administrator, you can deploy cluster logging to aggregate all the logs from your OpenShift Container Platform cluster, such as node system logs, application container logs, and so forth.

1.1. ABOUT CLUSTER LOGGING

OpenShift Container Platform cluster administrators can deploy cluster logging using a few CLI commands and the OpenShift Container Platform web console to install the Elasticsearch Operator and Cluster Logging Operator. When the operators are installed, create a Cluster Logging Custom Resource (CR) to schedule cluster logging pods and other resources necessary to support cluster logging. The operators are responsible for deploying, upgrading, and maintaining cluster logging.

You can configure cluster logging by modifying the Cluster Logging Custom Resource (CR), named instance. The CR defines a complete cluster logging deployment that includes all the components of the logging stack to collect, store and visualize logs. The Cluster Logging Operator watches the ClusterLogging Custom Resource and adjusts the logging deployment accordingly.

Administrators and application developers can view the logs of the projects for which they have view access.

1.1.1. Cluster logging components

The cluster logging components are based upon Elasticsearch, Fluentd, and Kibana (EFK). The collector, Fluentd, is deployed to each node in the OpenShift Container Platform cluster. It collects all node and container logs and writes them to Elasticsearch (ES). Kibana is the centralized, web UI where users and administrators can create rich visualizations and dashboards with the aggregated data.

There are currently 5 different types of cluster logging components:

- logStore - This is where the logs will be stored. The current implementation is Elasticsearch.
- collection - This is the component that collects logs from the node, formats them, and stores them in the logStore. The current implementation is Fluentd.
- visualization - This is the UI component used to view logs, graphs, charts, and so forth. The current implementation is Kibana.
- curation - This is the component that trims logs by age. The current implementation is Curator.
- event routing - This is the component forwards OpenShift Container Platform events to cluster logging. The current implementation is Event Router.

In this document, we may refer to logStore or Elasticsearch, visualization or Kibana, curation or Curator, collection or Fluentd, interchangeably, except where noted.

1.1.2. About the log store

OpenShift Container Platform uses Elasticsearch (ES) to organize the log data from Fluentd into datastores, or indices.

Elasticsearch subdivides each index into multiple pieces called shards, which it spreads across a set of Elasticsearch nodes in an Elasticsearch cluster. You can configure Elasticsearch to make copies of the shards, called replicas. Elasticsearch also spreads these replicas across the Elasticsearch nodes. The
ClusterLogging Custom Resource allows you to specify the replication policy in the Custom Resource Definition (CRD) to provide data redundancy and resilience to failure.

The cluster logging Elasticsearch instance is optimized and tested for short term storage of approximately seven days. If you want to retain your logs over a longer term, it is recommended that you move the data to a third-party storage system.

**NOTE**

The number of primary shards for the index templates is equal to the number of Elasticsearch data nodes.

The Cluster Logging Operator and companion Elasticsearch Operator ensure that each Elasticsearch node is deployed using a unique Deployment that includes its own storage volume. You can use a Cluster Logging Custom Resource (CR) to increase the number of Elasticsearch nodes. Refer to Elastic’s documentation for considerations involved in choosing storage and network location as directed below.

**NOTE**

A highly-available Elasticsearch environment requires at least three Elasticsearch nodes, each on a different host.

Role-based access control (RBAC) applied on the Elasticsearch indices enables the controlled access of the logs to the developers. Access to the indexes with the `project.{project_name}.{project_uuid}.*` format is restricted based on the permissions of the user in the specific project.

For more information, see Elasticsearch (ES).

### 1.1.3. About the logging collector

OpenShift Container Platform uses Fluentd to collect data about your cluster.

The logging collector is deployed as a DaemonSet in OpenShift Container Platform that deploys pods to each OpenShift Container Platform node. *journald* is the system log source supplying log messages from the operating system, the container runtime, and OpenShift Container Platform.

The container runtimes provide minimal information to identify the source of log messages: project, pod name, and container id. This is not sufficient to uniquely identify the source of the logs. If a pod with a given name and project is deleted before the log collector begins processing its logs, information from the API server, such as labels and annotations, might not be available. There might not be a way to distinguish the log messages from a similarly named pod and project or trace the logs to their source. This limitation means log collection and normalization is considered **best effort**.

**IMPORTANT**

The available container runtimes provide minimal information to identify the source of log messages and do not guarantee unique individual log messages or that these messages can be traced to their source.

For more information, see Fluentd.

### 1.1.4. About logging visualization
OpenShift Container Platform uses Kibana to display the log data collected by Fluentd and indexed by Elasticsearch.

Kibana is a browser-based console interface to query, discover, and visualize your Elasticsearch data through histograms, line graphs, pie charts, heat maps, built-in geospatial support, and other visualizations.

For more information, see Kibana.

1.1.5. About logging curation

The Elasticsearch Curator tool performs scheduled maintenance operations on a global and/or on a per-project basis. Curator performs actions based on its configuration. Only one Curator Pod is recommended per Elasticsearch cluster.

```yaml
spec:
curation:
type: "curator"
resources:
curator:
schedule: "30 3 * * *"
```

1 Specify the Curator schedule in the cron format.

For more information, see Curator.

1.1.6. About event routing

The Event Router is a pod that forwards OpenShift Container Platform events to cluster logging. You must manually deploy Event Router.

The Event Router collects events and converts them into JSON format, which takes those events and pushes them to STDOUT. Fluentd indexes the events to the .operations index.

1.1.7. About the Cluster Logging Custom Resource

To make changes to your cluster logging deployment, create and modify the Cluster Logging Custom Resource (CR). Instructions for creating or modifying a CR are provided in this documentation as appropriate.

The following is an example of a typical Custom Resource for cluster logging.

Sample Cluster Logging CR

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
namespace: openshift-logging
spec:
  managementState: "Managed"
  logStore:
    type: "elasticsearch"
nodeCount: 2
resources:
  limits:
    memory: 2Gi
  requests:
    cpu: 200m
    memory: 2Gi
storage:
  storageClassName: "gp2"
  size: "200G"
  redundancyPolicy: "SingleRedundancy"
visualization:
  type: "kibana"
kibana:
  resources:
    limits:
      memory: 1Gi
    requests:
      cpu: 500m
      memory: 1Gi
proxy:
  resources:
    limits:
      memory: 100Mi
    requests:
      cpu: 100m
      memory: 100Mi
replicas: 2
curator:
  type: "curator"
curator:
  resources:
    limits:
      memory: 200Mi
    requests:
      cpu: 200m
      memory: 200Mi
    schedule: "*/10 * * * *"
collection:
logs:
  type: "fluentd"
fluentd:
  resources:
    limits:
      memory: 1Gi
    requests:
      cpu: 200m
      memory: 1Gi
CHAPTER 2. ABOUT DEPLOYING CLUSTER LOGGING

Before installing cluster logging into your OpenShift Container Platform cluster, review the following sections.

2.1. ABOUT DEPLOYING AND CONFIGURING CLUSTER LOGGING

OpenShift Container Platform cluster logging is designed to be used with the default configuration, which is tuned for small to medium sized OpenShift Container Platform clusters.

The installation instructions that follow include a sample Cluster Logging Custom Resource (CR), which you can use to create a cluster logging instance and configure your cluster logging deployment.

If you want to use the default cluster logging install, you can use the sample CR directly.

If you want to customize your deployment, make changes to the sample CR as needed. The following describes the configurations you can make when installing your cluster logging instance or modify after installation. See the Configuring sections for more information on working with each component, including modifications you can make outside of the Cluster Logging Custom Resource.

2.1.1. Configuring and Tuning Cluster Logging

You can configure your cluster logging environment by modifying the Cluster Logging Custom Resource deployed in the openshift-logging project.

You can modify any of the following components upon install or after install:

Memory and CPU

You can adjust both the CPU and memory limits for each component by modifying the resources block with valid memory and CPU values:

```
spec:
    logStore:
        elasticsearch:
            resources:
                limits:
                    cpu: 1
                    memory: 16Gi
                requests:
                    cpu: 1
                    memory: 16Gi
        type: "elasticsearch"
    collection:
        logs:
            fluentd:
                resources:
                    limits:
                        cpu: 1
                        memory: 16Gi
                    requests:
                        cpu: 1
                        memory: 16Gi
                type: "fluentd"
            visualization:
                kibana:
```
resources:
limits:
cpu:
memory:
requests:
cpu:
memory:
type: kibana
curation:
resources:
limits:
memory: 200Mi
requests:
cpu: 200m
memory: 200Mi
type: "curator"

Elasticsearch storage

You can configure a persistent storage class and size for the Elasticsearch cluster using the storageClass name and size parameters. The Cluster Logging Operator creates a PersistentVolumeClaim for each data node in the Elasticsearch cluster based on these parameters.

spec:
logStore:
type: "elasticsearch"
elasticsearch:
nodeCount: 3
storage:
storageClassName: "gp2"
size: "200G"

This example specifies each data node in the cluster will be bound to a PersistentVolumeClaim that requests "200G" of "gp2" storage. Each primary shard will be backed by a single replica.

NOTE

Omitting the storage block results in a deployment that includes ephemeral storage only.

spec:
logStore:
type: "elasticsearch"
elasticsearch:
nodeCount: 3
storage: {}

Elasticsearch replication policy

You can set the policy that defines how Elasticsearch shards are replicated across data nodes in the cluster:

- **FullRedundancy**. The shards for each index are fully replicated to every data node.
- **MultipleRedundancy**. The shards for each index are spread over half of the data nodes.
- **SingleRedundancy.** A single copy of each shard. Logs are always available and recoverable as long as at least two data nodes exist.

- **ZeroRedundancy.** No copies of any shards. Logs may be unavailable (or lost) in the event a node is down or fails.

**Curator schedule**

You specify the schedule for Curator in the **cron format**.

```yaml
spec:
curation:
type: "curator"
resources:
curator:
schedule: "30 3 * * *"
```

### 2.1.2. Sample modified Cluster Logging Custom Resource

The following is an example of a Cluster Logging Custom Resource modified using the options previously described.

**Sample modified Cluster Logging Custom Resource**

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
  namespace: "openshift-logging"
spec:
  managementState: "Managed"
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 2
      resources:
        limits:
          memory: 2Gi
          requests:
            cpu: 200m
            memory: 2Gi
        storage: {}
      redundancyPolicy: "SingleRedundancy"
  visualization:
    type: "kibana"
    kibana:
      resources:
        limits:
          memory: 1Gi
        requests:
          cpu: 500m
          memory: 1Gi
        replicas: 1
      curation:
        type: "curator"
```
2.2. STORAGE CONSIDERATIONS FOR CLUSTER LOGGING AND OPENSHIFT CONTAINER PLATFORM

A persistent volume is required for each Elasticsearch deployment to have one data volume per data node. On OpenShift Container Platform this is achieved using Persistent Volume Claims.

The Elasticsearch Operator names the PVCs using the Elasticsearch resource name. Refer to Persistent Elasticsearch Storage for more details.

Fluentd ships any logs from systemd journal and /var/log/containers/ to Elasticsearch.

Therefore, consider how much data you need in advance and that you are aggregating application log data. Some Elasticsearch users have found that it is necessary to keep absolute storage consumption around 50% and below 70% at all times. This helps to avoid Elasticsearch becoming unresponsive during large merge operations.

By default, at 85% Elasticsearch stops allocating new data to the node, at 90% Elasticsearch attempts to relocate existing shards from that node to other nodes if possible. But if no nodes have free capacity below 85%, Elasticsearch effectively rejects creating new indices and becomes RED.

NOTE

These low and high watermark values are Elasticsearch defaults in the current release. You can modify these values, but you also must apply any modifications to the alerts also. The alerts are based on these defaults.

2.3. ADDITIONAL RESOURCES

For more information on installing operators, see Installing Operators from the OperatorHub.
CHAPTER 3. DEPLOYING CLUSTER LOGGING

You can install cluster logging by deploying the Elasticsearch and Cluster Logging Operators. The Elasticsearch Operator creates and manages the Elasticsearch cluster used by cluster logging. The Cluster Logging Operator creates and manages the components of the logging stack.

The process for deploying cluster logging to OpenShift Container Platform involves:

- Reviewing the installation options in About deploying cluster logging.
- Reviewing the cluster logging storage considerations.
- Installing the Elasticsearch Operator and Cluster Logging Operator.

3.1. INSTALL THE ELASTICSEARCH OPERATOR USING THE CLI

You must install the Elasticsearch Operator using the CLI following the directions below.

Prerequisites

Ensure that you have the necessary persistent storage for Elasticsearch. Note that each Elasticsearch node requires its own storage volume.

Elasticsearch is a memory-intensive application. Each Elasticsearch node needs 16G of memory for both memory requests and limits. The initial set of OpenShift Container Platform nodes might not be large enough to support the Elasticsearch cluster. You must add additional nodes to the OpenShift Container Platform cluster to run with the recommended or higher memory. Each Elasticsearch node can operate with a lower memory setting though this is not recommended for production deployments.

Procedure

To install the Elasticsearch Operator using the CLI:

1. Create a Namespace for the Elasticsearch Operator.
   a. Create a Namespace object YAML file (for example, eo-namespace.yaml) for the Elasticsearch Operator:

```
apiVersion: v1
kind: Namespace
metadata:
  name: openshift-operators-redhat
  annotations:
    openshift.io/node-selector: ""
  labels:
    openshift.io/cluster-monitoring: "true"
```

1. You must specify the `openshift-operators-redhat` Namespace. To prevent possible conflicts with metrics, you should configure the Prometheus Cluster Monitoring stack to scrape metrics from the `openshift-operators-redhat` Namespace and not the `openshift-operators` Namespace. The `openshift-operators` Namespace might contain Community Operators, which are untrusted and could publish a metric with the same name as an OpenShift Container Platform metric, which would cause conflicts.

2. You must specify this label as shown to ensure that cluster monitoring scrapes the `openshift-operators-redhat` Namespace.
b. Create the Namespace:

```
$ oc create -f <file-name>.yaml
```

For example:

```
$ oc create -f eo-namespace.yaml
```

2. Install the Elasticsearch Operator by creating the following objects:

a. Create an Operator Group object YAML file (for example, eo-og.yaml) for the Elasticsearch operator:

```
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: openshift-operators-redhat
  namespace: openshift-operators-redhat
spec: {}
```

1 You must specify the `openshift-operators-redhat` Namespace.

b. Create an Operator Group object:

```
$ oc create -f <file-name>.yaml
```

For example:

```
$ oc create -f eo-og.yaml
```

c. Create a Subscription object YAML file (for example, eo-sub.yaml) to subscribe a Namespace to an Operator.

**Example Subscription**

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: "elasticsearch-operator"
  namespace: "openshift-operators-redhat"
spec:
  channel: "4.2"
  installPlanApproval: "Automatic"
  source: "redhat-operators"
  sourceNamespace: "openshift-marketplace"
  name: "elasticsearch-operator"
```

1 You must specify the `openshift-operators-redhat` Namespace.
2 Specify **4.2** as the channel.
3 Specify `redhat-operators`. If your OpenShift Container Platform cluster is installed on a restricted network, also known as a disconnected cluster, specify the name of the
CatalogSource object created when you configured the Operator Lifecycle Manager (OLM).

d. Create the Subscription object:

$ oc create -f <file-name>.yaml

For example:

$ oc create -f eo-sub.yaml

e. Change to the openshift-operators-redhat project:

$ oc project openshift-operators-redhat

Now using project "openshift-operators-redhat"

f. Create a Role-based Access Control (RBAC) object file (for example, eo-rbac.yaml) to grant Prometheus permission to access the openshift-operators-redhat Namespace:

```yaml
apiVersion: rbac.authorization.k8s.io/v1
kind: Role
metadata:
  name: prometheus-k8s
  namespace: openshift-operators-redhat
rules:
- apiGroups: 
  - ""
  resources:
  - services
  - endpoints
  - pods
  verbs: 
  - get
  - list
  - watch
---
apiVersion: rbac.authorization.k8s.io/v1
kind: RoleBinding
metadata:
  name: prometheus-k8s
  namespace: openshift-operators-redhat
roleRef:
  apiGroup: rbac.authorization.k8s.io
  kind: Role
  name: prometheus-k8s
subjects:
- kind: ServiceAccount
  name: prometheus-k8s
  namespace: openshift-operators-redhat
```

g. Create the RBAC object:
$ oc create -f <file-name>.yaml

For example:

$ oc create -f eo-rbac.yaml

The Elasticsearch Operator is installed to the openshift-operators-redhat Namespace and copied to each project in the cluster.

3. Verify the Operator installation:

```bash
oc get csv --all-namespaces

<table>
<thead>
<tr>
<th>NAMESPACE</th>
<th>NAME</th>
<th>DISPLAY</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>default</td>
<td>kub-node-lease</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>default</td>
<td>kub-public</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>default</td>
<td>kub-system</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>openshift-apiserver-operator</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>openshift-apiserver</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>openshift-apiserver-operator</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>openshift-authentication-operator</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>openshift-authentication</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
<tr>
<td>openshift-authentication</td>
<td>Elasticsearch Operator</td>
<td>4.2.1-202002032140</td>
</tr>
</tbody>
</table>

There should be an Elasticsearch Operator in each Namespace. The version number might be different than shown.

Next step

Install the Cluster Logging Operator using the Console or the CLI using the steps in the following sections.

3.2. INSTALL THE CLUSTER LOGGING OPERATOR USING THE WEB CONSOLE

You can use the OpenShift Container Platform web console to install the Cluster Logging Operator.

**NOTE**

You cannot create a Project starting with openshift- using the web console or by using the `oc new-project` command. You must create a Namespace using a YAML object file and run the `oc create -f <file-name>.yaml` command, as shown.

**Procedure**
To install the Cluster Logging Operator using the OpenShift Container Platform web console:

1. Create a Namespace for the Cluster Logging Operator. You must use the CLI to create the Namespace.
   a. Create a Namespace object YAML file (for example, clo-namespace.yaml) for the Cluster Logging Operator:
      ```yaml
      apiVersion: v1
      kind: Namespace
      metadata:
        name: openshift-logging
        annotations:
          openshift.io/node-selector: ""
        labels:
          openshift.io/cluster-logging: "true"
          openshift.io/cluster-monitoring: "true"
      
      1 Specify these values as shown.
      
      2
      
      b. Create the Namespace:
         ```bash
         $ oc create -f <file-name>.yaml
         For example:
         $ oc create -f clo-namespace.yaml
         ```

2. Install the Cluster Logging Operator:
   b. Choose Cluster Logging from the list of available Operators, and click Install.
   c. On the Create Operator Subscription page, under A specific Namespace on the cluster select openshift-logging. Then, click Subscribe.

3. Verify that the Cluster Logging Operator installed:
   a. Switch to the Operators → Installed Operators page.
   b. Ensure that Cluster Logging is listed in the openshift-logging project with a Status of InstallSucceeded.

   **NOTE**
   During installation an Operator might display a Failed status. If the Operator then installs with an InstallSucceeded message, you can safely ignore the Failed message.

   If the Operator does not appear as installed, to troubleshoot further:
   - Switch to the Operators → Installed Operators page and inspect the Status column for any errors or failures.
4. Create a cluster logging instance:

a. Switch to the Administration → Custom Resource Definitions page.

c. On the Custom Resource Definition Overview page, select View Instances from the Actions menu.

d. On the Cluster Loggings page, click Create Cluster Logging.
   You might have to refresh the page to load the data.

e. In the YAML field, replace the code with the following:

   ```yaml
   apiVersion: "logging.openshift.io/v1"
   kind: "ClusterLogging"
   metadata:
     name: "instance"  
     namespace: "openshift-logging"
   spec:
     managementState: "Managed"  
     logStore:
       type: "elasticsearch"  
       elasticsearch:
         nodeCount: 3  
         storage:
           storageClassName: gp2  
           size: 200G  
           redundancyPolicy: "SingleRedundancy"
       visualization:
         type: "kibana"  
         kibana:
           replicas: 1
         curation:
           type: "curator"  
           curator:
             schedule: "30 3 * * *"
       collection:
         logs:
           type: "fluentd"  
           fluentd: {}
   ```

   **NOTE**

   This default cluster logging configuration should support a wide array of environments. Review the topics on tuning and configuring the cluster logging components for information on modifications you can make to your cluster logging cluster.

   1. The name must be `instance`. 
2. The cluster logging management state. In most cases, if you change the cluster logging defaults, you must set this to **Unmanaged**. However, an unmanaged deployment does not provide the same level of security and manageability as a managed deployment.

3. Settings for configuring Elasticsearch. Using the CR, you can configure shard replication policy and persistent storage. For more information, see **Configuring Elasticsearch**.

4. Specify the number of Elasticsearch nodes. See the note that follows this list.

5. Specify that each Elasticsearch node in the cluster is bound to a Persistent Volume Claim.

6. Settings for configuring Kibana. Using the CR, you can scale Kibana for redundancy and configure the CPU and memory for your Kibana nodes. For more information, see **Configuring Kibana**.

7. Settings for configuring Curator. Using the CR, you can set the Curator schedule. For more information, see **Configuring Curator**.

8. Settings for configuring Fluentd. Using the CR, you can configure Fluentd CPU and memory limits. For more information, see **Configuring Fluentd**.

**NOTE**

The maximum number of Elasticsearch master nodes is three. If you specify a `nodeCount` greater than 3, OpenShift Container Platform creates three Elasticsearch nodes that are Master-eligible nodes, with the master, client, and data roles. The additional Elasticsearch nodes are created as Data-only nodes, using client and data roles. Master nodes perform cluster-wide actions such as creating or deleting an index, shard allocation, and tracking nodes. Data nodes hold the shards and perform data-related operations such as CRUD, search, and aggregations. Data-related operations are I/O-, memory-, and CPU-intensive. It is important to monitor these resources and to add more Data nodes if the current nodes are overloaded.

For example, if `nodeCount=4`, the following nodes are created:

