OpenShift Container Platform 4.8

Installing

Installing and configuring OpenShift Container Platform clusters
Installing and configuring OpenShift Container Platform clusters
Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.
Table of Contents

CHAPTER 1. OPENSШIFT CONTAINER PLATFORM INSTALLATION OVERVIEW ........................................... 51
  1.1. OPENSШIFT CONTAINER PLATFORM INSTALLATION OVERVIEW ........................................ 51
    1.1.1. Installation process ........................................................................................................ 51
       The installation process with installer-provisioned infrastructure ........................................ 52
       The installation process with user-provisioned infrastructure ........................................... 53
       Installation process details .................................................................................................. 53
       Installation scope ................................................................................................................ 55
  1.2. SUPPORTED PLATFORMS FOR OPENSШIFT CLUSTERS ......................................................... 55

CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS .......... 57
  2.1. SELECTING A CLUSTER INSTALLATION TYPE ....................................................................... 57
    2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself? .......... 57
    2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4? 57
    2.1.3. Do you want to use existing components in your cluster? ............................................... 58
    2.1.4. Do you need extra security for your cluster? .................................................................. 58
  2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION ....................................... 59
  2.3. PREPARING YOUR CLUSTER FOR WORKLOADS .................................................................. 59
  2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS ............................... 59

CHAPTER 3. MIRRroring IMAGES FOR A DISCONNECTED INSTALLATION ........................................... 62
  3.1. PREREQUISITES ...................................................................................................................... 62
  3.2. ABOUT THE MIRROR REGISTRY ............................................................................................ 62
  3.3. PREPARING YOUR MIRROR HOST .......................................................................................... 63
    3.3.1. Installing the OpenShift CLI by downloading the binary .................................................. 63
           Installing the OpenShift CLI on Linux .............................................................................. 63
           Installing the OpenShift CLI on Windows ...................................................................... 63
           Installing the OpenShift CLI on macOS ....................................................................... 64
  3.4. CONFIGURING CREDENTIALS THAT ALLOW IMAGES TO BE MIRRORED ............................... 64
  3.5. MIRRoring THE OPENSШIFT CONTAINER PLATFORM IMAGE REPOSITORY ......................... 66
  3.6. THE CLUSTER SAMPLES OPERATOR IN A DISCONNECTED ENVIRONMENT ......................... 70
    3.6.1. Cluster Samples Operator assistance for mirroring ......................................................... 70
  3.7. NEXT STEPS ........................................................................................................................ 70
  3.8. ADDITIONAL RESOURCES .................................................................................................... 71

CHAPTER 4. INSTALLING ON AWS .................................................................................................. 72
  4.1. PREPARING TO INSTALL ON AWS ....................................................................................... 72
    4.1.1. Prerequisites ................................................................................................................... 72
    4.1.2. Requirements for installing OpenShift Container Platform on AWS ............................. 72
    4.1.3. Choosing a method to install OpenShift Container Platform on AWS ........................... 72
       4.1.3.1. Installing a cluster on installer-provisioned infrastructure ......................................... 72
       4.1.3.2. Installing a cluster on user-provisioned infrastructure ............................................. 73
    4.1.4. Next steps ....................................................................................................................... 73
  4.2. CONFIGURING AN AWS ACCOUNT ....................................................................................... 73
    4.2.1. Configuring Route 53 ..................................................................................................... 73
       4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53 ....................................... 74
    4.2.2. AWS account limits ....................................................................................................... 75
    4.2.3. Required AWS permissions for the IAM user ................................................................. 77
    4.2.4. Creating an IAM user ..................................................................................................... 84
    4.2.5. Required AWS permissions for IAM roles ................................................................... 85
    4.2.6. Supported AWS regions ................................................................................................. 87
    4.2.7. Next steps ....................................................................................................................... 88
  4.3. MANUALLY CREATING IAM FOR AWS ................................................................................. 88
4.3.1. Alternatives to storing administrator-level secrets in the kube-system project
4.3.2. Manually create IAM
4.3.3. Admin credentials root secret format
4.3.4. Upgrading clusters with manually maintained credentials
4.3.5. Mint mode
4.3.6. Mint mode with removal or rotation of the administrator-level credential
4.3.7. Next steps

4.4. INSTALLING A CLUSTER QUICKLY ON AWS
4.4.1. Prerequisites
4.4.2. Internet and Telemetry access for OpenShift Container Platform
4.4.3. Generating a key pair for cluster node SSH access
4.4.4. Obtaining the installation program
4.4.5. Deploying the cluster
4.4.6. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
4.4.7. Logging in to the cluster by using the CLI
4.4.8. Logging in to the cluster by using the web console
4.4.9. Next steps

4.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS
4.5.1. Prerequisites
4.5.2. Internet and Telemetry access for OpenShift Container Platform
4.5.3. Generating a key pair for cluster node SSH access
4.5.4. Obtaining the installation program
4.5.5. Creating the installation configuration file
   4.5.5.1. Installation configuration parameters
      4.5.5.1.1. Required configuration parameters
      4.5.5.1.2. Network configuration parameters
      4.5.5.1.3. Optional configuration parameters
      4.5.5.1.4. Optional AWS configuration parameters
   4.5.5.2. Supported AWS machine types
   4.5.5.3. Sample customized install-config.yaml file for AWS
4.5.6. Deploying the cluster
4.5.7. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
4.5.8. Logging in to the cluster by using the CLI
4.5.9. Logging in to the cluster by using the web console
4.5.10. Next steps

4.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS
4.6.1. Prerequisites
4.6.2. Internet and Telemetry access for OpenShift Container Platform
4.6.3. Generating a key pair for cluster node SSH access
4.6.4. Obtaining the installation program
4.6.5. Network configuration phases
4.6.6. Creating the installation configuration file
   4.6.6.1. Installation configuration parameters
      4.6.6.1.1. Required configuration parameters
      4.6.6.1.2. Network configuration parameters
      4.6.6.1.3. Optional configuration parameters
      4.6.6.1.4. Optional AWS configuration parameters
4.6.6.2. Supported AWS machine types

4.6.6.3. Sample customized install-config.yaml file for AWS

4.6.7. Cluster Network Operator configuration

4.6.7.1. Cluster Network Operator configuration object
   defaultNetwork object configuration
   Configuration for the OpenShift SDN CNI cluster network provider
   Configuration for the OVN-Kubernetes CNI cluster network provider
   kubeProxyConfig object configuration

4.6.8. Specifying advanced network configuration

4.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

4.6.10. Configuring hybrid networking with OVN-Kubernetes

4.6.11. Deploying the cluster

4.6.12. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS

4.6.13. Logging in to the cluster by using the CLI

4.6.14. Logging in to the cluster by using the web console

4.6.15. Next steps

4.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

4.7.1. Prerequisites

4.7.2. About installations in restricted networks
   4.7.2.1. Additional limits

4.7.3. About using a custom VPC
   4.7.3.1. Requirements for using your VPC
   4.7.3.2. VPC validation
   4.7.3.3. Division of permissions
   4.7.3.4. Isolation between clusters

4.7.4. Internet and Telemetry access for OpenShift Container Platform

4.7.5. Generating a key pair for cluster node SSH access

4.7.6. Creating the installation configuration file
   4.7.6.1. Installation configuration parameters
      4.7.6.1.1. Required configuration parameters
      4.7.6.1.2. Network configuration parameters
      4.7.6.1.3. Optional configuration parameters
      4.7.6.1.4. Optional AWS configuration parameters
   4.7.6.2. Sample customized install-config.yaml file for AWS
   4.7.6.3. Configuring the cluster-wide proxy during installation

4.7.7. Deploying the cluster

4.7.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS

4.7.9. Logging in to the cluster by using the CLI

4.7.10. Disabling the default OperatorHub sources

4.7.11. Next steps

4.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

4.8.1. Prerequisites

4.8.2. About using a custom VPC
   4.8.2.1. Requirements for using your VPC
   4.8.2.2. VPC validation
   4.8.2.3. Division of permissions
   4.8.2.4. Isolation between clusters
4.8.3. Internet and Telemetry access for OpenShift Container Platform

4.8.4. Generating a key pair for cluster node SSH access

4.8.5. Obtaining the installation program

4.8.6. Creating the installation configuration file
  4.8.6.1. Installation configuration parameters
    4.8.6.1.1. Required configuration parameters
    4.8.6.1.2. Network configuration parameters
    4.8.6.1.3. Optional configuration parameters
    4.8.6.1.4. Optional AWS configuration parameters
    4.8.6.2. Supported AWS machine types
    4.8.6.3. Sample customized install-config.yaml file for AWS
    4.8.6.4. Configuring the cluster-wide proxy during installation

4.8.7. Deploying the cluster

4.8.8. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS

4.8.9. Logging in to the cluster by using the CLI

4.8.10. Logging in to the cluster by using the web console

4.8.11. Next steps

4.9. INSTALLING A PRIVATE CLUSTER ON AWS
  4.9.1. Prerequisites
  4.9.2. Private clusters
    4.9.2.1. Private clusters in AWS
      4.9.2.1.1. Limitations
  4.9.3. About using a custom VPC
    4.9.3.1. Requirements for using your VPC
    4.9.3.2. VPC validation
    4.9.3.3. Division of permissions
    4.9.3.4. Isolation between clusters
  4.9.4. Internet and Telemetry access for OpenShift Container Platform
  4.9.5. Generating a key pair for cluster node SSH access
  4.9.6. Obtaining the installation program

4.9.7. Manually creating the installation configuration file
  4.9.7.1. Installation configuration parameters
    4.9.7.1.1. Required configuration parameters
    4.9.7.1.2. Network configuration parameters
    4.9.7.1.3. Optional configuration parameters
    4.9.7.1.4. Optional AWS configuration parameters
    4.9.7.2. Supported AWS machine types
    4.9.7.3. Sample customized install-config.yaml file for AWS
    4.9.7.4. Configuring the cluster-wide proxy during installation

4.9.8. Deploying the cluster

4.9.9. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS

4.9.10. Logging in to the cluster by using the CLI

4.9.11. Next steps

4.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT OR SECRET REGION
  4.10.1. Prerequisites
  4.10.2. AWS government and secret regions
4.10.3. Private clusters
  4.10.3.1. Private clusters in AWS
    4.10.3.1.1. Limitations
  4.10.4. About using a custom VPC
    4.10.4.1. Requirements for using your VPC
    4.10.4.2. VPC validation
    4.10.4.3. Division of permissions
    4.10.4.4. Isolation between clusters
  4.10.5. Internet and Telemetry access for OpenShift Container Platform
  4.10.6. Generating a key pair for cluster node SSH access
  4.10.7. Obtaining the installation program
  4.10.8. Manually creating the installation configuration file
    4.10.8.1. Installation configuration parameters
      4.10.8.1.1. Required configuration parameters
      4.10.8.1.2. Network configuration parameters
      4.10.8.1.3. Optional configuration parameters
      4.10.8.1.4. Optional AWS configuration parameters
    4.10.8.2. Supported AWS machine types
    4.10.8.3. Sample customized install-config.yaml file for AWS
    4.10.8.4. AWS regions without a published RHCOS AMI
    4.10.8.5. Uploading a custom RHCOS AMI in AWS
    4.10.8.6. Configuring the cluster-wide proxy during installation
  4.10.9. Deploying the cluster
  4.10.10. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
  4.10.11. Logging in to the cluster by using the CLI
  4.10.12. Logging in to the cluster by using the web console
  4.10.13. Next steps

