OpenShift Container Platform 4.4

CLI tools

Learning how to use the command-line tools for OpenShift Container Platform
OpenShift Container Platform 4.4 CLI tools

Learning how to use the command-line tools for OpenShift Container Platform
Abstract

This document provides information about installing, configuring, and using the command-line tools for OpenShift Container Platform. It also contains a reference of CLI commands and examples of how to use them.

1.5.3. Security and policy CLI commands
1.5.3.1. certificate 31
1.5.3.2. groups 31
1.5.3.3. new-project 31
1.5.3.4. pod-network 32
1.5.3.5. policy 32
1.5.4. Maintenance CLI commands
1.5.4.1. migrate 32
1.5.4.2. prune 32
1.5.5. Configuration CLI commands
1.5.5.1. create-api-client-config 32
1.5.5.2. create-bootstrap-policy-file 33
1.5.5.3. create-bootstrap-project-template 33
1.5.5.4. create-error-template 33
1.5.5.5. create-kubeconfig 33
1.5.5.6. create-login-template 33
1.5.5.7. create-provider-selection-template 34
1.5.6. Other Administrator CLI commands
1.5.6.1. build-chain 34
1.5.6.2. completion 34
1.5.6.3. config 34
1.5.6.4. release 34
1.5.6.5. verify-image-signature 35
1.6. USAGE OF OC AND KUBECTL COMMANDS
1.6.1. The oc binary 35
1.6.2. The kubectl binary 35

CHAPTER 2. DEVELOPER CLI (ODO) ................................................................. 36
2.1. UNDERSTANDING OPENSHIFT DO ......................................................... 36
2.1.1. Key features 36
2.1.2. Core concepts 36
2.1.2.1. Officially supported languages and corresponding container images 36
2.1.2.1.1. Listing available container images 37
2.2. ODO ARCHITECTURE 38
2.2.1. Developer setup 38
2.2.2. OpenShift source-to-image 38
2.2.3. OpenShift cluster objects 38
2.2.3.1. Init Containers 38
2.2.3.1.1. copy-supervisord 38
2.2.3.1.2. copy-files-to-volume 39
2.2.3.2. Application container 39
2.2.3.3. PersistentVolume and PersistentVolumeClaim 39
2.2.3.4. emptyDir Volume 40
2.2.3.5. Service 40
2.2.4. odo push workflow 40
2.3. INSTALLING ODO 41
2.3.1. Installing odo on Linux 41
2.3.1.1. Binary installation 41
2.3.1.2. Tarball installation 42
2.3.2. Installing odo on Windows 42
2.3.2.1. Binary installation 42
Setting the PATH variable for Windows 7/8 42
Setting the PATH variable for Windows 10 42
2.3.3. Installing odo on macOS
   2.3.3.1. Binary installation
   2.3.3.2. Tarball installation

2.4. USING ODO IN A RESTRICTED ENVIRONMENT
   2.4.1. About odo in a restricted environment
   2.4.2. Pushing the odo init image to the restricted cluster registry
      2.4.2.1. Pushing the odo init image to a mirror registry
         2.4.2.1.1. Pushing the init image to a mirror registry on Linux
         2.4.2.1.2. Pushing the init image to a mirror registry on MacOS
         2.4.2.1.3. Pushing the init image to a mirror registry on Windows
      2.4.2.2. Pushing the odo init image to an internal registry directly
         2.4.2.2.1. Pushing the init image directly on Linux
         2.4.2.2.2. Pushing the init image directly on MacOS
         2.4.2.2.3. Pushing the init image directly on Windows
   2.4.3. Creating and deploying a component to the disconnected cluster
      2.4.3.1. Mirroring a supported builder image
      2.4.3.2. Overwriting the mirror registry
      2.4.3.3. Creating a Node.js application with odo

2.5. CREATING A SINGLE-COMPONENT APPLICATION WITH ODO
   2.5.1. Creating a project
   2.5.2. Creating a Node.js application with odo
   2.5.3. Modifying your application code
   2.5.4. Adding storage to the application components
   2.5.5. Adding a custom builder to specify a build image
   2.5.6. Connecting your application to multiple services using OpenShift Service Catalog
   2.5.7. Deleting an application

2.6. CREATING A MULTICOMPONENT APPLICATION WITH ODO
   2.6.1. Creating a project
   2.6.2. Deploying the back-end component
   2.6.3. Deploying the front-end component
   2.6.4. Linking both components
   2.6.5. Exposing components to the public
   2.6.6. Modifying the running application
   2.6.7. Deleting an application

2.7. CREATING AN APPLICATION WITH A DATABASE
   2.7.1. Creating a project
   2.7.2. Deploying the front-end component
   2.7.3. Deploying a database in interactive mode
   2.7.4. Deploying a database manually
   2.7.5. Connecting the database to the front-end application
   2.7.6. Deleting an application

2.8. USING SAMPLE APPLICATIONS
   2.8.1. Examples from Git repositories
      2.8.1.1. httpd
      2.8.1.2. java
      2.8.1.3. nodejs
      2.8.1.4. perl
      2.8.1.5. php
      2.8.1.6. python
      2.8.1.7. ruby
      2.8.1.8. wildfly
   2.8.2. Binary examples
      2.8.2.1. java
2.8.2.2. wildfly

2.9. CREATING INSTANCES OF SERVICES MANAGED BY OPERATORS

2.9.1. Creating a project
2.9.2. Listing available services from the Operators installed on the cluster
2.9.3. Creating a service from an Operator
2.9.4. Creating services from YAML files

2.10. DEBUGGING APPLICATIONS IN ODO

2.10.1. Debugging an application
2.10.2. Configuring debugging parameters

2.11. MANAGING ENVIRONMENT VARIABLES

2.11.1. Setting and unsetting environment variables

2.12. CONFIGURING THE ODO CLI

2.12.1. Using command completion
2.12.2. Ignoring files or patterns

2.13. ODO CLI REFERENCE

2.13.1. Basic odo CLI commands

2.13.1.1. app
2.13.1.2. catalog
2.13.1.3. component
2.13.1.4. config
2.13.1.5. create
2.13.1.6. debug
2.13.1.7. delete
2.13.1.8. describe
2.13.1.9. link
2.13.1.10. list
2.13.1.11. log
2.13.1.12. login
2.13.1.13. logout
2.13.1.14. preference
2.13.1.15. project
2.13.1.16. push
2.13.1.17. service
2.13.1.18. storage
2.13.1.19. unlink
2.13.1.20. update
2.13.1.21. url
2.13.1.22. utils
2.13.1.23. version
2.13.1.24. watch

2.14. ODO RELEASE NOTES

2.14.1. Notable changes and improvements in odo
2.14.2. Getting support
2.14.3. Fixed issues
2.14.4. Known issues
2.14.5. Technology Preview features odo

CHAPTER 3. HELM CLI

3.1. GETTING STARTED WITH HELM 3 ON OPENSShift CONTAINER PLATFORM

3.1.1. Understanding Helm
3.1.1.1. Key features
3.1.2. Installing Helm
3.1.2.1. On Linux
3.1.2.2. On Windows 7/8
3.1.2.3. On Windows 10
3.1.2.4. On MacOS
3.1.3. Installing a Helm chart on an OpenShift Container Platform cluster
3.1.4. Creating a custom Helm chart on OpenShift Container Platform

CHAPTER 4. KNATIVE CLI (KN) FOR USE WITH OPENSHIFT SERVERLESS
4.1. KEY FEATURES
4.2. INSTALLING KN
4.3. NEXT STEPS

CHAPTER 5. PIPELINES CLI (TKN)
5.1. INSTALLING TKN
5.1.1. Installing OpenShift Pipelines CLI (tkn) on Linux
5.1.2. Installing OpenShift Pipelines CLI (tkn) on Linux using an RPM
5.1.3. Installing OpenShift Pipelines CLI (tkn) on Windows
5.1.4. Installing OpenShift Pipelines CLI (tkn) on macOS
5.2. OPENSHIFT PIPELINES TKN REFERENCE
5.2.1. Basic Syntax
5.2.2. Global Options
5.2.3. Utility commands
5.2.3.1. tkn
5.2.3.2. completion [shell]
5.2.3.3. version
5.2.4. Pipelines management commands
5.2.4.1. pipeline
5.2.4.2. pipeline create
5.2.4.3. pipeline delete
5.2.4.4. pipeline describe
5.2.4.5. pipeline list
5.2.4.6. pipeline logs
5.2.4.7. pipeline start
5.2.5. PipelineRun commands
5.2.5.1. pipelinerun
5.2.5.2. pipelinerun cancel
5.2.5.3. pipelinerun delete
5.2.5.4. pipelinerun describe
5.2.5.5. pipelinerun list
5.2.5.6. pipelinerun logs
5.2.6. Task management commands
5.2.6.1. task
5.2.6.2. task create
5.2.6.3. task delete
5.2.6.4. task describe
5.2.6.5. task list
5.2.6.6. task logs
5.2.6.7. task start
5.2.7. TaskRun commands
5.2.7.1. taskrun
5.2.7.2. taskrun cancel
5.2.7.3. taskrun delete
5.2.7.4. taskrun describe
5.2.7.5. taskrun list

1.1. GETTING STARTED WITH THE CLI

1.1.1. About the CLI

With the OpenShift Container Platform command-line interface (CLI), you can create applications and manage OpenShift Container Platform projects from a terminal. The CLI is ideal in situations where you:

- Work directly with project source code.
- Script OpenShift Container Platform operations.
- Are restricted by bandwidth resources and cannot use the web console.

1.1.2. Installing the CLI

You can install the OpenShift CLI (oc) either by downloading the binary or by using an RPM.

1.1.2.1. Installing the CLI by downloading the binary

You can install the OpenShift CLI (oc) in order to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.4. Download and install the new version of oc.

1.1.2.1.1. Installing the CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command-line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.

4. Unpack the archive:

   ```
   $ tar xzvf <file>
   ```

5. Place the oc binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:
$ oc <command>

1.1.2.1.2. Installing the CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command-line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   
   After you install the CLI, it is available using the oc command:
   ```
   ```
   C:\> oc <command>
   ```

1.1.2.1.3. Installing the CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command-line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   ```
   $ echo $PATH
   
   After you install the CLI, it is available using the oc command:
   ```
   ```
   $ oc <command>
   ```

1.1.2.2. Installing the CLI by using an RPM

For Red Hat Enterprise Linux (RHEL), you can install the OpenShift CLI (oc) as an RPM if you have an OpenShift Container Platform 4.4 CLI tools
For Red Hat Enterprise Linux (RHEL), you can install the OpenShift CLI (oc) as an RPM if you have an active OpenShift Container Platform subscription on your Red Hat account.

Prerequisites

- Must have root or sudo privileges.

Procedure

1. Register with Red Hat Subscription Manager:
   ```bash
   # subscription-manager register
   ```

2. Pull the latest subscription data:
   ```bash
   # subscription-manager refresh
   ```

3. List the available subscriptions:
   ```bash
   # subscription-manager list --available --matches "OpenShift"
   ```

4. In the output for the previous command, find the pool ID for an OpenShift Container Platform subscription and attach the subscription to the registered system:
   ```bash
   # subscription-manager attach --pool=<pool_id>
   ```

5. Enable the repositories required by OpenShift Container Platform 4.4:
   ```bash
   # subscription-manager repos --enable="rhel-7-server-ose-4.4-rpms"
   ```

6. Install the openshift-clients package:
   ```bash
   # yum install openshift-clients
   ```

After you install the CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

1.1.3. Logging in to the CLI

You can log in to the `oc` CLI to access and manage your cluster.

Prerequisites

- You must have access to an OpenShift Container Platform cluster.
- You must have installed the CLI.

Procedure

- Log in to the CLI using the `oc login` command and enter the required information when prompted.
$ oc login
Server [https://localhost:8443]: https://openshift.example.com:6443
The server uses a certificate signed by an unknown authority.
You can bypass the certificate check, but any data you send to the server could be intercepted by others.
Use insecure connections? (y/n): y

Authentication required for https://openshift.example.com:6443 (openshift)
Username: user1
Password:
Login successful.

You don't have any projects. You can try to create a new project, by running

oc new-project <projectname>

Welcome! See 'oc help' to get started.

1. Enter the OpenShift Container Platform server URL.
2. Enter whether to use insecure connections.
3. Enter the user name to log in as.
4. Enter the user’s password.

You can now create a project or issue other commands for managing your cluster.

1.1.4. Using the CLI

Review the following sections to learn how to complete common tasks using the CLI.

1.1.4.1. Creating a project

Use the `oc new-project` command to create a new project.

```
$ oc new-project my-project
Now using project "my-project" on server "https://openshift.example.com:6443".
```

1.1.4.2. Creating a new app

Use the `oc new-app` command to create a new application.

```
$ oc new-app https://github.com/sclorg/cakephp-ex
--> Found image 40de956 (9 days old) in imagestream "openshift/php" under tag "7.2" for "php"
```

Run 'oc status' to view your app.

1.1.4.3. Viewing pods
CHAPTER 1. OPENSOURCE CLI (OC)

Use the `oc get pods` command to view the pods for the current project.

```
$ oc get pods -o wide
NAME                  READY   STATUS      RESTARTS   AGE     IP            NODE
NOMINATED NODE
cakephp-ex-1-build    0/1     Completed   0          5m45s   10.131.0.10   ip-10-0-141-74.ec2.internal
<none>
cakephp-ex-1-deploy   0/1     Completed   0          3m44s   10.129.2.9    ip-10-0-147-65.ec2.internal
<none>
cakephp-ex-1-ktz97    1/1     Running     0          3m33s   10.128.2.11   ip-10-0-168-105.ec2.internal
<none>
```

1.1.4.4. Viewing pod logs

Use the `oc logs` command to view logs for a particular pod.

```
$ oc logs cakephp-ex-1-deploy
--> Scaling cakephp-ex-1 to 1
--> Success
```

1.1.4.5. Viewing the current project

Use the `oc project` command to view the current project.

```
$ oc project
Using project "my-project" on server "https://openshift.example.com:6443".
```

1.1.4.6. Viewing the status for the current project

Use the `oc status` command to view information about the current project, such as Services, DeploymentConfigs, and BuildConfigs.

```
$ oc status
In project my-project on server https://openshift.example.com:6443
svc/cakephp-ex - 172.30.236.80 ports 8080, 8443
dc/cakephp-ex deploys istag/cakephp-ex:latest <-
  bc/cakephp-ex source builds https://github.com/sclorg/cakephp-ex on openshift/php:7.2
deployment #1 deployed 2 minutes ago - 1 pod

3 infos identified, use 'oc status --suggest' to see details.
```

1.1.4.7. Listing supported API resources

Use the `oc api-resources` command to view the list of supported API resources on the server.

```
$ oc api-resources
NAME                                  SHORTNAMES       APIGROUP                              NAMESPACED   KIND
bindings                                                                                     true         Binding
componentstatuses                     cs                                                     false        ComponentStatus
configmaps                            cm                                                     true         ConfigMap
...                                    ...
```
1.1.5. Getting help

You can get help with CLI commands and OpenShift Container Platform resources in the following ways.

- Use `oc help` to get a list and description of all available CLI commands:

  **Example: Get general help for the CLI**

  ```
  $ oc help
  OpenShift Client

  This client helps you develop, build, deploy, and run your applications on any OpenShift or Kubernetes compatible platform. It also includes the administrative commands for managing a cluster under the 'adm' subcommand.

  Usage:
  oc [flags]

  Basic Commands:
  login           Log in to a server
  new-project     Request a new project
  new-app         Create a new application
  ...
  ```

- Use the `--help` flag to get help about a specific CLI command:

  **Example: Get help for the oc create command**

  ```
  $ oc create --help
  Create a resource by filename or stdin

  JSON and YAML formats are accepted.

  Usage:
  oc create -f FILENAME [flags]
  ...
  ```

- Use the `oc explain` command to view the description and fields for a particular resource:

  **Example: View documentation for the Pod resource**

  ```
  $ oc explain pods
  KIND:     Pod
  VERSION:  v1

  DESCRIPTION:
  Pod is a collection of containers that can run on a host. This resource is created by clients and scheduled onto hosts.

  FIELDS:
  apiVersion <string>
  ```
1.1.6. Logging out of the CLI

You can log out the CLI to end your current session.

- Use the `oc logout` command.

```bash
$ oc logout
Logged "user1" out on "https://openshift.example.com"
```

This deletes the saved authentication token from the server and removes it from your configuration file.

1.2. CONFIGURING THE CLI

1.2.1. Enabling tab completion

After you install the `oc` CLI tool, you can enable tab completion to automatically complete `oc` commands or suggest options when you press Tab.