```
$ oc get deployment
cluster-logging-operator       1/1     1            1           18h
elasticsearch-cd-x6dekli-1    0/1     1            0           6m54s
elasticsearch-cdm-x6dekli-1   1/1     1            1           18h
elasticsearch-cdm-x6dekli-2   0/1     1            0           6m49s
elasticsearch-cdm-x6dekli-3   0/1     1            0           6m44s
```

The number of primary shards for the index templates is equal to the number of Elasticsearch data nodes.

5. Verify the install:

   a. Click **Create**. This creates the Cluster Logging Custom Resource and Elasticsearch Custom Resource, which you can edit to make changes to your cluster logging cluster.

5. Verify the install:

   a. Switch to the **Workloads → Pods** page.
b. Select the **openshift-logging** project. You should see several Pods for cluster logging, Elasticsearch, Fluentd, and Kibana similar to the following list:

- cluster-logging-operator-cb795f8dc-xkckc
- elasticsearch-cdm-b3nqzchd-1-5c6797-67kfz
- elasticsearch-cdm-b3nqzchd-2-6667f4-wtprv
- elasticsearch-cdm-b3nqzchd-3-588c65-clg7g
- fluentd-2c7dg
- fluentd-9z7kk
- fluentd-br7r2
- fluentd-fn2sb
- fluentd-pb2f8
- fluentd-zqgqx
- kibana-7fb4f4dc9-bvtp4

### 3.3. INSTALL THE CLUSTER LOGGING OPERATOR USING THE CLI

You can use the OpenShift Container Platform CLI to install the Cluster Logging Operator. The Cluster Logging Operator creates and manages the components of the logging stack.

**Procedure**

To install the Cluster Logging Operator using the CLI:

1. Create a Namespace for the Cluster Logging Operator:
   
   a. Create a Namespace object YAML file (for example, `clo-namespace.yaml`) for the Cluster Logging Operator:

   ```yaml
   apiVersion: v1
   kind: Namespace
   metadata:
     name: openshift-logging
   annotations:
     openshift.io/node-selector: ""
   labels:
     openshift.io/cluster-logging: "true"
     openshift.io/cluster-monitoring: "true"
   
   b. Create the Namespace:

   ```bash
   $ oc create -f <file-name>.yaml
   ```

   For example:
Install the Cluster Logging Operator by creating the following objects:

a. Create an OperatorGroup object YAML file (for example, `clo-og.yaml`) for the Cluster Logging Operator:

```yaml
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: cluster-logging
  namespace: openshift-logging
spec:
  targetNamespaces:
    - openshift-logging
```

You must specify the `openshift-logging` namespace.

b. Create the OperatorGroup object:

```
$ oc create -f <file-name>.yaml
```

For example:

```
$ oc create -f clo-og.yaml
```

c. Create a Subscription object YAML file (for example, `clo-sub.yaml`) to subscribe a Namespace to an Operator.

Example Subscription

```yaml
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: cluster-logging
  namespace: openshift-logging
spec:
  channel: "4.2"
  name: cluster-logging
  source: redhat-operators
  sourceNamespace: openshift-marketplace
```

You must specify the `openshift-logging` Namespace.

Specify 4.2 as the channel.

Specify `redhat-operators`. If your OpenShift Container Platform cluster is installed on a restricted network, also known as a disconnected cluster, specify the name of the CatalogSource object you created when you configured the Operator Lifecycle Manager (OLM).

d. Create the Subscription object:
$ oc create -f <file-name>.yaml

For example:

$ oc create -f clo-sub.yaml

The Cluster Logging Operator is installed to the `openshift-logging` Namespace.

3. Verify the Operator installation.
   There should be a Cluster Logging Operator in the `openshift-logging` Namespace. The Version number might be different than shown.

```
oc get csv --all-namespaces
```

<table>
<thead>
<tr>
<th>NAMESPACE</th>
<th>NAME</th>
<th>DISPLAY</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>openshift-logging</td>
<td>clusterlogging.4.2.1-202002032140</td>
<td>Cluster Logging</td>
</tr>
<tr>
<td></td>
<td>4.2.1-202002032140</td>
<td>Succeeded</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. Create a Cluster Logging instance:

a. Create an instance object YAML file (for example, `clo-instance.yaml`) for the Cluster Logging Operator:

```
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance" 1
  namespace: "openshift-logging"
spec:
  managementState: "Managed" 2
  logStore:
    type: "elasticsearch" 3
    elasticsearch:
      nodeCount: 3 4
      storage:
        storageClassName: gp2 5
        size: 200G
        redundancyPolicy: "SingleRedundancy"
  visualization:
    type: "kibana" 6
    kibana:
      replicas: 1
```
The name must be **instance**.

The Cluster Logging management state. In most cases, if you change the Cluster Logging defaults, you must set this to **Unmanaged**. However, an unmanaged deployment does not receive updates until Cluster Logging is placed back into the **Managed** state. For more information, see *Changing cluster logging management state*.

Settings for configuring Elasticsearch. Using the Custom Resource (CR), you can configure shard replication policy and persistent storage. For more information, see *Configuring Elasticsearch*.

Specify the number of Elasticsearch nodes. See the note that follows this list.

Specify that each Elasticsearch node in the cluster is bound to a Persistent Volume Claim.

Settings for configuring Kibana. Using the CR, you can scale Kibana for redundancy and configure the CPU and memory for your Kibana nodes. For more information, see *Configuring Kibana*.

Settings for configuring Curator. Using the CR, you can set the Curator schedule. For more information, see *Configuring Curator*.

Settings for configuring Fluentd. Using the CR, you can configure Fluentd CPU and memory limits. For more information, see *Configuring Fluentd*.
NOTE

The maximum number of Elasticsearch master nodes is three. If you specify a `nodeCount` greater than 3, OpenShift Container Platform creates three Elasticsearch nodes that are Master-eligible nodes, with the master, client, and data roles. The additional Elasticsearch nodes are created as Data-only nodes, using client and data roles. Master nodes perform cluster-wide actions such as creating or deleting an index, shard allocation, and tracking nodes. Data nodes hold the shards and perform data-related operations such as CRUD, search, and aggregations. Data-related operations are I/O-, memory-, and CPU-intensive. It is important to monitor these resources and to add more Data nodes if the current nodes are overloaded.

For example, if `nodeCount=4`, the following nodes are created:

```
$ oc get deployment

cluster-logging-operator       1/1     1           1           18h
elasticsearch-cd-x6kdekli-1    1/1     1           0           6m54s
elasticsearch-cdm-x6kdekli-1   1/1     1           1           18h
elasticsearch-cdm-x6kdekli-2   1/1     1           0           6m49s
elasticsearch-cdm-x6kdekli-3   1/1     1           0           6m44s
```

The number of primary shards for the index templates is equal to the number of Elasticsearch data nodes.

b. Create the instance:

```
$ oc create -f <file-name>.yaml
```

For example:

```
$ oc create -f clo-instance.yaml
```

5. Verify the install by listing the Pods in the `openshift-logging` project.

You should see several Pods for Cluster Logging, Elasticsearch, Fluentd, and Kibana similar to the following list:

```
oc get pods -n openshift-logging

NAME                                            READY   STATUS    RESTARTS   AGE
cluster-logging-operator-66f77ffcccb-ppzbzg       1/1     Running   0          7m
elasticsearch-cdm-ftuhdww-1-f8c4b9566-q6bhp       2/2     Running   0          2m40s
elasticsearch-cdm-ftuhdww-2-7b4994dbfc-rd2gc       2/2     Running   0          2m36s
elasticsearch-cdm-ftuhdww-3-84b5ff7ff8-gqnm2       2/2     Running   0          2m4s
fluentd-587vb                                     1/1     Running   0          2m26s
fluentd-7mpb9                                     1/1     Running   0          2m30s
fluentd-flm6j                                     1/1     Running   0          2m33s
fluentd-gn4rn                                     1/1     Running   0          2m26s
fluentd-nlgb6                                     1/1     Running   0          2m30s
fluentd-snpkt                                     1/1     Running   0          2m28s
kibana-d6d5668c5-rppqm                           2/2     Running   0          2m39s
```
3.4. ADDITIONAL RESOURCES

For more information on installing Operators, see Installing Operators from the OperatorHub.
CHAPTER 4. UPGRADING CLUSTER LOGGING

After upgrading the OpenShift Container Platform cluster from 4.1 to 4.2, you must then upgrade cluster logging from 4.1 to 4.2.

NOTE

Because of a change in the default global catalog Namespace and Catalog Source, if you manually created CatalogSourceConfig and Subscription objects from YAML files, as described by the Elasticsearch installation, you need to update these objects to point to the new catalog Namespace and Source before upgrading, as shown below.

4.1. UPDATING CLUSTER LOGGING

After upgrading the OpenShift Container Platform cluster, you can upgrade cluster logging from 4.1 to 4.2 by updating the Elasticsearch Operator and the Cluster Logging Operator.

Prerequisites

- Upgrade cluster from 4.1 to 4.2.
- Make sure the clusterlogging status is healthy:
  - All Pods are ready.
  - Elasticsearch cluster is healthy.

Procedure

1. Edit the CatalogSourceConfig (CSC) and Subscription objects to point to the new catalog Namespace and Cource:
   
   a. From the CLI, get the name of the Elasticsearch CSC:

   ```sh
   $ oc get csc --all-namespaces
   NAME                STATUS      MESSAGE
   AGE
   openshift-marketplace certified-operators Succeeded The object has been successfully reconciled 42m
   openshift-marketplace community-operators Succeeded The object has been successfully reconciled 42m
   openshift-marketplace elasticsearch Succeeded The object has been successfully reconciled 27m
   openshift-marketplace installed-redhat-default Succeeded The object has been successfully reconciled 26m
   openshift-marketplace installed-redhat-openshift-logging Succeeded The object has been successfully reconciled 18m
   openshift-marketplace redhat-operators Succeeded The object has been successfully reconciled 42m
   
   b. Edit the file as follows:
   
   ```sh
   $ oc edit csc elasticsearch -n openshift-marketplace
   ```
apiVersion: operators.coreos.com/v1
kind: CatalogSourceConfig
metadata:
  creationTimestamp: "2020-02-18T15:09:00Z"
finalizers:
- finalizer.catalogsourceconfigs.operators.coreos.com
generation: 3
name: elasticsearch
namespace: openshift-marketplace
resourceVersion: "17694"
selfLink: /apis/operators.coreos.com/v1/namespaces/openshift-marketplace/catalogsourceconfigs/elasticsearch
uid: 97c0cd55-5260-11ea-873c-02939b2f528f
spec:
  csDisplayName: Custom
  csPublisher: Custom
  packages: elasticsearch-operator
targetNamespace: openshift-operators-redhat
  source: redhat-operators

1. Change the current value to **redhat-operators**.

c. Get the name of the Elasticsearch Subscription object:

   $ oc get sub

<table>
<thead>
<tr>
<th>NAME</th>
<th>PACKAGE</th>
<th>SOURCE</th>
<th>CHANNEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>elasticsearch-pj7pf</td>
<td>elasticsearch-operator</td>
<td>elasticsearch</td>
<td>preview</td>
</tr>
</tbody>
</table>

   d. Edit the file as follows:

   $ oc edit sub elasticsearch-pj7pf

   apiVersion: operators.coreos.com/v1alpha1
   kind: Subscription
   metadata:
     creationTimestamp: "2020-02-17T17:51:18Z"
   generateName: elasticsearch-
   generation: 2
   name: elasticsearch-p5k7n
   namespace: openshift-operators-redhat
   resourceVersion: "38098"
   selfLink: /apis/operators.coreos.com/v1alpha1/namespaces/openshift-operators-redhat/subscriptions/elasticsearch-p5k7n
   uid: 19f6df33-51ae-11ea-82b9-027dfdb65ec2
   spec:
     channel: "4.2"
     installPlanApproval: Automatic
     name: elasticsearch-operator
     source: redhat-operators
     sourceNamespace: openshift-marketplace
     ....

   1. Change the current value to **redhat-operators**.

   2. Change the current value to **redhat-operators**.
2. Upgrade the Elasticsearch Operator:
   a. From the web console, click Operator Management.
   b. Change the project to all projects.
   c. Click the Elasticsearch Operator, which has the same name as the Elasticsearch subscription.
   d. Click Subscription → Channel.
   e. In the Change Subscription Update Channel window, select 4.2 and click Save.
   f. Wait for a few seconds, then click Operators → Installed Operators. The Elasticsearch Operator is shown as 4.2. For example:

   Elasticsearch Operator
   4.2.0-201909201915 provided by Red Hat, Inc

3. Upgrade the Cluster Logging Operator:
   a. From the web console, click Operator Management.
   b. Change the project to all projects.
   c. Click the Cluster Logging Operator.
   d. Click Subscription → Channel.
   e. In the Change Subscription Update Channel window, select 4.2 and click Save.
   f. Wait for a few seconds, then click Operators → Installed Operators. The Cluster Logging Operator is shown as 4.2. For example:

   Cluster Logging
   4.2.0-201909201915 provided by Red Hat, Inc

4. Check the logging components:
   a. Ensure that the Elasticsearch Pods are using a 4.2 image:

   $ oc get pod -o yaml -n openshift-logging --selector component=elasticsearch |grep 'image:'

   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
   image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2.0-201909201915
b. Ensure that all Elasticsearch Pods are in the **Ready** status:

```bash
$ oc get pod -n openshift-logging --selector component=elasticsearch
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>elasticsearch-cdm-1pbrl44l-1-55b7546f4c-mshhk</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>31m</td>
</tr>
<tr>
<td>elasticsearch-cdm-1pbrl44l-2-5c6d87589f-gx5hk</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>30m</td>
</tr>
<tr>
<td>elasticsearch-cdm-1pbrl44l-3-88df5d47-m45jc</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>29m</td>
</tr>
</tbody>
</table>

c. Ensure that the Elasticsearch cluster is healthy:

```bash
oc exec -n openshift-logging -c elasticsearch elasticsearch-cdm-1pbrl44l-1-55b7546f4c-mshhk -- es_cluster_health
```

```json
{
  "cluster_name" : "elasticsearch",
  "status" : "green",
  ....
}
```

d. Ensure that the logging collector Pods are using a 4.2 image:

```bash
$ oc get pod -n openshift-logging --selector logging-infra=fluentd -o yaml |grep 'image:'
```

```
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-fluentd:v4.2.0-201909201915
```

e. Ensure that the Kibana Pods are using a 4.2 image:

```bash
$ oc get pod -n openshift-logging --selector logging-infra=kibana -o yaml |grep 'image:'
```

```
image: registry.redhat.io/openshift4/ose-logging-kibana5:v4.2.0-201909210748
image: registry.redhat.io/openshift4/ose-oauth-proxy:v4.2.0-201909201915
image: registry.redhat.io/openshift4/ose-logging-kibana5:v4.2.0-201909210748
image: registry.redhat.io/openshift4/ose-oauth-proxy:v4.2.0-201909201915
```

f. Ensure that the Curator CronJob is using a 4.2 image:
$ oc get CronJob curator -n openshift-logging -o yaml |grep 'image:'

image: registry.redhat.io/openshift4/ose-logging-curator5:v4.2.0-201909201915
CHAPTER 5. WORKING WITH EVENT ROUTER

The Event Router communicates with the OpenShift Container Platform and prints OpenShift Container Platform events to log of the pod where the event occurs.

If Cluster Logging is deployed, you can view the OpenShift Container Platform events in Kibana.

5.1. DEPLOYING AND CONFIGURING THE EVENT ROUTER

Use the following steps to deploy Event Router into your cluster.

The following Template object creates the Service Account, ClusterRole, and ClusterRoleBinding required for the Event Router.

Prerequisites

- You need proper permissions to create service accounts and update cluster role bindings. For example, you can run the following template with a user that has the `cluster-admin` role.

- Set `TRANSFORM_EVENTS=true` in order to process and store event router events in Elasticsearch.
  - Set cluster logging to the unmanaged state.
  - Enable the `TRANSFORM_EVENTS` feature.

```
$ oc set env ds/fluentd TRANSFORM_EVENTS=true
```

Procedure

1. Create a template for the Event Router:

```json
kind: Template
apiVersion: v1
metadata:
  name: eventrouter-template
  annotations:
    description: "A pod forwarding kubernetes events to cluster logging stack."
    tags: "events,EFK,logging,cluster-logging"
objects:
  - kind: ServiceAccount
    apiVersion: v1
    metadata:
      name: eventrouter
      namespace: ${NAMESPACE}
  - kind: ClusterRole
    apiVersion: v1
    metadata:
      name: event-reader
    rules:
      - apiGroups: [""
        resources: ["events"]
        verbs: ["get", "watch", "list"]
  - kind: ClusterRoleBinding
```

32
apiVersion: v1
metadata:
  name: event-reader-binding
subjects:
- kind: ServiceAccount
  name: eventrouter
  namespace: ${NAMESPACE}
roleRef:
  kind: ClusterRole
  name: event-reader
- kind: ConfigMap
  apiVersion: v1
  metadata:
    name: eventrouter
    namespace: ${NAMESPACE}
data:
  config.json: |
    {
      "sink": "stdout"
    }
- kind: Deployment
  apiVersion: apps/v1
  metadata:
    name: eventrouter
    namespace: ${NAMESPACE}
  labels:
    component: eventrouter
    logging-infra: eventrouter
    provider: openshift
  spec:
    selector:
      matchLabels:
        component: eventrouter
        logging-infra: eventrouter
        provider: openshift
    replicas: 1
  template:
    metadata:
      labels:
        component: eventrouter
        logging-infra: eventrouter
        provider: openshift
    name: eventrouter
    spec:
      serviceAccount: eventrouter
      containers:
      - name: kube-eventrouter
        image: ${IMAGE}
        imagePullPolicy: IfNotPresent
        resources:
          limits:
            memory: ${MEMORY}
          requests:
            cpu: ${CPU}
            memory: ${MEMORY}
        volumeMounts:
Create a Service Account for the Event Router.

Create a cluster role to monitor for events in the cluster.

Allows the `get`, `watch`, and `list` permissions for the `events` resource.

Create a ClusterRoleBinding to bind the ClusterRole to the ServiceAccount.

Specify the image version for the Event Router.

Specify the memory limit for the Event Router pods. Defaults to '128Mi'.

Specify the minimum amount of CPU to allocate to the Event Router. Defaults to '100m'.

Specify the namespace where `eventrouter` is deployed. Defaults to `openshift-logging`. The value must be the same as specified for the ServiceAccount and ClusterRoleBinding. The project indicates where in Kibana you can locate events:

- If the event router pod is deployed in a default project, such as `kube-*` and `openshift-*`, you can find the events under the `.operation` index.

- If the event router pod is deployed in other projects, you can find the event under the index using the project namespace.

2. Use the following command to process and apply the template:

   $ oc process -f <templatefile> | oc apply -f -

   For example:

   $ oc process -f eventrouter.yaml | oc apply -f -

   serviceaccount/logging-eventrouter created
   clusterrole.authorization.openshift.io/event-reader created
clusterrolebinding.authorization.openshift.io/event-reader-binding created
configmap/logging-eventrouter created
deployment.apps/logging-eventrouter created

3. Validate that the Event Router installed:

$ oc get pods --selector component=eventrouter -o name

pod/logging-eventrouter-d649f97c8-qvv8r

$ oc logs logging-eventrouter-d649f97c8-qvv8r

{"verb":"ADDED","event":{"metadata":{"name":"elasticsearch-operator.v0.0.1.158f402e25397146","namespace":"openshift-operators","selfLink":"/api/v1/namespaces/openshift-operators/events/elasticsearch-operator.v0.0.1.158f402e25397146","uid":"37b7ff11-4f1a-11e9-a7ad-0271b2ca69f0","resourceVersion":"523264","creationTimestamp":"2019-03-25T16:22:43Z"},"involvedObject":{"kind":"ClusterServiceVersion","namespace":"openshift-operators","name":"elasticsearch-operator.v0.0.1","uid":"27b2ca6d-4f1a-11e9-8fba-0ea949a66f16","apiVersion":"operators.coreos.com/v1alpha1","resourceVersion":"523096"},"reason":"InstallSucceeded","message":"waiting for install components to report healthy","source":{"component":"operator-lifecycle-manager"},"firstTimestamp":"2019-03-25T16:22:43Z","lastTimestamp":"2019-03-25T16:22:43Z","count":1,"type":"Normal"}
CHAPTER 6. VIEWING CLUSTER LOGS

You can view OpenShift Container Platform cluster logs in the CLI or OpenShift Container Platform web console.