4.11. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

4.11.1. Prerequisites
  4.11.2. Internet and Telemetry access for OpenShift Container Platform
  4.11.3. Required AWS infrastructure components
    4.11.3.1. Certificate signing requests management
    4.11.3.2. Other infrastructure components
    4.11.3.3. Cluster machines
    4.11.3.4. Supported AWS machine types
    4.11.3.5. Required AWS permissions for the IAM user
  4.11.4. Obtaining the installation program
  4.11.5. Generating a key pair for cluster node SSH access
  4.11.6. Creating the installation files for AWS
    4.11.6.1. Optional: Creating a separate /var partition
    4.11.6.2. Creating the installation configuration file
    4.11.6.3. Configuring the cluster-wide proxy during installation
    4.11.6.4. Creating the Kubernetes manifest and Ignition config files
  4.11.7. Extracting the infrastructure name
  4.11.8. Creating a VPC in AWS
    4.11.8.1. CloudFormation template for the VPC
  4.11.9. Creating networking and load balancing components in AWS
    4.11.9.1. CloudFormation template for the network and load balancers
  4.11.10. Creating security group and roles in AWS
4.11.10.1. CloudFormation template for security objects

4.11.11. Accessing RHCOS AMIs with stream metadata

4.11.12. RHCOS AMIs for the AWS infrastructure
   4.11.12.1. AWS regions without a published RHCOS AMI
   4.11.12.2. Uploading a custom RHCOS AMI in AWS

4.11.13. Creating the bootstrap node in AWS
   4.11.13.1. CloudFormation template for the bootstrap machine

4.11.14. Creating the control plane machines in AWS
   4.11.14.1. CloudFormation template for control plane machines

4.11.15. Creating the worker nodes in AWS

4.11.15.1. CloudFormation template for worker machines

4.11.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

4.11.17. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS

4.11.18. Logging in to the cluster by using the CLI

4.11.19. Approving the certificate signing requests for your machines

4.11.20. Initial Operator configuration
   4.11.20.1. Image registry storage configuration
      4.11.20.1.1. Configuring registry storage for AWS with user-provisioned infrastructure
      4.11.20.1.2. Configuring storage for the image registry in non-production clusters

4.11.21. Deleting the bootstrap resources

4.11.22. Creating the Ingress DNS Records

4.11.23. Completing an AWS installation on user-provisioned infrastructure

4.11.24. Logging in to the cluster by using the web console

4.11.25. Additional resources

4.11.26. Next steps

4.12. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

4.12.1. Prerequisites

4.12.2. About installations in restricted networks
   4.12.2.1. Additional limits

4.12.3. Internet and Telemetry access for OpenShift Container Platform

4.12.4. Required AWS infrastructure components
   4.12.4.1. Certificate signing requests management
   4.12.4.2. Other infrastructure components
   4.12.4.3. Cluster machines
   4.12.4.4. Supported AWS machine types
   4.12.4.5. Required AWS permissions for the IAM user

4.12.5. Generating a key pair for cluster node SSH access

4.12.6. Creating the installation files for AWS
   4.12.6.1. Optional: Creating a separate /var partition
   4.12.6.2. Creating the installation configuration file
   4.12.6.3. Configuring the cluster-wide proxy during installation
   4.12.6.4. Creating the Kubernetes manifest and Ignition config files

4.12.7. Extracting the infrastructure name

4.12.8. Creating a VPC in AWS
   4.12.8.1. CloudFormation template for the VPC

4.12.9. Creating networking and load balancing components in AWS
   4.12.9.1. CloudFormation template for the network and load balancers

4.12.10. Creating security group and roles in AWS
   4.12.10.1. CloudFormation template for security objects

4.12.11. Accessing RHCOS AMIs with stream metadata

4.12.12. RHCOS AMIs for the AWS infrastructure
   4.12.12.1. AWS regions without a published RHCOS AMI
   4.12.12.2. Uploading a custom RHCOS AMI in AWS

4.12.13. Creating the bootstrap node in AWS

4.12.15. Creating the worker nodes in AWS

4.12.15.1. CloudFormation template for worker machines

4.12.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

4.12.17. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS

4.12.18. Logging in to the cluster by using the CLI

4.12.19. Approving the certificate signing requests for your machines

4.12.20. Initial Operator configuration
   4.12.20.1. Image registry storage configuration
      4.12.20.1.1. Configuring registry storage for AWS with user-provisioned infrastructure
      4.12.20.1.2. Configuring storage for the image registry in non-production clusters

4.12.21. Deleting the bootstrap resources

4.12.22. Creating the Ingress DNS Records

4.12.23. Completing an AWS installation on user-provisioned infrastructure

4.12.24. Logging in to the cluster by using the web console

4.12.25. Additional resources

4.12.11. Accessing RHCOS AMIs with stream metadata
4.12.12. RHCOS AMIs for the AWS infrastructure
4.12.13. Creating the bootstrap node in AWS
4.12.15. Creating the worker nodes in AWS
  4.12.15.1. CloudFormation template for worker machines
4.12.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure
4.12.17. Logging in to the cluster by using the CLI
4.12.18. Approving the certificate signing requests for your machines
4.12.19. Initial Operator configuration
  4.12.19.1. Disabling the default OperatorHub sources
  4.12.19.2. Image registry storage configuration
    4.12.19.2.1. Configuring registry storage for AWS with user-provisioned infrastructure
    4.12.19.2.2. Configuring storage for the image registry in non-production clusters
4.12.20. Deleting the bootstrap resources
4.12.21. Creating the Ingress DNS Records
4.12.22. Completing an AWS installation on user-provisioned infrastructure
4.12.23. Logging in to the cluster by using the web console
4.12.24. Additional resources
4.12.25. Next steps

4.13. UNINSTALLING A CLUSTER ON AWS
  4.13.1. Removing a cluster that uses installer-provisioned infrastructure
  4.13.2. Deleting AWS resources with the Cloud Credential Operator utility

CHAPTER 5. INSTALLING ON AZURE ................................................................. 522

5.1. PREPARING TO INSTALL ON AZURE .................................................. 522
  5.1.1. Prerequisites ................................................................................. 522
  5.1.2. Requirements for installing OpenShift Container Platform on Azure
  5.1.3. Choosing a method to install OpenShift Container Platform on Azure
    5.1.3.1. Installing a cluster on installer-provisioned infrastructure
    5.1.3.2. Installing a cluster on user-provisioned infrastructure
  5.1.4. Next steps .................................................................................. 523

5.2. CONFIGURING AN AZURE ACCOUNT ................................................... 523
  5.2.1. Azure account limits .................................................................... 523
  5.2.2. Configuring a public DNS zone in Azure ...................................... 526
  5.2.3. Increasing Azure account limits .................................................. 526
  5.2.4. Required Azure roles .................................................................. 527
  5.2.5. Creating a service principal ....................................................... 527
  5.2.6. Supported Azure regions ............................................................ 530
    Supported Azure public regions ......................................................... 530
    Supported Azure Government regions .............................................. 532
  5.2.7. Next steps .................................................................................. 532

5.3. MANUALLY CREATING IAM FOR AZURE .......................................... 532
  5.3.1. Alternatives to storing administrator-level secrets in the kube-system project
  5.3.2. Manually create IAM .................................................................. 532
  5.3.3. Admin credentials root secret format .......................................... 534
  5.3.4. Upgrading clusters with manually maintained credentials .......... 535
  5.3.5. Mint mode .................................................................................. 535
  5.3.6. Next steps .................................................................................. 536

5.4. INSTALLING A CLUSTER QUICKLY ON AZURE ............................... 536
  5.4.1. Prerequisites .............................................................................. 536
5.8.7.2. Sample customized install-config.yaml file for Azure
5.8.7.3. Configuring the cluster-wide proxy during installation
5.8.8. Deploying the cluster
5.8.9. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
5.8.10. Logging in to the cluster by using the CLI
5.8.11. Next steps
5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION
5.9.1. Prerequisites
5.9.2. Azure government regions
5.9.3. Private clusters
   5.9.3.1. Private clusters in Azure
      5.9.3.1.1. Limitations
   5.9.3.2. User-defined outbound routing
      Private cluster with network address translation
      Private cluster with Azure Firewall
      Private cluster with a proxy configuration
      Private cluster with no Internet access
5.9.4. About reusing a VNet for your OpenShift Container Platform cluster
   5.9.4.1. Requirements for using your VNet
      5.9.4.1.1. Network security group requirements
   5.9.4.2. Division of permissions
   5.9.4.3. Isolation between clusters
5.9.5. Internet and Telemetry access for OpenShift Container Platform
5.9.6. Generating a key pair for cluster node SSH access
5.9.7. Obtaining the installation program
5.9.8. Manually creating the installation configuration file
   5.9.8.1. Installation configuration parameters
      5.9.8.1.1. Required configuration parameters
      5.9.8.1.2. Network configuration parameters
      5.9.8.1.3. Optional configuration parameters
      5.9.8.1.4. Additional Azure configuration parameters
   5.9.8.2. Sample customized install-config.yaml file for Azure
   5.9.8.3. Configuring the cluster-wide proxy during installation
5.9.9. Deploying the cluster
5.9.10. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
5.9.11. Logging in to the cluster by using the CLI
5.9.12. Next steps
5.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES
5.10.1. Prerequisites
5.10.2. Internet and Telemetry access for OpenShift Container Platform
5.10.3. Configuring your Azure project
   5.10.3.1. Azure account limits
   5.10.3.2. Configuring a public DNS zone in Azure
   5.10.3.3. Increasing Azure account limits
   5.10.3.4. Certificate signing requests management
   5.10.3.5. Required Azure roles
   5.10.3.6. Creating a service principal
5.10.3.7. Supported Azure regions
Supported Azure public regions
Supported Azure Government regions

5.10.4. Obtaining the installation program

5.10.5. Generating a key pair for cluster node SSH access

5.10.6. Creating the installation files for Azure
5.10.6.1. Optional: Creating a separate /var partition
5.10.6.2. Creating the installation configuration file
5.10.6.3. Configuring the cluster-wide proxy during installation
5.10.6.4. Exporting common variables for ARM templates
5.10.6.5. Creating the Kubernetes manifest and Ignition config files

5.10.7. Creating the Azure resource group and identity

5.10.8. Uploading the RHCOS cluster image and bootstrap Ignition config file

5.10.9. Example for creating DNS zones

5.10.10. Creating a VNet in Azure
5.10.10.1. ARM template for the VNet
5.10.10.2. Deploying the RHCOS cluster image for the Azure infrastructure
5.10.10.1.1. ARM template for image storage
5.10.12. Networking requirements for user-provisioned infrastructure
5.10.12.1. Setting the cluster node hostnames through DHCP
5.10.12.2. Network connectivity requirements
5.10.13. Creating networking and load balancing components in Azure
5.10.13.1. ARM template for the network and load balancers
5.10.14. Creating the bootstrap machine in Azure
5.10.14.1. ARM template for the bootstrap machine
5.10.15. Creating the control plane machines in Azure
5.10.15.1. ARM template for control plane machines
5.10.16. Wait for bootstrap completion and remove bootstrap resources in Azure
5.10.17. Creating additional worker machines in Azure
5.10.17.1. ARM template for worker machines
5.10.18. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
5.10.19. Logging in to the cluster by using the CLI
5.10.20. Approving the certificate signing requests for your machines
5.10.21. Adding the Ingress DNS records
5.10.22. Completing an Azure installation on user-provisioned infrastructure

5.11. UNINSTALLING A CLUSTER ON AZURE
5.11.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 6. INSTALLING ON GCP ................................................................. 737
6.1. PREPARING TO INSTALL ON GCP
6.1.1. Prerequisites
6.1.2. Requirements for installing OpenShift Container Platform on GCP
6.1.3. Choosing a method to install OpenShift Container Platform on GCP
6.1.3.1. Installing a cluster on installer-provisioned infrastructure
6.1.3.2. Installing a cluster on user-provisioned infrastructure
6.1.4. Next steps