Prerequisites

- You must have the `oc` CLI tool installed.

Procedure

The following procedure enables tab completion for Bash.

1. Save the Bash completion code to a file.

```bash
$ oc completion bash > oc_bash_completion
```

2. Copy the file to `/etc/bash_completion.d/`.

```bash
$ sudo cp oc_bash_completion /etc/bash_completion.d/
```

You can also save the file to a local directory and source it from your `.bashrc` file instead.

Tab completion is enabled when you open a new terminal.

1.3. EXTENDING THE CLI WITH PLUG-INS

You can write and install plug-ins to build on the default `oc` commands, allowing you to perform new and more complex tasks with the OpenShift Container Platform CLI.

1.3.1. Writing CLI plug-ins
You can write a plug-in for the OpenShift Container Platform CLI in any programming language or script that allows you to write command-line commands. Note that you can not use a plug-in to overwrite an existing oc command.

**IMPORTANT**

OpenShift CLI plug-ins are currently a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs), might not be functionally complete, and Red Hat does not recommend to use them for production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

See the Red Hat Technology Preview features support scope for more information.

**Procedure**

This procedure creates a simple Bash plug-in that prints a message to the terminal when the oc foo command is issued.

1. Create a file called oc-foo.
   When naming your plug-in file, keep the following in mind:
   - The file must begin with oc- or kubectl- in order to be recognized as a plug-in.
   - The file name determines the command that invokes the plug-in. For example, a plug-in with the file name oc-foo-bar can be invoked by a command of oc foo bar. You can also use underscores if you want the command to contain dashes. For example, a plug-in with the file name oc-foo_bar can be invoked by a command of oc foo-bar.

2. Add the following contents to the file.

   ```bash
   #!/bin/bash

   # optional argument handling
   if [[ "$1" == "version" ]]
   then
     echo "1.0.0"
     exit 0
   fi

   # optional argument handling
   if [[ "$1" == "config" ]]
   then
     echo $KUBECONFIG
     exit 0
   fi

   echo "I am a plugin named kubectl-foo"
   ```

   After you install this plug-in for the OpenShift Container Platform CLI, it can be invoked using the oc foo command.

**Additional resources**

- Review the Sample plug-in repository for an example of a plug-in written in Go.
Review the CLI runtime repository for a set of utilities to assist in writing plug-ins in Go.

1.3.2. Installing and using CLI plug-ins

After you write a custom plug-in for the OpenShift Container Platform CLI, you must install it to use the functionality that it provides.

**IMPORTANT**

OpenShift CLI plug-ins are currently a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs), might not be functionally complete, and Red Hat does not recommend to use them for production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

See the Red Hat Technology Preview features support scope for more information.

**Prerequisites**

- You must have the oc CLI tool installed.
- You must have a CLI plug-in file that begins with `oc-` or `kubectl-`.

**Procedure**

1. If necessary, update the plug-in file to be executable.

   ```
   $ chmod +x <plugin_file>
   ```

2. Place the file anywhere in your PATH, such as `/usr/local/bin/`.

   ```
   $ sudo mv <plugin_file> /usr/local/bin/
   ```

3. Run `oc plugin list` to make sure that the plug-in is listed.

   ```
   $ oc plugin list
   The following compatible plugins are available:
   
   /usr/local/bin/<plugin_file>
   ```

   If your plug-in is not listed here, verify that the file begins with `oc-` or `kubectl-`, is executable, and is on your PATH.

4. Invoke the new command or option introduced by the plug-in.

   For example, if you built and installed the `kubectl-ns` plug-in from the Sample plug-in repository, you can use the following command to view the current namespace.

   ```
   $ oc ns
   ```

   Note that the command to invoke the plug-in depends on the plug-in file name. For example, a plug-in with the file name of `oc-foo-bar` is invoked by the `oc foo bar` command.

1.4. DEVELOPER CLI COMMANDS
1.4.1. Basic CLI commands

1.4.1.1. explain
Display documentation for a certain resource.

Example: Display documentation for Pods

```bash
$ oc explain pods
```

1.4.1.2. login
Log in to the OpenShift Container Platform server and save login information for subsequent use.

Example: Interactive login

```bash
$ oc login
```

Example: Log in specifying a user name

```bash
$ oc login -u user1
```

1.4.1.3. new-app
Create a new application by specifying source code, a template, or an image.

Example: Create a new application from a local Git repository

```bash
$ oc new-app .
```

Example: Create a new application from a remote Git repository

```bash
$ oc new-app https://github.com/sclorg/cakephp-ex
```

Example: Create a new application from a private remote repository

```bash
$ oc new-app https://github.com/youruser/yourprivaterepo --source-secret=yoursecret
```

1.4.1.4. new-project
Create a new project and switch to it as the default project in your configuration.

Example: Create a new project

```bash
$ oc new-project myproject
```

1.4.1.5. project
Switch to another project and make it the default in your configuration.
Example: Switch to a different project

$ oc project test-project

1.4.1.6. projects

Display information about the current active project and existing projects on the server.

Example: List all projects

$ oc projects

1.4.1.7. status

Show a high-level overview of the current project.

Example: Show the status of the current project

$ oc status

1.4.2. Build and Deploy CLI commands

1.4.2.1. cancel-build

Cancel a running, pending, or new build.

Example: Cancel a build

$ oc cancel-build python-1

Example: Cancel all pending builds from the python BuildConfig

$ oc cancel-build buildconfig/python --state=pending

1.4.2.2. import-image

Import the latest tag and image information from an image repository.

Example: Import the latest image information

$ oc import-image my-ruby

1.4.2.3. new-build

Create a new BuildConfig from source code.

Example: Create a BuildConfig from a local Git repository

$ oc new-build .
Example: Create a BuildConfig from a remote Git repository

$ oc new-build https://github.com/sclorg/cakephp-ex

1.4.2.4. rollback
Revert an application back to a previous Deployment.

Example: Roll back to the last successful Deployment

$ oc rollback php

Example: Roll back to a specific version

$ oc rollback php --to-version=3

1.4.2.5. rollout
Start a new rollout, view its status or history, or roll back to a previous revision of your application.

Example: Roll back to the last successful Deployment

$ oc rollout undo deploymentconfig/php

Example: Start a new rollout for a DeploymentConfig with its latest state

$ oc rollout latest deploymentconfig/php

1.4.2.6. start-build
Start a build from a BuildConfig or copy an existing build.

Example: Start a build from the specified BuildConfig

$ oc start-build python

Example: Start a build from a previous build

$ oc start-build --from-build=python-1

Example: Set an environment variable to use for the current build

$ oc start-build python --env=mykey=myvalue

1.4.2.7. tag
Tag existing images into imagestreams.

Example: Configure the ruby image’s latest tag to refer to the image for the 2.0 tag

$ oc tag ruby latest:2.0
1.4.3. Application management CLI commands

1.4.3.1. annotate

Update the annotations on one or more resources.

Example: Add an annotation to a Route

```bash
$ oc annotate route/test-route haproxy.router.openshift.io/ip_whitelist="192.168.1.10"
```

Example: Remove the annotation from the Route

```bash
$ oc annotate route/test-route haproxy.router.openshift.io/ip_whitelist-;
```

1.4.3.2. apply

Apply a configuration to a resource by file name or standard in (stdin) in JSON or YAML format.

Example: Apply the configuration in `pod.json` to a Pod

```bash
$ oc apply -f pod.json
```

1.4.3.3. autoscale

Autoscale a DeploymentConfig or ReplicationController.

Example: Autoscale to a minimum of two and maximum of five Pods

```bash
$ oc autoscale deploymentconfig/parksmap-katacoda --min=2 --max=5
```

1.4.3.4. create

Create a resource by file name or standard in (stdin) in JSON or YAML format.

Example: Create a Pod using the content in `pod.json`

```bash
$ oc create -f pod.json
```

1.4.3.5. delete

Delete a resource.

Example: Delete a Pod named `parksmap-katacoda-1-qfqz4`

```bash
$ oc delete pod/parksmap-katacoda-1-qfqz4
```

Example: Delete all Pods with the `app=parksmap-katacoda` label

```bash
$ oc delete pod/parksmap-katacoda-1-qfqz4
```
$ oc delete pods -l app=parksmap-katacoda

1.4.3.6. describe
Return detailed information about a specific object.
Example: Describe a Deployment named example
$ oc describe deployment/example
Example: Describe all Pods
$ oc describe pods

1.4.3.7. edit
Edit a resource.
Example: Edit a DeploymentConfig using the default editor
$ oc edit deploymentconfig/parksmap-katacoda
Example: Edit a DeploymentConfig using a different editor
$ OC_EDITOR="nano" oc edit deploymentconfig/parksmap-katacoda
Example: Edit a DeploymentConfig in JSON format
$ oc edit deploymentconfig/parksmap-katacoda -o json

1.4.3.8. expose
Expose a Service externally as a Route.
Example: Expose a Service
$ oc expose service/parksmap-katacoda
Example: Expose a Service and specify the host name
$ oc expose service/parksmap-katacoda --hostname=www.my-host.com

1.4.3.9. get
Display one or more resources.
Example: List Pods in the default namespace
$ oc get pods -n default
Example: Get details about the python DeploymentConfig in JSON format

```
$ oc get deploymentconfig/python -o json
```

1.4.3.10. label

Update the labels on one or more resources.

Example: Update the python-1-mz2rf Pod with the label status set to unhealthy

```
$ oc label pod/python-1-mz2rf status=unhealthy
```

1.4.3.11. scale

Set the desired number of replicas for a ReplicationController or a DeploymentConfig.

Example: Scale the ruby-app DeploymentConfig to three Pods

```
$ oc scale deploymentconfig/ruby-app --replicas=3
```

1.4.3.12. secrets

Manage secrets in your project.

Example: Allow my-pull-secret to be used as an image pull secret by the default service account

```
$ oc secrets link default my-pull-secret --for=pull
```

1.4.3.13. serviceaccounts

Get a token assigned to a service account or create a new token or kubeconfig file for a service account.

Example: Get the token assigned to the default service account

```
$ oc serviceaccounts get-token default
```

1.4.3.14. set

Configure existing application resources.

Example: Sets the name of a secret on a BuildConfig

```
$ oc set build-secret --source buildconfig/mybc mysecret
```

1.4.4. Troubleshooting and debugging CLI commands

1.4.4.1. attach
Attach the shell to a running container.

**Example:** Get output from the python container from Pod python-1-mz2rf

```
$ oc attach python-1-mz2rf -c python
```

1.4.4.2. `cp`

Copy files and directories to and from containers.

**Example:** Copy a file from the python-1-mz2rf Pod to the local file system

```
$ oc cp default/python-1-mz2rf:/opt/app-root/src/README.md ~/mydirectory/.
```

1.4.4.3. `debug`

Launch a command shell to debug a running application.

**Example:** Debug the python Deployment

```
$ oc debug deploymentconfig/python
```

1.4.4.4. `exec`

Execute a command in a container.

**Example:** Execute the `ls` command in the python container from Pod python-1-mz2rf

```
$ oc exec python-1-mz2rf -c python ls
```

1.4.4.5. `logs`

Retrieve the log output for a specific build, BuildConfig, DeploymentConfig, or Pod.

**Example:** Stream the latest logs from the python DeploymentConfig

```
$ oc logs -f deploymentconfig/python
```

1.4.4.6. `port-forward`

Forward one or more local ports to a Pod.

**Example:** Listen on port 8888 locally and forward to port 5000 in the Pod

```
$ oc port-forward python-1-mz2rf 8888:5000
```

1.4.4.7. `proxy`

Run a proxy to the Kubernetes API server.
Example: Run a proxy to the API server on port 8011 serving static content from ./local/www/

```bash
$ oc proxy --port=8011 --www=./local/www/
```

1.4.4.8. rsh

Open a remote shell session to a container.

**Example:** Open a shell session on the first container in the python-1-mz2rf Pod

```bash
$ oc rsh python-1-mz2rf
```

1.4.4.9. rsync

Copy contents of a directory to or from a running Pod container. Only changed files are copied using the `rsync` command from your operating system.

**Example:** Synchronize files from a local directory with a Pod directory

```bash
$ oc rsync ~/mydirectory/ python-1-mz2rf:/opt/app-root/src/
```

1.4.4.10. run

Create and run a particular image. By default, this creates a DeploymentConfig to manage the created containers.

**Example:** Start an instance of the perl image with three replicas

```bash
$ oc run my-test --image=perl --replicas=3
```

1.4.4.11. wait

Wait for a specific condition on one or more resources.

**NOTE**

This command is experimental and might change without notice.

**Example:** Wait for the python-1-mz2rf Pod to be deleted

```bash
$ oc wait --for=delete pod/python-1-mz2rf
```

1.4.5. Advanced developer CLI commands

1.4.5.1. api-resources

Display the full list of API resources that the server supports.

**Example:** List the supported API resources

```bash
```

```bash
```
$ oc api-resources

1.4.5.2. api-versions
Display the full list of API versions that the server supports.

Example: List the supported API versions

$ oc api-versions

1.4.5.3. auth
Inspect permissions and reconcile RBAC roles.

Example: Check whether the current user can read Pod logs

$ oc auth can-i get pods --subresource=log

Example: Reconcile RBAC roles and permissions from a file

$ oc auth reconcile -f policy.json

1.4.5.4. cluster-info
Display the address of the master and cluster services.

Example: Display cluster information

$ oc cluster-info

1.4.5.5. convert
Convert a YAML or JSON configuration file to a different API version and print to standard output (stdout).

Example: Convert pod.yaml to the latest version

$ oc convert -f pod.yaml

1.4.5.6. extract
Extract the contents of a ConfigMap or secret. Each key in the ConfigMap or secret is created as a separate file with the name of the key.

Example: Download the contents of the ruby-1-ca ConfigMap to the current directory

$ oc extract configmap/ruby-1-ca

Example: Print the contents of the ruby-1-ca ConfigMap to stdout
Idle scalable resources. An idled Service will automatically become unidled when it receives traffic or it can be manually unidled using the `oc scale` command.

**Example: Idle the ruby-app Service**

```bash
$ oc idle ruby-app
```

Manage images in your OpenShift Container Platform cluster.

**Example: Copy an image to another tag**

```bash
$ oc image mirror myregistry.com/myimage:latest myregistry.com/myimage:stable
```

Observe changes to resources and take action on them.

**Example: Observe changes to Services**

```bash
$ oc observe services
```

Updates one or more fields of an object using strategic merge patch in JSON or YAML format.

**Example: Update the `spec.unschedulable` field for node node1 to true**

```bash
$ oc patch node/node1 -p '{"spec":{"unschedulable":true}}'
```

**NOTE**

If you must patch a Custom Resource Definition, you must include the `--type merge` option in the command.

Manage authorization policies.

**Example: Add the edit role to user1 for the current project**

```bash
$ oc policy add-role-to-user edit user1
```

1.4.5.12. process
Process a template into a list of resources.

Example: Convert template.json to a resource list and pass to oc create

```
$ oc process -f template.json | oc create -f -
```

1.4.5.13. registry

Manage the integrated registry on OpenShift Container Platform.

Example: Display information about the integrated registry

```
$ oc registry info
```

1.4.5.14. replace

Modify an existing object based on the contents of the specified configuration file.

Example: Update a Pod using the content in pod.json

```
$ oc replace -f pod.json
```

1.4.6. Settings CLI commands

1.4.6.1. completion

Output shell completion code for the specified shell.

Example: Display completion code for Bash

```
$ oc completion bash
```

1.4.6.2. config

Manage the client configuration files.

Example: Display the current configuration

```
$ oc config view
```

Example: Switch to a different context

```
$ oc config use-context test-context
```

1.4.6.3. logout

Log out of the current session.

Example: End the current session
$ oc logout

1.4.6.4. whoami
Display information about the current session.

Example: Display the currently authenticated user

$ oc whoami

1.4.7. Other developer CLI commands

1.4.7.1. help
Display general help information for the CLI and a list of available commands.

Example: Display available commands

$ oc help

Example: Display the help for the new-project command

$ oc help new-project

1.4.7.2. plugin
List the available plug-ins on the user’s PATH.

Example: List available plug-ins

$ oc plugin list

1.4.7.3. version
Display the oc client and server versions.

Example: Display version information

$ oc version

For cluster administrators, the OpenShift Container Platform server version is also displayed.

1.5. ADMINISTRATOR CLI COMMANDS

1.5.1. Cluster management CLI commands

1.5.1.1. inspect
Gather debugging information for a particular resource.
This command is experimental and might change without notice.