6.1. VIEWING CLUSTER LOGS

You can view cluster logs in the CLI.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

To view cluster logs:

1. Determine if the log location is a file or **CONSOLE** (stdout).

   ```
   $ oc -n openshift-logging set env daemonset/fluentd --list | grep LOGGING_FILE_PATH
   ```

2. Depending on the log location, execute the logging command:

   - If **LOGGING_FILE_PATH** points to a file, the default, use the `logs` utility, from the project, where the pod is located, to print out the contents of Fluentd log files:

     ```
     $ oc exec <any-fluentd-pod> -- logs
     ```

     1 Specify the name of a log collector pod. Note the space before `logs`.

     For example:

     ```
     $ oc exec fluentd-ht42r -n openshift-logging -- logs
     ```

   - If you are using **LOGGING_FILE_PATH=console**, the log collector writes logs to stdout/stderr. You can retrieve the logs with the `oc logs [-f] <pod_name>` command, where the `-f` is optional.

     ```
     $ oc logs -f <any-fluentd-pod> -n openshift-logging
     ```

     1 Specify the name of a log collector pod. Use the `-f` option to follow what is being written into the logs.

     For example

     ```
     $ oc logs -f fluentd-ht42r -n openshift-logging
     ```

     The contents of log files are printed out.

     By default, Fluentd reads logs from the tail, or end, of the log.
6.2. VIEWING CLUSTER LOGS IN THE OPENSSHIFT CONTAINER PLATFORM WEB CONSOLE

You can view cluster logs in the OpenShift Container Platform web console.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

To view cluster logs:

1. In the OpenShift Container Platform console, navigate to Workloads → Pods.
2. Select the openshift-logging project from the drop-down menu.
3. Click one of the logging collector pods with the fluentd prefix.
4. Click Logs.

By default, Fluentd reads logs from the tail, or end, of the log.
CHAPTER 7. VIEWING CLUSTER LOGS USING KIBANA

The cluster logging installation deploys the Kibana web console.

7.1. LAUNCHING KIBANA

Kibana is a browser-based console to query, discover, and visualize your logs through histograms, line graphs, pie charts, heat maps, built-in geospatial support, and other visualizations.

Procedure

To launch Kibana:

1. In the OpenShift Container Platform console, click Monitoring → Logging.

2. Log in using the same credentials you use to log in to the OpenShift Container Platform console.
   The Kibana interface launches. You can now:
   
   - Search and browse your data using the Discover page.
   - Chart and map your data using the Visualize page.
   - Create and view custom dashboards using the Dashboard page.
   
   Use and configuration of the Kibana interface is beyond the scope of this documentation. For more information, on using the interface, see the Kibana documentation.

NOTE

If you get a security_exception error in the Kibana console and cannot access your Kibana indices, you might have an expired OAuth token. If you see this error, log out of the Kibana console, and then log back in. This refreshes your OAuth tokens and you should be able to access your indices.
CHAPTER 8. CONFIGURING YOUR CLUSTER LOGGING DEPLOYMENT

8.1. ABOUT CONFIGURING CLUSTER LOGGING

After installing cluster logging into your OpenShift Container Platform cluster, you can make the following configurations.

NOTE

You must set cluster logging to Unmanaged state before performing these configurations, unless otherwise noted. For more information, see Changing the cluster logging management state.

Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades. For more information, see Support policy for unmanaged Operators.

8.1.1. About deploying and configuring cluster logging

OpenShift Container Platform cluster logging is designed to be used with the default configuration, which is tuned for small to medium sized OpenShift Container Platform clusters.

The installation instructions that follow include a sample Cluster Logging Custom Resource (CR), which you can use to create a cluster logging instance and configure your cluster logging deployment.

If you want to use the default cluster logging install, you can use the sample CR directly.

If you want to customize your deployment, make changes to the sample CR as needed. The following describes the configurations you can make when installing your cluster logging instance or modify after installation. See the Configuring sections for more information on working with each component, including modifications you can make outside of the Cluster Logging Custom Resource.

8.1.1.1. Configuring and Tuning Cluster Logging

You can configure your cluster logging environment by modifying the Cluster Logging Custom Resource deployed in the openshift-logging project.

You can modify any of the following components upon install or after install:

Memory and CPU

You can adjust both the CPU and memory limits for each component by modifying the resources block with valid memory and CPU values:

```yaml
spec:
  logStore:
    elasticsearch:
      resources:
        limits:
          cpu: 1
          memory:
          requests:
            cpu: 1
```
You can configure a persistent storage class and size for the Elasticsearch cluster using the `storageClass name` and `size` parameters. The Cluster Logging Operator creates a `PersistentVolumeClaim` for each data node in the Elasticsearch cluster based on these parameters.

This example specifies each data node in the cluster will be bound to a `PersistentVolumeClaim` that requests "200G" of "gp2" storage. Each primary shard will be backed by a single replica.
NOTE

Omitting the `storage` block results in a deployment that includes ephemeral storage only.

```yaml
spec:
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 3
      storage: {}
```

Elasticsearch replication policy

You can set the policy that defines how Elasticsearch shards are replicated across data nodes in the cluster:

- **FullRedundancy.** The shards for each index are fully replicated to every data node.
- **MultipleRedundancy.** The shards for each index are spread over half of the data nodes.
- **SingleRedundancy.** A single copy of each shard. Logs are always available and recoverable as long as at least two data nodes exist.
- **ZeroRedundancy.** No copies of any shards. Logs may be unavailable (or lost) in the event a node is down or fails.

Curator schedule

You specify the schedule for Curator in the cron format.

```yaml
spec:
  curation:
    type: "curator"
    resources:
      curator:
        schedule: "30 3 * * *"
```

8.1.1.2. Sample modified Cluster Logging Custom Resource

The following is an example of a Cluster Logging Custom Resource modified using the options previously described.

Sample modified Cluster Logging Custom Resource

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
  namespace: "openshift-logging"
spec:
  managementState: "Managed"
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 2
```
8.2. CHANGING CLUSTER LOGGING MANAGEMENT STATE

In order to modify certain components managed by the Cluster Logging Operator or the Elasticsearch Operator, you must set the operator to the unmanaged state.

In unmanaged state, the operators do not respond to changes in the CRs. The administrator assumes full control of individual component configurations and upgrades when in unmanaged state.

IMPORTANT

Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades. For more information, see Support policy for unmanaged Operators.

In managed state, the Cluster Logging Operator (CLO) responds to changes in the Cluster Logging Custom Resource (CR) and adjusts the logging deployment accordingly.
The OpenShift Container Platform documentation indicates in a prerequisite step when you must set the OpenShift Container Platform cluster to Unmanaged.

**NOTE**

If you set the Elasticsearch Operator (EO) to unmanaged and leave the Cluster Logging Operator (CLO) as managed, the CLO will revert changes you make to the EO, as the EO is managed by the CLO.

### 8.2.1. Changing the cluster logging management state

You must set the operator to the *unmanaged* state in order to modify the components managed by the Cluster Logging Operator:

- the Curator CronJob,
- the Elasticsearch CR,
- the Kibana Deployment,
- the log collector DaemonSet.

If you make changes to these components in managed state, the Cluster Logging Operator reverts those changes.

**NOTE**

An unmanaged cluster logging environment does not receive updates until you return the Cluster Logging Operator to Managed state.

**Prerequisites**

- The Cluster Logging Operator must be installed.

**Procedure**

1. Edit the Cluster Logging Custom Resource (CR) in the *openshift-logging* project:

   ```bash
   $ oc edit ClusterLogging instance
   ``
8.2.2. Changing the Elasticsearch management state

You must set the operator to the unmanaged state in order to modify the Elasticsearch deployment files, which are managed by the Elasticsearch Operator.

If you make changes to these components in managed state, the Elasticsearch Operator reverts those changes.

**NOTE**
An unmanaged Elasticsearch cluster does not receive updates until you return the Elasticsearch Operator to Managed state.

**Prerequisite**
- The Elasticsearch Operator must be installed.
- Have the name of the Elasticsearch CR, in the openshift-logging project:

  ```
  $ oc get -n openshift-logging Elasticsearch
  NAME    AGE
  elasticsearch   28h
  ```

**Procedure**

Edit the Elasticsearch Custom Resource (CR) in the openshift-logging project:

```
$ oc edit Elasticsearch elasticsearch
apiVersion: logging.openshift.io/v1
kind: Elasticsearch
metadata:
  name: elasticsearch
...

spec:
  managementState: "Managed"
```

Specify the management state as Managed or Unmanaged.

**NOTE**
If you set the Elasticsearch Operator (EO) to unmanaged and leave the Cluster Logging Operator (CLO) as managed, the CLO will revert changes you make to the EO, as the EO is managed by the CLO.

8.3. CONFIGURING CLUSTER LOGGING

Cluster logging is configurable using a Cluster Logging Custom Resource (CR) deployed in the openshift-logging project.
The Cluster Logging Operator watches for changes to Cluster Logging CRs, creates any missing logging components, and adjusts the logging deployment accordingly.

The Cluster Logging CR is based on the Cluster Logging Custom Resource Definition (CRD), which defines a complete cluster logging deployment and includes all the components of the logging stack to collect, store and visualize logs.

### Sample Cluster Logging Custom Resource (CR)

```yaml
apiVersion: logging.openshift.io/v1
kind: ClusterLogging
metadata:
  creationTimestamp: '2019-03-20T18:07:02Z'
  generation: 1
  name: instance
  namespace: openshift-logging
spec:
  collection:
    logs:
      fluentd:
        resources: null
        type: fluentd
curation:
  curator:
    resources: null
    schedule: 30 3 * * *
type: curator
logStore:
  elasticsearch:
    nodeCount: 3
    redundancyPolicy: SingleRedundancy
    resources:
      limits:
        cpu: 
        memory:
      requests:
        cpu: 
        memory: 
      storage: {}
type: elasticsearch
managementState: Managed
visualization:
  kibana:
    proxy:
      resources: null
    replicas: 1
    resources: null
type: kibana
```

You can configure the following for cluster logging:

- You can place cluster logging into an unmanaged state that allows an administrator to assume full control of individual component configurations and upgrades.

- You can overwrite the image for each cluster logging component by modifying the appropriate environment variable in the `cluster-logging-operator` Deployment.
You can specify specific nodes for the logging components using node selectors.

### 8.3.1. Understanding the cluster logging component images

There are several components in cluster logging, each one implemented with one or more images. Each image is specified by an environment variable defined in the `cluster-logging-operator` deployment in the `openshift-logging` project and should not be changed.

You can view the images by running the following command:

```
$ oc -n openshift-logging set env deployment/cluster-logging-operator --list | grep _IMAGE
```

1. **ELASTICSEARCH_IMAGE** deploys Elasticsearch.
2. **FLUENTD_IMAGE** deploys Fluentd.
3. **KIBANA_IMAGE** deploys Kibana.
4. **CURATOR_IMAGE** deploys Curator.
5. **OAUTH_PROXY_IMAGE** defines OAUTH for OpenShift Container Platform.

The values might be different depending on your environment.

**IMPORTANT**

The logging routes are managed by the Cluster Logging Operator and cannot be modified by the user.

### 8.4. CONFIGURING ELASTICSEARCH TO STORE AND ORGANIZE LOG DATA

OpenShift Container Platform uses Elasticsearch (ES) to store and organize the log data.

Some of the modifications you can make to your log store include:

- storage for your Elasticsearch cluster;
- how shards are replicated across data nodes in the cluster, from full replication to no replication;
- allowing external access to Elasticsearch data.
NOTE

Scaling down Elasticsearch nodes is not supported. When scaling down, Elasticsearch pods can be accidentally deleted, possibly resulting in shards not being allocated and replica shards being lost.

Elasticsearch is a memory-intensive application. Each Elasticsearch node needs 16G of memory for both memory requests and limits, unless you specify otherwise in the Cluster Logging Custom Resource. The initial set of OpenShift Container Platform nodes might not be large enough to support the Elasticsearch cluster. You must add additional nodes to the OpenShift Container Platform cluster to run with the recommended or higher memory.

Each Elasticsearch node can operate with a lower memory setting though this is not recommended for production deployments.

NOTE

If you set the Elasticsearch Operator (EO) to unmanaged and leave the Cluster Logging Operator (CLO) as managed, the CLO will revert changes you make to the EO, as the EO is managed by the CLO.

8.4.1. Configuring Elasticsearch CPU and memory limits

Each component specification allows for adjustments to both the CPU and memory limits. You should not have to manually adjust these values as the Elasticsearch Operator sets values sufficient for your environment.

Each Elasticsearch node can operate with a lower memory setting though this is not recommended for production deployments. For production use, you should have no less than the default 16Gi allocated to each Pod. Preferably you should allocate as much as possible, up to 64Gi per Pod.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

1. Edit the Cluster Logging Custom Resource (CR) in the openshift-logging project:

   `$ oc edit ClusterLogging instance`

   ```yaml
   apiVersion: "logging.openshift.io/v1"
   kind: "ClusterLogging"
   metadata:
     name: "instance"
   ....
   spec:
     logStore:
       type: "elasticsearch"
       elasticsearch:
         resources: 1
         limits:
           memory: "16Gi"
   ```
Specify the CPU and memory limits as needed. If you leave these values blank, the Elasticsearch Operator sets default values that should be sufficient for most deployments.

If you adjust the amount of Elasticsearch CPU and memory, you must change both the request value and the limit value.

For example:

```
resources:
  limits:
    cpu: "8"
    memory: "32Gi"
  requests:
    cpu: "8"
    memory: "32Gi"
```

Kubernetes generally adheres the node CPU configuration and DOES not allow Elasticsearch to use the specified limits. Setting the same value for the requests and limits ensures that Elasticsearch can use the CPU and memory you want, assuming the node has the CPU and memory available.

### 8.4.2. Configuring Elasticsearch replication policy

You can define how Elasticsearch shards are replicated across data nodes in the cluster.

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Edit the Cluster Logging Custom Resource (CR) in the openshift-logging project:

```
oc edit clusterlogging instance
```

```
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"

spec:
  logStore:
    type: "elasticsearch"
elasticsearch:
  redundancyPolicy: "SingleRedundancy"
```
Specify a redundancy policy for the shards. The change is applied upon saving the changes.

- **FullRedundancy.** Elasticsearch fully replicates the primary shards for each index to every data node. This provides the highest safety, but at the cost of the highest amount of disk required and the poorest performance.

- **MultipleRedundancy.** Elasticsearch fully replicates the primary shards for each index to half of the data nodes. This provides a good tradeoff between safety and performance.

- **SingleRedundancy.** Elasticsearch makes one copy of the primary shards for each index. Logs are always available and recoverable as long as at least two data nodes exist. Better performance than MultipleRedundancy, when using 5 or more nodes. You cannot apply this policy on deployments of single Elasticsearch node.

- **ZeroRedundancy.** Elasticsearch does not make copies of the primary shards. Logs might be unavailable or lost in the event a node is down or fails. Use this mode when you are more concerned with performance than safety, or have implemented your own disk/PVC backup/restore strategy.

**NOTE**

The number of primary shards for the index templates is equal to the number of Elasticsearch data nodes.

### 8.4.3. Configuring Elasticsearch storage

Elasticsearch requires persistent storage. The faster the storage, the faster the Elasticsearch performance.

**WARNING**

Using NFS storage as a volume or a persistent volume (or via NAS such as Gluster) is not supported for Elasticsearch storage, as Lucene relies on file system behavior that NFS does not supply. Data corruption and other problems can occur.

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Edit the Cluster Logging CR to specify that each data node in the cluster is bound to a Persistent Volume Claim.

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
```
This example specifies each data node in the cluster is bound to a Persistent Volume Claim that requests "200G" of AWS General Purpose SSD (gp2) storage.

8.4.4. Configuring Elasticsearch for emptyDir storage

You can use emptyDir with Elasticsearch, which creates an ephemeral deployment in which all of a pod’s data is lost upon restart.

**NOTE**

When using emptyDir, if Elasticsearch is restarted or redeployed, you will lose data.

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Edit the Cluster Logging CR to specify emptyDir:

   ```yaml
   name: "instance"
   ....
   spec:
     logStore:
       type: "elasticsearch"
       elasticsearch:
         nodeCount: 3
         storage:
           storageClassName: "gp2"
           size: "200G"
   ```

8.4.5. Exposing Elasticsearch as a route

By default, Elasticsearch deployed with cluster logging is not accessible from outside the logging cluster. You can enable a route with re-encryption termination for external access to Elasticsearch for those tools that access its data.

Externally, you can access Elasticsearch by creating a reencrypt route, your OpenShift Container Platform token and the installed Elasticsearch CA certificate. Then, access an Elasticsearch node with a cURL request that contains:

- The **Authorization: Bearer ${token}**
- The Elasticsearch reencrypt route and an [Elasticsearch API request](https://www.elastic.co/guide/en/elasticsearch/client/api/2.0/).
Internally, you can access Elasticsearch using the Elasticsearch cluster IP:

You can get the Elasticsearch cluster IP using either of the following commands:

```bash
$ oc get service elasticsearch -o jsonpath={.spec.clusterIP} -n openshift-logging
172.30.183.229
```

```
oc get service elasticsearch
NAME       TYPE        CLUSTER-IP       EXTERNAL-IP   PORT(S)    AGE
elasticsearch ClusterIP   172.30.183.229   <none>        9200/TCP   22h
```

```bash
```

Prerequisites

- Cluster logging and Elasticsearch must be installed.
- You must have access to the project in order to be able to access to the logs.

Procedure

To expose Elasticsearch externally:

1. Change to the `openshift-logging` project:

   ```bash
   $ oc project openshift-logging
   ```

2. Extract the CA certificate from Elasticsearch and write to the `admin-ca` file:

   ```bash
   $ oc extract secret/elasticsearch --to=. --keys=admin-ca
   admin-ca
   ```

3. Create the route for the Elasticsearch service as a YAML file:
   - Create a YAML file with the following:
     ```yaml
     apiVersion: route.openshift.io/v1
     kind: Route
     metadata:
       name: elasticsearch
       namespace: openshift-logging
     spec:
       host: 
       to:
         kind: Service
         name: elasticsearch
     ```
Add the Elasticsearch CA certificate or use the command in the next step. You do not have to set the `spec.tls.key`, `spec.tls.certificate`, and `spec.tls.caCertificate` parameters required by some reencrypt routes.

b. Run the following command to add the Elasticsearch CA certificate to the route YAML you created:

```bash
cat ./admin-ca | sed -e "s/^/      /" >> <file-name>.yaml
```

c. Create the route:

```bash
$ oc create -f <file-name>.yaml
route.route.openshift.io/elasticsearch created
```

4. Check that the Elasticsearch service is exposed:

a. Get the token of this ServiceAccount to be used in the request:

```bash
$ token=$(oc whoami -t)
```

b. Set the `elasticsearch` route you created as an environment variable.