6.2. CONFIGURING A GCP PROJECT
6.2.1. Creating a GCP project
6.2.2. Enabling API services in GCP
6.2.3. Configuring DNS for GCP
6.2.4. GCP account limits
6.2.5. Creating a service account in GCP
   6.2.5.1. Required GCP permissions
6.2.6. Supported GCP regions
6.2.7. Next steps

6.3. MANUALLY CREATING IAM FOR GCP
   6.3.1. Alternatives to storing administrator-level secrets in the kube-system project
   6.3.2. Manually create IAM
   6.3.3. Admin credentials root secret format
   6.3.4. Upgrading clusters with manually maintained credentials
   6.3.5. Mint mode
   6.3.6. Mint mode with removal or rotation of the administrator-level credential
   6.3.7. Next steps

6.4. INSTALLING A CLUSTER QUICKLY ON GCP
   6.4.1. Prerequisites
   6.4.2. Internet and Telemetry access for OpenShift Container Platform
   6.4.3. Generating a key pair for cluster node SSH access
   6.4.4. Obtaining the installation program
   6.4.5. Deploying the cluster
   6.4.6. Installing the OpenShift CLI by downloading the binary
      Installing the OpenShift CLI on Linux
      Installing the OpenShift CLI on Windows
      Installing the OpenShift CLI on macOS
   6.4.7. Logging in to the cluster by using the CLI
   6.4.8. Next steps

6.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS
   6.5.1. Prerequisites
   6.5.2. Internet and Telemetry access for OpenShift Container Platform
   6.5.3. Generating a key pair for cluster node SSH access
   6.5.4. Obtaining the installation program
   6.5.5. Creating the installation configuration file
      6.5.5.1. Installation configuration parameters
         6.5.5.1.1. Required configuration parameters
         6.5.5.1.2. Network configuration parameters
         6.5.5.1.3. Optional configuration parameters
         6.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
      6.5.5.2. Sample customized install-config.yaml file for GCP
   6.5.6. Additional resources
   6.5.7. Deploying the cluster
   6.5.8. Installing the OpenShift CLI by downloading the binary
      Installing the OpenShift CLI on Linux
      Installing the OpenShift CLI on Windows
      Installing the OpenShift CLI on macOS
   6.5.9. Logging in to the cluster by using the CLI
   6.5.10. Next steps

6.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS
   6.6.1. Prerequisites
   6.6.2. Internet and Telemetry access for OpenShift Container Platform
   6.6.3. Generating a key pair for cluster node SSH access
   6.6.4. Obtaining the installation program
   6.6.5. Creating the installation configuration file
      6.6.5.1. Installation configuration parameters
         6.6.5.1.1. Required configuration parameters

6.8.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters
6.8.5.2. Sample customized install-config.yaml file for GCP
6.8.5.3. Create an Ingress Controller with global access on GCP
6.8.6. Additional resources
6.8.6.1. Configuring the cluster-wide proxy during installation
6.8.7. Deploying the cluster
6.8.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.8.9. Logging in to the cluster by using the CLI
6.8.10. Next steps
6.9. INSTALLING A PRIVATE CLUSTER ON GCP
6.9.1. Prerequisites
6.9.2. Private clusters
   6.9.2.1. Private clusters in GCP
   6.9.2.1.1. Limitations
6.9.3. About using a custom VPC
   6.9.3.1. Requirements for using your VPC
   6.9.3.2. Division of permissions
   6.9.3.3. Isolation between clusters
6.9.4. Internet and Telemetry access for OpenShift Container Platform
6.9.5. Generating a key pair for cluster node SSH access
6.9.6. Obtaining the installation program
6.9.7. Manually creating the installation configuration file
   6.9.7.1. Installation configuration parameters
      6.9.7.1.1. Required configuration parameters
      6.9.7.1.2. Network configuration parameters
      6.9.7.1.3. Optional configuration parameters
      6.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters
   6.9.7.2. Sample customized install-config.yaml file for GCP
6.9.8. Additional resources
   6.9.8.1. Configuring the cluster-wide proxy during installation
6.9.9. Deploying the cluster
6.9.10. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.9.11. Logging in to the cluster by using the CLI
6.9.12. Next steps
6.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES
6.10.1. Prerequisites
6.10.2. Certificate signing requests management
6.10.3. Configuring your GCP project
   6.10.3.1. Creating a GCP project
   6.10.3.2. Enabling API services in GCP
   6.10.3.3. Configuring DNS for GCP
   6.10.3.4. GCP account limits
   6.10.3.5. Creating a service account in GCP
      6.10.3.5.1. Required GCP permissions
      6.10.3.6. Supported GCP regions
      6.10.3.7. Installing and configuring CLI tools for GCP
6.10.4. Creating the installation files for GCP
6.10.4.1. Optional: Creating a separate /var partition
6.10.4.2. Creating the installation configuration file
6.10.4.3. Configuring the cluster-wide proxy during installation
6.10.4.4. Creating the Kubernetes manifest and Ignition config files
6.10.5. Exporting common variables
6.10.5.1. Extracting the infrastructure name
6.10.5.2. Exporting common variables for Deployment Manager templates
6.10.6. Creating a VPC in GCP
6.10.6.1. Deployment Manager template for the VPC
6.10.7. Networking requirements for user-provisioned infrastructure
6.10.7.1. Setting the cluster node hostnames through DHCP
6.10.7.2. Network connectivity requirements
6.10.8. Creating load balancers in GCP
6.10.8.1. Deployment Manager template for the external load balancer
6.10.8.2. Deployment Manager template for the internal load balancer
6.10.9. Creating a private DNS zone in GCP
6.10.9.1. Deployment Manager template for the private DNS
6.10.10. Creating firewall rules in GCP
6.10.10.1. Deployment Manager template for firewall rules
6.10.11. Creating IAM roles in GCP
6.10.11.1. Deployment Manager template for IAM roles
6.10.12. Creating the RH COS cluster image for the GCP infrastructure
6.10.13. Creating the bootstrap machine in GCP
6.10.13.1. Deployment Manager template for the bootstrap machine
6.10.14. Creating the control plane machines in GCP
6.10.14.1. Deployment Manager template for control plane machines
6.10.15. Wait for bootstrap completion and remove bootstrap resources in GCP
6.10.16. Creating additional worker machines in GCP
6.10.16.1. Deployment Manager template for worker machines
6.10.17. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.10.18. Logging in to the cluster by using the CLI
6.10.19. Approving the certificate signing requests for your machines
6.10.20. Optional: Adding the ingress DNS records
6.10.21. Completing a GCP installation on user-provisioned infrastructure
6.10.22. Next steps
6.11. INSTALLING A CLUSTER WITH SHARED VPC ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES
6.11.1. Prerequisites
6.11.2. Certificate signing requests management
6.11.3. Configuring the GCP project that hosts your cluster
   6.11.3.1. Creating a GCP project
   6.11.3.2. Enabling API services in GCP
   6.11.3.3. GCP account limits
   6.11.3.4. Creating a service account in GCP
   6.11.3.4.1. Required GCP permissions
   6.11.3.5. Supported GCP regions
   6.11.3.6. Installing and configuring CLI tools for GCP
6.11.4. Configuring the GCP project that hosts your shared VPC network
   6.11.4.1. Configuring DNS for GCP
6.11.4.2. Creating a VPC in GCP
   6.11.4.2.1. Deployment Manager template for the VPC
6.11.5. Creating the installation files for GCP
   6.11.5.1. Manually creating the installation configuration file
   6.11.5.2. Sample customized install-config.yaml file for GCP
   6.11.5.3. Configuring the cluster-wide proxy during installation
   6.11.5.4. Creating the Kubernetes manifest and Ignition config files
6.11.6. Exporting common variables
   6.11.6.1. Extracting the infrastructure name
   6.11.6.2. Exporting common variables for Deployment Manager templates
6.11.7. Networking requirements for user-provisioned infrastructure
   6.11.7.1. Setting the cluster node hostnames through DHCP
   6.11.7.2. Network connectivity requirements
6.11.8. Creating load balancers in GCP
   6.11.8.1. Deployment Manager template for the external load balancer
   6.11.8.2. Deployment Manager template for the internal load balancer
6.11.9. Creating a private DNS zone in GCP
   6.11.9.1. Deployment Manager template for the private DNS
6.11.10. Creating firewall rules in GCP
   6.11.10.1. Deployment Manager template for firewall rules
6.11.11. Creating IAM roles in GCP
   6.11.11.1. Deployment Manager template for IAM roles
6.11.12. Creating the RHCOS cluster image for the GCP infrastructure
6.11.13. Creating the bootstrap machine in GCP
   6.11.13.1. Deployment Manager template for the bootstrap machine
6.11.14. Creating the control plane machines in GCP
   6.11.14.1. Deployment Manager template for control plane machines
6.11.15. Wait for bootstrap completion and remove bootstrap resources in GCP
6.11.16. Creating additional worker machines in GCP
   6.11.16.1. Deployment Manager template for worker machines
6.11.17. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
6.11.18. Logging in to the cluster by using the CLI
6.11.19. Approving the certificate signing requests for your machines
6.11.20. Adding the ingress DNS records
6.11.21. Adding ingress firewall rules
   6.11.21.1. Creating cluster-wide firewall rules for a shared VPC in GCP
6.11.22. Completing a GCP installation on user-provisioned infrastructure
6.11.23. Next steps
6.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
6.12.1. Prerequisites
6.12.2. Configuring your GCP project
   6.12.2.1. Creating a GCP project
   6.12.2.2. Enabling API services in GCP
   6.12.2.3. Configuring DNS for GCP
   6.12.2.4. GCP account limits
   6.12.2.5. Creating a service account in GCP
   6.12.2.5.1. Required GCP permissions
   6.12.2.6. Supported GCP regions
   6.12.2.7. Installing and configuring CLI tools for GCP
6.12.3. Creating the installation files for GCP
   6.12.3.1. Optional: Creating a separate /var partition
   6.12.3.2. Creating the installation configuration file
   6.12.3.3. Creating the Kubernetes manifest and Ignition config files
6.12.4. Exporting common variables
   6.12.4.1. Extracting the infrastructure name
   6.12.4.2. Exporting common variables for Deployment Manager templates
6.12.5. Creating a VPC in GCP
   6.12.5.1. Deployment Manager template for the VPC
   6.12.6. Networking requirements for user-provisioned infrastructure
   6.12.6.1. Setting the cluster node hostnames through DHCP
   6.12.6.2. Network connectivity requirements
6.12.7. Creating load balancers in GCP
   6.12.7.1. Deployment Manager template for the external load balancer
   6.12.7.2. Deployment Manager template for the internal load balancer
6.12.8. Creating a private DNS zone in GCP
   6.12.8.1. Deployment Manager template for the private DNS
   6.12.9. Creating firewall rules in GCP
   6.12.9.1. Deployment Manager template for firewall rules
6.12.10. Creating IAM roles in GCP
   6.12.10.1. Deployment Manager template for IAM roles
6.12.11. Creating the RH COS cluster image for the GCP infrastructure
6.12.12. Creating the bootstrap machine in GCP
   6.12.12.1. Deployment Manager template for the bootstrap machine
6.12.13. Creating the control plane machines in GCP
   6.12.13.1. Deployment Manager template for control plane machines
6.12.14. Wait for bootstrap completion and remove bootstrap resources in GCP
6.12.15. Creating additional worker machines in GCP
   6.12.15.1. Deployment Manager template for worker machines
6.12.16. Logging in to the cluster by using the CLI
6.12.17. Disabling the default OperatorHub sources
6.12.18. Approving the certificate signing requests for your machines
6.12.19. Optional: Adding the ingress DNS records
6.12.20. Completing a GCP installation on user-provisioned infrastructure
6.12.21. Next steps
6.13. UNINSTALLING A CLUSTER ON GCP
   6.13.1. Removing a cluster that uses installer-provisioned infrastructure