Example: Collect debugging data for the OpenShift API server cluster Operator

$ oc adm inspect clusteroperator/openshift-apiserver

1.5.1.2. must-gather

Bulk collect data about the current state of your cluster to debug issues.

This command is experimental and might change without notice.

Example: Gather debugging information

$ oc adm must-gather

1.5.1.3. top

Show usage statistics of resources on the server.

Example: Show CPU and memory usage for Pods

$ oc adm top pods

Example: Show usage statistics for images

$ oc adm top images

1.5.2. Node management CLI commands

1.5.2.1. cordon

Mark a node as unschedulable. Manually marking a node as unschedulable blocks any new pods from being scheduled on the node, but does not affect existing pods on the node.

Example: Mark node1 as unschedulable

$ oc adm cordon node1

1.5.2.2. drain

Drain a node in preparation for maintenance.

Example: Drain node1

$ oc adm drain node1
1.5.2.3. node-logs
Display and filter node logs.

Example: Get logs for NetworkManager
$ oc adm node-logs --role master -u NetworkManager.service

1.5.2.4. taint
Update the taints on one or more nodes.

Example: Add a taint to dedicate a node for a set of users
$ oc adm taint nodes node1 dedicated=groupName:NoSchedule

Example: Remove the taints with key dedicated from node node1
$ oc adm taint nodes node1 dedicated-

1.5.2.5. uncordon
Mark a node as schedulable.

Example: Mark node1 as schedulable
$ oc adm uncordon node1

1.5.3. Security and policy CLI commands

1.5.3.1. certificate
Approve or reject certificate signing requests (CSRs).

Example: Approve a CSR
$ oc adm certificate approve csr-sqgzp

1.5.3.2. groups
Manage groups in your cluster.

Example: Create a new group
$ oc adm groups new my-group

1.5.3.3. new-project
Create a new project and specify administrative options.
Example: Create a new project using a node selector

```
$ oc adm new-project myproject --node-selector='type=user-node,region=east'
```

### 1.5.3.4. pod-network

Manage Pod networks in the cluster.

**Example: Isolate project1 and project2 from other non-global projects**

```
$ oc adm pod-network isolate-projects project1 project2
```

### 1.5.3.5. policy

Manage roles and policies on the cluster.

**Example: Add the *edit* role to *user1* for all projects**

```
$ oc adm policy add-cluster-role-to-user edit user1
```

**Example: Add the *privileged* security context constraint to a service account**

```
$ oc adm policy add-scc-to-user privileged -z myserviceaccount
```

### 1.5.4. Maintenance CLI commands

#### 1.5.4.1. migrate

Migrate resources on the cluster to a new version or format depending on the subcommand used.

**Example: Perform an update of all stored objects**

```
$ oc adm migrate storage
```

**Example: Perform an update of only Pods**

```
$ oc adm migrate storage --include=pods
```

#### 1.5.4.2. prune

Remove older versions of resources from the server.

**Example: Prune older builds including those whose BuildConfigs no longer exist**

```
$ oc adm prune builds --orphans
```

### 1.5.5. Configuration CLI commands

#### 1.5.5.1. create-api-client-config
Create a client configuration for connecting to the server. This creates a folder containing a client certificate, a client key, a server certificate authority, and a `kubeconfig` file for connecting to the master as the provided user.

**Example: Generate a client certificate for a proxy**

```
$ oc adm create-api-client-config \
   --certificate-authority='/etc/origin/master/proxyca.crt' \
   --client-dir='/etc/origin/master/proxy' \
   --signer-cert='/etc/origin/master/proxyca.crt' \
   --signer-key='/etc/origin/master/proxyca.key' \
   --signer-serial='/etc/origin/master/proxyca.serial.txt' \
   --user='system:proxy'
```

### 1.5.5.2. create-bootstrap-policy-file

Create the default bootstrap policy.

**Example: Create a file called policy.json with the default bootstrap policy**

```
$ oc adm create-bootstrap-policy-file --filename=policy.json
```

### 1.5.5.3. create-bootstrap-project-template

Create a bootstrap project template.

**Example: Output a bootstrap project template in YAML format to stdout**

```
$ oc adm create-bootstrap-project-template -o yaml
```

### 1.5.5.4. create-error-template

Create a template for customizing the error page.

**Example: Output a template for the error page to stdout**

```
$ oc adm create-error-template
```

### 1.5.5.5. create-kubeconfig

Creates a basic `.kubeconfig` file from client certificates.

**Example: Create a `.kubeconfig` file with the provided client certificates**

```
$ oc adm create-kubeconfig \
   --client-certificate=/path/to/client.crt \
   --client-key=/path/to/client.key \
   --certificate-authority=/path/to/ca.crt
```

### 1.5.5.6. create-login-template
Create a template for customizing the login page.

**Example: Output a template for the login page to stdout**

```bash
$ oc adm create-login-template
```

1.5.5.7. create-provider-selection-template

Create a template for customizing the provider selection page.

**Example: Output a template for the provider selection page to stdout**

```bash
$ oc adm create-provider-selection-template
```

1.5.6. Other Administrator CLI commands

1.5.6.1. build-chain

Output the inputs and dependencies of any builds.

**Example: Output dependencies for the perl imagestream**

```bash
$ oc adm build-chain perl
```

1.5.6.2. completion

Output shell completion code for the `oc adm` commands for the specified shell.

**Example: Display oc adm completion code for Bash**

```bash
$ oc adm completion bash
```

1.5.6.3. config

Manage the client configuration files. This command has the same behavior as the `oc config` command.

**Example: Display the current configuration**

```bash
$ oc adm config view
```

**Example: Switch to a different context**

```bash
$ oc adm config use-context test-context
```

1.5.6.4. release

Manage various aspects of the OpenShift Container Platform release process, such as viewing information about a release or inspecting the contents of a release.

**Example: Generate a changelog between two releases and save to changelog.md**
1.5.6.5. verify-image-signature

Verify the image signature of an image imported to the internal registry using the local public GPG key.

Example: Verify the nodejs image signature

```bash
$ oc adm verify-image-signature \\   sha256:2bba968aedb7dd2aafe65fa8c7453f5ac36a0b9639f1bf5b03f95de325238b288 \\   --expected-identity 172.30.1.1:5000/openshift/nodejs:latest \\   --public-key /etc/pki/rpm-gpg/RPM-GPG-KEY-redhat-release \\   --save
```

1.6. USAGE OF OC AND KUBECTL COMMANDS

Kubernetes’ command line interface (CLI), **kubectl**, can be used to run commands against a Kubernetes cluster. Because OpenShift Container Platform is a certified Kubernetes distribution, you can use the supported kubectl binaries that ship with OpenShift Container Platform, or you can gain extended functionality by using the **oc** binary.

1.6.1. The oc binary

The **oc** binary offers the same capabilities as the **kubectl** binary, but it extends to natively support additional OpenShift Container Platform features, including:

- **Full support for OpenShift Container Platform resources**
  Resources such as DeploymentConfigs, BuildConfigs, Routes, ImageStreams, and ImageStreamTags are specific to OpenShift Container Platform distributions, and build upon standard Kubernetes primitives.

- **Authentication**
  The **oc** binary offers a built-in **login** command that allows authentication and enables you to work with OpenShift Container Platform projects, which map Kubernetes namespaces to authenticated users. See **Understanding authentication** for more information.

- **Additional commands**
  The additional command **oc new-app**, for example, makes it easier to get new applications started using existing source code or pre-built images. Similarly, the additional command **oc new-project** makes it easier to start a project that you can switch to as your default.

1.6.2. The kubectl binary

The **kubectl** binary is provided as a means to support existing workflows and scripts for new OpenShift Container Platform users coming from a standard Kubernetes environment, or for those who prefer to use the **kubectl** CLI. Existing users of **kubectl** can continue to use the binary to interact with Kubernetes primitives, with no changes required to the OpenShift Container Platform cluster.

For more information, see the **kubectl docs**.
CHAPTER 2. DEVELOPER CLI (ODO)

2.1. UNDERSTANDING OPENSHIFT DO

odo is a CLI tool for creating applications on OpenShift Container Platform and Kubernetes. odo allows developers to concentrate on creating applications without the need to administer a cluster itself. Creating deployment configurations, build configurations, service routes and other OpenShift Container Platform or Kubernetes elements are all automated by odo.

Existing tools such as oc are more operations-focused and require a deep understanding of Kubernetes and OpenShift Container Platform concepts. odo abstracts away complex Kubernetes and OpenShift Container Platform concepts allowing developers to focus on what is most important to them: code.

2.1.1. Key features

odo is designed to be simple and concise with the following key features:

- Simple syntax and design centered around concepts familiar to developers, such as projects, applications, and components.
- Completely client based. No additional server other than OpenShift Container Platform is required for deployment.
- Official support for Node.js and Java components.
- Partial compatibility with languages and frameworks such as Ruby, Perl, PHP, and Python.
- Detects changes to local code and deploys it to the cluster automatically, giving instant feedback to validate changes in real time.
- Lists all the available components and services from the cluster.

2.1.2. Core concepts

Project
A project is your source code, tests, and libraries organized in a separate single unit.

Application
An application is a program designed for end users. An application consists of multiple microservices or components that work individually to build the entire application. Examples of applications: a video game, a media player, a web browser.

Component
A component is a set of Kubernetes resources which host code or data. Each component can be run and deployed separately. Examples of components: Node.js, Perl, PHP, Python, Ruby.

Service
A service is software that your component links to or depends on. Examples of services: MariaDB, Jenkins, MySQL. In odo, services are provisioned from the OpenShift Service Catalog and must be enabled within your cluster.

2.1.2.1. Officially supported languages and corresponding container images

Table 2.1. Supported languages, container images, and package managers
<table>
<thead>
<tr>
<th>Language</th>
<th>Container image</th>
<th>Package manager</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node.js</td>
<td>centos/nodejs-8-centos7</td>
<td>NPM</td>
</tr>
<tr>
<td></td>
<td>rhoar-nodejs/nodejs-8</td>
<td>NPM</td>
</tr>
<tr>
<td></td>
<td>bucharestgold/centos7-s2i-nodejs</td>
<td>NPM</td>
</tr>
<tr>
<td></td>
<td>rhscl/nodejs-8-rhel7</td>
<td>NPM</td>
</tr>
<tr>
<td></td>
<td>rhscl/nodejs-10-rhel7</td>
<td>NPM</td>
</tr>
<tr>
<td>Java</td>
<td>redhat-openjdk-18/openjdk18-openshift</td>
<td>Maven, Gradle</td>
</tr>
<tr>
<td></td>
<td>openjdk/openjdk-11-rhel8</td>
<td>Maven, Gradle</td>
</tr>
<tr>
<td></td>
<td>openjdk/openjdk-11-rhel7</td>
<td>Maven, Gradle</td>
</tr>
</tbody>
</table>

2.1.2.1.1. Listing available container images

NOTE

The list of available container images is sourced from the cluster's internal container registry and external registries associated with the cluster.

To list the available components and associated container images for your cluster:

1. Log in to the cluster with `odo`:

   ```
   $ odo login -u developer -p developer
   ```

2. List the available `odo` supported and unsupported components and corresponding container images:

   ```
   $ odo catalog list components
   Odo Supported OpenShift Components:
   NAME    PROJECT      TAGS
   java    openshift    8,latest
   nodejs  openshift    10,8,8-RHOAR,latest

   Odo Unsupported OpenShift Components:
   NAME    PROJECT      TAGS
   dotnet  openshift    1.0,1.1,2.1,2.2,latest
   fuse7-eap-openshift  openshift  1.3
   ```

   The TAGS column represents the available image versions, for example, 10 represents the `rhoar-nodejs/nodejs-10` container image.
2.2. ODO ARCHITECTURE

This section describes odo architecture and how odo manages resources on a cluster.

2.2.1. Developer setup

With odo you can create and deploy application on OpenShift Container Platform clusters from a terminal. Code editor plug-ins use odo which allows users to interact with OpenShift Container Platform clusters from their IDE terminals. Examples of plug-ins that use odo: VS Code Openshift Connector, Openshift Connector for IntelliJ, Codewind for Eclipse Che.

odo works on Windows, macOS, and Linux operating systems and from any terminal. odo provides autocompletion for bash and zsh command line shells.

odo supports Node.js and Java components.

2.2.2. OpenShift source-to-image

OpenShift Source-to-Image (S2I) is an open-source project which helps in building artifacts from source code and injecting these into container images. S2I produces ready-to-run images by building source code without the need of a Dockerfile. odo uses S2I builder image for executing developer source code inside a container.

2.2.3. OpenShift cluster objects

2.2.3.1. Init Containers

Init containers are specialized containers that run before the application container starts and configure the necessary environment for the application containers to run. Init containers can have files that application images do not have, for example setup scripts. Init containers always run to completion and the application container does not start if any of the init containers fails.

The Pod created by odo executes two Init Containers:

- The copy-supervisord Init container.
- The copy-files-to-volume Init container.

2.2.3.1.1. copy-supervisord

The copy-supervisord Init container copies necessary files onto an emptyDir Volume. The main application container utilizes these files from the emptyDir Volume.

Files that are copied onto the emptyDir Volume:

- Binaries:
  - go-init is a minimal init system. It runs as the first process (PID 1) inside the application container. go-init starts the SupervisorD daemon which runs the developer code. go-init is required to handle orphaned processes.
  - SupervisorD is a process control system. It watches over configured processes and ensures that they are running. It also restarts services when necessary. For odo, SupervisorD executes and monitors the developer code.
• Configuration files:
  ○ supervisor.conf is the configuration file necessary for the SupervisorD daemon to start.

• Scripts:
  ○ assemble-and-restart is an OpenShift S2I concept to build and deploy user-source code. The assemble-and-restart script first assembles the user source code inside the application container and then restarts SupervisorD for user changes to take effect.
  ○ Run is an OpenShift S2I concept of executing the assembled source code. The run script executes the assembled code created by the assemble-and-restart script.
  ○ s2i-setup is a script that creates files and directories which are necessary for the assemble-and-restart and run scripts to execute successfully. The script is executed whenever the application container starts.

• Directories:
  ○ language-scripts: Openshift S2I allows custom assemble and run scripts. A few language specific custom scripts are present in the language-scripts directory. The custom scripts provide additional configuration to make odo debug work.

The emptyDir Volume is mounted at the /opt/odo mount point for both the Init container and the application container.

2.2.3.1.2. copy-files-to-volume

The copy-files-to-volume Init container copies files that are in /opt/app-root in the S2I builder image onto the Persistent Volume. The volume is then mounted at the same location (/opt/app-root) in an application container.

Without the PersistentVolume on /opt/app-root the data in this directory is lost when PersistentVolumeClaim is mounted at the same location.

The PVC is mounted at the /mnt mount point inside the Init container.

2.2.3.2. Application container

Application container is the main container inside of which the user-source code executes.

Application container is mounted with two Volumes:

  • emptyDir Volume mounted at /opt/odo
  • The PersistentVolume mounted at /opt/app-root

go-init is executed as the first process inside the application container. The go-init process then starts the SupervisorD daemon.

SupervisorD executes and monitors the user assembled source code. If the user process crashes, SupervisorD restarts it.

2.2.3.3. PersistentVolume and PersistentVolumeClaim

PersistentVolume Claim (PVC) is the object which provides access to the PersistentVolume. PVC is a volume type in Kubernetes which provisions a PersistentVolume. Without PVC, the PersistentVolume will be lost after the Pod is deleted.
PersistentVolumeClaim (PVC) is a volume type in Kubernetes which provisions a PersistentVolume. The life of a PersistentVolume is independent of a Pod lifecycle. The data on the PersistentVolume persists across Pod restarts.

The copy-files-to-volume Init container copies necessary files onto the PersistentVolume. The main application container utilizes these files at runtime for execution.

The naming convention of the PersistentVolume is <component-name>-s2idata.

<table>
<thead>
<tr>
<th>Container</th>
<th>PVC Mounted at</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy-files-to-volume</td>
<td>/mnt</td>
</tr>
<tr>
<td>Application container</td>
<td>/opt/app-root</td>
</tr>
</tbody>
</table>

2.2.3.4. emptyDir Volume

An emptyDir Volume is created when a Pod is assigned to a node, and exists as long as that Pod is running on the node. If the container is restarted or moved, the content of the emptyDir is removed, Init container restores the data back to the emptyDir. emptyDir is initially empty.

The copy-supervisord Init container copies necessary files onto the emptyDir volume. These files are then utilized by the main application container at runtime for execution.