```bash
$ routeES=`oc get route elasticsearch -o jsonpath={.spec.host}`
```

c. To verify the route was successfully created, run the following command that accesses Elasticsearch through the exposed route:

```bash
curl -tlsv1.2 --insecure -H "Authorization: Bearer ${token}"
"https://${routeES}/.operations/*/search?size=1" | jq
```

The response appears similar to the following:

```
% Total  % Received % Xferd Average Speed Time Time Time Current
          Dload  Upload   Total   Spent    Left  Speed
100   944  100   944    0     0     62      0  0:00:15  0:00:15 --:--:--   204

{ "took": 441,
  "timed_out": false,
  "_shards": { "total": 3,
    "successful": 3,
    "skipped": 0,
    "failed": 0
  },
  "hits": { "total": 89157,
    "max_score": 1,
    "hits": [
```
8.4.6. About Elasticsearch alerting rules

You can view these alerting rules in Prometheus.

<table>
<thead>
<tr>
<th>Alert</th>
<th>Description</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>ElasticsearchClusterNotHealthy</td>
<td>Cluster health status has been RED for at least 2m. Cluster does not accept writes, shards may be missing or master node hasn’t been elected yet.</td>
<td>critical</td>
</tr>
<tr>
<td>ElasticsearchClusterNotHealthy</td>
<td>Cluster health status has been YELLOW for at least 20m. Some shard replicas are not allocated.</td>
<td>warning</td>
</tr>
<tr>
<td>Alert</td>
<td>Description</td>
<td>Severity</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>ElasticsearchBulkRequestsRejectionJumps</td>
<td>High Bulk Rejection Ratio at node in cluster. This node may not be keeping up with the indexing speed.</td>
<td>warning</td>
</tr>
<tr>
<td>ElasticsearchNodeDiskWatermarkReached</td>
<td>Disk Low Watermark Reached at node in cluster. Shards can not be allocated to this node anymore. You should consider adding more disk space to the node.</td>
<td>alert</td>
</tr>
<tr>
<td>ElasticsearchNodeDiskWatermarkReached</td>
<td>Disk High Watermark Reached at node in cluster. Some shards will be re-allocated to different nodes if possible. Make sure more disk space is added to the node or drop old indices allocated to this node.</td>
<td>high</td>
</tr>
<tr>
<td>ElasticsearchJVMHeapUseHigh</td>
<td>JVM Heap usage on the node in cluster is &lt;value&gt;</td>
<td>alert</td>
</tr>
<tr>
<td>AggregatedLoggingSystemCPUHigh</td>
<td>System CPU usage on the node in cluster is &lt;value&gt;</td>
<td>alert</td>
</tr>
<tr>
<td>ElasticsearchProcessCPUHigh</td>
<td>ES process CPU usage on the node in cluster is &lt;value&gt;</td>
<td>alert</td>
</tr>
</tbody>
</table>

### 8.5. CONFIGURING KIBANA

OpenShift Container Platform uses Kibana to display the log data collected by Fluentd and indexed by Elasticsearch.

You can scale Kibana for redundancy and configure the CPU and memory for your Kibana nodes.

**NOTE**

You must set cluster logging to Unmanaged state before performing these configurations, unless otherwise noted. For more information, see Changing the cluster logging management state.

Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades. For more information, see Support policy for unmanaged Operators.

### 8.5.1. Configure Kibana CPU and memory limits

Each component specification allows for adjustments to both the CPU and memory limits.

**Procedure**

1. Edit the Cluster Logging Custom Resource (CR) in the openshift-logging project:

```
$ oc edit ClusterLogging instance
```
Specify the CPU and memory limits to allocate for each node.

Specify the CPU and memory limits to allocate to the Kibana proxy.

8.5.2. Scaling Kibana for redundancy

You can scale the Kibana deployment for redundancy.

Procedure

1. Edit the Cluster Logging Custom Resource (CR) in the openshift-logging project:

   ```bash
   $ oc edit ClusterLogging instance
   ```
8.5.3. Using tolerations to control the Kibana Pod placement

You can control which nodes the Kibana Pods run on and prevent other workloads from using those nodes by using tolerations on the Pods.

You apply tolerations to the Kibana Pods through the Cluster Logging Custom Resource (CR) and apply taints to a node through the node specification. A taint on a node is a **key:value pair** that instructs the node to repel all Pods that do not tolerate the taint. Using a specific **key:value** pair that is not on other Pods ensures only the Kibana Pod can run on that node.

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Use the following command to add a taint to a node where you want to schedule the Kibana Pod:
   
   ```bash
   $ oc adm taint nodes <node-name> <key>=<value>:<effect>
   ```
   
   For example:
   
   ```bash
   $ oc adm taint nodes node1 kibana=node:NoExecute
   ```
   
   This example places a taint on `node1` that has key `kibana`, value `node`, and taint effect `NoExecute`. You must use the `NoExecute` taint effect. `NoExecute` schedules only Pods that match the taint and remove existing Pods that do not match.

2. Edit the **visualization** section of the Cluster Logging Custom Resource (CR) to configure a toleration for the Kibana Pod:

   ```json
   visualization:
   type: "kibana"
   kibana:
   tolerations:
   - key: "kibana"
     operator: "Exists"
     effect: "NoExecute"
     tolerationSeconds: 6000
   ```

   1. Specify the key that you added to the node.
   2. Specify the **Exists** operator to require the **key/value/effect** parameters to match.
   3. Specify the **NoExecute** effect.
   4. Optionally, specify the **tolerationSeconds** parameter to set how long a Pod can remain bound to a node before being evicted.
This toleration matches the taint created by the `oc adm taint` command. A Pod with this toleration would be able to schedule onto `node1`.

### 8.5.4. Installing the Kibana Visualize tool

Kibana’s **Visualize** tab enables you to create visualizations and dashboards for monitoring container logs, allowing administrator users (**cluster-admin** or **cluster-reader**) to view logs by deployment, namespace, pod, and container.

**Procedure**

To load dashboards and other Kibana UI objects:

1. If necessary, get the Kibana route, which is created by default upon installation of the Cluster Logging Operator:

   ```
   $ oc get routes -n openshift-logging
   
<table>
<thead>
<tr>
<th>NAMESPACE</th>
<th>NAME</th>
<th>HOST/PORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>openshift-logging</td>
<td>kibana</td>
<td>kibana-openshift-logging.apps.openshift.com</td>
</tr>
<tr>
<td></td>
<td>&lt;all&gt;</td>
<td>reencrypt/Redirect</td>
</tr>
<tr>
<td></td>
<td></td>
<td>None</td>
</tr>
</tbody>
</table>
   ```

2. Get the name of your Elasticsearch pods.

   ```
   $ oc get pods -l component=elasticsearch
   
<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>elasticsearch-cdm-5ceex6ts-1-dcd6c4c7c-jpw6k</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>22h</td>
</tr>
<tr>
<td>elasticsearch-cdm-5ceex6ts-2-f799564cb-l9mj7</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>22h</td>
</tr>
<tr>
<td>elasticsearch-cdm-5ceex6ts-3-585968dc68-k7kj</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>22h</td>
</tr>
</tbody>
</table>
   ```

3. Create the necessary per-user configuration that this procedure requires:

   a. Log in to the Kibana dashboard as the user you want to add the dashboards to.

   ```
   https://kibana-openshift-logging.apps.openshift.com
   ```

   Where the URL is Kibana route.

   b. If the **Authorize Access** page appears, select all permissions and click **Allow selected permissions**.

   c. Log out of the Kibana dashboard.

4. Run the following command from the project where the pod is located using the name of any of your Elasticsearch pods:

   ```
   $ oc exec <es-pod> -- es_load_kibana_ui_objects <user-name>
   ```

   For example:

   ```
   $ oc exec elasticsearch-cdm-5ceex6ts-1-dcd6c4c7c-jpw6k -- es_load_kibana_ui_objects <user-name>
   ```
NOTE

The metadata of the Kibana objects such as visualizations, dashboards, and so forth are stored in Elasticsearch with the `.kibana.{user_hash}` index format. You can obtain the `user_hash` using the `userhash=$(echo -n $username | sha1sum | awk '{print $1}')` command. By default, the Kibana `shared_ops` index mode enables all users with cluster admin roles to share the index, and this Kibana object metadata is saved to the `.kibana` index.

Any custom dashboard can be imported for a particular user either by using the import/export feature or by inserting the metadata onto the Elasticsearch index using the `curl` command.

8.6. CURATION OF ELASTICSEARCH DATA

The Elasticsearch Curator tool performs scheduled maintenance operations on a global and/or on a per-project basis. Curator performs actions based on its configuration.

The Cluster Logging Operator installs Curator and its configuration. You can configure the Curator `cron schedule` using the Cluster Logging Custom Resource and further configuration options can be found in the Curator ConfigMap, `curator` in the `openshift-logging` project, which incorporates the Curator configuration file, `curator5.yaml` and an OpenShift Container Platform custom configuration file, `config.yaml`.

OpenShift Container Platform uses the `config.yaml` internally to generate the Curator `action` file.

Optionally, you can use the `action` file, directly. Editing this file allows you to use any action that Curator has available to it to be run periodically. However, this is only recommended for advanced users as modifying the file can be destructive to the cluster and can cause removal of required indices/settings from Elasticsearch. Most users only must modify the Curator configuration map and never edit the `action` file.

8.6.1. Configuring the Curator schedule

You can specify the schedule for Curator using the cluster logging Custom Resource created by the cluster logging installation.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

To configure the Curator schedule:

1. Edit the Cluster Logging Custom Resource in the `openshift-logging` project:

```bash
$ oc edit clusterlogging instance
```

```
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
...
```
Specify the schedule for Curator in cron format.

NOTE
The time zone is set based on the host node where the Curator pod runs.

8.6.2. Configuring Curator index deletion

You can configure Curator to delete Elasticsearch data based on retention settings. You can configure per-project and global settings. Global settings apply to any project not specified. Per-project settings override global settings.

Prerequisite

- Cluster logging must be installed.

Procedure

To delete indices:

1. Edit the OpenShift Container Platform custom Curator configuration file:

   $ oc edit configmap/curator

2. Set the following parameters as needed:

   config.yaml:
   
   project_name: action
   unit: value

The available parameters are:

Table 8.1. Project options

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>project_name</td>
<td>The actual name of a project, such as <code>myapp-devel</code>. For OpenShift Container Platform operations logs, use the name <code>.operations</code> as the project name.</td>
</tr>
<tr>
<td>action</td>
<td>The action to take, currently only <code>delete</code> is allowed.</td>
</tr>
<tr>
<td>unit</td>
<td>The period to use for deletion, <code>days</code>, <code>weeks</code>, or <code>months</code>.</td>
</tr>
<tr>
<td>value</td>
<td>The number of units.</td>
</tr>
</tbody>
</table>
Table 8.2. Filter options

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.defaults</td>
<td>Use .defaults as the project_name to set the defaults for projects that are not specified.</td>
</tr>
<tr>
<td>.regex</td>
<td>The list of regular expressions that match project names.</td>
</tr>
<tr>
<td>pattern</td>
<td>The valid and properly escaped regular expression pattern enclosed by single quotation marks.</td>
</tr>
</tbody>
</table>

For example, to configure Curator to:

- Delete indices in the myapp-dev project older than 1 day
- Delete indices in the myapp-qe project older than 1 week
- Delete operations logs older than 8 weeks
- Delete all other projects indices after they are 31 days old
- Delete indices older than 1 day that are matched by the ^project\..+-dev\.\*$ regex
- Delete indices older than 2 days that are matched by the ^project\..+-test\.\*$ regex

Use:

```yaml
config.yaml: |
  .defaults:
    delete:
      days: 31
  .operations:
    delete:
      weeks: 8
  myapp-dev:
    delete:
      days: 1
  myapp-qe:
    delete:
      weeks: 1
  .regex:
    - pattern: '^project\..+-dev\..*$'
      delete:
        days: 1
    - pattern: '^project\..+-test\..*$'
      delete:
        days: 2
```
When you use **months** as the **$UNIT** for an operation, Curator starts counting at the first day of the current month, not the current day of the current month. For example, if today is April 15, and you want to delete indices that are 2 months older than today (delete: months: 2), Curator does not delete indices that are dated older than February 15; it deletes indices older than February 1. That is, it goes back to the first day of the current month, then goes back two whole months from that date. If you want to be exact with Curator, it is best to use days (for example, **delete: days: 30**).

### 8.6.3. Troubleshooting Curator

You can use information in this section for debugging Curator. For example, if curator is in failed state, but the log messages do not provide a reason, you could increase the log level and trigger a new job, instead of waiting for another scheduled run of the cron job.

#### Prerequisites

Cluster logging and Elasticsearch must be installed.

#### Procedure

Enable the Curator debug log and trigger next Curator iteration manually

1. Enable debug log of Curator:

   ```
   $ oc set env cronjob/curator CURATOR_LOG_LEVEL=DEBUG
   CURATOR_SCRIPT_LOG_LEVEL=DEBUG
   ```

   Specify the log level:

   - **CRITICAL**. Curator displays only critical messages.
   - **ERROR**. Curator displays only error and critical messages.
   - **WARNING**. Curator displays only error, warning, and critical messages.
   - **INFO**. Curator displays only informational, error, warning, and critical messages.
   - **DEBUG**. Curator displays only debug messages, in addition to all of the above.

   The default value is **INFO**.

   **NOTE**

   Cluster logging uses the OpenShift Container Platform custom environment variable `CURATOR_SCRIPT_LOG_LEVEL` in OpenShift Container Platform wrapper scripts (`run.sh` and `convert.py`). The environment variable takes the same values as `CURATOR_LOG_LEVEL` for script debugging, as needed.

2. Trigger next curator iteration:

   ```
   $ oc create job --from=cronjob/curator <job_name>
   ```

3. Use the following commands to control the CronJob:

   - **Suspend** a CronJob:
Suspend a CronJob:

```
$ oc patch cronjob curator -p '{"spec":{"suspend":true}}'
```

Resume a CronJob:

```
$ oc patch cronjob curator -p '{"spec":{"suspend":false}}'
```

Change a CronJob schedule:

```
$ oc patch cronjob curator -p '{"spec":{"schedule":"0 0 * * *"}}'
```

The schedule option accepts schedules in cron format.

8.6.4. Configuring Curator in scripted deployments

Use the information in this section if you must configure Curator in scripted deployments.

Prerequisites

- Cluster logging and Elasticsearch must be installed.
- Set cluster logging to the unmanaged state.

Procedure

Use the following snippets to configure Curator in your scripts:

- For scripted deployments
  1. Create and modify the configuration:
     a. Copy the Curator configuration file and the OpenShift Container Platform custom configuration file from the Curator configuration map and create separate files for each:

     ```
     $ oc extract configmap/curator --keys=curator5.yaml,config.yaml --to=/my/config
     ```

     b. Edit the `/my/config/curator5.yaml` and `/my/config/config.yaml` files.

     2. Delete the existing Curator config map and add the edited YAML files to a new Curator config map.

     ```
     $ oc delete configmap curator ; sleep 1
     $ oc create configmap curator
     --from-file=curator5.yaml=/my/config/curator5.yaml
     --from-file=config.yaml=/my/config/config.yaml
     ; sleep 1
     ```

     The next iteration will use this configuration.

- If you are using the action file:
  1. Create and modify the configuration:
a. Copy the Curator configuration file and the action file from the Curator configuration map and create separate files for each:

```bash
$ oc extract configmap/curator --keys=curator5.yaml,actions.yaml --to=/my/config
```

b. Edit the `/my/config/curator5.yaml` and `/my/config/actions.yaml` files.

2. Delete the existing Curator config map and add the edited YAML files to a new Curator config map.

```bash
$ oc delete configmap curator ; sleep 1
$ oc create configmap curator \
    --from-file=curator5.yaml=/my/config/curator5.yaml \
    --from-file=actions.yaml=/my/config/actions.yaml \
    ; sleep 1
```

The next iteration will use this configuration.

### 8.6.5. Using the Curator Action file

The Curator ConfigMap in the openshift-logging project includes a Curator action file where you configure any Curator action to be run periodically.

However, when you use the action file, OpenShift Container Platform ignores the config.yaml section of the curator ConfigMap, which is configured to ensure important internal indices do not get deleted by mistake. In order to use the action file, you should add an exclude rule to your configuration to retain these indices. You also must manually add all the other patterns following the steps in this topic.

**IMPORTANT**

The actions and config.yaml are mutually-exclusive configuration files. Once the actions file exist, OpenShift Container Platform ignores the config.yaml file. Using the action file is recommended only for advanced users as using this file can be destructive to the cluster and can cause removal of required indices/settings from Elasticsearch.

**Prerequisite**

- Cluster logging and Elasticsearch must be installed.
- Set cluster logging to the unmanaged state. Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades.

**Procedure**

To configure Curator to delete indices:

1. Edit the Curator ConfigMap:

   ```bash
   oc edit cm/curator -n openshift-logging
   ```

2. Make the following changes to the action file:

   ```yaml
   actions:
   ```
Specify `delete_indices` to delete the specified index.

Use the `filters` parameters to specify the index to be deleted. See the Elastic Search curator documentation for information on these parameters.

Specify `false` to allow the index to be deleted.

### 8.7. CONFIGURING THE LOGGING COLLECTOR

OpenShift Container Platform uses Fluentd to collect operations and application logs from your cluster and enriches the data with Kubernetes Pod and Namespace metadata.

You can configure log rotation, log location, use an external log aggregator, and make other configurations for the log collector.
NOTE
You must set cluster logging to Unmanaged state before performing these configurations, unless otherwise noted. For more information, see Changing the cluster logging management state.

Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades. For more information, see Support policy for unmanaged Operators.

8.7.1. Viewing logging collector pods
You can use the `oc get pods --all-namespaces -o wide` command to see the nodes where the Fluentd are deployed.

Procedure
Run the following command in the `openshift-logging` project:

```bash
$ oc get pods --all-namespaces -o wide | grep fluentd
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
<th>AGE</th>
<th>IP</th>
<th>NODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOMINATED NODE</td>
<td></td>
<td>READINESS</td>
<td>GATES</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>fluentd-5mr28</td>
<td>1/1</td>
<td>Running</td>
<td>0</td>
<td>4m56s</td>
<td>10.129.2.12</td>
<td>ip-10-0-164-233.ec2.internal</td>
</tr>
<tr>
<td>&lt;none&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>fluentd-cnc4c</td>
<td>1/1</td>
<td>Running</td>
<td>0</td>
<td>4m56s</td>
<td>10.128.2.13</td>
<td>ip-10-0-155-142.ec2.internal</td>
</tr>
<tr>
<td>&lt;none&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>fluentd-nlp8z</td>
<td>1/1</td>
<td>Running</td>
<td>0</td>
<td>4m56s</td>
<td>10.131.0.13</td>
<td>ip-10-0-138-77.ec2.internal</td>
</tr>
<tr>
<td>&lt;none&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>fluentd-rknlk</td>
<td>1/1</td>
<td>Running</td>
<td>0</td>
<td>4m56s</td>
<td>10.128.0.33</td>
<td>ip-10-0-128-130.ec2.internal</td>
</tr>
<tr>
<td>&lt;none&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>fluentd-rsm49</td>
<td>1/1</td>
<td>Running</td>
<td>0</td>
<td>4m56s</td>
<td>10.129.0.37</td>
<td>ip-10-0-163-191.ec2.internal</td>
</tr>
<tr>
<td>&lt;none&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>fluentd-wjt8s</td>
<td>1/1</td>
<td>Running</td>
<td>0</td>
<td>4m56s</td>
<td>10.130.0.42</td>
<td>ip-10-0-156-251.ec2.internal</td>
</tr>
<tr>
<td>&lt;none&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

8.7.2. Configure log collector CPU and memory limits
The log collector allows for adjustments to both the CPU and memory limits.