CHAPTER 7. INSTALLING ON BARE METAL

7.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION
   7.1.1. Prerequisites
   7.1.2. Choosing a method to install OpenShift Container Platform on bare metal
      7.1.2.1. Installing a cluster on installer-provisioned infrastructure
      7.1.2.2. Installing a cluster on user-provisioned infrastructure
7.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL
   7.2.1. Prerequisites
   7.2.2. Internet and Telemetry access for OpenShift Container Platform
   7.2.3. Requirements for a cluster with user-provisioned infrastructure
      7.2.3.1. Required machines
      7.2.3.2. Minimum resource requirements
      7.2.3.3. Managing certificate signing requests
      7.2.3.4. Networking requirements for user-provisioned infrastructure
         7.2.3.4.1. Setting the cluster node hostnames through DHCP
7.2.3.4.2. Network connectivity requirements
7.2.3.5. User-provisioned DNS requirements
7.2.3.5.1. Example DNS configuration for user-provisioned clusters
7.2.3.6. Load balancing requirements for user-provisioned infrastructure
7.2.3.6.1. Example load balancer configuration for user-provisioned clusters
7.2.4. Preparing the user-provisioned infrastructure
7.2.5. Validating DNS resolution for user-provisioned infrastructure
7.2.6. Generating a key pair for cluster node SSH access
7.2.7. Obtaining the installation program
7.2.8. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
7.2.9. Manually creating the installation configuration file
7.2.9.1. Installation configuration parameters
7.2.9.1.1. Required configuration parameters
7.2.9.1.2. Network configuration parameters
7.2.9.1.3. Optional configuration parameters
7.2.9.1.4. Additional Google Cloud Platform (GCP) configuration parameters
7.2.9.2. Sample install-config.yaml file for bare metal
7.2.9.3. Configuring the cluster-wide proxy during installation
7.2.9.4. Configuring a three-node cluster
7.2.10. Creating the Kubernetes manifest and Ignition config files
7.2.11. Installing RH COS and starting the OpenShift Container Platform bootstrap process
7.2.11.1. Installing RH COS by using an ISO image
7.2.11.2. Installing RH COS by using PXE or iPXE booting
7.2.11.3. Advanced RH COS installation configuration
7.2.11.3.1. Using advanced networking options for PXE and ISO installations
7.2.11.3.2. Disk partitioning
7.2.11.3.2.1. Creating a separate /var partition
7.2.11.3.2.2. Retaining existing partitions
7.2.11.3.3. Identifying Ignition configs
7.2.11.3.3.1. Embedding a live install Ignition config in the RH COS ISO
7.2.11.3.4. Advanced RH COS installation reference
7.2.11.3.4.1. Networking and bonding options for ISO installations
7.2.11.3.4.2. coreos-installer options for ISO installations
7.2.11.3.4.3. coreos.inst boot options for ISO or PXE installations
7.2.11.4. Enabling multipathing with kernel arguments on RH COS
7.2.11.5. Updating the bootloader using bootupd
7.2.12. Waiting for the bootstrap process to complete
7.2.13. Logging in to the cluster by using the CLI
7.2.14. Approving the certificate signing requests for your machines
7.2.15. Initial Operator configuration
7.2.15.1. Image registry removed during installation
7.2.15.2. Image registry storage configuration
7.2.15.2.1. Configuring registry storage for bare metal and other manual installations
7.2.15.2.2. Configuring storage for the image registry in non-production clusters
7.2.15.2.3. Configuring block registry storage
7.2.16. Completing installation on user-provisioned infrastructure
7.2.17. Next steps
7.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS
7.3.1. Prerequisites
7.3.2. Internet and Telemetry access for OpenShift Container Platform
7.3.3. Requirements for a cluster with user-provisioned infrastructure

7.3.3.1. Required machines

7.3.3.2. Minimum resource requirements

7.3.3.3. Managing certificate signing requests

7.3.3.4. Networking requirements for user-provisioned infrastructure
    7.3.3.4.1. Setting the cluster node hostnames through DHCP
    7.3.3.4.2. Network connectivity requirements

7.3.3.5. User-provisioned DNS requirements
    7.3.3.5.1. Example DNS configuration for user-provisioned clusters

7.3.3.6. Load balancing requirements for user-provisioned infrastructure
    7.3.3.6.1. Example load balancer configuration for user-provisioned clusters

7.3.4. Preparing the user-provisioned infrastructure

7.3.5. Validating DNS resolution for user-provisioned infrastructure

7.3.6. Generating a key pair for cluster node SSH access

7.3.7. Obtaining the installation program

7.3.8. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS

7.3.9. Manually creating the installation configuration file
    7.3.9.1. Installation configuration parameters
        7.3.9.1.1. Required configuration parameters
        7.3.9.1.2. Network configuration parameters
        7.3.9.1.3. Optional configuration parameters
        7.3.9.1.4. Additional Google Cloud Platform (GCP) configuration parameters
    7.3.9.2. Sample install-config.yaml file for bare metal

7.3.10. Network configuration phases

7.3.11. Specifying advanced network configuration

7.3.12. Cluster Network Operator configuration
    7.3.12.1. Cluster Network Operator configuration object
        defaultNetwork object configuration
        Configuration for the OpenShift SDN CNI cluster network provider
        Configuration for the OVN-Kubernetes CNI cluster network provider
        kubeProxyConfig object configuration

7.3.13. Creating the Ignition config files

7.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
    7.3.14.1. Installing RHCOS by using an ISO image
    7.3.14.2. Installing RHCOS by using PXE or iPXE booting
    7.3.14.3. Advanced RHCOS installation configuration
        7.3.14.3.1. Using advanced networking options for PXE and ISO installations
        7.3.14.3.2. Disk partitioning
            7.3.14.3.2.1. Creating a separate /var partition
            7.3.14.3.2.2. Retaining existing partitions
            7.3.14.3.3. Identifying Ignition configs
            7.3.14.3.3.1. Embedding a live install Ignition config in the RHCOS ISO
        7.3.14.3.4. Advanced RHCOS installation reference
            7.3.14.3.4.1. Networking and bonding options for ISO installations
            7.3.14.3.4.2. coreos-installer options for ISO installations
            7.3.14.3.4.3. coreos.inst boot options for ISO or PXE installations
    7.3.14.4. Enabling multipathing with kernel arguments on RHCOS
    7.3.14.5. Updating the bootloader using bootupd

7.3.15. Waiting for the bootstrap process to complete

7.3.16. Logging in to the cluster by using the CLI
7.3.17. Approving the certificate signing requests for your machines
7.3.18. Initial Operator configuration
  7.3.18.1. Image registry removed during installation
  7.3.18.2. Image registry storage configuration
  7.3.18.3. Configuring block registry storage
7.3.19. Completing installation on user-provisioned infrastructure
7.3.20. Next steps

7.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK

7.4.1. Prerequisites
7.4.2. About installations in restricted networks
  7.4.2.1. Additional limits
7.4.3. Internet and Telemetry access for OpenShift Container Platform
7.4.4. Requirements for a cluster with user-provisioned infrastructure
  7.4.4.1. Required machines
  7.4.4.2. Minimum resource requirements
  7.4.4.3. Managing certificate signing requests
  7.4.4.4. Networking requirements for user-provisioned infrastructure
    7.4.4.4.1. Setting the cluster node hostnames through DHCP
    7.4.4.4.2. Network connectivity requirements
  7.4.4.5. User-provisioned DNS requirements
    7.4.4.5.1. Example DNS configuration for user-provisioned clusters
  7.4.4.6. Load balancing requirements for user-provisioned infrastructure
    7.4.4.6.1. Example load balancer configuration for user-provisioned clusters
7.4.5. Preparing the user-provisioned infrastructure
7.4.6. Validating DNS resolution for user-provisioned infrastructure
7.4.7. Generating a key pair for cluster node SSH access
7.4.8. Manually creating the installation configuration file
  7.4.8.1. Installation configuration parameters
    7.4.8.1.1. Required configuration parameters
    7.4.8.1.2. Network configuration parameters
    7.4.8.1.3. Optional configuration parameters
    7.4.8.1.4. Additional Google Cloud Platform (GCP) configuration parameters
  7.4.8.2. Sample install-config.yaml file for bare metal
  7.4.8.3. Configuring the cluster-wide proxy during installation
  7.4.8.4. Configuring a three-node cluster
7.4.9. Creating the Kubernetes manifest and Ignition config files
7.4.10. Configuring chrony time service
7.4.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  7.4.11.1. Installing RHCOS by using an ISO image
  7.4.11.2. Installing RHCOS by using PXE or iPXE booting
  7.4.11.3. Advanced RHCOS installation configuration
    7.4.11.3.1. Using advanced networking options for PXE and ISO installations
    7.4.11.3.2. Disk partitioning
      7.4.11.3.2.1. Creating a separate /var partition
      7.4.11.3.2.2. Retaining existing partitions
    7.4.11.3.3. Identifying Ignition configs
    7.4.11.3.3.1. Embedding a live install Ignition config in the RHCOS ISO
  7.4.11.4. Advanced RHCOS installation reference
    7.4.11.4.1. Networking and bonding options for ISO installations
    7.4.11.4.2. coreos-installer options for ISO or PXE installations
  7.4.11.5. Updating the bootloader using bootupd
7.4.12. Waiting for the bootstrap process to complete
7.4.13. Logging in to the cluster by using the CLI
7.4.14. Approving the certificate signing requests for your machines
7.4.15. Initial Operator configuration
  7.4.15.1. Disabling the default OperatorHub sources
  7.4.15.2. Image registry storage configuration
    7.4.15.2.1. Changing the image registry’s management state
    7.4.15.2.2. Configuring registry storage for bare metal and other manual installations
    7.4.15.2.3. Configuring storage for the image registry in non-production clusters
    7.4.15.2.4. Configuring block registry storage
7.4.16. Completing installation on user-provisioned infrastructure
7.4.17. Next steps

CHAPTER 8. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL

8.1. OVERVIEW
8.2. PREREQUISITES
  8.2.1. Node requirements
  8.2.2. Firmware requirements for installing with virtual media
  8.2.3. Network requirements
  8.2.4. Configuring nodes
  8.2.5. Out-of-band management
  8.2.6. Required data for installation
  8.2.7. Validation checklist for nodes
8.3. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT INSTALLATION
  8.3.1. Installing RHEL on the provisioner node
  8.3.2. Preparing the provisioner node for OpenShift Container Platform installation
  8.3.3. Retrieving the OpenShift Container Platform installer
  8.3.4. Extracting the OpenShift Container Platform installer
  8.3.5. Creating an RHCOS images cache (optional)
  8.3.6. Configuration files
    8.3.6.1. Configuring the install-config.yaml file
    8.3.6.2. Setting proxy settings within the install-config.yaml file (optional)
    8.3.6.3. Modifying the install-config.yaml file for no provisioning network (optional)
    8.3.6.4. Modifying the install-config.yaml file for dual-stack network (optional)
    8.3.6.5. Configuring managed Secure Boot in the install-config.yaml file (optional)
    8.3.6.6. Additional install-config parameters
    8.3.6.7. BMC addressing
      8.3.6.8. BMC addressing for Dell iDRAC
      8.3.6.9. BMC addressing for HPE iLO
        8.3.6.9.1. BMC addressing for Fujitsu iRMC
    8.3.6.10. Root device hints
    8.3.6.11. Creating the OpenShift Container Platform manifests
    8.3.6.12. Configuring NTP for disconnected clusters (optional)
    8.3.6.13. Configure network components to run on the control plane
  8.3.7. Creating a disconnected registry (optional)
    8.3.7.1. Preparing the registry node to host the mirrored registry (optional)
    8.3.7.2. Generating the self-signed certificate (optional)
    8.3.7.3. Creating the registry podman container (optional)
    8.3.7.4. Copy and update the pull-secret (optional)
    8.3.7.5. Mirroring the repository (optional)
    8.3.7.6. Modify the install-config.yaml file to use the disconnected registry (optional)
  8.3.8. Deploying routers on worker nodes
  8.3.9. Validation checklist for installation
8.3.10. Deploying the cluster via the OpenShift Container Platform installer
8.3.11. Following the installation
8.3.12. Verifying static IP address configuration