<table>
<thead>
<tr>
<th>Container</th>
<th>emptyDir Volume Mounted at</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy-supervisord</td>
<td>/opt/odo</td>
</tr>
<tr>
<td>Application container</td>
<td>/opt/odo</td>
</tr>
</tbody>
</table>

2.2.3.5. Service

Service is a Kubernetes concept of abstracting the way of communicating with a set of Pods.

odo creates a Service for every application Pod to make it accessible for communication.

2.2.4. odo push workflow

This section describes odo push workflow. odo push deploys user code on an OpenShift Container Platform cluster with all the necessary OpenShift Container Platform resources.

1. Creating resources
   If not already created, odo push creates the following OpenShift Container Platform resources:

   - Deployment config (DC):
     - Two init containers are executed: copy-supervisord and copy-files-to-volume. The init containers copy files onto the emptyDir and the PersistentVolume type of volumes respectively.
     - The application container starts. The first process in the application container is the go-init process with PID=1.
- `go-init` process starts the SupervisorD daemon.

**NOTE**

The user application code has not been copied into the application container yet, so the SupervisorD daemon does not execute the `run` script.

- Service
- Secrets
- `PersistentVolumeClaim`

2. Indexing files
   - A file indexer indexes the files in the source code directory. The indexer traverses through the source code directories recursively and finds files which have been created, deleted, or renamed.
   - A file indexer maintains the indexed information in an odo index file inside the `.odo` directory.
   - If the odo index file is not present, it means that the file indexer is being executed for the first time, and creates a new odo index JSON file. The odo index JSON file contains a file map - the relative file paths of the traversed files and the absolute paths of the changed and deleted files.

3. Pushing code
   Local code is copied into the application container, usually under `/tmp/src`.

4. Executing `assemble-and-restart`
   On a successful copy of the source code, the `assemble-and-restart` script is executed inside the running application container.

### 2.3. INSTALLING ODO

The following section describes how to install odo on different platforms using the CLI.

**NOTE**

Currently, odo does not support installation in a restricted network environment.

You can also find the URL to the latest binaries from the OpenShift Container Platform web console by clicking the `?` icon in the upper-right corner and selecting `Command Line Tools`.

#### 2.3.1. Installing odo on Linux

#### 2.3.1.1. Binary installation

```bash
# chmod +x /usr/local/bin/odo
```
2.3.1.2. Tarball installation

```
# sh -c 'curl -L https://mirror.openshift.com/pub/openshift-v4/clients/odo/latest/odo-linux-amd64.tar.gz | gzip -d > /usr/local/bin/odo'
# chmod +x /usr/local/bin/odo
```

2.3.2. Installing odo on Windows

2.3.2.1. Binary installation

1. Download the latest odo.exe file.
2. Add the location of your odo.exe to your GOPATH/bin directory.

Setting the PATH variable for Windows 7/8

The following example demonstrates how to set up a path variable. Your binaries can be located in any location, but this example uses C:\go-bin as the location.

1. Create a folder at C:\go-bin.
2. Right click Start and click Control Panel.
3. Select System and Security and then click System.
4. From the menu on the left, select the Advanced systems settings and click the Environment Variables button at the bottom.
5. Select Path from the Variable section and click Edit.
6. Click New and type C:\go-bin into the field or click Browse and select the directory, and click OK.

Setting the PATH variable for Windows 10

Edit Environment Variables using search:

1. Click Search and type env or environment.
2. Select Edit environment variables for your account.
3. Select Path from the Variable section and click Edit.
4. Click New and type C:\go-bin into the field or click Browse and select the directory, and click OK.

2.3.3. Installing odo on macOS

2.3.3.1. Binary installation

```
# chmod +x /usr/local/bin/odo
```

2.3.3.2. Tarball installation
2.4. USING ODO IN A RESTRICTED ENVIRONMENT

2.4.1. About odo in a restricted environment

To run odo in a disconnected cluster or a cluster provisioned in a restricted environment, you must ensure that a cluster administrator has created a cluster with a mirrored registry.

To start working in a disconnected cluster, you must first push the odo init image to the registry of the cluster and then overwrite the odo init image path using the ODO_BOOTSTRAPPER_IMAGE environment variable.

After you push the odo init image, you must mirror a supported builder image from the registry, overwrite a mirror registry and then create your application. A builder image is necessary to configure a runtime environment for your application and also contains the build tool needed to build your application, for example npm for Node.js or Maven for Java. A mirror registry contains all the necessary dependencies for your application.

Additional resources

- Creating a mirror registry for installation in a restricted network
- Accessing the registry

2.4.2. Pushing the odo init image to the restricted cluster registry

Depending on the configuration of your cluster and your operating system you can either push the odo init image to a mirror registry or directly to an internal registry.

Prerequisites

- Install oc on the client operating system.
- Install odo on the client operating system.
- Access to a restricted cluster with a configured internal registry or a mirror registry.

2.4.2.1. Pushing the odo init image to a mirror registry

Depending on your operating system, you can push the odo init image to a cluster with a mirror registry as follows:

2.4.2.1.1. Pushing the init image to a mirror registry on Linux

Procedure

1. Use base64 to encode the root certification authority (CA) content of your mirror registry:

   ```
   $ echo <content_of_additional_ca> | base64 -d > disconnect-ca.crt
   ```
2. Copy the encoded root CA certificate to the appropriate location:

```bash
$ sudo cp ./disconnect-ca.crt /etc/pki/ca-trust/source/anchors/<mirror-registry>.crt
```

3. Trust a CA in your client platform and log into the OpenShift Container Platform mirror registry:

```bash
$ sudo update-ca-trust enable && sudo systemctl daemon-reload && sudo systemctl restart /docker && docker login <mirror-registry>:5000 -u <username> -p <password>
```

4. Mirror the `odo` init image:

```bash
$ oc image mirror registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag> <mirror-registry>:5000/openshiftdo/odo-init-image-rhel7:<tag>
```

5. Override the default `odo` init image path by setting the `ODO_BOOTSTRAPPER_IMAGE` environment variable:

```bash
$ export ODO_BOOTSTRAPPER_IMAGE=<mirror-registry>:5000/openshiftdo/odo-init-image-rhel7:<tag>
```

### 2.4.2.1.2. Pushing the `init` image to a mirror registry on MacOS

**Procedure**

1. Use `base64` to encode the root certification authority (CA) content of your mirror registry:

```bash
$ echo <content_of_additional_ca> | base64 -d > disconnect-ca.crt
```

2. Copy the encoded root CA certificate to the appropriate location:

   a. Restart Docker using the Docker UI.

   b. Run the following command:

   ```bash
   $ docker login <mirror-registry>:5000 -u <username> -p <password>
   ```

3. Mirror the `odo` init image:

```bash
$ oc image mirror registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag> <mirror-registry>:5000/openshiftdo/odo-init-image-rhel7:<tag>
```

4. Override the default `odo` init image path by setting the `ODO_BOOTSTRAPPER_IMAGE` environment variable:

```bash
$ export ODO_BOOTSTRAPPER_IMAGE=<mirror-registry>:5000/openshiftdo/odo-init-image-rhel7:<tag>
```

### 2.4.2.1.3. Pushing the `init` image to a mirror registry on Windows

**Procedure**

1. Use `base64` to encode the root certification authority (CA) content of your mirror registry:
As an administrator, copy the encoded root CA certificate to the appropriate location by executing the following command:

```
PS C:\WINDOWS\system32> certutil -addstore -f "ROOT" disconnect-ca.crt
```

Trust a CA in your client platform and log into the OpenShift Container Platform mirror registry:

a. Restart Docker using the Docker UI.

b. Run the following command:

```
PS C:\WINDOWS\system32> docker login <mirror-registry>:5000 -u <username> -p <password>
```

Mirror the `odo` init image:

```
PS C:\> oc image mirror registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag> <mirror-registry>:5000/openshiftdo/odo-init-image-rhel7:<tag>
```

Override the default `odo` init image path by setting the `ODO_BOOTSTRAPPER_IMAGE` environment variable:

```
PS C:\> $env:ODO_BOOTSTRAPPER_IMAGE="<mirror-registry>:5000/openshiftdo/odo-init-image-rhel7:<tag>"
```

### 2.4.2.2. Pushing the `odo` init image to an internal registry directly

If your cluster allows images to be pushed to the internal registry directly, push the `odo` init image to the registry as follows:

#### 2.4.2.2.1. Pushing the init image directly on Linux

**Procedure**

1. Enable the default route:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster -p '{"spec":
{"defaultRoute":true}}' --type='merge' -n openshift-image-registry
```

2. Get a wildcard route CA:

```
$ oc get secret router-certs-default -n openshift-ingress -o yml
apiVersion: v1
data:
tls.crt: ***********************
tls.key: ####################
kind: Secret
metadata:
[...]
type: kubernetes.io/tls
```
3. Use `base64` to encode the root certification authority (CA) content of your mirror registry:

```
$ echo <tls.crt> | base64 -d > ca.crt
```

4. Trust a CA in your client platform:

```
$ sudo cp ca.crt /etc/pki/ca-trust/source/anchors/externalroute.crt && sudo update-ca-trust enable && sudo systemctl daemon-reload && sudo systemctl restart docker
```

5. Log into the internal registry:

```
$ oc get route -n openshift-image-registry
NAME       HOST/PORT    PATH   SERVICES     PORT  TERMINATION   WILDCARD
default-route   <registry_path>          image-registry <all>   reencrypt     None

$ docker login <registry_path> -u kubeadmin -p $(oc whoami -t)
```

6. Push the `odo` init image:

```
$ docker pull registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag>
$ docker tag registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag> <registry_path>/openshiftdo/odo-init-image-rhel7:<tag>
$ docker push <registry_path>/openshiftdo/odo-init-image-rhel7:<tag>
```

7. Override the default `odo` init image path by setting the `ODO_BOOTSTRAPPER_IMAGE` environment variable:

```
$ export ODO_BOOTSTRAPPER_IMAGE=<registry_path>/openshiftdo/odo-init-image-rhel7:1.0.1
```

2.4.2.2. Pushing the init image directly on MacOS

**Procedure**

1. Enable the default route:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster -p '{"spec":
{"defaultRoute":true}}' --type='merge' -n openshift-image-registry
```

2. Get a wildcard route CA:

```
$ oc get secret router-cert-default -n openshift-ingress -o yaml
apiVersion: v1
data:  
tls.crt: **************
tls.key: **************
kind: Secret
metadata:  [...]
type: kubernetes.io/tls
```
3. Use `base64` to encode the root certification authority (CA) content of your mirror registry:

   ```bash
   $ echo <tls.crt> | base64 -d > ca.crt
   ```

4. Trust a CA in your client platform:

   ```bash
   $ sudo security add-trusted-cert -d -r trustRoot -k /Library/Keychains/System.keychain ca.crt
   ```

5. Log into the internal registry:

   ```bash
   $ oc get route -n openshift-image-registry
   NAME       HOST/PORT    PATH   SERVICES     PORT  TERMINATION   WILDCARD
   default-route   <registry_path>          image-registry   <all>   reencrypt     None
   $ docker login <registry_path> -u kubeadmin -p $(oc whoami -t)
   ```

6. Push the `odo` init image:

   ```bash
   $ docker pull registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag>
   $ docker tag registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag> <registry_path>/openshiftdo/odo-init-image-rhel7:<tag>
   $ docker push <registry_path>/openshiftdo/odo-init-image-rhel7:<tag>
   ```

7. Override the default `odo` init image path by setting the `ODO_BOOTSTRAPPER_IMAGE` environment variable:

   ```bash
   $ export ODO_BOOTSTRAPPER_IMAGE=<registry_path>/openshiftdo/odo-init-image-rhel7:1.0.1
   ```

2.4.2.2.3. Pushing the `init` image directly on Windows

**Procedure**

1. Enable the default route:

   ```powershell
   PS C:\> oc patch configs.imageregistry.operator.openshift.io cluster -p '{"spec":
   {"defaultRoute":true}}' --type='merge' -n openshift-image-registry
   ```

2. Get a wildcard route CA:

   ```yaml
   PS C:\> oc get secret router-certs-default -n openshift-ingress -o yaml
   apiVersion: v1
data:
tls.crt: "***************
tls.key: ********************
kind: Secret
metadata:
[...]
type: kubernetes.io/tls
```
3. Use `base64` to encode the root certification authority (CA) content of your mirror registry:

   ```
   PS C:\> echo <tls.crt> | base64 -d > ca.crt
   ```

4. As an administrator, trust a CA in your client platform by executing the following command:

   ```
   PS C:\WINDOWS\system32> certutil -addstore -f "ROOT" ca.crt
   ```

5. Log into the internal registry:

   ```
   PS C:\> oc get route -n openshift-image-registry
   NAME       HOST/PORT    PATH   SERVICES     PORT  TERMINATION   WILDCARD
   default-route   <registry_path>          image-registry <all>   reencrypt  None
   PS C:\> docker login <registry_path> -u kubeadmin -p $(oc whoami -t)
   ```

6. Push the `odo` init image:

   ```
   PS C:\> docker pull registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag>
   PS C:\> docker tag registry.access.redhat.com/openshiftdo/odo-init-image-rhel7:<tag> <registry_path>/openshiftdo/odo-init-image-rhel7:<tag>
   PS C:\> docker push <registry_path>/openshiftdo/odo-init-image-rhel7:<tag>
   ```

7. Override the default `odo` init image path by setting the `ODO_BOOTSTRAPPER_IMAGE` environment variable:

   ```
   PS C:\> $env:ODO_BOOTSTRAPPER_IMAGE="<registry_path>/openshiftdo/odo-init-image-rhel7:<tag>"
   ```

### 2.4.3. Creating and deploying a component to the disconnected cluster

After you push the `init` image to a cluster with a mirrored registry, you must mirror a supported builder image for your application with the `oc` tool, overwrite the mirror registry using the environment variable, and then create your component.

**Prerequisites**

- Install `oc` on the client operating system.
- Install `odo` on the client operating system.
- Access to a restricted cluster with a configured internal registry or a mirror registry.
- Push the `odo` init image to your cluster registry.

### 2.4.3.1. Mirroring a supported builder image

To use npm packages for Node.js dependencies and Maven packages for Java dependencies and configure a runtime environment for your application, you must mirror a respective builder image from the mirror registry.
Procedure

1. Verify that the required images tag is not imported:

   ```
   $ oc describe is nodejs -n openshift
   Name: nodejs
   Namespace: openshift
   [...]
   10 tagged from <mirror-registry>:<port>/rhoar-nodejs/nodejs-10
   prefer registry pullthrough when referencing this tag
   
   Build and run Node.js 10 applications on RHEL 7. For more information about using this builder image, including OpenShift considerations, see https://github.com/nodeshift/centos7-s2i-nodejs.
   Tags: builder, nodejs, hidden
   Example Repo: https://github.com/sclorg/nodejs-ex.git
   
   ! error: Import failed (NotFound): dockerimage.image.openshift.io "<mirror-registry>:<port>/rhoar-nodejs/nodejs-10:latest" not found
   About an hour ago
   
   10-SCL (latest)
   tagged from <mirror-registry>:<port>/rhscl/nodejs-10-rhel7
   prefer registry pullthrough when referencing this tag
   
   Build and run Node.js 10 applications on RHEL 7. For more information about using this builder image, including OpenShift considerations, see https://github.com/nodeshift/centos7-s2i-nodejs.
   Tags: builder, nodejs
   Example Repo: https://github.com/sclorg/nodejs-ex.git
   
   ! error: Import failed (NotFound): dockerimage.image.openshift.io "<mirror-registry>:<port>/rhscl/nodejs-10-rhel7:latest" not found
   About an hour ago
   [...]
   ```

2. Mirror the supported image tag to the private registry:

   ```
   $ oc image mirror registry.access.redhat.com/rhscl/nodejs-10-rhel7:<tag>
   <private_registry>/rhscl/nodejs-10-rhel7:<tag>
   ```

3. Import the image:

   ```
   $ oc tag <mirror-registry>:<port>/rhscl/nodejs-10-rhel7:<tag> nodejs-10-rhel7:latest --scheduled
   ```

   You must periodically re-import the image. The **scheduled** flag enables automatic re-import of the image.

4. Verify that the images with the given tag have been imported:

   ```
   $ oc describe is nodejs -n openshift
   ```
Name: nodejs

10-SCL (latest)
tagged from <mirror-registry>:<port>/rhscl/nodejs-10-rhel7
prefer registry pullthrough when referencing this tag

Build and run Node.js 10 applications on RHEL 7. For more information about using this builder image, including OpenShift considerations, see https://github.com/nodeshift/centos7-s2i-nodejs.
Tags: builder, nodejs
Example Repo: https://github.com/sclorg/nodejs-ex.git

3 minutes ago

2.4.3.2. Overwriting the mirror registry

To download npm packages for Node.js dependencies and Maven packages for Java dependencies from a private mirror registry, you must create and configure a mirror npm or Maven registry on the cluster. You can then overwrite the mirror registry on an existing component or when you create a new component.