Procedure
1. Edit the Cluster Logging Custom Resource (CR) in the `openshift-logging` project:

```bash
$ oc edit ClusterLogging instance
```

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
.....
```
Specify the CPU and memory limits and requests as needed. The values shown are the default values.

8.7.3. Configuring the collected log location

The log collector writes logs to a specified file or to the default location, /var/log/fluentd/fluentd.log based on the LOGGING_FILE_PATH environment variable.

**Prerequisite**

- Set cluster logging to the unmanaged state. Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades.

**Procedure**

To set the output location for the Fluentd logs:

1. Edit the LOGGING_FILE_PATH parameter in the fluentd daemonset. You can specify a particular file or console:

```
spec:
  template:
    spec:
      containers:
        env:
          - name: LOGGING_FILE_PATH
            value: console
```

Specify the log output method:

- use **console** to use the Fluentd default location. Retrieve the logs with the `oc logs [-f] <pod_name>` command.

- use `<path-to-log/fluentd.log>` to send the log output to the specified file. Retrieve the logs with the `oc exec <pod_name> -- logs` command. This is the default setting.

Or, use the CLI:

```
$ oc -n openshift-logging set env daemonset/fluentd LOGGING_FILE_PATH=/logs/fluentd.log
```
8.7.4. Throttling log collection

For projects that are especially verbose, an administrator can throttle down the rate at which the logs are read in by the log collector before being processed. By throttling, you deliberately slow down the rate at which you are reading logs, so Kibana might take longer to display records.

WARNING

Throttling can contribute to log aggregation falling behind for the configured projects; log entries can be lost if a pod is deleted before Fluentd catches up.

NOTE

Throttling does not work when using the systemd journal as the log source. The throttling implementation depends on being able to throttle the reading of the individual log files for each project. When reading from the journal, there is only a single log source, no log files, so no file-based throttling is available. There is not a method of restricting the log entries that are read into the Fluentd process.

Prerequisite

Set cluster logging to the unmanaged state.

Procedure

1. To configure Fluentd to restrict specific projects, edit the throttle configuration in the Fluentd ConfigMap after deployment:

   $ oc edit configmap/fluentd

   The format of the `throttle-config.yaml` key is a YAML file that contains project names and the desired rate at which logs are read in on each node. The default is 1000 lines at a time per node. For example:

   ```yaml
   throttle-config.yaml: |
   - opensift-logging:
     read_lines_limit: 10
   - .operations:
     read_lines_limit: 100
   ```

8.7.5. Understanding Buffer Chunk Limiting for Fluentd

If the Fluentd logger is unable to keep up with a high number of logs, it will need to switch to file buffering to reduce memory usage and prevent data loss.

Fluentd file buffering stores records in **chunks**. Chunks are stored in **buffers**.
NOTE

To modify the FILE_BUFFER_LIMIT or BUFFER_SIZE_LIMIT parameters in the Fluentd daemonset as described below, you must set cluster logging to the unmanaged state. Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades.

The Fluentd buffer_chunk_limit is determined by the environment variable BUFFER_SIZE_LIMIT, which has the default value 8m. The file buffer size per output is determined by the environment variable FILE_BUFFER_LIMIT, which has the default value 256Mi. The permanent volume size must be larger than FILE_BUFFER_LIMIT multiplied by the output.

On the Fluentd pods, permanent volume /var/lib/fluentd should be prepared by the PVC or hostmount, for example. That area is then used for the file buffers.

The buffer_type and buffer_path are configured in the Fluentd configuration files as follows:

```
$ egrep "buffer_type|buffer_path" *.conf
output-es-config.conf:
  buffer_type file
  buffer_path `/var/lib/fluentd/buffer-output-es-config`
output-es-ops-config.conf:
  buffer_type file
  buffer_path `/var/lib/fluentd/buffer-output-es-ops-config`
```

The Fluentd buffer_queue_limit is the value of the variable BUFFER_QUEUE_LIMIT. This value is 32 by default.

The environment variable BUFFER_QUEUE_LIMIT is calculated as (FILE_BUFFER_LIMIT / (number_of_outputs * BUFFER_SIZE_LIMIT)).

If the BUFFER_QUEUE_LIMIT variable has the default set of values:

- FILE_BUFFER_LIMIT = 256Mi
- number_of_outputs = 1
- BUFFER_SIZE_LIMIT = 8Mi

The value of buffer_queue_limit will be 32. To change the buffer_queue_limit, you must change the value of FILE_BUFFER_LIMIT.

In this formula, number_of_outputs is 1 if all the logs are sent to a single resource, and it is incremented by 1 for each additional resource. For example, the value of number_of_outputs is:

- 1 - if all logs are sent to a single Elasticsearch pod
- 2 - if application logs are sent to an Elasticsearch pod and ops logs are sent to another Elasticsearch pod
- 4 - if application logs are sent to an Elasticsearch pod, ops logs are sent to another Elasticsearch pod, and both of them are forwarded to other Fluentd instances

8.7.6. Configuring the logging collector using environment variables

You can use environment variables to modify the configuration of the Fluentd log collector.
See the Fluentd README in Github for lists of the available environment variables.

Prerequisite

- Set cluster logging to the unmanaged state. Operators in an unmanaged state are unsupported and the cluster administrator assumes full control of the individual component configurations and upgrades.

Procedure

Set any of the Fluentd environment variables as needed:

```bash
oc set env ds/fluentd <env-var>=<value>
```

For example:

```bash
oc set env ds/fluentd LOGGING_FILE_AGE=30
```

8.7.7. About logging collector alerts

The following alerts are generated by the logging collector and can be viewed on the Alerts tab of the Prometheus UI.

All the logging collector alerts are listed on the Monitoring → Alerts page of the OpenShift Container Platform web console. Alerts are in one of the following states:

- **Firing**. The alert condition is true for the duration of the timeout. Click the **Options** menu at the end of the firing alert to view more information or silence the alert.

- **Pending**. The alert condition is currently true, but the timeout has not been reached.

- **Not Firing**. The alert is not currently triggered.

Table 8.3. Fluentd Prometheus alerts

<table>
<thead>
<tr>
<th>Alert</th>
<th>Message</th>
<th>Description</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>FluentdErrorsHigh</td>
<td>In the last minute, &lt;value&gt; errors reported by fluentd &lt;instance&gt;.</td>
<td>Fluentd is reporting a higher number of issues than the specified number, default 10.</td>
<td>Critical</td>
</tr>
<tr>
<td>FluentdNodeDown</td>
<td>Prometheus could not scrape fluentd &lt;instance&gt; for more than 10m.</td>
<td>Fluentd is reporting that Prometheus could not scrape a specific Fluentd instance.</td>
<td>Critical</td>
</tr>
<tr>
<td>FluentdQueueLengthBurst</td>
<td>In the last minute, fluentd &lt;instance&gt; buffer queue length increased more than 32. Current value is &lt;value&gt;.</td>
<td>Fluentd is reporting that it is overwhelmed.</td>
<td>Warning</td>
</tr>
<tr>
<td>Alert</td>
<td>Message</td>
<td>Description</td>
<td>Severity</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>--------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>FluentdQueueLengthIncreasing</td>
<td>In the last 12h, fluentd &lt;instance&gt; buffer queue length constantly increased more than 1. Current value is &lt;value&gt;.</td>
<td>Fluentd is reporting queue usage issues.</td>
<td>Critical</td>
</tr>
</tbody>
</table>

8.8. USING TOLERATIONS TO CONTROL CLUSTER LOGGING POD PLACEMENT

You can use taints and tolerations to ensure that cluster logging pods run on specific nodes and that no other workload can run on those nodes.

Taints and tolerations are simple **key:value** pair. A taint on a node instructs the node to repel all Pods that do not tolerate the taint.

The **key** is any string, up to 253 characters and the **value** is any string up to 63 characters. The string must begin with a letter or number, and may contain letters, numbers, hyphens, dots, and underscores.

**Sample cluster logging CR with tolerations**

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
  namespace: openshift-logging
spec:
  managementState: "Managed"
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 1
      tolerations: 1
      - key: "logging"
        operator: "Exists"
        effect: "NoExecute"
        tolerationSeconds: 6000
  resources:
    limits:
      memory: 8Gi
      requests:
        cpu: 100m
        memory: 1Gi
      storage: {}
    redundancyPolicy: "ZeroRedundancy"
  visualization:
    type: "kibana"
    kibana:
      tolerations: 2
      - key: "logging"
        operator: "Exists"
```
This toleration is added to the Elasticsearch pods.

This toleration is added to the Kibana pod.

This toleration is added to the Curator pod.

This toleration is added to the logging collector pods.

8.8.1. Using tolerations to control the Elasticsearch Pod placement

You can control which nodes the Elasticsearch Pods runs on and prevent other workloads from using those nodes by using tolerations on the Pods.

You apply tolerations to Elasticsearch Pods through the Cluster Logging Custom Resource (CR) and apply taints to a node through the node specification. A taint on a node is a key:value pair that
instructs the node to repel all Pods that do not tolerate the taint. Using a specific key:value pair that is not on other Pods ensures only Elasticseach Pods can run on that node.

By default, the Elasticsearch Pods have the following toleration:

```yaml
tolerations:
  - effect: "NoExecute"
    key: "node.kubernetes.io/disk-pressure"
    operator: "Exists"
```

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Use the following command to add a taint to a node where you want to schedule the cluster logging Pods:

   ```bash
   $ oc adm taint nodes <node-name> <key>=<value>:<effect>
   
   For example:
   
   ```bash
   $ oc adm taint nodes node1 elasticsearch=node:NoExecute
   ```

   This example places a taint on node1 that has key `elasticsearch`, value `node`, and taint effect `NoExecute`. Nodes with the `NoExecute` effect schedule only Pods that match the taint and remove existing Pods that do not match.

2. Edit the `logstore` section of the Cluster Logging Custom Resource (CR) to configure a toleration for the Elasticsearch Pods:

   ```yaml
   logStore:
     type: "elasticsearch"
     elasticsearch:
       nodeCount: 1
       tolerations:
         - key: "elasticsearch"
           operator: "Exists"
           effect: "NoExecute"
           tolerationSeconds: 6000
   ```

   1. Specify the key that you added to the node.
   2. Specify the `Exists` operator to require a taint with the key `elasticsearch` to be present on the Node.
   3. Specify the `NoExecute` effect.
   4. Optionally, specify the `tolerationSeconds` parameter to set how long a Pod can remain bound to a node before being evicted.
This toleration matches the taint created by the `oc adm taint` command. A Pod with this toleration could be scheduled onto `node1`.

### 8.8.2. Using tolerations to control the Kibana Pod placement

You can control which nodes the Kibana Pods run on and prevent other workloads from using those nodes by using tolerations on the Pods.

You apply tolerations to the Kibana Pods through the Cluster Logging Custom Resource (CR) and apply taints to a node through the node specification. A taint on a node is a **key:value pair** that instructs the node to repel all Pods that do not tolerate the taint. Using a specific key:value pair that is not on other Pods ensures only the Kibana Pod can run on that node.

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Use the following command to add a taint to a node where you want to schedule the Kibana Pod:

   ```bash
   $ oc adm taint nodes <node-name> <key>==<value>:<effect>
   ```

   For example:

   ```bash
   $ oc adm taint nodes node1 kibana=node:NoExecute
   ```

   This example places a taint on `node1` that has key `kibana`, value `node`, and taint effect `NoExecute`. You must use the `NoExecute` taint effect. `NoExecute` schedules only Pods that match the taint and remove existing Pods that do not match.

2. Edit the `visualization` section of the Cluster Logging Custom Resource (CR) to configure a toleration for the Kibana Pod:

   ```yaml
   visualization:
     type: "kibana"
   kibana:
     tolerations:
       - key: "kibana"
         operator: "Exists"
         effect: "NoExecute"
       tolerationSeconds: 6000
   ```

   - **1** Specify the key that you added to the node.
   - **2** Specify the `Exists` operator to require the `key/value/effect` parameters to match.
   - **3** Specify the `NoExecute` effect.
   - **4** Optionally, specify the `tolerationSeconds` parameter to set how long a Pod can remain bound to a node before being evicted.
This toleration matches the taint created by the `oc adm taint` command. A Pod with this toleration would be able to schedule onto `node1`.

### 8.8.3. Using tolerations to control the Curator Pod placement

You can control which node the Curator Pod runs on and prevent other workloads from using those nodes by using tolerations on the Pod.

You apply tolerations to the Curator Pod through the Cluster Logging Custom Resource (CR) and apply taints to a node through the node specification. A taint on a node is a **key:value pair** that instructs the node to repel all Pods that do not tolerate the taint. Using a specific **key:value** pair that is not on other Pods ensures only the Curator Pod can run on that node.

**Prerequisites**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

1. Use the following command to add a taint to a node where you want to schedule the Curator Pod:

   ```bash
   $ oc adm taint nodes <node-name> <key>=<value>:<effect>
   ```

   For example:

   ```bash
   $ oc adm taint nodes node1 curator=node:NoExecute
   ```

   This example places a taint on `node1` that has key `curator`, value `node`, and taint effect **NoExecute**. You must use the **NoExecute** taint effect. **NoExecute** schedules only Pods that match the taint and remove existing Pods that do not match.

2. Edit the **curation** section of the Cluster Logging Custom Resource (CR) to configure a toleration for the Curator Pod:

   ```yaml
   curation:
     type: "curator"
     curator:
       tolerations:
       - key: "curator"
         operator: "Exists"
         effect: "NoExecute"
         tolerationSeconds: 6000
   ```

   - **1** Specify the key that you added to the node.
   - **2** Specify the **Exists** operator to require the **key/value/effect** parameters to match.
   - **3** Specify the **NoExecute** effect.
   - **4** Optionally, specify the **tolerationSeconds** parameter to set how long a Pod can remain bound to a node before being evicted.
This toleration matches the taint that is created by the `oc adm taint` command. A Pod with this toleration would be able to schedule onto `node1`.

8.8.4. Using tolerations to control the log collector Pod placement

You can ensure which nodes the logging collector Pods run on and prevent other workloads from using those nodes by using tolerations on the Pods.

You apply tolerations to logging collector Pods through the Cluster Logging Custom Resource (CR) and apply taints to a node through the node specification. You can use taints and tolerations to ensure the Pod does not get evicted for things like memory and CPU issues.

By default, the logging collector Pods have the following toleration:

```
tolerations:
  - key: "node-role.kubernetes.io/master"
    operator: "Exists"
    effect: "NoExecute"
```

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

1. Use the following command to add a taint to a node where you want logging collector Pods to schedule logging collector Pods:

   ```
   $ oc adm taint nodes <node-name> <key>=<value>:<effect>
   ```

   For example:

   ```
   $ oc adm taint nodes node1 collector=node:NoExecute
   ```

   This example places a taint on `node1` that has key `collector`, value `node`, and taint effect `NoExecute`. You must use the `NoExecute` taint effect. `NoExecute` schedules only Pods that match the taint and removes existing Pods that do not match.

2. Edit the `collection` section of the Cluster Logging Custom Resource (CR) to configure a toleration for the logging collector Pods:

   ```yaml
   collection:
     logs:
       type: "fluentd"
     rsyslog:
       tolerations:
         - key: "collector"
           operator: "Exists"
           effect: "NoExecute"
           toleranceSeconds: 6000
   ```

   ```
   1 Specify the key that you added to the node.
   ```
Specify the **Exists** operator to require the **key/value/effect** parameters to match.

Specify the **NoExecute** effect.

Optionally, specify the **tolerationSeconds** parameter to set how long a Pod can remain bound to a node before being evicted.

This toleration matches the taint created by the `oc adm taint` command. A Pod with this toleration would be able to schedule onto node1.

### 8.8.5. Additional resources

For more information about taints and tolerations, see [Controlling pod placement using node taints](#).

### 8.9. SENDING OPENSIFT CONTAINER PLATFORM LOGS TO EXTERNAL DEVICES

You can send Elasticsearch logs to external devices, such as an externally-hosted Elasticsearch instance or an external syslog server. You can also configure Fluentd to send logs to an external log aggregator.

**NOTE**

You must set cluster logging to Unmanaged state before performing these configurations, unless otherwise noted. For more information, see [Changing the cluster logging management state](#).

### 8.9.1. Configuring the log collector to send logs to an external Elasticsearch instance

The log collector sends logs to the value of the `ES_HOST`, `ES_PORT`, `OPS_HOST`, and `OPS_PORT` environment variables of the Elasticsearch deployment configuration. The application logs are directed to the `ES_HOST` destination, and operations logs to `OPS_HOST`.

**NOTE**

Sending logs directly to an AWS Elasticsearch instance is not supported. Use Fluentd Secure Forward to direct logs to an instance of Fluentd that you control and that is configured with the `fluent-plugin-aws-elasticsearch-service` plug-in.

#### Prerequisite

- Cluster logging and Elasticsearch must be installed.
- Set cluster logging to the unmanaged state.

#### Procedure

To direct logs to a specific Elasticsearch instance:

1. Edit the `fluentd` DaemonSet in the `openshift-logging` project:

   ```bash
   $ oc edit ds/fluentd
   spec:
   ```
Set `ES_HOST` and `OPS_HOST` to the same destination, while ensuring that `ES_PORT` and `OPS_PORT` also have the same value for an external Elasticsearch instance to contain both application and operations logs.

3. Configure your externally-hosted Elasticsearch instance for TLS. Only externally-hosted Elasticsearch instances that use Mutual TLS are allowed.

**NOTE**

If you are not using the provided Kibana and Elasticsearch images, you will not have the same multi-tenant capabilities and your data will not be restricted by user access to a particular project.

8.9.2. Configuring log collector to send logs to an external syslog server

Use the `fluent-plugin-remote-syslog` plug-in on the host to send logs to an external syslog server.

**Prerequisite**

Set cluster logging to the unmanaged state.

**Procedure**

1. Set environment variables in the `fluentd` daemonset in the `openshift-logging` project:

   ```yaml
   spec:
     template:
       spec:
         containers:
           - name: fluentd
```
image: 'registry.redhat.io/openshift4/ose-logging-fluentd:v4.2'
env:
- name: REMOTE_SYSLOG_HOST
  value: host1
- name: REMOTE_SYSLOG_HOST_BACKUP
  value: host2
- name: REMOTE_SYSLOG_PORT_BACKUP
  value: 5555

1. The desired remote syslog host. Required for each host.

This will build two destinations. The syslog server on host1 will be receiving messages on the default port of 514, while host2 will be receiving the same messages on port 5555.

2. Alternatively, you can configure your own custom the fluentd daemonset in the openshift-logging project.
Fluentd Environment Variables

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USE_REMOTE_SYSLOG</td>
<td>Defaults to false. Set to true to enable use of the fluent-plugin-remote-syslog gem</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_HOST</td>
<td>(Required) Hostname or IP address of the remote syslog server.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_PORT</td>
<td>Port number to connect on. Defaults to 514.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_SEVERITY</td>
<td>Set the syslog severity level. Defaults to debug.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_FACILITY</td>
<td>Set the syslog facility. Defaults to local0.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_USE_RECORD</td>
<td>Defaults to false. Set to true to use the record’s severity and facility fields to set on the syslog message.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_REMOVE_TAG_PREFIX</td>
<td>Removes the prefix from the tag, defaults to &quot; (empty).</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_TAG_KEY</td>
<td>If specified, uses this field as the key to look on the record, to set the tag on the syslog message.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_PAYLOAD_KEY</td>
<td>If specified, uses this field as the key to look on the record, to set the payload on the syslog message.</td>
</tr>
<tr>
<td>REMOTE_SYSLOG_TYPE</td>
<td>Set the transport layer protocol type. Defaults to syslog_buffered, which sets the TCP protocol. To switch to UDP, set this to syslog.</td>
</tr>
</tbody>
</table>
8.9.3. Configuring Fluentd to send logs to an external log aggregator

You can configure Fluentd to send a copy of its logs to an external log aggregator, and not the default Elasticsearch, using the `out_forward` plug-in. From there, you can further process log records after the locally hosted Fluentd has processed them.

The `forward` plug-in is supported by Fluentd only. The `out_forward` plug-in implements the client side (sender) and the `in_forward` plug-in implements the server side (receiver).

To configure OpenShift Container Platform to send logs using `out_forward`, create a ConfigMap called `secure-forward` in the `openshift-logging` namespace that points to a receiver. On the receiver, configure the `in_forward` plug-in to receive the logs from OpenShift Container Platform. For more information on using the `in_forward` plug-in, see the Fluentd documentation.

Default secure-forward.conf section

```
# <store>
#   @type forward
#   <security>
#     self_hostname ${hostname} # ${hostname} is a placeholder.
#     shared_key <shared_key_between_forwarder_and_forwardee>
#   </security>
#   transport tls
#   tls_verify_hostname true           # Set false to ignore server cert hostname.
#   <buffer>
#     @type file
#     path '/var/lib/fluentd/forward'
#     queued_chunks_limit_size "#{ENV['BUFFER_QUEUE_LIMIT']} || '1024'"
#     chunk_limit_size "#{ENV['BUFFER_SIZE_LIMIT']} || '1m'"
#     flush_interval "#{ENV['FORWARD_FLUSH_INTERVAL']} || '5s'"
#     flush_at_shutdown "#{ENV['FLUSH_AT_SHUTDOWN']} || 'false'"
#     flush_thread_count "#{ENV['FLUSH_THREAD_COUNT']} || 2"
#     retry_max_interval "#{ENV['FORWARD_RETRY_WAIT']} || '300'"
#     retry_forever true
#   </buffer>
#   <server>
#     host server.fqdn.example.com  # or IP
#     port 24284
#   </server>
```
Procedure

To send a copy of Fluentd logs to an external log aggregator:

1. Edit the `secure-forward.conf` section of the Fluentd configuration map:

   ```bash
   $ oc edit configmap/fluentd -n openshift-logging
   ```

2. Enter the name, host, and port for your external Fluentd server:

   ```xml
   <server>
   name externalserver1 1
   host 192.168.1.1 2
   port 24224 3
   </server>
   <server> 4
   name externalserver1
   host 192.168.1.2
   port 24224
   </server>
</store>
   ``

   - Optionally, enter a name for this external aggregator.
   - Specify the host name or IP of the external aggregator.
   - Specify the port of the external aggregator.
   - Optionally, add additional external aggregator.

3. Add the path to your CA certificate and private key to the `secure-forward.conf` section:

   ```xml
   # <security>
   # self_hostname ${hostname} # ${hostname} is a placeholder. 1
   # shared_key <shared_key_between_forwarder_and_forwardee> 2
   ```
1. Specify the default value of the auto-generated certificate common name (CN).
2. Specify a shared key for authentication.
3. Specify the path to your CA certificate.

For example:

```xml
<security>
  self_hostname client.fqdn.local
  shared_key cluster_logging_key
</security>
```

```bash
tls_cert_path /path/to/your_ca_cert.pem
```

To use mTLS, see the Fluentd documentation for information about client certificate and key parameters and other settings.

4. Add certificates to be used in `secure-forward.conf` to the existing secret that is mounted on the Fluentd pods. The `your_ca_cert` and `your_private_key` values must match what is specified in `secure-forward.conf` in `configmap/fluentd`:

```bash
$ oc patch secrets/fluentd --type=json
   --patch "[{'op':'add','path':'/data/your_ca_cert','value':'$(base64 -w0 /path/to/your_ca_cert.pem)'}]"
$ oc patch secrets/fluentd --type=json
   --patch "[{'op':'add','path':'/data/your_private_key','value':'$(base64 -w0 /path/to/your_private_key.pem)'}]"
```

**NOTE**

Replace `your_private_key` with a generic name. This is a link to the JSON path, not a path on your host system.