8.4. INSTALLER-PROVISIONED POST-INSTALLATION CONFIGURATION
8.4.1. Configuring NTP for disconnected clusters (optional)
8.4.2. Enabling a provisioning network after installation
8.4.3. Configuring an external load balancer

8.5. EXPANDING THE CLUSTER
8.5.1. Preparing the bare metal node
8.5.1.1. Diagnosing a duplicate MAC address when provisioning a new host in the cluster
8.5.2. Provisioning the bare metal node

8.6. TROUBLESHOOTING
8.6.1. Troubleshooting the installer workflow
8.6.2. Troubleshooting install-config.yaml
8.6.3. Bootstrap VM issues
8.6.3.1. Bootstrap VM cannot boot up the cluster nodes
8.6.3.2. Inspecting logs
8.6.4. Cluster nodes will not PXE boot
8.6.5. The API is not accessible
8.6.6. Cleaning up previous installations
8.6.7. Issues with creating the registry
8.6.8. Miscellaneous issues
8.6.8.1. Addressing the runtime network not ready error
8.6.8.2. Cluster nodes not getting the correct IPv6 address over DHCP
8.6.8.3. Cluster nodes not getting the correct hostname over DHCP
8.6.8.4. Routes do not reach endpoints
8.6.8.5. Failed Ignition during Firstboot
8.6.8.6. NTP out of sync
8.6.9. Reviewing the installation

CHAPTER 9. INSTALLING WITH Z/VM ON IBM Z AND LINUXONE

9.1. PREPARING TO INSTALL WITH Z/VM ON IBM Z AND LINUXONE
9.1.1. Prerequisites
9.1.2. Choosing a method to install OpenShift Container Platform with z/VM on IBM Z or LinuxONE

9.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE
9.2.1. Prerequisites
9.2.2. Internet and Telemetry access for OpenShift Container Platform
9.2.3. Requirements for a cluster with user-provisioned infrastructure
9.2.3.1. Required machines
9.2.3.2. Minimum resource requirements
9.2.3.3. Minimum IBM Z system requirements
   Hardware requirements
   Operating system requirements
   IBM Z network connectivity requirements
   Disk storage for the z/VM guest virtual machines
   Storage / Main Memory
9.2.3.4. Preferred IBM Z system requirements
   Hardware requirements
   Operating system requirements
   IBM Z network connectivity requirements
   Disk storage for the z/VM guest virtual machines
   Storage / Main Memory
9.2.3.5. Managing certificate signing requests
9.2.3.6. Networking requirements for user-provisioned infrastructure

9.2.3.6.1. Network connectivity requirements
9.2.3.7. User-provisioned DNS requirements
9.2.3.7.1. Example DNS configuration for user-provisioned clusters
9.2.3.8. Load balancing requirements for user-provisioned infrastructure
9.2.3.8.1. Example load balancer configuration for user-provisioned clusters

9.2.4. Preparing the user-provisioned infrastructure

9.2.5. Validating DNS resolution for user-provisioned infrastructure

9.2.6. Generating a key pair for cluster node SSH access
9.2.7. Obtaining the installation program

9.2.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS

9.2.9. Manually creating the installation configuration file
9.2.9.1. Sample install-config.yaml file for IBM Z
9.2.9.2. Configuring the cluster-wide proxy during installation
9.2.9.3. Configuring a three-node cluster

9.2.10. Creating the Kubernetes manifest and Ignition config files

9.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process

9.2.12. Waiting for the bootstrap process to complete
9.2.13. Logging in to the cluster by using the CLI

9.2.14. Approving the certificate signing requests for your machines

9.2.15. Initial Operator configuration
9.2.15.1. Image registry storage configuration
9.2.15.1.1. Configuring registry storage for IBM Z
9.2.15.1.2. Configuring storage for the image registry in non-production clusters

9.2.16. Completing installation on user-provisioned infrastructure
9.2.17. Collecting debugging information
9.2.18. Next steps

9.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK

9.3.1. Prerequisites
9.3.2. About installations in restricted networks
9.3.2.1. Additional limits

9.3.3. Requirements for a cluster with user-provisioned infrastructure
9.3.3.1. Required machines
9.3.3.2. Minimum resource requirements
9.3.3.3. Minimum IBM Z system requirements
   Hardware requirements
   Operating system requirements
   IBM Z network connectivity requirements
   Disk storage for the z/VM guest virtual machines
   Storage / Main Memory
9.3.3.4. Preferred IBM Z system requirements
   Hardware requirements
   Operating system requirements
   IBM Z network connectivity requirements
   Disk storage for the z/VM guest virtual machines
   Storage / Main Memory
9.3.3.5. Managing certificate signing requests
9.3.3.6. Networking requirements for user-provisioned infrastructure
9.3.3.6.1. Setting the cluster node hostnames through DHCP
9.3.3.6.2. Network connectivity requirements
9.3.3.7. User-provisioned DNS requirements
  9.3.3.7.1. Example DNS configuration for user-provisioned clusters
  9.3.3.8. Load balancing requirements for user-provisioned infrastructure
  9.3.3.8.1. Example load balancer configuration for user-provisioned clusters
9.3.4. Preparing the user-provisioned infrastructure
9.3.5. Validating DNS resolution for user-provisioned infrastructure
9.3.6. Generating a key pair for cluster node SSH access
9.3.7. Manually creating the installation configuration file
  9.3.7.1. Sample install-config.yaml file for IBM Z
  9.3.7.2. Configuring the cluster-wide proxy during installation
  9.3.7.3. Configuring a three-node cluster
9.3.8. Creating the Kubernetes manifest and Ignition config files
9.3.9. Installing RH COS and starting the OpenShift Container Platform bootstrap process
9.3.10. Waiting for the bootstrap process to complete
9.3.11. Logging in to the cluster by using the CLI
9.3.12. Approving the certificate signing requests for your machines
9.3.13. Initial Operator configuration
  9.3.13.1. Disabling the default OperatorHub sources
  9.3.13.2. Image registry storage configuration
    9.3.13.2.1. Configuring registry storage for IBM Z
    9.3.13.2.2. Configuring storage for the image registry in non-production clusters
  9.3.13.3. Completing installation on user-provisioned infrastructure
9.3.15. Collecting debugging information

CHAPTER 10. INSTALLING WITH RHEL KVM ON IBM Z AND LINUXONE

10.1. PREPARING TO INSTALL WITH RHEL KVM ON IBM Z AND LINUXONE
  10.1.1. Prerequisites
  10.1.2. Choosing a method to install OpenShift Container Platform with RHEL KVM on IBM Z or LinuxONE

10.2. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE
  10.2.1. Prerequisites
  10.2.2. Internet and Telemetry access for OpenShift Container Platform
  10.2.3. Machine requirements for a cluster with user-provisioned infrastructure
    10.2.3.1. Required machines
    10.2.3.2. Network connectivity requirements
    10.2.3.3. IBM Z network connectivity requirements
    10.2.3.4. Host machine resource requirements
    10.2.3.5. Minimum IBM Z system environment
      Hardware requirements
        Operating system requirements
    10.2.3.6. Minimum resource requirements
    10.2.3.7. Preferred IBM Z system environment
      Hardware requirements
        Operating system requirements
    10.2.3.8. Preferred resource requirements
    10.2.3.9. Certificate signing requests management
    10.2.3.10. Networking requirements for user-provisioned infrastructure
      10.2.3.10.1. Setting the cluster node hostnames through DHCP
      10.2.3.10.2. Network connectivity requirements
    10.2.3.11. User-provisioned DNS requirements
    10.2.3.11.1. Example DNS configuration for user-provisioned clusters
    10.2.3.12. Load balancing requirements for user-provisioned infrastructure
    10.2.3.12.1. Example load balancer configuration for user-provisioned clusters

24
10.2.4. Preparing the user-provisioned infrastructure
10.2.5. Validating DNS resolution for user-provisioned infrastructure
10.2.6. Generating a key pair for cluster node SSH access
10.2.7. Obtaining the installation program
10.2.8. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
10.2.9. Manually creating the installation configuration file
   10.2.9.1. Sample install-config.yaml file for IBM Z
   10.2.9.2. Configuring the cluster-wide proxy during installation
   10.2.9.3. Configuring a three-node cluster
10.2.10. Creating the Kubernetes manifest and Ignition config files
10.2.11. Installing RH COS and starting the OpenShift Container Platform bootstrap process
   10.2.11.1. Fast-track installation by using a prepackaged QCOW2 disk image
   10.2.11.2. Full installation on a new QCOW2 disk image
10.2.12. Waiting for the bootstrap process to complete
10.2.13. Logging into the cluster by using the CLI
10.2.14. Approving the certificate signing requests for your machines
10.2.15. Initial Operator configuration
   10.2.15.1. Image registry storage configuration
   10.2.15.1.1. Configuring registry storage for bare metal and other manual installations
   10.2.15.1.2. Configuring storage for the image registry in non-production clusters
10.2.16. Completing installation on user-provisioned infrastructure
10.2.17. Collecting debugging information
10.2.18. Next steps

10.3. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK

10.3.1. Prerequisites
10.3.2. About installations in restricted networks
   10.3.2.1. Additional limits
10.3.3. Machine requirements for a cluster with user-provisioned infrastructure
   10.3.3.1. Required machines
   10.3.3.2. Network connectivity requirements
   10.3.3.3. IBM Z network connectivity requirements
   10.3.3.4. Host machine resource requirements
   10.3.3.5. Minimum IBM Z system environment
      Hardware requirements
      Operating system requirements
   10.3.3.6. Minimum resource requirements
   10.3.3.7. Preferred IBM Z system environment
      Hardware requirements
      Operating system requirements
   10.3.3.8. Preferred resource requirements
   10.3.3.9. Certificate signing requests management
10.3.4. Preparing the user-provisioned infrastructure
   10.3.4.1. Networking requirements for user-provisioned infrastructure
   10.3.4.1.1. Setting the cluster node hostnames through DHCP
   10.3.4.1.2. Network connectivity requirements
   10.3.4.2. User-provisioned DNS requirements
   10.3.4.2.1. Example DNS configuration for user-provisioned clusters
10.3.5. Generating a key pair for cluster node SSH access
10.3.6. Manually creating the installation configuration file
10.3.6.1. Sample install-config.yaml file for IBM Z
10.3.6.2. Configuring the cluster-wide proxy during installation
10.3.6.3. Configuring a three-node cluster
10.3.7. Creating the Kubernetes manifest and Ignition config files
10.3.8. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  10.3.8.1. Fast-track installation by using a prepackaged QCOW2 disk image
  10.3.8.2. Full installation on a new QCOW2 disk image
10.3.9. Waiting for the bootstrap process to complete
10.3.10. Logging in to the cluster by using the CLI
10.3.11. Approving the certificate signing requests for your machines
10.3.12. Initial Operator configuration
  10.3.12.1. Disabling the default OperatorHub sources
  10.3.12.2. Image registry storage configuration
    10.3.12.2.1. Configuring registry storage for bare metal and other manual installations
    10.3.12.2.2. Configuring storage for the image registry in non-production clusters
10.3.13. Completing installation on user-provisioned infrastructure
10.3.14. Collecting debugging information
10.3.15. Next steps

CHAPTER 11. INSTALLING ON IBM POWER SYSTEMS ........................................ 1503

11.1. PREPARING TO INSTALL ON IBM POWER SYSTEMS 1503
11.1.1. Prerequisites 1503
11.1.2. Choosing a method to install OpenShift Container Platform on IBM Power Systems 1503