Procedure

- To overwrite the mirror registry on an existing component:

  $ odo config set --env NPM_MIRROR=<npm_mirror_registry>

- To overwrite the mirror registry when creating a component:

  $ odo component create nodejs --env NPM_MIRROR=<npm_mirror_registry>

2.4.3.3. Creating a Node.js application with odo

To create a Node.js component, download the Node.js application and push the source code to your cluster with odo.

Procedure

1. Change the current directory to the directory with your application:

   $ cd <directory name>

2. Add a component of the type Node.js to your application:

   $ odo create nodejs
NOTE
By default, the latest image is used. You can also explicitly specify an image version by using `odo create openshift/nodejs:8`.

3. Push the initial source code to the component:
   ```bash
   $ odo push
   ``
   Your component is now deployed to OpenShift Container Platform.

4. Create a URL and add an entry in the local configuration file as follows:
   ```bash
   $ odo url create --port 8080
   ``

5. Push the changes. This creates a URL on the cluster.
   ```bash
   $ odo push
   ``

6. List the URLs to check the desired URL for the component.
   ```bash
   $ odo url list
   ``

7. View your deployed application using the generated URL.
   ```bash
   $ curl <URL>
   ``

### 2.5. CREATING A SINGLE-COMPONENT APPLICATION WITH `odo`

With `odo`, you can create and deploy applications on clusters.

**Prerequisites**

- `odo` is installed.
- You have a running cluster. You can use CodeReady Containers (CRC) to deploy a local cluster quickly.

#### 2.5.1. Creating a project

Create a project to keep your source code, tests, and libraries organized in a separate single unit.

**Procedure**

1. Log in to an OpenShift Container Platform cluster:
   ```bash
   $ odo login -u developer -p developer
   ``

2. Create a project:
2.5.2. Creating a Node.js application with odo

To create a Node.js component, download the Node.js application and push the source code to your cluster with odo.

Procedure

1. Create a directory for your components:

   ```bash
   $ mkdir my_components $$ cd my_components
   ```

2. Download the example Node.js application:

   ```bash
   $ git clone https://github.com/openshift/nodejs-ex
   ```

3. Change the current directory to the directory with your application:

   ```bash
   $ cd <directory name>
   ```

4. Add a component of the type Node.js to your application:

   ```bash
   $ odo create nodejs
   ```

   **NOTE**

   By default, the latest image is used. You can also explicitly specify an image version by using `odo create openshift/nodejs:8`.

5. Push the initial source code to the component:

   ```bash
   $ odo push
   ```

   Your component is now deployed to OpenShift Container Platform.

6. Create a URL and add an entry in the local configuration file as follows:

   ```bash
   $ odo url create --port 8080
   ```

7. Push the changes. This creates a URL on the cluster.

   ```bash
   $ odo push
   ```

8. List the URLs to check the desired URL for the component.

   ```bash
   $ odo url list
   ```

9. View your deployed application using the generated URL.
2.5.3. Modifying your application code

You can modify your application code and have the changes applied to your application on OpenShift Container Platform.

1. Edit one of the layout files within the Node.js directory with your preferred text editor.
2. Update your component:

   ```bash
   $ odo push
   ```
3. Refresh your application in the browser to see the changes.

2.5.4. Adding storage to the application components

Persistent storage keeps data available between restarts of odo. You can add storage to your components with the `odo storage` command.

**Procedure**

- Add storage to your components:

  ```bash
  $ odo storage create nodestorage --path=/opt/app-root/src/storage/ --size=1Gi
  ```

Your component now has 1 GB storage.

2.5.5. Adding a custom builder to specify a build image

With OpenShift Container Platform, you can add a custom image to bridge the gap between the creation of custom images.

The following example demonstrates the successful import and use of the `redhat-openjdk-18` image:

**Prerequisites**

- The OpenShift CLI (oc) is installed.

**Procedure**

1. Import the image into OpenShift Container Platform:

   ```bash
   $ oc import-image openjdk18
   --from=registry.access.redhat.com/redhat-openjdk-18/openjdk18-openshift
   --confirm
   ```
2. Tag the image to make it accessible to odo:

   ```bash
   $ oc annotate istag/openjdk18:latest tags=builder
   ```
3. Deploy the image with odo:
2.5.6. Connecting your application to multiple services using OpenShift Service Catalog

The OpenShift service catalog is an implementation of the Open Service Broker API (OSB API) for Kubernetes. You can use it to connect applications deployed in OpenShift Container Platform to a variety of services.

Prerequisites

- You have a running OpenShift Container Platform cluster.
- The service catalog is installed and enabled on your cluster.

Procedure

- To list the services:
  $$ odo catalog list services $$

- To use service catalog-related operations:
  $$ odo service <verb> <servicename> $$

2.5.7. Deleting an application

**IMPORTANT**

Deleting an application will delete all components associated with the application.

Procedure

1. List the applications in the current project:

   $$ odo app list $$
   The project '<project_name>' has the following applications:
   NAME
   app

2. List the components associated with the applications. These components will be deleted with the application:

   $$ odo component list $$
<table>
<thead>
<tr>
<th>APP</th>
<th>NAME</th>
<th>TYPE</th>
<th>SOURCE</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>nodejs-nodejs-ex-elyf</td>
<td>nodejs</td>
<td>file://./</td>
<td>Pushed</td>
</tr>
</tbody>
</table>

3. Delete the application:
$ odo app delete <application_name>

  ? Are you sure you want to delete the application: <application_name> from project: <project_name>

4. Confirm the deletion with Y. You can suppress the confirmation prompt using the -f flag.

2.6. CREATING A MULTICOMPONENT APPLICATION WITH odo

odo allows you to create a multicomponent application, modify it, and link its components in an easy and automated way.

This example describes how to deploy a multicomponent application - a shooter game. The application consists of a front-end Node.js component and a back-end Java component.

Prerequisites

- odo is installed.
- You have a running cluster. Developers can use CodeReady Containers (CRC) to deploy a local cluster quickly.
- Maven is installed.

2.6.1. Creating a project

Create a project to keep your source code, tests, and libraries organized in a separate single unit.

Procedure

1. Log in to an OpenShift Container Platform cluster:

   $ odo login -u developer -p developer

2. Create a project:

   $ odo project create myproject

   ✓ Project 'myproject' is ready for use
   ✓ New project created and now using project : myproject

2.6.2. Deploying the back-end component

To create a Java component, import the Java builder image, download the Java application and push the source code to your cluster with odo.

Procedure

1. Import openjdk18 into the cluster:

   $ oc import-image openjdk18 \ 
   --from=registry.access.redhat.com/redhat-openjdk-18/openjdk18-openshift --confirm

2. Tag the image as builder to make it accessible for odo:

   -
$ oc annotate istag/openjdk18:latest tags=builder

3. Run **odo catalog list components** to see the created image:

```
$ odo catalog list components
Odo Supported OpenShift Components:
NAME          PROJECT       TAGS
nodejs        openshift     10,8,8-RHOAR,latest
openjdk18     myproject     latest
```

4. Create a directory for your components:

```
$ mkdir my_components
$ cd my_components
```

5. Download the example back-end application:

```
$ git clone https://github.com/openshift-evangelists/Wild-West-Backend backend
```

6. Change directory to the back-end source directory and check that you have the correct files in the directory:

```
$ cd backend
$ ls
debug.sh  pom.xml  src
```

7. Build the back-end source files with Maven to create a JAR file:

```
$ mvn package
...  
[INFO] -----------------------------
[INFO] BUILD SUCCESS
[INFO] -----------------------------
[INFO] Total time: 2.635 s
[INFO] Final Memory: 30M/91M
[INFO] -----------------------------
```

8. Create a component configuration of Java component-type named **backend**:

```
$ odo create openjdk18 backend --binary target/wildwest-1.0.jar
✓ Validating component [1ms]
Please use `odo push` command to create the component with source deployed
```

Now the configuration file `config.yaml` is in the local directory of the back-end component that contains information about the component for deployment.

9. Check the configuration settings of the back-end component in the `config.yaml` file using:

```
$ odo config view
COMPONENT SETTINGS
----------------------
PARAMETER CURRENT_VALUE
Type openjdk18
10. Push the component to the OpenShift Container Platform cluster.

```
$ odo push
Validation
✓ Checking component [6ms]

Configuration changes
✓ Initializing component
✓ Creating component [124ms]

Pushing to component backend of type binary
✓ Checking files for pushing [1ms]
✓ Waiting for component to start [48s]
✓ Syncing files to the component [811ms]
✓ Building component [3s]
```

Using `odo push`, OpenShift Container Platform creates a container to host the back-end component, deploys the container into a Pod running on the OpenShift Container Platform cluster, and starts the `backend` component.

11. Validate:

- The status of the action in odo:

```
odo log -f
Starting WildWestApplication v1.0 onbackend-app-1-9tnhc with PID 444
(/deployments/wildwest-1.0.jar started by jboss in /deployments)
```

- The status of the back-end component:

```
$ odo list
APP     NAME        TYPE          SOURCE                             STATE
app     backend     openjdk18     file://target/wildwest-1.0.jar     Pushed
```

### 2.6.3. Deploying the front-end component

To create and deploy a front-end component, download the Node.js application and push the source code to your cluster with `odo`. 
Procedure

1. Download the example front-end application:

   $ git clone https://github.com/openshift/nodejs-ex

2. Change the current directory to the front-end directory:

   $ cd <directory-name>

3. List the contents of the directory to see that the front end is a Node.js application.

   $ ls
   assets  bin  index.html  kwww-frontend.iml  package.json  package-lock.json  playfield.png
   README.md  server.js

   **NOTE**

   The front-end component is written in an interpreted language (Node.js); it does not need to be built.

4. Create a component configuration of Node.js component-type named `frontend`:

   $ odo create nodejs frontend
   ✓ Validating component [5ms]
   Please use `odo push` command to create the component with source deployed

5. Push the component to a running container.

   $ odo push
   Validation
   ✓ Checking component [8ms]

   Configuration changes
   ✓ Initializing component
   ✓ Creating component [83ms]

   Pushing to component frontend of type local
   ✓ Checking files for pushing [2ms]
   ✓ Waiting for component to start [45s]
   ✓ Syncing files to the component [3s]
   ✓ Building component [18s]
   ✓ Changes successfully pushed to component

2.6.4. Linking both components

Components running on the cluster need to be connected in order to interact. OpenShift Container Platform provides linking mechanisms to publish communication bindings from a program to its clients.

Procedure

1. List all the components that are running on the cluster:
$ odo list
<table>
<thead>
<tr>
<th>APP</th>
<th>NAME</th>
<th>TYPE</th>
<th>SOURCE</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>backend</td>
<td>openjdk18</td>
<td>file://target/wildwest-1.0.jar</td>
<td>Pushed</td>
</tr>
<tr>
<td>app</td>
<td>frontend</td>
<td>nodejs</td>
<td>file://./</td>
<td>Pushed</td>
</tr>
</tbody>
</table>

2. Link the current front-end component to the backend:

$ odo link backend --port 8080
✓ Component backend has been successfully linked from the component frontend

Following environment variables were added to frontend component:
- COMPONENT_BACKEND_HOST
- COMPONENT_BACKEND_PORT

The configuration information of the back-end component is added to the front-end component and the front-end component restarts.

2.6.5. Exposing components to the public

Procedure

1. Create an external URL for the application:

$ cd frontend
$ odo url create frontend --port 8080
✓ URL frontend created for component: frontend

To create URL on the OpenShift cluster, use `odo push`

2. Apply the changes:

$ odo push
Validation
✓ Checking component [21ms]

Configuration changes
✓ Retrieving component data [35ms]
✓ Applying configuration [29ms]

Applying URL changes
✓ URL frontend: http://frontend-app-myproject.192.168.42.79.nip.io created

Pushing to component frontend of type local
✓ Checking file changes for pushing [1ms]
✓ No file changes detected, skipping build. Use the `-f` flag to force the build.

3. Open the URL in a browser to view the application.
NOTE

If an application requires permissions to the active Service Account to access the OpenShift Container Platform namespace and delete active pods, the following error may occur when looking at `odo log` from the back-end component:

**Message:** Forbidden! Configured service account doesn’t have access. Service account may have been revoked

To resolve this error, add permissions for the Service Account role:

```bash
$ oc policy add-role-to-group view system:serviceaccounts -n <project>
$ oc policy add-role-to-group edit system:serviceaccounts -n <project>
```

Do not do this on a production cluster.

### 2.6.6. Modifying the running application

**Procedure**

1. Change the local directory to the front-end directory:

   ```bash
   $ cd ~/frontend
   ```

2. Monitor the changes on the file system using:

   ```bash
   $ odo watch
   ```

3. Edit the `index.html` file to change the displayed name for the game.

   **NOTE**

   A slight delay is possible before odo recognizes the change.

   odo pushes the changes to the front-end component and prints its status to the terminal:

   ```
   File /root/frontend/index.html changed
   File  changed
   Pushing files...
   ✓ Waiting for component to start
   ✓ Copying files to component
   ✓ Building component
   ```

4. Refresh the application page in the web browser. The new name is now displayed.

### 2.6.7. Deleting an application

**IMPORTANT**

Deleting an application will delete all components associated with the application.

**Procedure**
1. List the applications in the current project:

   $ odo app list
   The project '<project_name>' has the following applications:
   NAME
   app

2. List the components associated with the applications. These components will be deleted with the application:

   $ odo component list
   APP     NAME                      TYPE       SOURCE        STATE
   app     nodejs-nodejs-ex-elyf     nodejs     file://./     Pushed

3. Delete the application:

   $ odo app delete <application_name>
   ? Are you sure you want to delete the application: <application_name> from project: <project_name>

4. Confirm the deletion with Y. You can suppress the confirmation prompt using the -f flag.

2.7. CREATING AN APPLICATION WITH A DATABASE

This example describes how to deploy and connect a database to a front-end application.

Prerequisites

- odo is installed.
- oc client is installed.
- You have a running cluster. Developers can use CodeReady Containers (CRC) to deploy a local cluster quickly.
- Service Catalog is enabled.

2.7.1. Creating a project

Create a project to keep your source code, tests, and libraries organized in a separate single unit.

Procedure

1. Log in to an OpenShift Container Platform cluster:

   $ odo login -u developer -p developer

2. Create a project:

   $ odo project create myproject
   ✓ Project 'myproject' is ready for use
   ✓ New project created and now using project : myproject
2.7.2. Deploying the front-end component

To create and deploy a front-end component, download the Node.js application and push the source code to your cluster with odo.

Procedure

1. Download the example front-end application:

   ```bash
   $ git clone https://github.com/openshift/nodejs-ex
   ```

2. Change the current directory to the front-end directory:

   ```bash
   $ cd <directory-name>
   ```

3. List the contents of the directory to see that the front end is a Node.js application.

   ```bash
   $ ls
   assets  bin  index.html  kwww-frontend.iml  package.json  package-lock.json  playfield.png
           README.md  server.js
   ```

   **NOTE**
   The front-end component is written in an interpreted language (Node.js); it does not need to be built.

4. Create a component configuration of Node.js component-type named frontend:

   ```bash
   $ odo create nodejs frontend
   ✓ Validating component [5ms]
   Please use `odo push` command to create the component with source deployed
   ```

5. Create a URL to access the frontend interface.

   ```bash
   $ odo url create myurl
   ✓ URL myurl created for component: nodejs-nodejs-ex-pmdp
   ```

6. Push the component to the OpenShift Container Platform cluster.

   ```bash
   $ odo push
   Validation
   ✓ Checking component [7ms]
   Configuration changes
   ✓ Initializing component
   ✓ Creating component [134ms]
   Applying URL changes
   ✓ URL myurl: http://myurl-app-myproject.192.168.42.79.nip.io created
   Pushing to component nodejs-nodejs-ex-mhbb of type local
   ✓ Checking files for pushing [657850ns]
   ✓ Waiting for component to start [6s]
   ```
2.7.3. Deploying a database in interactive mode

odo provides a command-line interactive mode which simplifies deployment.

**Procedure**

- Run the interactive mode and answer the prompts:

```
$ odo service create
? Which kind of service do you wish to create database
? Which database service class should we use mongodb-persistent
? Enter a value for string property DATABASE_SERVICE_NAME (Database Service Name): mongodb
? Enter a value for string property MEMORY_LIMIT (Memory Limit): 512Mi
? Enter a value for string property MONGODB_DATABASE (MongoDB Database Name): sampledb
? Enter a value for string property MONGODB_VERSION (Version of MongoDB Image): 3.2
? Enter a value for string property VOLUME_CAPACITY (Volume Capacity): 1Gi
? Provide values for non-required properties No
? How should we name your service mongodb-persistent No
? Output the non-interactive version of the selected options No
? Wait for the service to be ready No
✓ Creating service [32ms]
✓ Service 'mongodb-persistent' was created
Progress of the provisioning will not be reported and might take a long time.
You can see the current status by executing 'odo service list'
```

**NOTE**

Your password or username will be passed to the front-end application as environment variables.

2.7.4. Deploying a database manually

1. List the available services:

```
$ odo catalog list services
NAME                         PLANS
django-psql-persistent       default
jenkins-ephemeral            default
jenkins-pipeline-example     default
mariadb-persistent           default
mongodb-persistent           default
mysql-persistent             default
nodejs-mongo-persistent      default
postgresql-persistent       default
rails-pgsql-persistent       default
```

2. Choose the **mongodb-persistent** type of service and see the required parameters:
3. Pass the required parameters as flags and wait for the deployment of the database:

```bash
$ odo service create mongodb-persistent --plan default --wait -p DATABASE_SERVICE_NAME=mongodb -p MEMORY_LIMIT=512Mi -p MONGODB_DATABASE=sampledb -p VOLUME_CAPACITY=1Gi
```

2.7.5. Connecting the database to the front-end application

1. Link the database to the front-end service:

```bash
$ odo link mongodb-persistent
✓ Service mongodb-persistent has been successfully linked from the component nodejs-nodejs-ex-mhbb
```

Following environment variables were added to nodejs-nodejs-ex-mhbb component:
- database_name
- password
- uri
- username
- admin_password

2. See the environment variables of the application and the database in the Pod:

```bash
$ oc get pods
NAME                                READY     STATUS    RESTARTS   AGE
mongodb-1-gsznc                     1/1       Running   0          28m
nodejs-nodejs-ex-mhbb-app-4-vkn9l   1/1       Running   0          1m
$ oc rsh nodejs-nodejs-ex-mhbb-app-4-vkn9l
sh-4.2$ env
```
3. Open the URL in the browser and notice the database configuration in the bottom right:

```
$ odo url list

Request information
Page view count: 24

DB Connection Info:
Type: MongoDB
URL: mongodb://172.30.126.3:27017/sampledb
```

2.7.6. Deleting an application

**IMPORTANT**

Deleting an application will delete all components associated with the application.

**Procedure**

1. List the applications in the current project:

   ```
   $ odo app list
   The project '<project_name>' has the following applications:
   NAME
   app
   ```

2. List the components associated with the applications. These components will be deleted with the application:

   ```
   $ odo component list
   APP     NAME                      TYPE       SOURCE        STATE
   app     nodejs-nodejs-ex-elyf     nodejs     file://./     Pushed
   ```

3. Delete the application:

   ```
   $ odo app delete <application_name>
   ? Are you sure you want to delete the application: <application_name> from project: <project_name>
   ```

4. Confirm the deletion with Y. You can suppress the confirmation prompt using the -f flag.

2.8. USING SAMPLE APPLICATIONS

odo offers partial compatibility with any language or runtime listed within the OpenShift catalog of component types. For example:
### NAME       PROJECT       TAGS

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dotnet</td>
<td>openshift</td>
<td>2.0,latest</td>
</tr>
<tr>
<td>httpd</td>
<td>openshift</td>
<td>2.4,latest</td>
</tr>
<tr>
<td>java</td>
<td>openshift</td>
<td>8,latest</td>
</tr>
<tr>
<td>nginx</td>
<td>openshift</td>
<td>1.10,1.12,1.8,latest</td>
</tr>
<tr>
<td>nodejs</td>
<td>openshift</td>
<td>0.10,4,6,8,latest</td>
</tr>
<tr>
<td>perl</td>
<td>openshift</td>
<td>5.16,5.20,5.24,latest</td>
</tr>
<tr>
<td>php</td>
<td>openshift</td>
<td>5.5,5.6,7,0,7.1,latest</td>
</tr>
<tr>
<td>python</td>
<td>openshift</td>
<td>2.7,3.3,3.4,3.5,3.6,latest</td>
</tr>
<tr>
<td>ruby</td>
<td>openshift</td>
<td>2.0,2.2,2.3,2.4,latest</td>
</tr>
<tr>
<td>wildfly</td>
<td>openshift</td>
<td>10.0,10.1,8.1,9.0,latest</td>
</tr>
</tbody>
</table>

---

**NOTE**

For **odo** Java and Node.js are the officially supported component types. Run **odo catalog list components** to verify the officially supported component types.

In order to access the component over the web, create a URL using **odo url create**.

### 2.8.1. Examples from Git repositories

#### 2.8.1.1. httpd

This example helps build and serve static content using httpd on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the [Apache HTTP Server container image repository](https://github.com/openshift/httpd-ex.git).

```
$ odo create httpd --git https://github.com/openshift/httpd-ex.git
```

#### 2.8.1.2. java

This example helps build and run fat JAR Java applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the [Java S2I Builder image](https://github.com/spring-projects/spring-petclinic.git).

```
$ odo create java --git https://github.com/spring-projects/spring-petclinic.git
```

#### 2.8.1.3. nodejs

Build and run Node.js applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the [Node.js 8 container image](https://github.com/openshift/nodejs-ex.git).

```
$ odo create nodejs --git https://github.com/openshift/nodejs-ex.git
```

#### 2.8.1.4. perl

This example helps build and run Perl applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the [Perl 5.26 container image](https://github.com/openshift/dancer-ex.git).

```
$ odo create perl --git https://github.com/openshift/dancer-ex.git
```
2.8.1.5. php
This example helps build and run PHP applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the PHP 7.1 Docker image.

$ odo create php --git https://github.com/openshift/cakephp-ex.git

2.8.1.6. python
This example helps build and run Python applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the Python 3.6 container image.

$ odo create python --git https://github.com/openshift/django-ex.git

2.8.1.7. ruby
This example helps build and run Ruby applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see Ruby 2.5 container image.

$ odo create ruby --git https://github.com/openshift/ruby-ex.git

2.8.1.8. wildfly
This example helps build and run WildFly applications on CentOS 7. For more information about using this builder image, including OpenShift Container Platform considerations, see the Wildfly - CentOS Docker images for OpenShift.

$ odo create wildfly --git https://github.com/openshift/openshift-jee-sample.git

2.8.2. Binary examples

2.8.2.1. java
Java can be used to deploy a binary artifact as follows:

$ git clone https://github.com/spring-projects/spring-petclinic.git
$ cd spring-petclinic
$ mvn package
$ odo create java test3 --binary target/*.jar
$ odo push

2.8.2.2. wildfly
WildFly can be used to deploy a binary application as follows:

$ git clone https://github.com/openshiftdemos/os-sample-java-web.git
$ cd os-sample-java-web
$ mvn package
2.9. CREATING INSTANCES OF SERVICES MANAGED BY OPERATORS

IMPORTANT

Creating instances of services managed by Operators in `odo` is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see https://access.redhat.com/support/offerings/techpreview/.

Operators are a method of packaging, deploying, and managing Kubernetes services. With odo, you can create instances of services from the Custom Resource Definitions (CRDs) provided by the Operators. You can then use these instances in your projects and link them to your components.

To create services from an Operator, you must ensure that the Operator has valid values defined in its metadata to start the requested service. odo uses the metadata.annotations.alm-examples YAML file of an Operator to start the service. If this YAML has placeholder values or sample values, a service cannot start. You can modify the YAML file and start the service with the modified values. To learn how to modify YAML files and start services from it, go to Creating services from YAML files.

Prerequisites

- Install the oc CLI and log into the cluster.
  - Note that the configuration of the cluster determines the services available to you. To access the Operator services, a cluster administrator must install the respective Operator on the cluster first. To learn more, see Adding Operators to the cluster.

- Install the odo CLI.

- Enable experimental mode. To enable experimental mode in odo, run: odo preference set Experimental true or use the environment variable odo config set --env ODO_EXPERIMENTAL=true

2.9.1. Creating a project

Create a project to keep your source code, tests, and libraries organized in a separate single unit.

Procedure

1. Log in to an OpenShift Container Platform cluster:

   $ odo login -u developer -p developer

2. Create a project:
2.9.2. Listing available services from the Operators installed on the cluster

With odo, you can display the list of the Operators installed on your cluster, and the services they provide.

- To list the Operators installed in current project, run:

  ```
  $ odo catalog list services
  ```

  The command lists Operators and the CRDs. The output of the command shows the Operators installed on your cluster. For example:

<table>
<thead>
<tr>
<th>Operators available in the cluster</th>
<th>CRDs</th>
</tr>
</thead>
<tbody>
<tr>
<td>etcdoperator.v0.9.4</td>
<td>etcdCluster, EtcdBackup, EtcdRestore</td>
</tr>
<tr>
<td>mongodb-enterprise.v1.4.5</td>
<td>MongoDB, MongoDBUser, MongoDBOpsManager</td>
</tr>
</tbody>
</table>

etcdoperator.v0.9.4 is the Operator, EtcdCluster, EtcdBackup and EtcdRestore are the CRDs provided by the Operator.

2.9.3. Creating a service from an Operator

If an Operator has valid values defined in its metadata to start the requested service, you can use the service with odo service create.

1. Print the YAML of the service as a file on your local drive:

  ```
  $ oc get csv/etcdoperator.v0.9.4 -o yaml
  ```

2. Verify that the values of the service are valid:

   ```
   apiVersion: etcd.database.coreos.com/v1beta2
   kind: EtcdCluster
   metadata:
     name: example
   spec:
     size: 3
   version: 3.2.13
   ```

3. Start an EtcdCluster service from the etcdoperator.v0.9.4 Operator:

   ```
   $ odo service create etcdoperator.v0.9.4 --crd EtcdCluster
   ```

4. Verify that a service has started:

   ```
   $ oc get EtcdCluster
   ```

2.9.4. Creating services from YAML files
If the YAML definition of the service or Custom Resource (CR) has invalid or placeholder data, you can use the `--dry-run` flag to get the YAML definition, specify the correct values, and start the service using the corrected YAML definition. Printing and modifying the YAML used to start a service `odo` provides the feature to print the YAML definition of the service or CR provided by the Operator before starting a service.

1. To display the YAML of the service, run:
   ```bash
   $ odo service create <operator-name> --crd <cr-name> --dry-run
   ```
   For example, to print YAML definition of `EtcdCluster` provided by the `etcdoperator.v0.9.4` Operator, run:
   ```bash
   $ odo service create etcdoperator.v0.9.4 --crd EtcdCluster --dry-run
   ```
   The YAML is saved as the `etcd.yaml` file.

2. Modify the `etcd.yaml` file:
   ```yaml
   apiVersion: etcd.database.coreos.com/v1beta2
   kind: EtcdCluster
   metadata:
     name: my-etcd-cluster
   spec:
     size: 1
     version: 3.2.13
   ```
   1. Change the name from `example` to `my-etcd-cluster`  
   2. Reduce the size from 3 to 1

3. Start a service from the YAML file:
   ```bash
   $ odo service create --from-file etcd.yaml
   ```

4. Verify that the `EtcdCluster` service has started with one Pod instead of the pre-configured three Pods:
   ```bash
   $ oc get pods | grep my-etcd-cluster
   ```

### 2.10. DEBUGGING APPLICATIONS IN odo

**IMPORTANT**

Interactive debugging in odo is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [https://access.redhat.com/support/offerings/techpreview/](https://access.redhat.com/support/offerings/techpreview/).
With **odo**, you can attach a debugger to remotely debug your application. This feature is only supported for NodeJS and Java components.

Components created with **odo** run in the debug mode by default. A debugger agent runs on the component, on a specific port. To start debugging your application, you must start port forwarding and attach the local debugger bundled in your Integrated development environment (IDE).

### 2.10.1. Debugging an application

You can debug your application on in **odo** with the **odo debug** command.

**Procedure**

1. After an application is deployed, start the port forwarding for your component to debug the application:

   ```bash
   $ odo debug port-forward
   ```

2. Attach the debugger bundled in your IDE to the component. Instructions vary depending on your IDE.

### 2.10.2. Configuring debugging parameters

You can specify a remote port with **odo config** command and a local port with the **odo debug** command.

**Procedure**

- To set a remote port on which the debugging agent should run, run:

  ```bash
  $ odo config set DebugPort 9292
  ```

  **NOTE**

  You must redeploy your component for this value to be reflected on the component.

- To set a local port to port forward, run:

  ```bash
  $ odo debug port-forward --local-port 9292
  ```

  **NOTE**

  The local port value does not persist. You must provide it every time you need to change the port.

### 2.11. MANAGING ENVIRONMENT VARIABLES

**odo** stores component-specific configurations and environment variables in the **config** file. You can use the **odo config** command to set, unset, and list environment variables for components without the need to modify the **config** file.
2.11.1. Setting and unsetting environment variables

Procedure

- To set an environment variable in a component:
  
  $ odo config set --env <variable>=<value>

- To unset an environment variable in a component:
  
  $ odo config unset --env <variable>

- To list all environment variables in a component:
  
  $ odo config view

2.12. CONFIGURING THE ODO CLI

2.12.1. Using command completion

**NOTE**

Currently command completion is only supported for bash, zsh, and fish shells.

odo provides a smart completion of command parameters based on user input. For this to work, odo needs to integrate with the executing shell.

Procedure

- To install command completion automatically:
  
  1. Run:
     
     $ odo --complete

  2. Press y when prompted to install the completion hook.

- To install the completion hook manually, add `complete -o nofospace -C <full path to your odo binary> odo` to your shell configuration file. After any modification to your shell configuration file, restart your shell.

- To disable completion:
  
  1. Run:
     
     $ odo --uncomplete

  2. Press y when prompted to uninstall the completion hook.
2.12.2. Ignoring files or patterns

You can configure a list of files or patterns to ignore by modifying the `.odoignore` file in the root directory of your application. This applies to both `odo push` and `odo watch`.

If the `.odoignore` file does not exist, the `.gitignore` file is used instead for ignoring specific files and folders.

To ignore `.git` files, any files with the `.js` extension, and the folder `tests`, add the following to either the `.odoignore` or the `.gitignore` file:

```
.git
*.js
tests/
```

The `.odoignore` file allows any glob expressions.

## 2.13. ODO CLI REFERENCE

### 2.13.1. Basic odo CLI commands

#### 2.13.1.1. app

Perform application operations related to your OpenShift Container Platform project.

**Example using app**

```bash
# Delete the application
odo app delete myapp

# Describe 'webapp' application,
odo app describe webapp

# List all applications in the current project
odo app list

# List all applications in the specified project
odo app list --project myproject
```

#### 2.13.1.2. catalog

Perform catalog-related operations.

**Example using catalog**

```bash
# Get the supported components
odo catalog list components
```
# Get the supported services from service catalog
odo catalog list services

# Search for a component
odo catalog search component python

# Search for a service
odo catalog search service mysql

# Describe a service
odo catalog describe service mysql-persistent

## 2.13.1.3. component

Manage components of an application.

**Example using component**

# Create a new component
odo component create

# Create a local configuration and create all objects on the cluster
odo component create --now

## 2.13.1.4. config

Modify *odo* specific settings within the *config* file.

**Example using config**

# For viewing the current local configuration
odo config view

# Set a configuration value in the local configuration
odo config set Type java
odo config set Name test
odo config set MinMemory 50M
odo config set MaxMemory 500M
odo config set Memory 250M
odo config set Ignore false
odo config set MinCPU 0.5
odo config set MaxCPU 2
odo config set CPU 1

# Set an environment variable in the local configuration
odo config set --env KAFKA_HOST=kafka --env KAFKA_PORT=6639

# Create a local configuration and apply the changes to the cluster immediately
odo config set --now

# Unset a configuration value in the local config
odo config unset Type
odo config unset Name
odo config unset MinMemory
odo config unset MaxMemory
odo config unset Memory
odo config unset Ignore
odo config unset MinCPU
odo config unset MaxCPU
odo config unset CPU

# Unset an env variable in the local config
odo config unset --env KAFKA_HOST --env KAFKA_PORT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application is the name of application the component needs to be part of</td>
</tr>
<tr>
<td>CPU</td>
<td>The minimum and maximum CPU a component can consume</td>
</tr>
<tr>
<td>Ignore</td>
<td>Consider the .odoignore file for push and watch</td>
</tr>
</tbody>
</table>

Table 2.2. Available Local Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>The name of application that the component needs to be part of</td>
</tr>
<tr>
<td>CPU</td>
<td>The minimum and maximum CPU a component can consume</td>
</tr>
<tr>
<td>Ignore</td>
<td>Whether to consider the .odoignore file for push and watch</td>
</tr>
<tr>
<td>MaxCPU</td>
<td>The maximum CPU a component can consume</td>
</tr>
<tr>
<td>MaxMemory</td>
<td>The maximum memory a component can consume</td>
</tr>
<tr>
<td>Memory</td>
<td>The minimum and maximum memory a component can consume</td>
</tr>
<tr>
<td>MinCPU</td>
<td>The minimum CPU a component can consume</td>
</tr>
<tr>
<td>MinMemory</td>
<td>The minimum memory a component is provided</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the component</td>
</tr>
<tr>
<td>Ports</td>
<td>Ports to be opened in the component</td>
</tr>
<tr>
<td>Project</td>
<td>The name of the project that the component is part of</td>
</tr>
<tr>
<td>Ref</td>
<td>Git ref to use for creating component from git source</td>
</tr>
</tbody>
</table>
2.13.1.5. create

Create a configuration describing a component to be deployed on OpenShift Container Platform. If a component name is not provided, it is autogenerated.

By default, builder images are used from the current namespace. To explicitly supply a namespace, use: `odo create namespace/name:version`. If a version is not specified, the version defaults to latest.

Use `odo catalog list` to see a full list of component types that can be deployed.

Example using create