For example:

```bash
$ oc patch secrets/fluentd --type=json
   --patch "[{'op':'add','path':'/data/ca.crt','value':'$(base64 -w0 /etc/fluent/keys/ca.crt)'}]"
$ oc patch secrets/fluentd --type=json
   --patch "[{'op':'add','path':'/data/ext-agg','value':'$(base64 -w0 /etc/fluent/keys/ext-agg.pem)'}]"
```

5. Configure the `secure-forward.conf` file on the external aggregator to accept messages securely from Fluentd.

When configuring the external aggregator, it must be able to accept messages securely from Fluentd.

You can find further explanation of how to set up the `inforward` plugin and the `out_forward` plugin.
8.10. CONFIGURING SYSTEMD-JOURNALD AND FLUENTD

Because Fluentd reads from the journal, and the journal default settings are very low, journal entries can be lost because the journal cannot keep up with the logging rate from system services.

We recommend setting `RateLimitInterval=1s` and `RateLimitBurst=10000` (or even higher if necessary) to prevent the journal from losing entries.

8.10.1. Configuring systemd-journald for cluster logging

As you scale up your project, the default logging environment might need some adjustments.

For example, if you are missing logs, you might have to increase the rate limits for journald. You can adjust the number of messages to retain for a specified period of time to ensure that cluster logging does not use excessive resources without dropping logs.

You can also determine if you want the logs compressed, how long to retain logs, how or if the logs are stored, and other settings.

Procedure

1. Create a `journald.conf` file with the required settings:

```
Compress=no 1
ForwardToConsole=yes 2
ForwardToSyslog=no 3
MaxRetentionSec=30 4
RateLimitBurst=10000 5
RateLimitInterval=1s 6
Storage=volatile 7
SyncIntervalSec=1s 8
SystemMaxUse=8g 9
SystemKeepFree=20% 10
SystemMaxFileSize=10M 11
```

1 Specify whether you want logs compressed before they are written to the file system. Specify `yes` to compress the message or `no` to not compress. The default is `yes`.

2-3 Configure whether to forward log messages. Defaults to `no` for each. Specify:

- `ForwardToConsole` to forward logs to the system console.
- `ForwardToKsmg` to forward logs to the kernel log buffer.
- `ForwardToSyslog` to forward to a syslog daemon.
- `ForwardToWall` to forward messages as wall messages to all logged-in users.

4 Specify the maximum time to store journal entries. Enter a number to specify seconds. Or include a unit: "year", "month", "week", "day", "h" or "m". Enter 0 to disable. The default is 1month.

5-6 Configure rate limiting. If, during the time interval defined by `RateLimitIntervalSec`, more logs than specified in `RateLimitBurst` are received, all further messages within the interval are dropped until the interval is over. It is recommended to set `RateLimitInterval=1s` and...
RateLimitBurst=10000, which are the defaults.

7 Specify how logs are stored. The default is persistent:

- volatile to store logs in memory in /var/log/journal/.
- persistent to store logs to disk in /var/log/journal/. systemd creates the directory if it does not exist.
- auto to store logs in in /var/log/journal/ if the directory exists. If it does not exist, systemd temporarily stores logs in /run/systemd/journal.
- none to not store logs. systemd drops all logs.

8 Specify the timeout before synchronizing journal files to disk for ERR, WARNING, NOTICE, INFO, and DEBUG logs. systemd immediately syncs after receiving a CRIT, ALERT, or EMERG log. The default is 1s.

9 Specify the maximum size the journal can use. The default is 8g.

10 Specify how much disk space systemd must leave free. The default is 20%.

11 Specify the maximum size for individual journal files stored persistently in /var/log/journal. The default is 10M.

NOTE

If you are removing the rate limit, you might see increased CPU utilization on the system logging daemons as it processes any messages that would have previously been throttled.

For more information on systemd settings, see https://www.freedesktop.org/software/systemd/man/journald.conf.html. The default settings listed on that page might not apply to OpenShift Container Platform.

2. Convert the journal.conf file to base64:

   $ export jrnl_cnf=$( cat /journald.conf | base64 -w0 )

3. Create a new MachineConfig for master or worker and add the journal.conf parameters:

   For example:

   ```yaml
   ...
   config:
     storage:
       files:
         - contents:
             source: data:text/plain;charset=utf-8;base64,${jrnl_cnf}
             verification: {}
             filesystem: root
             mode: 0644
             path: /etc/systemd/journald.conf
             systemd: {}
   ```
1. Set the permissions for the `journal.conf` file. It is recommended to set **0644** permissions.

2. Specify the path to the base64-encoded `journal.conf` file.

4. Create the MachineConfig:

   ```bash
   $ oc apply -f <filename>.yaml
   ```

   The controller detects the new MachineConfig and generates a new `rendered-worker-<hash>` version.

5. Monitor the status of the rollout of the new rendered configuration to each node:

   ```bash
   $ oc describe machineconfigpool/worker
   ```

   Name: worker
   Namespace: 
   Labels: machineconfiguration.openshift.io/mco-built-in=
   Annotations: <none>
   API Version: machineconfiguration.openshift.io/v1
   Kind: MachineConfigPool

   Conditions:
   Message:
   Reason: All nodes are updating to rendered-worker-913514517bcea7c93bd446f4830bc64e
CHAPTER 9. VIEWING ELASTICSEARCH STATUS

You can view the status of the Elasticsearch Operator and for a number of Elasticsearch components.

9.1. VIEWING ELASTICSEARCH STATUS

You can view the status of your Elasticsearch cluster.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

1. Change to the openshift-logging project.
   ```shell
   $ oc project openshift-logging
   ```

2. To view the Elasticsearch cluster status:
   a. Get the name of the Elasticsearch instance:
      ```shell
      $ oc get Elasticsearch
      NAME    AGE
      elasticsearch 5h9m
      ```
   b. Get the Elasticsearch status:
      ```shell
      $ oc get Elasticsearch <Elasticsearch-instance> -o yaml
      ```
      For example:
      ```shell
      $ oc get Elasticsearch elasticsearch -n openshift-logging -o yaml
      ```
      The output includes information similar to the following:
      ```yaml
      status:
      cluster:
      activePrimaryShards: 30
      activeShards: 60
      initializingShards: 0
      numDataNodes: 3
      numNodes: 3
      pendingTasks: 0
      relocatingShards: 0
      status: green
      unassignedShards: 0
      clusterHealth: """
      conditions: []
      nodes:
      - deploymentName: elasticsearch-cdm-zjf34ved-1
        upgradeStatus: {}
      ```
In the output, the cluster status fields appear in the `status` stanza.

The status of the Elasticsearch cluster:

- The number of active primary shards.
- The number of active shards.
- The number of shards that are initializing.
- The number of Elasticsearch data nodes.
- The total number of Elasticsearch nodes.
- The number of pending tasks.
- The Elasticsearch status: green, red, yellow.
- The number of unassigned shards.

Any status conditions, if present. The Elasticsearch cluster status indicates the reasons from the scheduler if a pod could not be placed. Any events related to the following conditions are shown:

- Container Waiting for both the Elasticsearch and proxy containers.
- Container Terminated for both the Elasticsearch and proxy containers.
• Pod unschedulable. Also, a condition is shown for a number of issues, see Example condition messages.

4 The Elasticsearch nodes in the cluster, with upgradeStatus.

5 The Elasticsearch client, data, and master pods in the cluster, listed under ‘failed’, notReady or ready state.

9.1.1. Example condition messages

The following are examples of some condition messages from the Status section of the Elasticsearch instance.

This status message indicates a node has exceeded the configured low watermark and no shard will be allocated to this node.

```
status:
  nodes:
    - conditions:
        message: Disk storage usage for node is 27.5gb (36.74%). Shards will not be allocated on this node.
        reason: Disk Watermark Low
        status: "True"
        type: NodeStorage
      deploymentName: example-elasticsearch-cdm-0-1
      upgradeStatus: {}
```

This status message indicates a node has exceeded the configured high watermark and shards will be relocated to other nodes.

```
status:
  nodes:
    - conditions:
      - lastTransitionTime: 2019-03-15T16:04:45Z
        message: Disk storage usage for node is 27.5gb (36.74%). Shards will be relocated from this node.
        reason: Disk Watermark High
        status: "True"
        type: NodeStorage
      deploymentName: example-elasticsearch-cdm-0-1
      upgradeStatus: {}
```

This status message indicates the Elasticsearch node selector in the CR does not match any nodes in the cluster:

```
status:
  nodes:
    - conditions:
      - lastTransitionTime: 2019-04-10T02:26:24Z
        message: '0/8 nodes are available: 8 node(s) didn"t match node selector.'
        reason: Unschedulable
        status: "True"
        type: Unschedulable
```
This status message indicates that the Elasticsearch CR uses a non-existent PVC.

```
status:
  nodes:
    - conditions:
      - last Transition Time: 2019-04-10T05:55:51Z
        message:               pod has unbound immediate PersistentVolumeClaims (repeated 5 times)
        reason:                Unschedulable
        status:               True
        type:                  Unschedulable
```

This status message indicates that your Elasticsearch cluster does not have enough nodes to support your Elasticsearch redundancy policy.

```
status:
  clusterHealth: ""
  conditions:
    - lastTransitionTime: 2019-04-17T20:01:31Z
      message: Wrong RedundancyPolicy selected. Choose different RedundancyPolicy or add more nodes with data roles
      reason: Invalid Settings
      status: "True"
      type: InvalidRedundancy
```

This status message indicates your cluster has too many master nodes:

```
status:
  clusterHealth: green
  conditions:
    - lastTransitionTime: '2019-04-17T20:12:34Z'
      message: >-
        Invalid master nodes count. Please ensure there are no more than 3 total nodes with master roles
      reason: Invalid Settings
      status: 'True'
      type: InvalidMasters
```

**9.2. VIEWING ELASTICSEARCH COMPONENT STATUS**

You can view the status for a number of Elasticsearch components.

**Elasticsearch indices**

You can view the status of the Elasticsearch indices.

1. Get the name of an Elasticsearch pod:

   ```
   $ oc get pods --selector component=elasticsearch -o name
   pod/elasticsearch-cdm-1godmszn-1-6f8495-vp4lw
   pod/elasticsearch-cdm-1godmszn-2-5769cf-9ms2n
   pod/elasticsearch-cdm-1godmszn-3-f66f7d-zqkz7
   ```

2. Get the status of the indices:

   ```
   ```
$ oc exec elasticsearch-cdm-1godmszn-1-6f8495-vp4lw -- indices

Defaulting container name to elasticsearch.
Use 'oc describe pod/elasticsearch-cdm-1godmszn-1-6f8495-vp4lw -n openshift-logging' to see all of the containers in this pod.

```plaintext
Wed Apr 10 05:42:12 UTC 2019

5            1          0              0
```

### Elasticsearch pods

You can view the status of the Elasticsearch pods.

1. Get the name of a pod:

   ```bash
   $ oc get pods --selector component=elasticsearch -o name
   pod/elasticsearch-cdm-1godmszn-1-6f8495-vp4lw
   pod/elasticsearch-cdm-1godmszn-2-5769cf-9ms2n
   pod/elasticsearch-cdm-1godmszn-3-f66f7d-zqkz7
   ```

2. Get the status of a pod:

   ```bash
   oc describe pod elasticsearch-cdm-1godmszn-1-6f8495-vp4lw
   ```

   The output includes the following status information:

   ```plaintext
   ....
   Status: Running
   ....
   Containers:
   elasticsearch:
   Container ID:  cri-o://b7d44e0a9ea4a86e27f47763f5bb4c39dfd2
   State: Running
   Started: Mon, 08 Apr 2019 10:17:56 -0400
   Ready: True
   Restart Count: 0
   Readiness: exec [/usr/share/elasticsearch/probe/readiness.sh] delay=10s timeout=30s period=5s #success=1 #failure=3
   ....
   proxy:
   ```
Elasticsearch deployment configuration

You can view the status of the Elasticsearch deployment configuration.

1. Get the name of a deployment configuration:

   $ oc get deployment --selector component=elasticsearch -o name

   deployment.extensions/elasticsearch-cdm-1gon-1
deployment.extensions/elasticsearch-cdm-1gon-2
deployment.extensions/elasticsearch-cdm-1gon-3

2. Get the deployment configuration status:

   $ oc describe deployment elasticsearch-cdm-1gon-1

   The output includes the following status information:

   Containers:
   elasticsearch:
     Image:    registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2
     Readiness: exec [/usr/share/elasticsearch/probe/readiness.sh] delay=10s timeout=30s
     period=5s success=1 failure=3

   Conditions:
   Type            Status Reason
   ----            ------ ------
   Progressing    Unknown DeploymentPaused
   Available       True MinimumReplicasAvailable
Elasticsearch ReplicaSet

You can view the status of the Elasticsearch ReplicaSet.

1. Get the name of a replica set:

   ```
   $ oc get replicaSet --selector component=elasticsearch -o name
   
   replicaset.extensions/elasticsearch-cdm-1gon-1-6f8495
   replicaset.extensions/elasticsearch-cdm-1gon-2-5769cf
   replicaset.extensions/elasticsearch-cdm-1gon-3-f66f7d
   ```

2. Get the status of the replica set:

   ```
   $ oc describe replicaSet elasticsearch-cdm-1gon-1-6f8495
   
   The output includes the following status information:
   
   ....Containers:
   elasticsearch:
   Image: registry.redhat.io/openshift4/ose-logging-elasticsearch5:v4.2
   Readiness: exec [/usr/share/elasticsearch/probe/readiness.sh] delay=10s timeout=30s period=5s #success=1 #failure=3
   
   ....
   ```

   Events: <none>
CHAPTER 10. VIEWING CLUSTER LOGGING STATUS

You can view the status of the Cluster Logging Operator and for a number of cluster logging components.

10.1. VIEWING THE STATUS OF THE CLUSTER LOGGING OPERATOR

You can view the status of your Cluster Logging Operator.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

1. Change to the openshift-logging project.

   $ oc project openshift-logging

2. To view the cluster logging status:

   a. Get the cluster logging status:

      $ oc get clusterlogging instance -o yaml

The output includes information similar to the following:

apiVersion: logging.openshift.io/v1
kind: ClusterLogging
....

status: 1
  collection:
  logs:
    fluentdStatus:
      daemonSet: fluentd

1. In the output, the cluster status fields appear in the status stanza.
2. Information on the Fluentd pods.
3. Information on the Curator pods.
Information on the Elasticsearch pods, including Elasticsearch cluster health, green, yellow, or red.

Information on the Kibana pods.

10.1.1. Example condition messages

The following are examples of some condition messages from the `Status.Nodes` section of the cluster logging instance.

A status message similar to the following indicates a node has exceeded the configured low watermark and no shard will be allocated to this node:

```
nodes:
  - conditions:
      message: Disk storage usage for node is 27.5gb (36.74%). Shards will be not be allocated on this node.
      reason: Disk Watermark Low
      status: "True"
      type: NodeStorage
      deploymentName: example-elasticsearch-clientdatamaster-0-1
      upgradeStatus: {}
```

A status message similar to the following indicates a node has exceeded the configured high watermark and shards will be relocated to other nodes:

```
nodes:
  - conditions:
    - lastTransitionTime: 2019-03-15T16:04:45Z
      message: Disk storage usage for node is 27.5gb (36.74%). Shards will be relocated from this node.
      reason: Disk Watermark High
      status: "True"
      type: NodeStorage
      deploymentName: cluster-logging-operator
      upgradeStatus: {}
```

A status message similar to the following indicates the Elasticsearch node selector in the CR does not match any nodes in the cluster:

```
Elasticsearch Status:
  Shard Allocation Enabled: shard allocation unknown
Cluster:
  Active Primary Shards: 0
  Active Shards: 0
  Initializing Shards: 0
  Num Data Nodes: 0
  Num Nodes: 0
  Pending Tasks: 0
  Relocating Shards: 0
  Status: cluster health unknown
  Unassigned Shards: 0
Cluster Name: elasticsearch
```
Node Conditions:
elasticsearch-cdm-mkkdys93-1:
  Last Transition Time: 2019-06-26T03:37:32Z
  Message: 0/5 nodes are available: 5 node(s) didn't match node selector.
  Reason: Unschedulable
  Status: True
  Type: Unschedulable
elasticsearch-cdm-mkkdys93-2:
Node Count: 2
Pods:

  Type: ContainerTerminated
curator-1561519200-zqxxj:
  Last Transition Time: 2019-06-26T03:20:01Z
  Message: 0/5 nodes are available: 1 Insufficient cpu, 5 node(s) didn't match node selector.
  Reason: Unschedulable
A status message similar to the following indicates that the Fluentd pods cannot be scheduled because the node selector did not match any nodes:

10.2. VIEWING THE STATUS OF CLUSTER LOGGING COMPONENTS

You can view the status for a number of cluster logging components.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

1. Change to the openshift-logging project.

   ```
   $ oc project openshift-logging
   ```

2. View the status of the cluster logging deployment:

   ```
   $ oc describe deployment cluster-logging-operator
   ```

   The output includes the following status information:

   Name: cluster-logging-operator

   ....

   Conditions:

<table>
<thead>
<tr>
<th>Type</th>
<th>Status</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>True</td>
<td>MinimumReplicasAvailable</td>
</tr>
<tr>
<td>Progressing</td>
<td>True</td>
<td>NewReplicaSetAvailable</td>
</tr>
</tbody>
</table>

   ....

   Events:
3. View the status of the cluster logging ReplicaSet:
   a. Get the name of a ReplicaSet:

   ```
   $ oc get replicaset
   NAME                                      DESIRED   CURRENT   READY   AGE
   cluster-logging-operator-574b8987df       1         1         1       159m
   elasticsearch-cdm-uhr537yu-1-6869694fb    1         1         1       157m
   elasticsearch-cdm-uhr537yu-2-857b6d676f   1         1         1       156m
   elasticsearch-cdm-uhr537yu-3-5b6fdd8cfd   1         1         1       155m
   kibana-5bd5544f87                         1         1         1       157m
   ```

   b. Get the status of the ReplicaSet:

   ```
   $ oc describe replicaset cluster-logging-operator-574b8987df
   ```

   The output includes the following status information:

   ```
   Name:           cluster-logging-operator-574b8987df
   ....
   Replicas:       1 current / 1 desired
   Pods Status:    1 Running / 0 Waiting / 0 Succeeded / 0 Failed
   ....
   Events:

   ```
CHAPTER 11. MOVING THE CLUSTER LOGGING RESOURCES
WITH NODE SELECTORS

You use node selectors to deploy the Elasticsearch, Kibana, and Curator pods to different nodes.

11.1. MOVING THE CLUSTER LOGGING RESOURCES

You can configure the Cluster Logging Operator to deploy the pods for any or all of the Cluster Logging components, Elasticsearch, Kibana, and Curator to different nodes. You cannot move the Cluster Logging Operator pod from its installed location.

For example, you can move the Elasticsearch pods to a separate node because of high CPU, memory, and disk requirements.

NOTE

You should set your MachineSet to use at least 6 replicas.

Prerequisites

- Cluster logging and Elasticsearch must be installed. These features are not installed by default.

Procedure

1. Edit the Cluster Logging Custom Resource in the openshift-logging project:

```bash
$ oc edit ClusterLogging instance
```

```yaml
apiVersion: logging.openshift.io/v1
kind: ClusterLogging

spec:
collection:
  logs:
    fluentd:
      resources: null
      type: fluentd
curation:
curator:
  nodeSelector:
    node-role.kubernetes.io/infra: "
    resources: null
    schedule: 30 3 * * *
    type: curator
logStore:
elasticsearch:
  nodeCount: 3
  nodeSelector:
    node-role.kubernetes.io/infra: "
    redundancyPolicy: SingleRedundancy
    resources:
```
Add a `nodeSelector` parameter with the appropriate value to the component you want to move. You can use a `nodeSelector` in the format shown or use `<key>: <value>` pairs, based on the value specified for the node.

Verification steps

To verify that a component has moved, you can use the `oc get pod -o wide` command.