11.2. INSTALLING A CLUSTER ON IBM POWER SYSTEMS 1503
11.2.1. Prerequisites 1503
11.2.2. Internet and Telemetry access for OpenShift Container Platform 1504
11.2.3. Requirements for a cluster with user-provisioned infrastructure 1504
  11.2.3.1. Required machines 1504
  11.2.3.2. Minimum resource requirements 1505
11.2.3.3. Minimum IBM Power Systems requirements 1505
    Hardware requirements 1506
    Operating system requirements 1506
    Disk storage for the IBM Power guest virtual machines 1506
    Network for the PowerVM guest virtual machines 1506
    Storage / main memory 1506
11.2.3.4. Recommended IBM Power system requirements 1506
    Hardware requirements 1506
    Operating system requirements 1506
    Disk storage for the IBM Power guest virtual machines 1506
    Network for the PowerVM guest virtual machines 1507
    Storage / main memory 1507
11.2.3.5. Managing certificate signing requests 1507
11.2.3.6. Networking requirements for user-provisioned infrastructure 1507
  11.2.3.6.1. Setting the cluster node hostnames through DHCP 1507
  11.2.3.6.2. Network connectivity requirements 1507
11.2.3.7. User-provisioned DNS requirements 1508
  11.2.3.7.1. Example DNS configuration for user-provisioned clusters 1510
11.2.3.8. Load balancing requirements for user-provisioned infrastructure 1512
  11.2.3.8.1. Example load balancer configuration for user-provisioned clusters 1514
11.2.4. Preparing the user-provisioned infrastructure 1516
11.2.5. Validating DNS resolution for user-provisioned infrastructure 1518
11.2.6. Generating a key pair for cluster node SSH access 1520
11.2.7. Obtaining the installation program 1522
11.2.8. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS

11.2.9. Manually creating the installation configuration file
11.2.9.1. Sample install-config.yaml file for IBM Power Systems
11.2.9.2. Configuring the cluster-wide proxy during installation
11.2.9.3. Configuring a three-node cluster

11.2.10. Creating the Kubernetes manifest and Ignition config files

11.2.11. Installing RH COS and starting the OpenShift Container Platform bootstrap process
11.2.11.1. Installing RH COS by using an ISO image
   11.2.11.1. Advanced RH COS installation reference
   11.2.11.1. Networking and bonding options for ISO installations
   11.2.11.1.2. coreos-installer options for ISO installations
   11.2.11.1.3. coreos.inst boot options for ISO or PXE installations
11.2.11.2. Installing RH COS by using PXE booting

11.2.12. Waiting for the bootstrap process to complete
11.2.13. Logging in to the cluster by using the CLI
11.2.14. Approving the certificate signing requests for your machines
11.2.15. Initial Operator configuration
   11.2.15.1. Image registry storage configuration
   11.2.15.1.1. Configuring registry storage for IBM Power Systems
   11.2.15.1.2. Configuring storage for the image registry in non-production clusters
11.2.16. Completing installation on user-provisioned infrastructure

11.3. INSTALLING A CLUSTER ON IBM POWER SYSTEMS IN A RESTRICTED NETWORK
11.3.1. Prerequisites
11.3.2. About installations in restricted networks
   11.3.2.1. Additional limits
11.3.3. Internet and Telemetry access for OpenShift Container Platform
11.3.4. Requirements for a cluster with user-provisioned infrastructure
   11.3.4.1. Required machines
   11.3.4.2. Minimum resource requirements
   11.3.4.3. Minimum IBM Power Systems requirements
      Hardware requirements
      Operating system requirements
      Disk storage for the IBM Power guest virtual machines
      Network for the PowerVM guest virtual machines
      Storage / main memory
   11.3.4.4. Recommended IBM Power system requirements
      Hardware requirements
      Operating system requirements
      Disk storage for the IBM Power guest virtual machines
      Network for the PowerVM guest virtual machines
      Storage / main memory
   11.3.4.5. Managing certificate signing requests
   11.3.4.6. Networking requirements for user-provisioned infrastructure
      11.3.4.6.1. Setting the cluster node hostnames through DHCP
      11.3.4.6.2. Network connectivity requirements
   11.3.4.7. User-provisioned DNS requirements
      11.3.4.7.1. Example DNS configuration for user-provisioned clusters
   11.3.4.8. Load balancing requirements for user-provisioned infrastructure
      11.3.4.8.1. Example load balancer configuration for user-provisioned clusters
   11.3.5. Preparing the user-provisioned infrastructure
11.3.6. Validating DNS resolution for user-provisioned infrastructure
11.3.7. Generating a key pair for cluster node SSH access
11.3.8. Manually creating the installation configuration file
   11.3.8.1. Sample install-config.yaml file for IBM Power Systems
   11.3.8.2. Configuring the cluster-wide proxy during installation
   11.3.8.3. Configuring a three-node cluster
11.3.9. Creating the Kubernetes manifest and Ignition config files
11.3.10. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
   11.3.10.1. Installing RHCOS by using an ISO image
      11.3.10.1.1. Advanced RHCOS installation reference
      11.3.10.1.1.1. Networking and bonding options for ISO installations
      11.3.10.1.1.2. coreos-installer options for ISO installations
      11.3.10.1.1.3. coreos.inst boot options for ISO or PXE installations
   11.3.10.2. Installing RHCOS by using PXE booting
11.3.11. Waiting for the bootstrap process to complete
11.3.12. Logging in to the cluster by using the CLI
11.3.13. Approving the certificate signing requests for your machines
11.3.14. Initial Operator configuration
   11.3.14.1. Disabling the default OperatorHub sources
   11.3.14.2. Image registry storage configuration
      11.3.14.2.1. Changing the image registry’s management state
      11.3.14.2.2. Configuring registry storage for IBM Power Systems
      11.3.14.2.3. Configuring storage for the image registry in non-production clusters
11.3.15. Completing installation on user-provisioned infrastructure

CHAPTER 12. INSTALLING ON OPENSTACK

12.1. PREPARING TO INSTALL ON OPENSTACK
   12.1.1. Prerequisites
   12.1.2. Choosing a method to install OpenShift Container Platform on OpenStack
      12.1.2.1. Installing a cluster on installer-provisioned infrastructure
      12.1.2.2. Installing a cluster on user-provisioned infrastructure
12.2. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS
   12.2.1. Prerequisites
   12.2.2. Resource guidelines for installing OpenShift Container Platform on RHOSP
      12.2.2.1. Control plane and compute machines
      12.2.2.2. Bootstrap machine
   12.2.3. Internet and Telemetry access for OpenShift Container Platform
   12.2.4. Enabling Swift on RHOSP
   12.2.5. Verifying external network access
   12.2.6. Defining parameters for the installation program
   12.2.7. Obtaining the installation program
   12.2.8. Creating the installation configuration file
      12.2.8.1. Configuring the cluster-wide proxy during installation
12.2.9. Installation configuration parameters
   12.2.9.1. Required configuration parameters
   12.2.9.2. Network configuration parameters
   12.2.9.3. Optional configuration parameters
   12.2.9.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
   12.2.9.5. Optional RHOSP configuration parameters
   12.2.9.6. Additional Google Cloud Platform (GCP) configuration parameters
   12.2.9.7. Custom subnets in RHOSP deployments
   12.2.9.8. Deploying a cluster with bare metal machines
   12.2.9.9. Cluster deployment on RHOSP provider networks
12.2.9.9.1. RHOSP provider network requirements for cluster installation
12.2.9.9.2. Deploying a cluster that has a primary interface on a provider network
12.2.9.10. Sample customized install-config.yaml file for RHOSP
12.2.10. Generating a key pair for cluster node SSH access
12.2.11. Enabling access to the environment
12.2.11.1. Enabling access with floating IP addresses
12.2.11.2. Completing installation without floating IP addresses
12.2.12. Deploying the cluster
12.2.13. Verifying cluster status
12.2.14. Logging in to the cluster by using the CLI
12.2.15. Next steps

12.3. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR
12.3.1. Prerequisites
12.3.2. About Kuryr SDN
12.3.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr
12.3.3.1. Increasing quota
12.3.3.2. Configuring Neutron
12.3.3.3. Configuring Octavia
12.3.3.3.1. The Octavia OVN Driver
12.3.3.4. Known limitations of installing with Kuryr
12.3.3.5. Control plane and compute machines
12.3.3.6. Bootstrap machine
12.3.4. Internet and Telemetry access for OpenShift Container Platform
12.3.5. Enabling Swift on RHOSP
12.3.6. Verifying external network access
12.3.7. Defining parameters for the installation program
12.3.8. Obtaining the installation program
12.3.9. Creating the installation configuration file
12.3.9.1. Configuring the cluster-wide proxy during installation
12.3.10. Installation configuration parameters
12.3.10.1. Required configuration parameters
12.3.10.2. Network configuration parameters
12.3.10.3. Optional configuration parameters
12.3.10.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
12.3.10.5. Optional RHOSP configuration parameters
12.3.10.6. Additional Google Cloud Platform (GCP) configuration parameters
12.3.10.7. Custom subnets in RHOSP deployments
12.3.10.8. Sample customized install-config.yaml file for RHOSP with Kuryr
12.3.10.9. Cluster deployment on RHOSP provider networks
12.3.10.9.1. RHOSP provider network requirements for cluster installation
12.3.10.9.2. Deploying a cluster that has a primary interface on a provider network
12.3.11. Generating a key pair for cluster node SSH access
12.3.12. Enabling access to the environment
12.3.12.1. Enabling access with floating IP addresses
12.3.12.2. Completing installation without floating IP addresses
12.3.13. Deploying the cluster
12.3.14. Verifying cluster status
12.3.15. Logging in to the cluster by using the CLI
12.3.16. Next steps
12.4. INSTALLING A CLUSTER ON OPENSTACK THAT SUPPORTS SR-IOV-CONNECTED COMPUTE MACHINES

12.4.1. Prerequisites
12.4.2. Resource guidelines for installing OpenShift Container Platform on RHOSP
  12.4.2.1. Control plane and compute machines
  12.4.2.2. Bootstrap machine
12.4.3. Internet and Telemetry access for OpenShift Container Platform
12.4.4. Enabling Swift on RHOSP
12.4.5. Verifying external network access
12.4.6. Defining parameters for the installation program
12.4.7. Obtaining the installation program
12.4.8. Creating the installation configuration file
  12.4.8.1. Configuring the cluster-wide proxy during installation
12.4.9. Installation configuration parameters
  12.4.9.1. Required configuration parameters
  12.4.9.2. Network configuration parameters
  12.4.9.3. Optional configuration parameters
  12.4.9.4. Additional Google Cloud Platform (GCP) configuration parameters
  12.4.9.5. Custom subnets in RHOSP deployments
  12.4.9.6. Deploying a cluster with bare metal machines
  12.4.9.7. Sample customized install-config.yaml file for RHOSP
12.4.10. Generating a key pair for cluster node SSH access
12.4.11. Enabling access to the environment
  12.4.11.1. Enabling access with floating IP addresses
  12.4.11.2. Completing installation without floating IP addresses
12.4.12. Creating SR-IOV networks for compute machines
12.4.13. Deploying the cluster
12.4.14. Verifying cluster status
12.4.15. Logging in to the cluster by using the CLI
12.4.16. Preparing a cluster that runs on RHOSP for SR-IOV
  12.4.16.1. Enabling the RHOSP metadata service as a mountable drive
  12.4.16.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver
12.4.17. Next steps