```bash
# Create new Node.js component with the source in current directory.
odo create nodejs

# Create new Node.js component and push it to the cluster immediately.
odo create nodejs --now

# A specific image version may also be specified
odo create nodejs:latest

# Create new Node.js component named ‘frontend’ with the source in ‘./frontend’ directory
odo create nodejs frontend --context ./frontend

# Create a new Node.js component of version 6 from the ‘openshift’ namespace
odo create openshift/nodejs:6 --context /nodejs-ex

# Create new Wildfly component with binary named sample.war in './downloads' directory
odo create wildfly wildfly --binary ./downloads/sample.war

# Create new Node.js component with source from remote git repository
odo create nodejs --git https://github.com/openshift/nodejs-ex.git

# Create new Node.js git component while specifying a branch, tag or commit ref
odo create nodejs --git https://github.com/openshift/nodejs-ex.git --ref master

# Create new Node.js git component while specifying a tag
odo create nodejs --git https://github.com/openshift/nodejs-ex.git --ref v1.0.1

# Create new Node.js component with the source in current directory and ports 8080-tcp,8100-tcp and 9100-udp exposed
odo create nodejs --port 8080,8100/tcp,9100/udp
```
# Create new Node.js component with the source in current directory and env variables key=value and key1=value1 exposed
odo create nodejs --env key=value,key1=value1

# For more examples, visit: https://github.com/openshift/odo/blob/master/docs/examples.adoc
odo create python --git https://github.com/openshift/django-ex.git

# Passing memory limits
odo create nodejs --memory 150Mi
odo create nodejs --min-memory 150Mi --max-memory 300 Mi

# Passing cpu limits
odo create nodejs --cpu 2
odo create nodejs --min-cpu 200m --max-cpu 2

2.13.1.6. debug

Debug a component.

# Displaying information about the state of debugging
odo debug info

# Starting the port forwarding for a component to debug the application
odo debug port-forward

# Setting a local port to port forward
odo debug port-forward --local-port 9292

2.13.1.7. delete

Delete an existing component.

Example using delete

# Delete component named 'frontend'.
odo delete frontend
odo delete frontend --all-apps

2.13.1.8. describe

Describe the given component.

Example using describe

# Describe nodejs component
odo describe nodejs

2.13.1.9. link

Link a component to a service or component.

Example using link
Link the current component to the 'my-postgresql' service
odo link my-postgresql

# Link component 'nodejs' to the 'my-postgresql' service
odo link my-postgresql --component nodejs

# Link current component to the 'backend' component (backend must have a single exposed port)
odo link backend

# Link component 'nodejs' to the 'backend' component
odo link backend --component nodejs

# Link current component to port 8080 of the 'backend' component (backend must have port 8080 exposed)
odo link backend --port 8080

Link adds the appropriate secret to the environment of the source component. The source component can then consume the entries of the secret as environment variables. If the source component is not provided, the current active component is assumed.

2.13.1.10. list

List all the components in the current application.

Example using list

# List all components in the application
odo list

2.13.1.11. log

Retrieve the log for the given component.

Example using log

# Get the logs for the nodejs component
odo log nodejs

2.13.1.12. login

Log in to the cluster.

Example using login

# Log in interactively
odo login

# Log in to the given server with the given certificate authority file
odo login localhost:8443 --certificate-authority=/path/to/cert.crt

# Log in to the given server with the given credentials (basic auth)
odo login localhost:8443 --username=myuser --password=mypass
# Log in to the given server with the given credentials (token)
odo login localhost:8443 --token=xxxxxxxxxxxxxxxxxxxxxxxxxx

2.13.13. logout

Log out of the current OpenShift Container Platform session.

Example using logout

# Log out
odo logout

2.13.14. preference

Modify odo specific configuration settings within the global preference file.

Example using preference

# For viewing the current preferences
odo preference view

# Set a preference value in the global preference
odo preference set UpdateNotification false
odo preference set NamePrefix "app"
odo preference set Timeout 20

# Enable experimental mode
odo preference set experimental true

# Unset a preference value in the global preference
odo preference unset UpdateNotification
odo preference unset NamePrefix
odo preference unset Timeout

# Disable experimental mode
odo preference set experimental false

NOTE

By default, the path to the global preference file is ~/.odo/preferece.yaml and it is stored in the environment variable GLOBALODOCONFIG. You can set up a custom path by setting the value of the environment variable to a new preference path, for example GLOBALODOCONFIG="new_path/preference.yaml"

Table 2.3. Available Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NamePrefix</td>
<td>The default prefix is the current directory name. Use this value to set a default name prefix.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The timeout (in seconds) for OpenShift Container Platform server connection checks.</td>
</tr>
</tbody>
</table>
UpdateNotification | Controls whether an update notification is shown.

### 2.13.1.15. project

Perform project operations.

**Example using project**

```bash
# Set the active project
odo project set

# Create a new project
odo project create myproject

# List all the projects
odo project list

# Delete a project
odo project delete myproject

# Get the active project
odo project get
```

### 2.13.1.16. push

Push source code to a component.

**Example using push**

```bash
# Push source code to the current component
odo push

# Push data to the current component from the original source.
odo push

# Push source code in ~/mycode to component called my-component
odo push my-component --context ~/mycode
```

### 2.13.1.17. service

Perform service catalog operations.

**Example using service**

```bash
# Create new postgresql service from service catalog using dev plan and name my-postgresql-db.
odo service create dh-postgresql-apb my-postgresql-db --plan dev -p postgresql_user=luke -p postgresql_password=secret

# Delete the service named 'mysql-persistent'
odo service delete mysql-persistent
```
# List all services in the application
odo service list

2.13.1.18. storage

Perform storage operations.

Example using storage

# Create storage of size 1Gb to a component
odo storage create mystorage --path=/opt/app-root/src/storage/ --size=1Gi

# Delete storage mystorage from the currently active component
odo storage delete mystorage

# Delete storage mystorage from component 'mongodb'
odo storage delete mystorage --component mongodb

# List all storage attached or mounted to the current component and
# all unattached or unmounted storage in the current application
odo storage list

# Set the `-o json` flag to get a JSON formatted output
odo storage list -o json

2.13.1.19. unlink

Unlink component or a service.

For this command to be successful, the service or component must have been linked prior to the
invocation using odo link.

Example using unlink

# Unlink the 'my-postgresql' service from the current component
odo unlink my-postgresql

# Unlink the 'my-postgresql' service from the 'nodejs' component
odo unlink my-postgresql --component nodejs

# Unlink the 'backend' component from the current component (backend must have a single exposed port)
odo unlink backend

# Unlink the 'backend' service from the 'nodejs' component
odo unlink backend --component nodejs

# Unlink the backend's 8080 port from the current component
odo unlink backend --port 8080

2.13.1.20. update

Update the source code path of a component
Example using update

```bash
# Change the source code path of a currently active component to local (use the current directory as
# a source)
odo update --local

# Change the source code path of the frontend component to local with source in ./frontend directory
odo update frontend --local ./frontend

# Change the source code path of a currently active component to git
odo update --git https://github.com/openshift/nodejs-ex.git

# Change the source code path of the component named node-ex to git
odo update node-ex --git https://github.com/openshift/nodejs-ex.git

# Change the source code path of the component named wildfly to a binary named sample.war in
# ./downloads directory
odo update wildfly --binary ./downloads/sample.war
```

2.13.1.21. url

Exposé a component to the outside world.

Example using url

```bash
# Create a URL for the current component with a specific port
odo url create --port 8080

# Create a URL with a specific name and port
odo url create example --port 8080

# Create a URL with a specific name by automatic detection of port (only for components which
# expose only one service port)
odo url create example

# Create a URL with a specific name and port for component frontend
odo url create example --port 8080 --component frontend

# Delete a URL to a component
odo url delete myurl

# List the available URLs
odo url list

# Create a URL in the configuration and apply the changes to the cluster
odo url create --now

# Create an HTTPS URL
odo url create --secure
```

The URLs that are generated using this command can be used to access the deployed components from outside the cluster.

2.13.1.22. utils
Utilities for terminal commands and modifying odo configurations.

**Example using utils**

```bash
# Bash terminal PS1 support
source <(odo utils terminal bash)

# Zsh terminal PS1 support
source <(odo utils terminal zsh)
```

**2.13.1.23. version**

Print the client version information.

**Example using version**

```bash
# Print the client version of odo
odo version
```

**2.13.1.24. watch**

odo starts watching for changes and updates the component upon a change automatically.

**Example using watch**

```bash
# Watch for changes in directory for current component
odo watch

# Watch for changes in directory for component called frontend
odo watch frontend
```

**2.14. odo RELEASE NOTES**

**2.14.1. Notable changes and improvements in odo**

- A `--now` flag is added for `odo create`, `odo url`, and `odo config.
  Run `odo url create --now` to create the URL in the configuration and propagate all the changes to the cluster.

- An `odo debug info` command is added. The command displays if the debug mode is enabled for a component, if the port-forward process is running, and information about ports used.

- The `odo push` output now shows the exact error from the OpenShift cluster on failure.

- A `--secure` flag is added for `odo url`. It indicates whether a URL is secure.

- `odo storage list` now displays the information about the storage state: **Pushed**, **NotPushed** or **Locally Deleted**.

- `odo debug port-forward` now selects a port automatically if the default port (5858) is occupied.

- The `--all` flag is renamed to `--all-apps`. 
• The default PVC size has been increased to 10GiB.

• The JSON output for `odo storage list -o json` has been restructured.

• `nodejs-8` and `nodejs-10` images are no longer supported.

• Experimental mode feature. By default, features under development or in experimental mode are hidden from the user.
  
  To enable experimental mode, run:

  ```
  $ odo config set --env ODO_EXPERIMENTAL=true
  or
  $ odo preference set experimental true
  ```

  To disable experimental mode, run:

  ```
  $ odo config unset --env ODO_EXPERIMENTAL
  or
  $ odo preference set experimental false
  ```

• `odo` now supports Ingress to create URLs on Kubernetes.

2.14.2. Getting support

For Documentation

If you find an error or have suggestions for improving the documentation, file an issue in Bugzilla. Choose the OpenShift Container Platform product type and the Documentation component type.

For Product

If you find an error, encounter a bug, or have suggestions for improving the functionality of `odo`, file an issue in Bugzilla. Choose the Red Hat odo for OpenShift Container Platform product type.

Provide as many details in the issue description as possible.

2.14.3. Fixed issues

• Bug 1760575 The `odo app delete` command removes application components but not Services.

• Bug 1760577 The `odo push` command does not delete the OpenShift objects when the component name is changed.

2.14.4. Known issues

• Bug 1760574 A deleted namespace is listed in the `odo project get` command.

• Bug 1760586 The `odo delete` command starts an infinite loop after a project is deleted and a component name is set.
- **Bug 1760588** The *odo service create* command crashes when run in Cygwin.

- **Bug 1760590** In Git BASH for Windows, the *odo login -u developer* command does not hide a typed password when requested.

- **Bug 1783188** In a disconnected cluster, the *odo component create* command throws an error *Tag not found*... despite the component being listed in the catalog list.

- **Bug 1761440** It is not possible to create two Services of the same type in one project.

- **Bug 1821643** *odo push* does not work on the .NET component tag 2.1+. Workaround: specify your .NET project file by running:

  ```
  $ odo config set --env DOTNET_STARTUP_PROJECT=<path to your project file>
  ```

### 2.14.5. Technology Preview features *odo*

- **odo debug** is a feature that allows users to attach a local debugger to a component running in the Pod. To learn more, see *Debugging applications in odo*

  **IMPORTANT**

  *odo debug* is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

  For more information about the support scope of Red Hat Technology Preview features, see [https://access.redhat.com/support/offerings/techpreview/](https://access.redhat.com/support/offerings/techpreview/).

- Devfile support. You can now create and deploy your applications using the devfiles with *odo*. A devfile is a file that defines the development environment: environment variables, image, and so on. To access this feature, you must enable experimental mode with *odo preference set experimental true*.

  To see the list of currently supported devfile components, run *odo catalog list components*

  **IMPORTANT**

  Devfile support is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

  For more information about the support scope of Red Hat Technology Preview features, see [https://access.redhat.com/support/offerings/techpreview/](https://access.redhat.com/support/offerings/techpreview/).
CHAPTER 3. HELM CLI

3.1. GETTING STARTED WITH HELM 3 ON OPENShift CONTAINER PLATFORM

3.1.1. Understanding Helm

Helm is a command-line interface (CLI) tool that simplifies deployment of applications and services to
OpenShift Container Platform clusters. Helm uses a packaging format called charts. A Helm chart is a
collection of files that describes OpenShift Container Platform resources. A running instance of the
chart in a cluster is called a release. A new release is created every time a chart is installed on the cluster.

3.1.1.1. Key features

Helm provides the ability to:

- Search through a large collection of charts stored in the chart repository.
- Modify existing charts.
- Create your own charts with OpenShift Container Platform or Kubernetes resources.
- Package and share your applications as charts.

3.1.2. Installing Helm

The following section describes how to install Helm on different platforms using the CLI.

You can also find the URL to the latest binaries from the OpenShift Container Platform web console by
clicking the ? icon in the upper-right corner and selecting Command Line Tools

Prerequisites

- You have installed Go, version 1.13 or higher.

3.1.2.1. On Linux

1. Download the Helm binary and add it to your path:

```
```

2. Make the binary file executable:

```
# chmod +x /usr/local/bin/helm
```

3. Check the installed version:

```
$ helm version
version.BuildInfo{Version:"v3.0", GitCommit:"b317199aab7963acf4887a1c1e6d5e53378e34d93", GitTreeState:"clean", GoVersion:"go1.13.4"}
```
3.1.2.2. On Windows 7/8
1. Download the latest .exe file and put in a directory of your preference.
2. Right click Start and click Control Panel.
3. Select System and Security and then click System.
4. From the menu on the left, select Advanced systems settings and click Environment Variables at the bottom.
5. Select Path from the Variable section and click Edit.
6. Click New and type the path to the folder with the .exe file into the field or click Browse and select the directory, and click OK.

3.1.2.3. On Windows 10
1. Download the latest .exe file and put in a directory of your preference.
2. Click Search and type env or environment.
3. Select Edit environment variables for your account.
4. Select Path from the Variable section and click Edit.
5. Click New and type the path to the directory with the exe file into the field or click Browse and select the directory, and click OK.

3.1.2.4. On MacOS
1. Download the Helm binary and add it to your path:

2. Make the binary file executable:

   # chmod +x /usr/local/bin/helm

3. Check the installed version:

   $ helm version
   version.BuildInfo{Version:"v3.0", GitCommit:"b31719aab7963acf4887a1c1e6d5e53378e34d93", GitTreeState:"clean", GoVersion:"go1.13.4"}

3.1.3. Installing a Helm chart on an OpenShift Container Platform cluster

Prerequisites
- You have a running OpenShift Container Platform cluster and you have logged into it.
- You have installed Helm.
**Procedure**

1. Create a new project:
   
   ```
   $ oc new-project mysql
   ```

2. Add a repository of Helm charts to your local Helm client:
   
   ```
   $ helm repo add stable https://kubernetes-charts.storage.googleapis.com/
   "stable" has been added to your repositories
   ```

3. Update the repository:
   
   ```
   $ helm repo update
   ```

4. Install an example MySQL chart:
   
   ```
   $ helm install example-mysql stable/mysql
   ```

5. Verify that the chart has installed successfully:
   
   ```
   $ helm list
   NAME NAMESPACE REVISION UPDATED STATUS CHART APP VERSION
   example-mysql mysql 1 2019-12-05 15:06:51.379134163 -0500 EST deployed mysql-1.5.0
   5.7.27
   ```

3.1.4. Creating a custom Helm chart on OpenShift Container Platform

**Procedure**

1. Create a new project:
   
   ```
   $ oc new-project nodejs-ex-k
   ```

2. Download an example Node.js chart that contains OpenShift Container Platform objects:
   
   ```
   $ git clone https://github.com/redhat-developer/redhat-helm-charts
   ```

3. Go to the directory with the sample chart:
   
   ```
   $ cd redhat-helm-charts/alpha/nodejs-ex-k/
   ```

4. Edit the **Chart.yaml** file and add a description of your chart:
   
   ```yaml
   apiVersion: v2 ①
   name: nodejs-ex-k ②
   description: A Helm chart for OpenShift ③
   icon: https://static.redhat.com/libs/redhat/brand-assets/lates...logo.svg ④
   ```

   **Notes:**
   
   ① The chart API version. It should be **v2** for Helm charts that require at least Helm 3.
   
   ② The chart name.
   
   ③ A description of the chart.
   
   ④ An icon for your chart.
2. The name of your chart.

3. The description of your chart.

4. The URL to an image to be used as an icon.

5. Verify that the chart is formatted properly:

   $ helm lint
   [INFO] Chart.yaml: icon is recommended
   1 chart(s) linted, 0 chart(s) failed

6. Install the chart:

   $ cd ..
   $ helm install nodejs-chart nodejs-ex-k

7. Verify that the chart has installed successfully:

   $ helm list
   NAME NAMESPACE REVISION UPDATED STATUS CHART APP VERSION
   nodejs-chart nodejs-ex-k 1 2019-12-05 15:06:51.379134163 -0500 EST deployed nodejs-0.1.0 1.16.0
CHAPTER 4. KNATIVE CLI (\(\text{kn}\)) FOR USE WITH OPENSHIFT SERVERLESS

\(\text{kn}\) enables simple interaction with Knative components on OpenShift Container Platform.

You can enable Knative on OpenShift Container Platform by installing OpenShift Serverless. For more information, see the documentation on Getting started with OpenShift Serverless.

NOTE

OpenShift Serverless cannot be installed using the \(\text{kn}\) CLI. A cluster administrator must install the OpenShift Serverless Operator and set up the Knative components, as described in the Serverless applications documentation for OpenShift Container Platform.

4.1. KEY FEATURES

\(\text{kn}\) is designed to make serverless computing tasks simple and concise. Key features of \(\text{kn}\) include:

- Deploy serverless applications from the command line.
- Manage features of Knative Serving, such as services, revisions, and traffic-splitting.
- Create and manage Knative Eventing components, such as event sources and triggers.

NOTE

Knative Eventing is currently available as a Technology Preview feature of OpenShift Serverless.

- Create sink binding to connect existing Kubernetes applications and Knative services.
- Extend \(\text{kn}\) with flexible plugin architecture, similar to kubectl.
- Configure autoscaling parameters for Knative services.
- Scripted usage, such as waiting for the results of an operation, or deploying custom rollout and rollback strategies.

4.2. INSTALLING \(\text{kn}\)

For information about installing \(\text{kn}\) for use with OpenShift Serverless, see the documentation on Installing the Knative CLI (\(\text{kn}\)).

4.3. NEXT STEPS

- For information about basic \(\text{kn}\) workflows and completing user tasks, see the documentation on Getting started with Knative CLI (\(\text{kn}\)).
- For information about completing Knative Eventing related user tasks with \(\text{kn}\), see the Knative Eventing documentation.
CHAPTER 5. PIPELINES CLI (TKN)

5.1. INSTALLING TKN

Use the tkn CLI to manage OpenShift Pipelines from a terminal. The following section describes how to install tkn on different platforms.

You can also find the URL to the latest binaries from the OpenShift Container Platform web console by clicking the ? icon in the upper-right corner and selecting Command Line Tools.

5.1.1. Installing OpenShift Pipelines CLI (tkn) on Linux

For Linux distributions, you can download the CLI directly as a tar.gz archive.

Procedure

1. Download the CLI.
2. Unpack the archive:
   
   ```
   $ tar xvzf <file>
   ```
3. Place the tkn binary in a directory that is on your PATH.
4. To check your PATH, run:
   
   ```
   $ echo $PATH
   ```

5.1.2. Installing OpenShift Pipelines CLI (tkn) on Linux using an RPM

For {op-system-base-full} version 8, you can install the OpenShift Pipelines CLI (tkn) as an RPM.

Prerequisites

- You have an active OpenShift Container Platform subscription on your Red Hat account.
- You have root or sudo privileges on your local system.

Procedure

1. Register with Red Hat Subscription Manager:
   
   ```
   # subscription-manager register
   ```
2. Pull the latest subscription data:
   
   ```
   # subscription-manager refresh
   ```
3. List the available subscriptions:
   
   ```
   # subscription-manager list --available --matches "*pipelines*
   ```
4. In the output for the previous command, find the pool ID for your OpenShift Container Platform subscription and attach the subscription to the registered system:

   # subscription-manager attach --pool=<pool_id>

5. Enable the repositories required by OpenShift Pipelines:

   # subscription-manager repos --enable="pipelines-1.0-for-rhel-8-x86_64-rpms"

6. Install the openshift-pipelines-client package:

   # yum install openshift-pipelines-client

After you install the CLI, it is available using the tkn command:

   $ tkn version

5.1.3. Installing OpenShift Pipelines CLI (tkn) on Windows

For Windows, the tkn CLI is provided as a zip archive.

Procedure

1. Download the CLI.

2. Unzip the archive with a ZIP program.

3. Add the location of your tkn.exe file to your PATH environment variable.

4. To check your PATH, open the command prompt and run the command:

   C:\> path

5.1.4. Installing OpenShift Pipelines CLI (tkn) on macOS

For macOS, the tkn CLI is provided as a tar.gz archive.

Procedure

1. Download the CLI.

2. Unpack and unzip the archive.

3. Move the tkn binary to a directory on your PATH.

4. To check your PATH, open a terminal window and run:

   $ echo $PATH

5.2. OPENSHIFT PIPELINES TKN REFERENCE

This section lists the basic tkn CLI commands.
5.2.1. Basic Syntax

tkn [command or options] [arguments…]

5.2.2. Global Options

--help, -h

5.2.3. Utility commands

5.2.3.1. tkn

Parent command for tkn CLI.

Example: Display all options

$ tkn

5.2.3.2. completion [shell]

Print shell completion code which must be evaluated to provide interactive completion. Supported shells are bash and zsh.

Example: Completion code for bash shell

$ tkn completion bash

5.2.3.3. version

Print version information of the tkn CLI.

Example: Check the tkn version

$ tkn version

5.2.4. Pipelines management commands

5.2.4.1. pipeline

Manage Pipelines.

Example: Display help

$ tkn pipeline --help

5.2.4.2. pipeline create

Create a Pipeline.

Example: Create a Pipeline defined by the mypipeline.yaml file in a namespace
5.2.4.3. pipeline delete
Delete a Pipeline.

Example: Delete the mypipeline Pipeline from a namespace

$ tkn pipeline delete mypipeline -n myspace

5.2.4.4. pipeline describe
Describe a Pipeline.

Example: Describe mypipeline Pipeline

$ tkn pipeline describe mypipeline

5.2.4.5. pipeline list
List Pipelines.

Example: Display a list of Pipelines

$ tkn pipeline list

5.2.4.6. pipeline logs
Display Pipeline logs for a specific Pipeline.

Example: Stream live logs for the mypipeline Pipeline

$ tkn pipeline logs -f mypipeline

5.2.4.7. pipeline start
Start a Pipeline.

Example: Start mypipeline Pipeline

$ tkn pipeline start mypipeline

5.2.5. PipelineRun commands

5.2.5.1. pipelinerun
Manage PipelineRuns.

Example: Display help
5.2.5.2. pipelinerun cancel
Cancel a PipelineRun.

Example: Cancel the mypipelinerun PipelineRun from a namespace

$ tkn pipelinerun cancel mypipelinerun -n myspace

5.2.5.3. pipelinerun delete
Delete a PipelineRun.

Example: Delete PipelineRuns from a namespace

$ tkn pipelinerun delete mypipelinerun1 mypipelinerun2 -n myspace

5.2.5.4. pipelinerun describe
Describe a PipelineRun.

Example: Describe the mypipelinerun PipelineRun in a namespace

tkn pipelinerun describe mypipelinerun -n myspace

5.2.5.5. pipelinerun list
List PipelineRuns.

Example: Display a list of PipelineRuns in a namespace

$ tkn pipelinerun list -n myspace

5.2.5.6. pipelinerun logs
Display the logs of a PipelineRun.

Example: Display the logs of the mypipelinerun PipelineRun with all tasks and steps in a namespace

$ tkn pipelinerun logs mypipelinerun -a -n myspace

5.2.6. Task management commands

5.2.6.1. task
Manage Tasks.

Example: Display help
5.2.6.2. task create
Create a Task.

Example: Create a Task defined by the mytask.yaml file in a namespace

$ tkn task create -f mytask.yaml -n myspace

5.2.6.3. task delete
Delete a Task.

Example: Delete mytask1 and mytask2 Tasks from a namespace

$ tkn task delete mytask1 mytask2 -n myspace

5.2.6.4. task describe
Describe a Task.

Example: Describe the mytask Task in a namespace

$ tkn task describe mytask -n myspace

5.2.6.5. task list
List Tasks.

Example: List all the Tasks in a namespace

$ tkn task list -n myspace

5.2.6.6. task logs
Display Task logs.

Example: Display logs for the mytaskrun TaskRun of the mytask Task

$ tkn task logs mytask mytaskrun -n myspace

5.2.6.7. task start
Start a Task.

Example: Start the mytask Task in a namespace

$ tkn task start mytask -s <ServiceAccountName> -n myspace
5.2.7. TaskRun commands

5.2.7.1. taskrun
Manage TaskRuns.

**Example: Display help**

```bash
$ tkn taskrun -h
```

5.2.7.2. taskrun cancel
Cancel a TaskRun.

**Example: Cancel the mytaskrun TaskRun from a namespace**

```bash
$ tkn taskrun cancel mytaskrun -n myspace
```

5.2.7.3. taskrun delete
Delete a TaskRun.

**Example: Delete mytaskrun1 and mytaskrun2 TaskRuns from a namespace**

```bash
$ tkn taskrun delete mytaskrun1 mytaskrun2 -n myspace
```

5.2.7.4. taskrun describe
Describe a TaskRun.

**Example: Describe the mytaskrun TaskRun in a namespace**

```bash
$ tkn taskrun describe mytaskrun -n myspace
```

5.2.7.5. taskrun list
List TaskRuns.

**Example: List all TaskRuns in a namespace**

```bash
$ tkn taskrun list -n myspace
```

5.2.7.6. taskrun logs
Display TaskRun logs.

**Example: Display live logs for the mytaskrun TaskRun in a namespace**

```bash
$ tkn taskrun logs -f mytaskrun -n myspace
```
5.2.8. Condition management commands

5.2.8.1. condition
Manage Conditions.

Example: Display help

$ tkn condition --help

5.2.8.2. condition delete
Delete a Condition.

Example: Delete the mycondition1 Condition from a namespace

$ tkn condition delete mycondition1 -n myspace

5.2.8.3. condition describe
Describe a Condition.

Example: Describe the mycondition1 Condition in a namespace

$ tkn condition describe mycondition1 -n myspace

5.2.8.4. condition list
List Conditions.

Example: List Conditions in a namespace

$ tkn condition list -n myspace

5.2.9. Pipeline Resource management commands

5.2.9.1. resource
Manage Pipeline Resources.

Example: Display help

$ tkn resource -h

5.2.9.2. resource create
Create a Pipeline Resource.

Example: Create Pipeline Resource defined by the myresource.yaml file in a namespace
$ tkn resource create -f myresource.yaml -n myspace

5.2.9.3. resource delete
Delete a Pipeline Resource.

Example: Delete the `myresource` Pipeline Resource from a namespace

$ tkn resource delete myresource -n myspace

5.2.9.4. resource describe
Describe a Pipeline Resource.

Example: Describe the `myresource` Pipeline Resource

$ tkn resource describe myresource -n myspace

5.2.9.5. resource list
List Pipeline Resources.

Example: List all Pipeline Resources in a namespace

$ tkn resource list -n myspace

5.2.10. ClusterTask management commands

5.2.10.1. clustertask
Manage ClusterTasks.

Example: Display help

$ tkn clustertask --help

5.2.10.2. clustertask delete
Delete a ClusterTask resource in a cluster.

Example: Delete `mytask1` and `mytask2` ClusterTasks

$ tkn clustertask delete mytask1 mytask2

5.2.10.3. clustertask describe
Describe a ClusterTask.

Example: Describe the `mytask` ClusterTask
5.2.10.4. clustertask list

List ClusterTasks.

Example: List ClusterTasks

$ tkn clustertask list

5.2.10.5. clustertask start

Start ClusterTasks.

Example: Start the mytask ClusterTask

$ tkn clustertask start mytask

5.2.11. Trigger management commands

5.2.11.1. eventlistener

Manage EventListeners.

Example: Display help

$ tkn eventlistener -h

5.2.11.2. eventlistener delete

Delete an EventListener.

Example: Delete mylistener1 and mylistener2 EventListeners in a namespace

$ tkn eventlistener delete mylistener1 mylistener2 -n myspace

5.2.11.3. eventlistener describe

Describe an EventListener.

Example: Describe the mylistener EventListener in a namespace

$ tkn eventlistener describe mylistener -n myspace

5.2.11.4. eventlistener list

List EventListeners.

Example: List all the EventListeners in a namespace
$ tkn eventlistener list -n myspace

5.2.11.5. triggerbinding
Manage TriggerBindings.

Example: Display TriggerBindings help
$ tkn triggerbinding -h

5.2.11.6. triggerbinding delete
Delete a TriggerBinding.

Example: Delete mybinding1 and mybinding2 TriggerBindings in a namespace
$ tkn triggerbinding delete mybinding1 mybinding2 -n myspace

5.2.11.7. triggerbinding describe
Describe a TriggerBinding.

Example: Describe the mybinding TriggerBinding in a namespace
$ tkn triggerbinding describe mybinding -n myspace

5.2.11.8. triggerbinding list
List TriggerBindings.

Example: List all the TriggerBindings in a namespace
$ tkn triggerbinding list -n myspace

5.2.11.9. triggertemplate
Manage TriggerTemplates.

Example: Display TriggerTemplate help
$ tkn triggertemplate -h

5.2.11.10. triggertemplate delete
Delete a TriggerTemplate.

Example: Delete mytemplate1 and mytemplate2 TriggerTemplates in a namespace
$ tkn triggertemplate delete mytemplate1 mytemplate2 -n `myspace`
5.2.11.1. triggertemplate describe
Describe a TriggerTemplate.

Example: Describe the mytemplate TriggerTemplate in a namespace

```bash
$ tkn triggertemplate describe mytemplate -n `myspace`
```

5.2.11.12. triggertemplate list
List TriggerTemplates.

Example: List all the TriggerTemplates in a namespace

```bash
$ tkn triggertemplate list -n myspace
```

5.2.11.13. clustertriggerbinding
Manage ClusterTriggerBindings.

Example: Display ClusterTriggerBindings help

```bash
$ tkn clustertriggerbinding -h
```

5.2.11.14. clustertriggerbinding delete
Delete a ClusterTriggerBinding.

Example: Delete myclusterbinding1 and myclusterbinding2 ClusterTriggerBindings

```bash
$ tkn clustertriggerbinding delete myclusterbinding1 myclusterbinding2
```

5.2.11.15. clustertriggerbinding describe
Describe a ClusterTriggerBinding.

Example: Describe the myclusterbinding ClusterTriggerBinding

```bash
$ tkn clustertriggerbinding describe myclusterbinding
```

5.2.11.16. clustertriggerbinding list
List ClusterTriggerBindings.

Example: List all ClusterTriggerBindings

```bash
$ tkn clustertriggerbinding list
```