For example:

- You want to move the Kibana pod from the `ip-10-0-147-79.us-east-2.compute.internal` node:

  ```
  $ oc get pod kibana-5b8bdf44f9-ccpq9 -o wide
  NAME                      READY   STATUS    RESTARTS   AGE   IP            NODE
  NOMINATED NODE   READINESS GATES
  kibana-5b8bdf44f9-ccpq9   2/2     Running   0          27s   10.129.2.18   ip-10-0-147-79.us-east-2.compute.internal   <none>           <none>
  ```

- You want to move the Kibana Pod to the `ip-10-0-139-48.us-east-2.compute.internal` node, a dedicated infrastructure node:

  ```
  $ oc get nodes
  NAME                                         STATUS   ROLES          AGE   VERSION
  ip-10-0-133-216.us-east-2.compute.internal   Ready    master         60m   v1.16.2
  ip-10-0-139-146.us-east-2.compute.internal   Ready    master         60m   v1.16.2
  ip-10-0-139-192.us-east-2.compute.internal   Ready    worker         51m   v1.16.2
  ip-10-0-139-241.us-east-2.compute.internal   Ready    worker         51m   v1.16.2
  ip-10-0-147-79.us-east-2.compute.internal    Ready    worker         51m   v1.16.2
  ip-10-0-152-241.us-east-2.compute.internal   Ready    master         60m   v1.16.2
  ip-10-0-139-48.us-east-2.compute.internal    Ready    infra          51m   v1.16.2
  ```

  Note that the node has a `node-role.kubernetes.io/infra: "` label:
To move the Kibana Pod, edit the Cluster Logging CR to add a node selector:

apiVersion: logging.openshift.io/v1
kind: ClusterLogging

....

spec:
....

visualization:
  kibana:
    nodeSelector: 1
      node-role.kubernetes.io/infra: " 2
  proxy:
    resources: null
    replicas: 1
    resources: null
    type: kibana

1 2 Add a node selector to match the label in the node specification.

After you save the CR, the current Kibana pod is terminated and new pod is deployed:

$ oc get pods

NAME                                            READY   STATUS        RESTARTS   AGE
cluster-logging-operator-84d98649c4-zb9g7       1/1     Running       0          29m
elasticsearch-cdm-hwv01pf7-1-5658f554f-kpmlg   2/2     Running       0          28m
elasticsearch-cdm-hwv01pf7-2-84c877d75d-75wqj   2/2     Running       0          28m
elasticsearch-cdm-hwv01pf7-3-f5d95b87b-4nx78    2/2     Running       0          28m
fluentd-42dzz                                    1/1     Running       0          28m
fluentd-d74rq                                    1/1     Running       0          28m
fluentd-m5vr9                                    1/1     Running       0          28m
fluentd-nkxl7                                   1/1     Running       0          28m
fluentd-pdvqb                                  1/1     Running       0          28m
fluentd-tflh6                                   1/1     Running       0          28m
kibana-5b8bdf44f9-ccpq9                         2/2     Terminating   0          4m11s
kibana-7d85dcff8-8bfhp                          2/2     Running       0          33s
The new pod is on the `ip-10-0-139-48.us-east-2.compute.internal` node:

```bash
$ oc get pod kibana-7d85dcfc8-bfpfp -o wide
NAME                      READY   STATUS        RESTARTS   AGE   IP            NODE
NOMINATED NODE   READINESS GATES
kibana-7d85dcfc8-bfpfp   2/2     Running       0          43s   10.131.0.22   ip-10-0-139-48.us-east-2.compute.internal   <none>           <none>
```

After a few moments, the original Kibana pod is removed.

```bash
$ oc get pods
NAME                                            READY   STATUS    RESTARTS   AGE
cluster-logging-operator-84d98649c4-zb9g7       1/1     Running   0          30m
elasticsearch-cdm-hwv01pf7-1-56588f554f-kpmlg   2/2     Running   0          29m
elasticsearch-cdm-hwv01pf7-2-84c877d75d-75wj    2/2     Running   0          29m
elasticsearch-cdm-hwv01pf7-3-f5d95b87b-4nx78     2/2     Running   0          29m
fluentd-42dzz                                   1/1     Running   0          29m
fluentd-d74rq                                   1/1     Running   0          29m
fluentd-m5vr9                                   1/1     Running   0          29m
fluentd-nkxl7                                   1/1     Running   0          29m
fluentd-pdvqb                                   1/1     Running   0          29m
fluentd-tflh6                                   1/1     Running   0          29m
kibana-7d85dcfc8-bfpfp                         2/2     Running   0          62s
```
CHAPTER 12. MANUALLY ROLLING OUT ELASTICSEARCH

OpenShift Container Platform supports the Elasticsearch rolling cluster restart. A rolling restart applies appropriate changes to the Elasticsearch cluster without down time (if three masters are configured). The Elasticsearch cluster remains online and operational, with nodes taken offline one at a time.

12.1. PERFORMING AN ELASTICSEARCH ROLLING CLUSTER RESTART

Perform a rolling restart when you change the `elasticsearch` configmap or any of the `elasticsearch-*` deployment configurations.

Also, a rolling restart is recommended if the nodes on which an Elasticsearch pod runs requires a reboot.

**Prerequisite**

- Cluster logging and Elasticsearch must be installed.

**Procedure**

To perform a rolling cluster restart:

1. Change to the `openshift-logging` project:

   ```bash
   $ oc project openshift-logging
   ```

2. Use the following command to extract the CA certificate from Elasticsearch and write to the `admin-ca` file:

   ```bash
   $ oc extract secret/elasticsearch --to=. --keys=admin-ca
   ```

3. Perform a shard synced flush to ensure there are no pending operations waiting to be written to disk prior to shutting down:

   ```bash
   $ oc exec <any_es_pod_in_the_cluster> -c elasticsearch -- curl -s --cacert /etc/elasticsearch/secret/admin-ca --cert /etc/elasticsearch/secret/admin-cert --key /etc/elasticsearch/secret/admin-key -XPOST 'https://localhost:9200/_flush/synced'
   ```

   For example:

   ```bash
   oc exec -c elasticsearch-cdm-5ceex6ts-1-dcd6c4c7c-jpw6 -- curl -s --cacert /etc/elasticsearch/secret/admin-ca --cert /etc/elasticsearch/secret/admin-cert --key /etc/elasticsearch/secret/admin-key -XPOST 'https://localhost:9200/_flush/synced'
   ```

4. Prevent shard balancing when purposely bringing down nodes using the OpenShift Container Platform `es_util` tool:

   ```bash
   ```

   For example:
  "transient": {
    "cluster.routing.allocation.enable": "none"
  }
}'

{
  "acknowledged": true,
  "persistent": {},
  "transient": {
    "cluster": {
      "routing": {
        "allocation": {
          "enable": "none"
        }
      }
    }
  }
}

5. Once complete, for each deployment you have for an ES cluster:

a. By default, the OpenShift Container Platform Elasticsearch cluster blocks rollouts to their nodes. Use the following command to allow rollouts and allow the pod to pick up the changes:

   $ oc rollout resume deployment/<deployment-name>

   For example:

   $ oc rollout resume deployment/elasticsearch-cdm-0-1
   deployment.extensions/elasticsearch-cdm-0-1 resumed

   A new pod is deployed. Once the pod has a ready container, you can move on to the next deployment.

   $ oc get pods | grep elasticsearch-*

   NAME                                            READY   STATUS    RESTARTS   AGE
   elasticsearch-cdm-5ceex6ts-1-dcd6c4c7c-jpw6k    2/2     Running   0          22h
   elasticsearch-cdm-5ceex6ts-2-f799564cb-l9mj7    2/2     Running   0          22h
   elasticsearch-cdm-5ceex6ts-3-585968dc68-k7kjr    2/2     Running   0          22h

b. Once complete, reset the pod to disallow rollouts:

   $ oc rollout pause deployment/<deployment-name>

   For example:

   $ oc rollout pause deployment/elasticsearch-cdm-0-1
   deployment.extensions/elasticsearch-cdm-0-1 paused

c. Check that the Elasticsearch cluster is in **green** state:

   $ oc exec <any_es_pod_in_the_cluster> -c elasticsearch -- es_util -- query=_cluster/health?pretty=true
NOTE

If you performed a rollout on the Elasticsearch pod you used in the previous commands, the pod no longer exists and you need a new pod name here.

For example:

```bash
$ oc exec elasticsearch-cdm-5ceex6ts-1-dcd6c4c7c-jpw6 -c elasticsearch -- es_util --
query=_cluster/health?pretty=true
{
  "cluster_name" : "elasticsearch",
  "status" : "green",
  "timed_out" : false,
  "number_of_nodes" : 3,
  "number_of_data_nodes" : 3,
  "active_primary_shards" : 8,
  "active_shards" : 16,
  "relocating_shards" : 0,
  "initializing_shards" : 0,
  "unassigned_shards" : 1,
  "delayed_unassigned_shards" : 0,
  "number_of_pending_tasks" : 0,
  "number_of_in_flight_fetch" : 0,
  "task_max_waiting_in_queue_millis" : 0,
  "active_shards_percent_as_number" : 100.0
}
```

1. Make sure this parameter is green before proceeding.

6. If you changed the Elasticsearch configuration map, repeat these steps for each Elasticsearch pod.

7. Once all the deployments for the cluster have been rolled out, re-enable shard balancing:

```bash
$ oc exec <any_es_pod_in_the_cluster> -c elasticsearch -- es_util --query=_cluster/settings -
XPUT 'https://localhost:9200/_cluster/settings' -d '{ "transient": {
  "cluster.routing.allocation.enable": "none" }
}'}
```

For example:

```bash
$ oc exec elasticsearch-cdm-5ceex6ts-1-dcd6c4c7c-jpw6 -c elasticsearch -- es_util --
  "transient": { "cluster.routing.allocation.enable": "all" } }
```

```json
{
  "acknowledged" : true,
  "persistent" : { },
  "transient" : {
    "cluster" : {
      "routing" : {
        "allocation": {
```
"enable" : "all"}
}
}
}
}
CHAPTER 13. TROUBLESHOOTING KIBANA

Using the Kibana console with OpenShift Container Platform can cause problems that are easily solved, but are not accompanied with useful error messages. Check the following troubleshooting sections if you are experiencing any problems when deploying Kibana on OpenShift Container Platform.

13.1. TROUBLESHOOTING A KUBERNETES LOGIN LOOP

The OAuth2 proxy on the Kibana console must share a secret with the master host’s OAuth2 server. If the secret is not identical on both servers, it can cause a login loop where you are continuously redirected back to the Kibana login page.

Procedure
To fix this issue:

1. Run the following command to delete the current OAuthClient:

   $ oc delete oauthclient/kibana-proxy

13.2. TROUBLESHOOTING A KUBERNETES CRYPTIC ERROR WHEN VIEWING THE KIBANA CONSOLE

When attempting to visit the Kibana console, you may receive a browser error instead:

   {"error":"invalid_request","error_description":"The request is missing a required parameter, includes an invalid parameter value, includes a parameter more than once, or is otherwise malformed."}

This can be caused by a mismatch between the OAuth2 client and server. The return address for the client must be in a whitelist so the server can securely redirect back after logging in.

Fix this issue by replacing the OAuthClient entry.

Procedure
To replace the OAuthClient entry:

1. Run the following command to delete the current OAuthClient:

   $ oc delete oauthclient/kibana-proxy

   If the problem persists, check that you are accessing Kibana at a URL listed in the OAuth client. This issue can be caused by accessing the URL at a forwarded port, such as 1443 instead of the standard 443 HTTPS port. You can adjust the server whitelist by editing the OAuth client:

   $ oc edit oauthclient/kibana-proxy

13.3. TROUBLESHOOTING A KUBERNETES 503 ERROR WHEN VIEWING THE KIBANA CONSOLE

If you receive a proxy error when viewing the Kibana console, it could be caused by one of two issues:
• Kibana might not be recognizing pods. If Elasticsearch is slow in starting up, Kibana may timeout trying to reach it. Check whether the relevant service has any endpoints:

```
$ oc describe service kibana
Name: kibana
[...]  
Endpoints: <none>
```

If any Kibana pods are live, endpoints are listed. If they are not, check the state of the Kibana pods and deployment. You might have to scale the deployment down and back up again.

• The route for accessing the Kibana service is masked. This can happen if you perform a test deployment in one project, then deploy in a different project without completely removing the first deployment. When multiple routes are sent to the same destination, the default router will only route to the first created. Check the problematic route to see if it is defined in multiple places:

```
$ oc get route --all-namespaces --selector logging-infra=support
```
CHAPTER 14. EXPORTED FIELDS

These are the fields exported by the logging system and available for searching from Elasticsearch and Kibana. Use the full, dotted field name when searching. For example, for an Elasticsearch /_search URL, to look for a Kubernetes Pod name, use /_search?q=kubernetes.pod_name:name-of-my-pod.

The following sections describe fields that may not be present in your logging store. Not all of these fields are present in every record. The fields are grouped in the following categories:

- exported-fields-Default
- exported-fields-systemd
- exported-fields-kubernetes
- exported-fields-pipeline_metadata
- exported-fields-ovirt
- exported-fields-aushape
- exported-fields-tlog

14.1. DEFAULT EXPORTED FIELDS

These are the default fields exported by the logging system and available for searching from Elasticsearch and Kibana. The default fields are Top Level and collectd*.

Top Level Fields

The top level fields are common to every application, and may be present in every record. For the Elasticsearch template, top level fields populate the actual mappings of default in the template’s mapping section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@timestamp</td>
<td>The UTC value marking when the log payload was created, or when the log</td>
</tr>
<tr>
<td></td>
<td>payload was first collected if the creation time is not known. This is the</td>
</tr>
<tr>
<td></td>
<td>log processing pipeline’s best effort determination of when the log payload</td>
</tr>
<tr>
<td></td>
<td>was generated. Add the @ prefix convention to note a field as being reserved</td>
</tr>
<tr>
<td></td>
<td>for a particular use. With Elasticsearch, most tools look for @timestamp by</td>
</tr>
<tr>
<td></td>
<td>default. For example, the format would be 2015-01-24 14:06:05.071000.</td>
</tr>
<tr>
<td>geoip</td>
<td>This is geo-ip of the machine.</td>
</tr>
<tr>
<td>hostname</td>
<td>The hostname is the fully qualified domain name (FQDN) of the entity</td>
</tr>
<tr>
<td></td>
<td>generating the original payload. This field is an attempt to derive this</td>
</tr>
<tr>
<td></td>
<td>context. Sometimes the entity generating it knows the context. While other</td>
</tr>
<tr>
<td></td>
<td>times that entity has a restricted namespace itself, which is known by the</td>
</tr>
<tr>
<td></td>
<td>collector or normalizer.</td>
</tr>
<tr>
<td>ipaddr4</td>
<td>The IP address V4 of the source server, which can be an array.</td>
</tr>
<tr>
<td>ipaddr6</td>
<td>The IP address V6 of the source server, if available.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>level</td>
<td>The logging level as provided by rsyslog (severitytext property), python’s logging module. Possible values are as listed at <code>misc/sys/syslog.h</code> plus <code>trace</code> and <code>unknown</code>. For example, “alert crit debug emerg err info notice trace unknown warning”. Note that <code>trace</code> is not in the <code>syslog.h</code> list but many applications use it.</td>
</tr>
<tr>
<td>message</td>
<td>A typical log entry message, or payload. It can be stripped of metadata pulled out of it by the collector or normalizer, that is UTF-8 encoded.</td>
</tr>
<tr>
<td>pid</td>
<td>This is the process ID of the logging entity, if available.</td>
</tr>
<tr>
<td>service</td>
<td>The name of the service associated with the logging entity, if available. For example, the <code>syslog APP-NAME</code> property is mapped to the service field.</td>
</tr>
<tr>
<td>tags</td>
<td>Optionally provided operator defined list of tags placed on each log by the collector or normalizer. The payload can be a string with whitespace-delimited string tokens, or a JSON list of string tokens.</td>
</tr>
<tr>
<td>file</td>
<td>Optional path to the file containing the log entry local to the collector. <strong>TODO</strong> analyzer for file paths.</td>
</tr>
<tr>
<td>offset</td>
<td>The offset value can represent bytes to the start of the log line in the file (zero or one based), or log line numbers (zero or one based), as long as the values are strictly monotonically increasing in the context of a single log file. The values are allowed to wrap, representing a new version of the log file (rotation).</td>
</tr>
<tr>
<td>namespace_name</td>
<td>Associate this record with the <code>namespace</code> that shares it’s name. This value will not be stored, but it is used to associate the record with the appropriate <code>namespace</code> for access control and visualization. Normally this value will be given in the tag, but if the protocol does not support sending a tag, this field can be used. If this field is present, it will override the <code>namespace</code> given in the tag or in <code>kubernetes.namespace_name</code>.</td>
</tr>
<tr>
<td>namespace_uuid</td>
<td>This is the <code>uuid</code> associated with the <code>namespace_name</code>. This value will not be stored, but is used to associate the record with the appropriate namespace for access control and visualization. If this field is present, it will override the <code>uuid</code> given in <code>kubernetes.namespace_uuid</code>. This will also cause the Kubernetes metadata lookup to be skipped for this log record.</td>
</tr>
</tbody>
</table>
### collectd Fields
The following fields represent namespace metrics metadata.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.interval</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> interval.</td>
</tr>
<tr>
<td>collectd.plugin</td>
<td>type: string</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> plug-in.</td>
</tr>
<tr>
<td>collectd.plugin_instance</td>
<td>type: string</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> plugin_instance.</td>
</tr>
<tr>
<td>collectd.type_instance</td>
<td>type: string</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> type_instance.</td>
</tr>
<tr>
<td>collectd.type</td>
<td>type: string</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> type.</td>
</tr>
<tr>
<td>collectd.dstypes</td>
<td>type: string</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> dstypes.</td>
</tr>
</tbody>
</table>

### collectd.processes Fields
The following field corresponds to the `collectd` processes plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.processes.ps_state</td>
<td>type: integer</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> <code>ps_state</code> type of processes plug-in.</td>
</tr>
</tbody>
</table>

### collectd.processes.ps_disk_ops Fields
The `collectd` `ps_disk_ops` type of processes plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.processes.ps_disk_ops.read</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td>collectd.processes.ps_disk_ops.write</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>
### CHAPTER 14. EXPORTED FIELDS

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `collectd.processes.ps_vm` | type: integer  
The *collectd ps_vm* type of processes plug-in. |
| `collectd.processes.ps_rss` | type: integer  
The *collectd ps_rss* type of processes plug-in. |
| `collectd.processes.ps_data` | type: integer  
The *collectd ps_data* type of processes plug-in. |
| `collectd.processes.ps_code` | type: integer  
The *collectd ps_code* type of processes plug-in. |
| `collectd.processes.ps_stacksize` | type: integer  
The *collectd ps_stacksize* type of processes plug-in. |

**collectd.processes.ps_cputime Fields**  
The *collectd ps_cputime* type of processes plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `collectd.processes.ps_cputime.user` | type: float  
Todo |
| `collectd.processes.ps_cputime.syst` | type: float  
Todo |

**collectd.processes.ps_count Fields**  
The *collectd ps_count* type of processes plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `collectd.processes.ps_count.processes` | type: integer  
Todo |
| `collectd.processes.ps_count.threads` | type: integer  
Todo |

**collectd.processes.ps_pagefaults Fields**
The **collectd ps_pagefaults** type of processes plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.processes.ps_pagefaults.majflt</td>
<td>type: float TODO</td>
</tr>
<tr>
<td>collectd.processes.ps_pagefaults.minflt</td>
<td>type: float TODO</td>
</tr>
</tbody>
</table>

**collectd.processes.ps_disk_octets Fields**

The **collectd ps_disk_octets** type of processes plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.processes.ps_disk_octets.read</td>
<td>type: float TODO</td>
</tr>
<tr>
<td>collectd.processes.ps_disk_octets.write</td>
<td>type: float TODO</td>
</tr>
<tr>
<td>collectd.processes.fork_rate</td>
<td>type: float The <strong>collectd fork_rate</strong> type of processes plug-in.</td>
</tr>
</tbody>
</table>

**collectd.disk Fields**

Corresponds to **collectd** disk plug-in.

**collectd.disk.disk_merged Fields**

The **collectd disk_merged** type of disk plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.disk.disk_merged.read</td>
<td>type: float TODO</td>
</tr>
<tr>
<td>collectd.disk.disk_merged.write</td>
<td>type: float TODO</td>
</tr>
</tbody>
</table>

**collectd.disk.disk_octets Fields**

The **collectd disk_octets** type of disk plug-in.
### collectd.disk.disk_time Fields
The `collectd disk_time` type of disk plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collectd.disk.disk_time.read</code></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><code>collectd.disk.disk_time.write</code></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>

### collectd.disk.disk_ops Fields
The `collectd disk_ops` type of disk plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collectd.disk.disk_ops.read</code></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><code>collectd.disk.disk_ops.write</code></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><code>collectd.disk.pending_operations</code></td>
<td>type: integer</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd pending_operations</code> type of disk plug-in.</td>
</tr>
</tbody>
</table>

### collectd.disk.disk_io_time Fields
The `collectd disk_io_time` type of disk plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collectd.disk.disk_io_time.io_time</code></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| `collectd.disk.disk_io_time.weighted_io_time` | type: float  
TODO                                             |

**collectd.interface Fields**

Corresponds to the `collectd` interface plug-in.