12.5. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN INFRASTRUCTURE

12.5.1. Prerequisites
12.5.2. Internet and Telemetry access for OpenShift Container Platform
12.5.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
  12.5.3.1. Control plane and compute machines
  12.5.3.2. Bootstrap machine
12.5.4. Downloading playbook dependencies
12.5.5. Downloading the installation playbooks
12.5.6. Obtaining the installation program
12.5.7. Generating a key pair for cluster node SSH access
12.5.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
12.5.9. Verifying external network access
12.5.10. Enabling access to the environment
  12.5.10.1. Enabling access with floating IP addresses
  12.5.10.2. Completing installation without floating IP addresses
12.5.11. Defining parameters for the installation program
12.5.12. Creating the installation configuration file
12.5.13. Installation configuration parameters
  12.5.13.1. Required configuration parameters
  12.5.13.2. Network configuration parameters
12.5.13.3. Optional configuration parameters
12.5.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
12.5.13.5. Optional RHOSP configuration parameters
12.5.13.6. Additional Google Cloud Platform (GCP) configuration parameters
12.5.13.7. Custom subnets in RHOSP deployments
12.5.13.8. Sample customized install-config.yaml file for RHOSP
12.5.13.9. Setting a custom subnet for machines
12.5.13.10. Emptying compute machine pools
12.5.13.11. Cluster deployment on RHOSP provider networks
  12.5.13.11.1. RHOSP provider network requirements for cluster installation
  12.5.13.11.2. Deploying a cluster that has a primary interface on a provider network
12.5.13.12. Creating the Kubernetes manifest and Ignition config files
12.5.13.13. Preparing the bootstrap Ignition files
12.5.13.14. Creating control plane Ignition config files on RHOSP
12.5.13.15. Creating network resources on RHOSP
  12.5.13.15.1. Deploying a cluster with bare metal machines
12.5.13.16. Creating the bootstrap machine on RHOSP
12.5.13.17. Creating the control plane machines on RHOSP
12.5.13.18. Logging in to the cluster by using the CLI
12.5.13.19. Deleting bootstrap resources from RHOSP
12.5.13.20. Creating compute machines on RHOSP
12.5.13.21. Approving the certificate signing requests for your machines
12.5.13.22. Verifying a successful installation
12.5.13.23. Next steps

12.6. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR ON YOUR OWN INFRASTRUCTURE
12.6.1. Prerequisites
12.6.2. About Kuryr SDN
12.6.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr
  12.6.3.1. Increasing quota
  12.6.3.2. Configuring Neutron
  12.6.3.3. Configuring Octavia
    12.6.3.3.1. The Octavia OVN Driver
  12.6.3.4. Known limitations of installing with Kuryr
    RHOSP general limitations
    RHOSP version limitations
    RHOSP environment limitations
    RHOSP upgrade limitations
12.6.3.5. Control plane and compute machines
12.6.3.6. Bootstrap machine
12.6.4. Internet and Telemetry access for OpenShift Container Platform
12.6.5. Downloading playbook dependencies
12.6.6. Downloading the installation playbooks
12.6.7. Obtaining the installation program
12.6.8. Generating a key pair for cluster node SSH access
12.6.9. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
12.6.10. Verifying external network access
12.6.11. Enabling access to the environment
  12.6.11.1. Enabling access with floating IP addresses
  12.6.11.2. Completing installation without floating IP addresses
12.6.12. Defining parameters for the installation program
12.6.13. Creating the installation configuration file
  12.6.14.1. Required configuration parameters
12.6.14.2. Network configuration parameters
12.6.14.3. Optional configuration parameters
12.6.14.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
12.6.14.5. Optional RHOSP configuration parameters
12.6.14.6. Additional Google Cloud Platform (GCP) configuration parameters
12.6.14.7. Custom subnets in RHOSP deployments
12.6.14.8. Sample customized install-config.yaml file for RHOSP with Kuryr
  12.6.14.9.1. RHOSP provider network requirements for cluster installation
  12.6.14.9.2. Deploying a cluster that has a primary interface on a provider network
12.6.14.10. Setting a custom subnet for machines
12.6.14.11. Emptying compute machine pools
12.6.14.12. Modifying the network type
12.6.15. Creating the Kubernetes manifest and Ignition config files
12.6.16. Preparing the bootstrap Ignition files
12.6.17. Creating control plane Ignition config files on RHOSP
12.6.18. Creating network resources on RHOSP
12.6.19. Creating the bootstrap machine on RHOSP
12.6.20. Creating the control plane machines on RHOSP
12.6.21. Logging in to the cluster by using the CLI
12.6.22. Deleting bootstrap resources from RHOSP
12.6.23. Creating compute machines on RHOSP
12.6.24. Approving the certificate signing requests for your machines
12.6.25. Verifying a successful installation
12.6.26. Next steps

12.7. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN SR-IOV INFRASTRUCTURE
12.7.1. Prerequisites
12.7.2. Internet and Telemetry access for OpenShift Container Platform
12.7.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
  12.7.3.1. Control plane and compute machines
  12.7.3.2. Bootstrap machine
12.7.4. Downloading playbook dependencies
12.7.5. Downloading the installation playbooks
12.7.6. Obtaining the installation program
12.7.7. Generating a key pair for cluster node SSH access
12.7.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image
12.7.9. Verifying external network access
12.7.10. Enabling access to the environment
  12.7.10.1. Enabling access with floating IP addresses
  12.7.10.2. Completing installation without floating IP addresses
  12.7.11. Defining parameters for the installation program
12.7.12. Creating the installation configuration file
12.7.13. Installation configuration parameters
  12.7.13.1. Required configuration parameters
  12.7.13.2. Network configuration parameters
  12.7.13.3. Optional configuration parameters
  12.7.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
  12.7.13.5. Optional RHOSP configuration parameters
  12.7.13.6. Additional Google Cloud Platform (GCP) configuration parameters
  12.7.13.7. Sample customized install-config.yaml file for RHOSP
  12.7.13.8. Custom subnets in RHOSP deployments
  12.7.13.9. Setting a custom subnet for machines
  12.7.13.10. Emptying compute machine pools
12.7.14. Creating the Kubernetes manifest and Ignition config files
12.7.15. Preparing the bootstrap Ignition files
12.7.16. Creating control plane Ignition config files on RHOSP
12.7.17. Creating network resources on RHOSP
  12.7.17.1. Deploying a cluster with bare metal machines
12.7.18. Creating the bootstrap machine on RHOSP
12.7.19. Creating the control plane machines on RHOSP
12.7.20. Logging in to the cluster by using the CLI
12.7.21. Deleting bootstrap resources from RHOSP
12.7.22. Creating SR-IOV networks for compute machines
12.7.23. Creating compute machines that run on SR-IOV networks
12.7.24. Approving the certificate signing requests for your machines
12.7.25. Verifying a successful installation
12.7.26. Preparing a cluster that runs on RHOSP for SR-IOV
  12.7.26.1. Enabling the RHOSP metadata service as a mountable drive
  12.7.26.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver
12.7.27. Additional resources
12.7.28. Next steps

12.8. INSTALLING A CLUSTER ON OPENSTACK IN A RESTRICTED NETWORK
  12.8.1. Prerequisites
  12.8.2. About installations in restricted networks
    12.8.2.1. Additional limits
  12.8.3. Resource guidelines for installing OpenShift Container Platform on RHOSP
    12.8.3.1. Control plane and compute machines
    12.8.3.2. Bootstrap machine
  12.8.4. Internet and Telemetry access for OpenShift Container Platform
  12.8.5. Enabling Swift on RHOSP
  12.8.6. Defining parameters for the installation program
  12.8.7. Creating the RHCOS image for restricted network installations
  12.8.8. Creating the installation configuration file
    12.8.8.1. Installation configuration parameters
      12.8.8.1.1. Required configuration parameters
      12.8.8.1.2. Network configuration parameters
      12.8.8.1.3. Optional configuration parameters
      12.8.8.1.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters
      12.8.8.1.5. Optional RHOSP configuration parameters
      12.8.8.1.6. Additional Google Cloud Platform (GCP) configuration parameters
    12.8.8.2. Sample customized install-config.yaml file for restricted OpenStack installations
  12.8.9. Generating a key pair for cluster node SSH access
  12.8.10. Enabling access to the environment
    12.8.10.1. Enabling access with floating IP addresses
    12.8.10.2. Completing installation without floating IP addresses
  12.8.11. Deploying the cluster
  12.8.12. Verifying cluster status
  12.8.13. Logging in to the cluster by using the CLI
  12.8.14. Disabling the default OperatorHub sources

12.9. UNINSTALLING A CLUSTER ON OPENSTACK
  12.9.1. Removing a cluster that uses installer-provisioned infrastructure

12.10. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE
  12.10.1. Downloading playbook dependencies
  12.10.2. Removing a cluster from RHOSP that uses your own infrastructure