**collectd.interface.if_octets Fields**

The `collectd if_octets` type of interface plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `collectd.interface.if_octets.rx`              | type: float  
TODO                                             |
| `collectd.interface.if_octets.tx`              | type: float  
TODO                                             |

**collectd.interface.if_packets Fields**

The `collectd if_packets` type of interface plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `collectd.interface.if_packets.rx`             | type: float  
TODO                                             |
| `collectd.interface.if_packets.tx`             | type: float  
TODO                                             |

**collectd.interface.if_errors Fields**

The `collectd if_errors` type of interface plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `collectd.interface.if_errors.rx`              | type: float  
TODO                                             |
| `collectd.interface.if_errors.tx`              | type: float  
TODO                                             |
**collectd.interface.if_dropped Fields**
The `collectd if_dropped` type of interface plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collectd.interface.if_dropped.rx</code></td>
<td>type: float</td>
</tr>
<tr>
<td><code>collectd.interface.if_dropped.tx</code></td>
<td>type: float</td>
</tr>
</tbody>
</table>

**collectd.virt Fields**
Corresponds to `collectd` virt plug-in.

**collectd.virt.if_octets Fields**
The `collectd if_octets` type of virt plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collectd.virt.if_octets.rx</code></td>
<td>type: float</td>
</tr>
<tr>
<td><code>collectd.virt.if_octets.tx</code></td>
<td>type: float</td>
</tr>
</tbody>
</table>

**collectd.virt.if_packets Fields**
The `collectd if_packets` type of virt plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>collectd.virt.if_packets.rx</code></td>
<td>type: float</td>
</tr>
<tr>
<td><code>collectd.virt.if_packets.tx</code></td>
<td>type: float</td>
</tr>
</tbody>
</table>

**collectd.virt.if_errors Fields**
The `collectd if_errors` type of virt plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td><strong>collectd.virt.if_errors.rx</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><strong>collectd.virt.if_errors.tx</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>

**collectd.virt.if_dropped Fields**

The **collectd if_dropped** type of virt plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>collectd.virt.if_dropped.rx</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><strong>collectd.virt.if_dropped.tx</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>

**collectd.virt.disk_ops Fields**

The **collectd disk_ops** type of virt plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>collectd.virt.disk_ops.read</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><strong>collectd.virt.disk_ops.write</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>

**collectd.virt.disk_octets Fields**

The **collectd disk_octets** type of virt plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>collectd.virt.disk_octets.read</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td><strong>collectd.virt.disk_octets.write</strong></td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>collectd.virt.memory</td>
<td>type: float The <code>collectd</code> memory type of virt plug-in.</td>
</tr>
<tr>
<td>collectd.virt.vcpu</td>
<td>type: float The <code>collectd</code> <code>virt_vcpu</code> type of virt plug-in.</td>
</tr>
<tr>
<td>collectd.virt.virt_cpu_total</td>
<td>type: float The <code>collectd</code> <code>virt_cpu_total</code> type of virt plug-in.</td>
</tr>
</tbody>
</table>

**collectd.CPU Fields**
Corresponds to the `collectd` CPU plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.CPU.percent</td>
<td>type: float The <code>collectd</code> type percent of plug-in CPU.</td>
</tr>
</tbody>
</table>

**collectd.df Fields**
Corresponds to the `collectd df` plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.df.df_complex</td>
<td>type: float The <code>collectd</code> type <code>df_complex</code> of plug-in <code>df</code>.</td>
</tr>
<tr>
<td>collectd.df.percent_bytes</td>
<td>type: float The <code>collectd</code> type <code>percent_bytes</code> of plug-in <code>df</code>.</td>
</tr>
</tbody>
</table>

**collectd.entropy Fields**
Corresponds to the `collectd` entropy plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.entropy.entropy</td>
<td>type: integer The <code>collectd</code> entropy type of entropy plug-in.</td>
</tr>
</tbody>
</table>

**collectd.memory Fields**
Corresponds to the `collectd` memory plug-in.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.memory.memory</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> memory type of memory plug-in.</td>
</tr>
<tr>
<td>collectd.memory.percent</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> percent type of memory plug-in.</td>
</tr>
</tbody>
</table>

**collectd.swap Fields**
Corresponds to the `collectd` swap plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.swap.swap</td>
<td>type: integer</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd</code> swap type of swap plug-in.</td>
</tr>
<tr>
<td>collectd.swap.swap_io</td>
<td>type: integer</td>
</tr>
<tr>
<td></td>
<td>The <code>collectd swap_io</code> type of swap plug-in.</td>
</tr>
</tbody>
</table>

**collectd.load Fields**
Corresponds to the `collectd` load plug-in.

**collectd.load.load Fields**
The `collectd` load type of load plug-in

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.load.load.shortterm</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td>collectd.load.load.midterm</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
<tr>
<td>collectd.load.load.longterm</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>

**collectd.aggregation Fields**
Corresponds to `collectd` aggregation plug-in.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.aggregation.percent</td>
<td>type: float</td>
</tr>
<tr>
<td></td>
<td>TODO</td>
</tr>
</tbody>
</table>

**collectd.statsd** Fields
Corresponds to **collectd statsd** plug-in.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectd.statsd.host_cpu</td>
<td>type: integer</td>
</tr>
<tr>
<td></td>
<td>The <em>collectd</em> CPU type of <em>statsd</em> plug-in.</td>

<tr>
<td>collectd.postgresql.pg_blks</td>
<td>type: integer  &lt;br&gt;The collectd type pg_blks of plug-in postgresql.</td>
</tr>
</tbody>
</table>
## 14.2. **SYSTEMD EXPORTED FIELDS**

These are the **systemd** fields exported by the OpenShift Container Platform cluster logging available for searching from Elasticsearch and Kibana.

Contains common fields specific to **systemd** journal. **Applications** may write their own fields to the journal. These will be available under the **systemd.u** namespace. **RESULT** and **UNIT** are two such fields.

**systemd.k Fields**
The following table contains **systemd** kernel-specific metadata.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>systemd.k.KERNEL_DEVICE</strong></td>
<td><strong>systemd.k.KERNEL_DEVICE</strong> is the kernel device name.</td>
</tr>
<tr>
<td><strong>systemd.k.KERNEL_SUBSYSTEM</strong></td>
<td><strong>systemd.k.KERNEL_SUBSYSTEM</strong> is the kernel subsystem name.</td>
</tr>
<tr>
<td><strong>systemd.k.UDEV_DEVLINK</strong></td>
<td><strong>systemd.k.UDEV_DEVLINK</strong> includes additional symlink names that point to the node.</td>
</tr>
<tr>
<td><strong>systemd.k.UDEV_DEVNODE</strong></td>
<td><strong>systemd.k.UDEV_DEVNODE</strong> is the node path of the device.</td>
</tr>
<tr>
<td><strong>systemd.k.UDEV_SYSNAME</strong></td>
<td><strong>systemd.k.UDEV_SYSNAME</strong> is the kernel device name.</td>
</tr>
</tbody>
</table>

**systemd.t Fields**

**systemd.t Fields** are trusted journal fields, fields that are implicitly added by the journal, and cannot be altered by client code.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>systemd.t.AUDIT_LOGINUID</strong></td>
<td><strong>systemd.t.AUDIT_LOGINUID</strong> is the user ID for the journal entry process.</td>
</tr>
<tr>
<td><strong>systemd.t.BOOT_ID</strong></td>
<td><strong>systemd.t.BOOT_ID</strong> is the kernel boot ID.</td>
</tr>
<tr>
<td><strong>systemd.t.AUDIT_SESSION</strong></td>
<td><strong>systemd.t.AUDIT_SESSION</strong> is the session for the journal entry process.</td>
</tr>
<tr>
<td><strong>systemd.t.CAP_EFFECTIVE</strong></td>
<td><strong>systemd.t.CAP_EFFECTIVE</strong> represents the capabilities of the journal entry process.</td>
</tr>
<tr>
<td><strong>systemd.t.CMDLINE</strong></td>
<td><strong>systemd.t.CMDLINE</strong> is the command line of the journal entry process.</td>
</tr>
<tr>
<td><strong>systemd.t.COMM</strong></td>
<td><strong>systemd.t.COMM</strong> is the name of the journal entry process.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>systemd.t.EXE</td>
<td><strong>systemd.t.EXE</strong> is the executable path of the journal entry process.</td>
</tr>
<tr>
<td>systemd.t.GID</td>
<td><strong>systemd.t.GID</strong> is the group ID for the journal entry process.</td>
</tr>
<tr>
<td>systemd.t.HOSTNAME</td>
<td><strong>systemd.t.HOSTNAME</strong> is the name of the host.</td>
</tr>
<tr>
<td>systemd.t.MACHINE_ID</td>
<td><strong>systemd.t.MACHINE_ID</strong> is the machine ID of the host.</td>
</tr>
<tr>
<td>systemd.t.PID</td>
<td><strong>systemd.t.PID</strong> is the process ID for the journal entry process.</td>
</tr>
<tr>
<td>systemd.t.SELINUX_CONTEXT</td>
<td><strong>systemd.t.SELINUX_CONTEXT</strong> is the security context, or label, for the journal entry process.</td>
</tr>
<tr>
<td>systemd.t.SOURCE_REALTIME_TIMESTAMP</td>
<td><strong>systemd.t.SOURCE_REALTIME_TIMESTAMP</strong> is the earliest and most reliable timestamp of the message. This is converted to RFC 3339 NS format.</td>
</tr>
<tr>
<td>systemd.t.SYSTEMD_CGROUP</td>
<td><strong>systemd.t.SYSTEMD_CGROUP</strong> is the <strong>systemd</strong> control group path.</td>
</tr>
<tr>
<td>systemd.t.SYSTEMD_OWNER_UID</td>
<td><strong>systemd.t.SYSTEMD_OWNER_UID</strong> is the owner ID of the session.</td>
</tr>
<tr>
<td>systemd.t.SYSTEMD_SESSION</td>
<td><strong>systemd.t.SYSTEMD_SESSION</strong>, if applicable, is the <strong>systemd</strong> session ID.</td>
</tr>
<tr>
<td>systemd.t.SYSTEMD_SLICE</td>
<td><strong>systemd.t.SYSTEMD_SLICE</strong> is the slice unit of the journal entry process.</td>
</tr>
<tr>
<td>systemd.t.SYSTEMD_UNIT</td>
<td><strong>systemd.t.SYSTEMD_UNIT</strong> is the unit name for a session.</td>
</tr>
<tr>
<td>systemd.t.SYSTEMD_USER_UNIT</td>
<td><strong>systemd.t.SYSTEMD_USER_UNIT</strong>, if applicable, is the user unit name for a session.</td>
</tr>
<tr>
<td>systemd.t.TRANSPORT</td>
<td><strong>systemd.t.TRANSPORT</strong> is the method of entry by the journal service. This includes, <strong>audit</strong>, <strong>driver</strong>, <strong>syslog</strong>, <strong>journal</strong>, <strong>stdout</strong>, and <strong>kernel</strong>.</td>
</tr>
<tr>
<td>systemd.t.UID</td>
<td><strong>systemd.t.UID</strong> is the user ID for the journal entry process.</td>
</tr>
<tr>
<td>systemd.t.SYSLOG_FACILITY</td>
<td><strong>systemd.t.SYSLOG_FACILITY</strong> is the field containing the facility, formatted as a decimal string, for <strong>syslog</strong>.</td>
</tr>
<tr>
<td>systemd.t.SYSLOG_IDENTIFIER</td>
<td><strong>systemd.t.systemd.t.SYSLOG_IDENTIFIER</strong> is the identifier for <strong>syslog</strong>.</td>
</tr>
</tbody>
</table>
systemd.t.SYSLOG_PID

SYSLOG_PID is the client process ID for syslog.

systemd.u Fields

systemd.u Fields are directly passed from clients and stored in the journal.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>systemd.u.CODE_FILE</td>
<td>systemd.u.CODE_FILE is the code location containing the filename of the source.</td>
</tr>
<tr>
<td>systemd.u.CODE_FUNCTION</td>
<td>systemd.u.CODE_FUNCTION is the code location containing the function of the source.</td>
</tr>
<tr>
<td>systemd.u.CODE_LINE</td>
<td>systemd.u.CODE_LINE is the code location containing the line number of the source.</td>
</tr>
<tr>
<td>systemd.u.ERRNO</td>
<td>systemd.u.ERRNO, if present, is the low-level error number formatted in numeric value, as a decimal string.</td>
</tr>
<tr>
<td>systemd.u.MESSAGE_ID</td>
<td>systemd.u.MESSAGE_ID is the message identifier ID for recognizing message types.</td>
</tr>
<tr>
<td>systemd.u.RESULT</td>
<td>For private use only.</td>
</tr>
<tr>
<td>systemd.u.UNIT</td>
<td>For private use only.</td>
</tr>
</tbody>
</table>

14.3. KUBERNETES EXPORTED FIELDS

These are the Kubernetes fields exported by the OpenShift Container Platform cluster logging available for searching from Elasticsearch and Kibana.

The namespace for Kubernetes-specific metadata. The kubernetes.pod_name is the name of the pod.

kubernetes.labels Fields

Labels attached to the OpenShift object are kubernetes.labels. Each label name is a subfield of labels field. Each label name is de-dotted, meaning dots in the name are replaced with underscores.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kubernetes.pod_id</td>
<td>Kubernetes ID of the pod.</td>
</tr>
<tr>
<td>kubernetes.namespace_name</td>
<td>The name of the namespace in Kubernetes.</td>
</tr>
<tr>
<td>kubernetes.namespace_id</td>
<td>ID of the namespace in Kubernetes.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>kubernetes.host</td>
<td>Kubernetes node name.</td>
</tr>
<tr>
<td>kubernetes.container_name</td>
<td>The name of the container in Kubernetes.</td>
</tr>
<tr>
<td>kubernetes.labels.deployment</td>
<td>The deployment associated with the Kubernetes object.</td>
</tr>
<tr>
<td>kubernetes.labels.deploymentconfig</td>
<td>The deploymentconfig associated with the Kubernetes object.</td>
</tr>
<tr>
<td>kubernetes.labels.component</td>
<td>The component associated with the Kubernetes object.</td>
</tr>
<tr>
<td>kubernetes.labels.provider</td>
<td>The provider associated with the Kubernetes object.</td>
</tr>
</tbody>
</table>

**kubernetes.annotations** Fields
Annotations associated with the OpenShift object are **kubernetes.annotations** fields.

### 14.4. CONTAINER EXPORTED FIELDS

These are the Docker fields exported by the OpenShift Container Platform cluster logging available for searching from Elasticsearch and Kibana. Namespace for docker container-specific metadata. The docker.container_id is the Docker container ID.

**pipeline_metadata.collector** Fields
This section contains metadata specific to the collector.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipeline_metadata.collector.hostname</td>
<td>FQDN of the collector. It might be different from the FQDN of the actual emitter of the logs.</td>
</tr>
<tr>
<td>pipeline_metadata.collector.name</td>
<td>Name of the collector.</td>
</tr>
<tr>
<td>pipeline_metadata.collector.version</td>
<td>Version of the collector.</td>
</tr>
<tr>
<td>pipeline_metadata.collector.ipaddr4</td>
<td>IP address v4 of the collector server, can be an array.</td>
</tr>
<tr>
<td>pipeline_metadata.collector.ipaddr6</td>
<td>IP address v6 of the collector server, can be an array.</td>
</tr>
</tbody>
</table>
### 14.5. OVIRT EXPORTED FIELDS

#### pipeline_metadata

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collect or.inputname</td>
<td>How the log message was received by the collector whether it was TCP/UDP, or imjournal/imfile.</td>
</tr>
<tr>
<td>collect or.received_at</td>
<td>Time when the message was received by the collector.</td>
</tr>
<tr>
<td>collect or.original_raw_message</td>
<td>The original non-parsed log message, collected by the collector or as close to the source as possible.</td>
</tr>
</tbody>
</table>

#### pipeline_metadata.normalizer

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>normalizer.hostname</td>
<td>FQDN of the normalizer.</td>
</tr>
<tr>
<td>normalizer.name</td>
<td>Name of the normalizer.</td>
</tr>
<tr>
<td>normalizer.version</td>
<td>Version of the normalizer.</td>
</tr>
<tr>
<td>normalizer.ipaddr4</td>
<td>IP address v4 of the normalizer server, can be an array.</td>
</tr>
<tr>
<td>normalizer.ipaddr6</td>
<td>IP address v6 of the normalizer server, can be an array.</td>
</tr>
<tr>
<td>normalizer.inputname</td>
<td>how the log message was received by the normalizer whether it was TCP/UDP.</td>
</tr>
<tr>
<td>normalizer.received_at</td>
<td>Time when the message was received by the normalizer.</td>
</tr>
<tr>
<td>normalizer.original_raw_message</td>
<td>The original non-parsed log message as it is received by the normalizer.</td>
</tr>
<tr>
<td>trace</td>
<td>The field records the trace of the message. Each collector and normalizer appends information about itself and the date and time when the message was processed.</td>
</tr>
</tbody>
</table>
These are the oVirt fields exported by the OpenShift Container Platform cluster logging available for searching from Elasticsearch and Kibana.

Namespace for oVirt metadata.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ovirt.entity</td>
<td>The type of the data source, hosts, VMS, and engine.</td>
</tr>
<tr>
<td>ovirt.host_id</td>
<td>The oVirt host UUID.</td>
</tr>
</tbody>
</table>

ovirt.engine Fields
Namespace for oVirt engine related metadata. The FQDN of the oVirt engine is **ovirt.engine.fqdn**

14.6. AUSHAPE EXPORTED FIELDS

These are the Aushape fields exported by the OpenShift Container Platform cluster logging available for searching from Elasticsearch and Kibana.

Audit events converted with Aushape. For more information, see [Aushape](#).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aushape.serial</td>
<td>Audit event serial number.</td>
</tr>
<tr>
<td>aushape.node</td>
<td>Name of the host where the audit event occurred.</td>
</tr>
<tr>
<td>aushape.error</td>
<td>The error aushape encountered while converting the event.</td>
</tr>
<tr>
<td>aushape.trimmed</td>
<td>An array of JSONPath expressions relative to the event object, specifying objects or arrays with the content removed as the result of event size limiting. An empty string means the event removed the content, and an empty array means the trimming occurred by unspecified objects and arrays.</td>
</tr>
<tr>
<td>aushape.text</td>
<td>An array log record strings representing the original audit event.</td>
</tr>
</tbody>
</table>

aushape.data Fields
Parsed audit event data related to Aushape.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aushape.data.avc</td>
<td>type: nested</td>
</tr>
<tr>
<td>aushape.data.execve</td>
<td>type: string</td>
</tr>
<tr>
<td>aushape.data.netfilter_cfg</td>
<td>type: nested</td>
</tr>
</tbody>
</table>
14.7. TLOG EXPORTED FIELDS

These are the Tlog fields exported by the OpenShift Container Platform cluster logging system and available for searching from Elasticsearch and Kibana.

Tlog terminal I/O recording messages. For more information see Tlog.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aushape.data.obj_pid</td>
<td>type: nested</td>
</tr>
<tr>
<td>aushape.data.path</td>
<td>type: nested</td>
</tr>
<tr>
<td>tlog.ver</td>
<td>Message format version number.</td>
</tr>
<tr>
<td>tlog.user</td>
<td>Recorded user name.</td>
</tr>
<tr>
<td>tlog.term</td>
<td>Terminal type name.</td>
</tr>
<tr>
<td>tlog.session</td>
<td>Audit session ID of the recorded session.</td>
</tr>
<tr>
<td>tlog.id</td>
<td>ID of the message within the session.</td>
</tr>
<tr>
<td>tlog.pos</td>
<td>Message position in the session, milliseconds.</td>
</tr>
<tr>
<td>tlog.timing</td>
<td>Distribution of this message’s events in time.</td>
</tr>
<tr>
<td>tlog.in_txt</td>
<td>Input text with invalid characters scrubbed.</td>
</tr>
<tr>
<td>tlog.in_bin</td>
<td>Scrubbed invalid input characters as bytes.</td>
</tr>
<tr>
<td>tlog.out_txt</td>
<td>Output text with invalid characters scrubbed.</td>
</tr>
<tr>
<td>tlog.out_bin</td>
<td>Scrubbed invalid output characters as bytes.</td>
</tr>
</tbody>
</table>
CHAPTER 15. UNINSTALLING CLUSTER LOGGING

You can remove cluster logging from your OpenShift Container Platform cluster.

15.1. UNINSTALLING CLUSTER LOGGING FROM OPENSHIFT CONTAINER PLATFORM

You can remove cluster logging from your cluster.

Prerequisites

- Cluster logging and Elasticsearch must be installed.

Procedure

To remove cluster logging:

1. Use the following command to remove everything generated during the deployment.

   $ oc delete clusterlogging instance -n openshift-logging

2. Use the following command to remove the Persistent Volume Claims that remain after the Operator instances are deleted:

   $ oc delete pvc --all -n openshift-logging