CHAPTER 13. INSTALLING ON RHV

Table of Contents
13.1. PREPARING TO INSTALL ON RHV

13.1.1. Prerequisites

13.1.2. Choosing a method to install OpenShift Container Platform on RHV

13.1.2.1. Installing a cluster on installer-provisioned infrastructure

13.1.2.2. Installing a cluster on user-provisioned infrastructure

13.2. INSTALLING A CLUSTER QUICKLY ON RHV

13.2.1. Prerequisites

13.2.2. Internet and Telemetry access for OpenShift Container Platform

13.2.3. Requirements for the RHV environment

13.2.4. Verifying the requirements for the RHV environment

13.2.5. Preparing the network environment on RHV

13.2.6. Installing OpenShift Container Platform on RHV in insecure mode

13.2.7. Generating a key pair for cluster node SSH access

13.2.8. Obtaining the installation program

13.2.9. Deploying the cluster

CHAPTER 14. INSTALLING THE OPENSHIFT CLI BY DOWNLOADING THE BINARY

Installing the OpenShift CLI on Linux

Installing the OpenShift CLI on Windows

Installing the OpenShift CLI on macOS

CHAPTER 15. LOGGING IN TO THE CLUSTER BY USING THE CLI

15.1. VERIFYING CLUSTER STATUS

15.2. ACCESSING THE OPENSHIFT CONTAINER PLATFORM WEB CONSOLE ON RHV

15.3. TROUBLESHOOTING COMMON ISSUES WITH INSTALLING ON RED HAT VIRTUALIZATION (RHV)

15.3.1. CPU load increases and nodes go into a Not Ready state

15.3.2. Trouble connecting the OpenShift Container Platform cluster API

15.4. POST-INSTALLATION TASKS

15.5. INSTALLING A CLUSTER ON RHV WITH CUSTOMIZATIONS

15.5.1. Prerequisites

15.5.2. Internet and Telemetry access for OpenShift Container Platform

15.5.3. Requirements for the RHV environment

15.5.4. Verifying the requirements for the RHV environment

15.5.5. Preparing the network environment on RHV

15.5.6. Installing OpenShift Container Platform on RHV in insecure mode

15.5.7. Generating a key pair for cluster node SSH access

15.5.8. Obtaining the installation program

15.5.9. Creating the installation configuration file

15.5.9.1. Example install--config.yaml files for Red Hat Virtualization (RHV)

Example default install--config.yaml file

Example minimal install--config.yaml file

Example Custom machine pools in an install--config.yaml file

Example non-enforcing affinity group

Example removing all affinity groups for a non-production lab setup

15.5.9.2. Installation configuration parameters

15.5.9.2.1. Required configuration parameters

15.5.9.2.2. Network configuration parameters

15.5.9.2.3. Optional configuration parameters

15.5.9.2.4. Additional Google Cloud Platform (GCP) configuration parameters

15.5.9.2.5. Additional Red Hat Virtualization (RHV) configuration parameters

15.5.9.2.6. Additional RHV parameters for machine pools

15.5.10. Deploying the cluster

15.5.11. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
15.5.12. Logging in to the cluster by using the CLI
15.5.13. Verifying cluster status
15.5.14. Accessing the OpenShift Container Platform web console on RHV
15.5.15. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)
  15.5.15.1. CPU load increases and nodes go into a Not Ready state
  15.5.15.2. Trouble connecting the OpenShift Container Platform cluster API
15.5.16. Post-installation tasks
15.5.17. Next steps
15.6. INSTALLING A CLUSTER ON RHV WITH USER-PROVISIONED INFRASTRUCTURE
  15.6.1. Prerequisites
  15.6.2. Internet and Telemetry access for OpenShift Container Platform
  15.6.3. Requirements for the RHV environment
  15.6.4. Verifying the requirements for the RHV environment
  15.6.5. Network infrastructure configuration for installing OpenShift Container Platform on Red Hat Virtualization (RHV)
  15.6.6. Setting up the installation machine
  15.6.7. Installing OpenShift Container Platform on RHV in insecure mode
  15.6.8. Generating a key pair for cluster node SSH access
  15.6.9. Obtaining the installation program
  15.6.10. Downloading the Ansible playbooks
  15.6.11. The inventory.yml file
  15.6.12. Specifying the RHCOS image settings
  15.6.13. Creating the install config file
  15.6.14. Customizing install-config.yaml
  15.6.15. Generate manifest files
  15.6.16. Making control-plane nodes non-schedulable
  15.6.17. Building the Ignition files
  15.6.18. Creating templates and virtual machines
  15.6.19. Creating the bootstrap machine
  15.6.20. Creating the control plane nodes
  15.6.21. Verifying cluster status
  15.6.22. Removing the bootstrap machine
  15.6.23. Creating the worker nodes and completing the installation
15.7. INSTALLING A CLUSTER ON RHV IN A RESTRICTED NETWORK
  15.7.1. Prerequisites
  15.7.2. About installations in restricted networks
    15.7.2.1. Additional limits
  15.7.3. Internet and Telemetry access for OpenShift Container Platform
  15.7.4. Requirements for the RHV environment
  15.7.5. Verifying the requirements for the RHV environment
  15.7.6. Networking requirements for user-provisioned infrastructure
    15.7.6.1. Setting the cluster node hostnames through DHCP
    15.7.6.2. Network connectivity requirements
  15.7.7. User-provisioned DNS requirements
    15.7.7.1. Example DNS configuration for user-provisioned clusters
    15.7.7.2. Load balancing requirements for user-provisioned infrastructure
      15.7.7.2.1. Example load balancer configuration for user-provisioned clusters
  15.7.8. Setting up the installation machine
  15.7.9. Setting up the CA certificate for RHV
  15.7.10. Generating a key pair for cluster node SSH access
15.7.11. Downloading the Ansible playbooks
15.7.12. The inventory.yml file
15.7.13. Specifying the RHCOS image settings
15.7.14. Creating the install config file
15.7.15. Sample install-config.yaml file for RHV
  15.7.15.1. Configuring the cluster-wide proxy during installation
15.7.16. Customizing install-config.yaml
15.7.17. Generate manifest files
15.7.18. Making control-plane nodes non-schedulable
15.7.19. Building the Ignition files
15.7.20. Creating templates and virtual machines
15.7.21. Creating the bootstrap machine
15.7.22. Creating the control plane nodes
15.7.23. Verifying cluster status
15.7.24. Removing the bootstrap machine
15.7.25. Creating the worker nodes and completing the installation
15.7.26. Disabling the default OperatorHub sources
15.8. UNINSTALLING A CLUSTER ON RHV
  15.8.1. Removing a cluster that uses installer-provisioned infrastructure
  15.8.2. Removing a cluster that uses user-provisioned infrastructure

CHAPTER 16. INSTALLING ON VSPHERE

16.1. PREPARING TO INSTALL ON VSPHERE
  16.1.1. Prerequisites
  16.1.2. Choosing a method to install OpenShift Container Platform on vSphere
    16.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere
    16.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on vSphere
  16.1.3. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere

16.2. INSTALLING A CLUSTER ON VSPHERE
  16.2.1. Prerequisites
  16.2.2. Internet and Telemetry access for OpenShift Container Platform
  16.2.3. VMware vSphere infrastructure requirements
  16.2.4. vCenter requirements
     Required vCenter account privileges
     Using OpenShift Container Platform with vMotion
     Cluster resources
     Cluster limits
     Networking requirements
     Required IP Addresses
     DNS records
  16.2.5. Generating a key pair for cluster node SSH access
  16.2.6. Obtaining the installation program
  16.2.7. Adding vCenter root CA certificates to your system trust
  16.2.8. Deploying the cluster
  16.2.9. Installing the OpenShift CLI by downloading the binary
    Installing the OpenShift CLI on Linux
    Installing the OpenShift CLI on Windows
    Installing the OpenShift CLI on macOS
  16.2.10. Logging in to the cluster by using the CLI
  16.2.11. Creating registry storage
    16.2.11.1. Image registry removed during installation
    16.2.11.2. Image registry storage configuration
16.2.11.2.1. Configuring registry storage for VMware vSphere
16.2.11.2.2. Configuring block registry storage for VMware vSphere
16.2.12. Backing up VMware vSphere volumes
16.2.13. Next steps

16.3. INSTALLING A CLUSTER ON VSPHERE WITH CUSTOMIZATIONS
16.3.1. Prerequisites
16.3.2. Internet and Telemetry access for OpenShift Container Platform
16.3.3. VMware vSphere infrastructure requirements
16.3.4. vCenter requirements
16.3.5. Generating a key pair for cluster node SSH access
16.3.6. Obtaining the installation program
16.3.7. Adding vCenter root CA certificates to your system trust
16.3.8. Creating the installation configuration file
16.3.9. Deploying the cluster
16.3.10. Installing the OpenShift CLI by downloading the binary
16.3.11. Logging in to the cluster by using the CLI
16.3.12. Creating registry storage
16.3.13. Backing up VMware vSphere volumes
16.3.14. Next steps

16.4. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS
16.4.1. Prerequisites
16.4.2. Internet and Telemetry access for OpenShift Container Platform
16.4.3. VMware vSphere infrastructure requirements
16.4.4. vCenter requirements
16.4.5. Backing up VMware vSphere volumes
16.4.6. Next steps
16.4.5. Generating a key pair for cluster node SSH access
16.4.6. Obtaining the installation program
16.4.7. Adding vCenter root CA certificates to your system trust
16.4.8. Creating the installation configuration file
  16.4.8.1. Installation configuration parameters
    16.4.8.1.1. Required configuration parameters
    16.4.8.1.2. Network configuration parameters
    16.4.8.1.3. Optional configuration parameters
    16.4.8.1.4. Additional Google Cloud Platform (GCP) configuration parameters
    16.4.8.1.5. Additional VMware vSphere configuration parameters
    16.4.8.1.6. Optional VMware vSphere machine pool configuration parameters
  16.4.8.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
16.4.9. Network configuration phases
16.4.10. Specifying advanced network configuration
16.4.11. Cluster Network Operator configuration
  16.4.11.1. Cluster Network Operator configuration object
    defaultNetwork object configuration
    Configuration for the OpenShift SDN CNI cluster network provider
    Configuration for the OVN-Kubernetes CNI cluster network provider
    kubeProxyConfig object configuration
16.4.12. Deploying the cluster
16.4.13. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
16.4.14. Logging in to the cluster by using the CLI
16.4.15. Creating registry storage
  16.4.15.1. Image registry removed during installation
  16.4.15.2. Image registry storage configuration
    16.4.15.2.1. Configuring registry storage for VMware vSphere
    16.4.15.2.2. Configuring block registry storage for VMware vSphere
16.4.16. Backing up VMware vSphere volumes
16.4.17. Next steps

16.5. INSTALLING A CLUSTER ON VSPHERE WITH USER-PROVISIONED INFRASTRUCTURE
16.5.1. Prerequisites
16.5.2. Internet and Telemetry access for OpenShift Container Platform
16.5.3. VMware vSphere infrastructure requirements
16.5.4. Requirements for a cluster with user-provisioned infrastructure
  16.5.4.1. Required machines
  16.5.4.2. Minimum resource requirements
  16.5.4.3. Managing certificate signing requests
  16.5.4.4. Networking requirements for user-provisioned infrastructure
    16.5.4.4.1. Setting the cluster node hostnames through DHCP
    16.5.4.4.2. Network connectivity requirements
      Ethernet adaptor hardware address requirements
  16.5.4.5. User-provisioned DNS requirements
    16.5.4.5.1. Example DNS configuration for user-provisioned clusters
  16.5.4.6. Load balancing requirements for user-provisioned infrastructure
    16.5.4.6.1. Example load balancer configuration for user-provisioned clusters
16.5.5. Preparing the user-provisioned infrastructure
16.5.6. Validating DNS resolution for user-provisioned infrastructure
16.5.7. Generating a key pair for cluster node SSH access
16.5.8. Obtaining the installation program
16.5.9. Manually creating the installation configuration file
16.5.9.1. Sample install-config.yaml file for VMware vSphere
16.5.9.2. Configuring the cluster-wide proxy during installation
16.5.10. Creating the Kubernetes manifest and Ignition config files
16.5.11. Extracting the infrastructure name
16.5.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
16.5.13. Adding more compute machines to a cluster in vSphere
16.5.14. Disk partitioning
  Creating a separate /var partition
16.5.15. Updating the bootloader using bootupd
16.5.16. Installing the OpenShift CLI by downloading the binary
  Installing the OpenShift CLI on Linux
  Installing the OpenShift CLI on Windows
  Installing the OpenShift CLI on macOS
16.5.17. Waiting for the bootstrap process to complete
16.5.18. Logging in to the cluster by using the CLI
16.5.19. Approving the certificate signing requests for your machines
16.5.20. Initial Operator configuration
  16.5.20.1. Image registry removed during installation
  16.5.20.2. Image registry storage configuration
    16.5.20.2.1. Configuring registry storage for VMware vSphere
    16.5.20.2.2. Configuring storage for the image registry in non-production clusters
  16.5.20.2.3. Configuring block registry storage for VMware vSphere
16.5.21. Completing installation on user-provisioned infrastructure
16.5.22. Backing up VMware vSphere volumes
16.5.23. Next steps

16.6. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS
16.6.1. Prerequisites
16.6.2. Internet and Telemetry access for OpenShift Container Platform
16.6.3. VMware vSphere infrastructure requirements
16.6.4. Requirements for a cluster with user-provisioned infrastructure
  16.6.4.1. Required machines
  16.6.4.2. Minimum resource requirements
  16.6.4.3. Managing certificate signing requests
  16.6.4.4. Networking requirements for user-provisioned infrastructure
    16.6.4.4.1. Setting the cluster node hostnames through DHCP
    16.6.4.4.2. Network connectivity requirements
      Ethernet adaptor hardware address requirements
  16.6.4.5. User-provisioned DNS requirements
  16.6.4.5.1. Example DNS configuration for user-provisioned clusters
  16.6.4.6. Load balancing requirements for user-provisioned infrastructure
    16.6.4.6.1. Example load balancer configuration for user-provisioned clusters
16.6.5. Preparing the user-provisioned infrastructure
16.6.6. Validating DNS resolution for user-provisioned infrastructure
16.6.7. Generating a key pair for cluster node SSH access
16.6.8. Obtaining the installation program
16.6.9. Manually creating the installation configuration file
  16.6.9.1. Sample install-config.yaml file for VMware vSphere
16.6.10. Network configuration phases
16.6.11. Specifying advanced network configuration
    defaultNetwork object configuration
Configuration for the OpenShift SDN CNI cluster network provider
Configuration for the OVN-Kubernetes CNI cluster network provider
kubeProxyConfig object configuration

16.6.13. Creating the Ignition config files
16.6.14. Extracting the infrastructure name
16.6.15. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
16.6.16. Adding more compute machines to a cluster in vSphere
16.6.17. Disk partitioning
   Creating a separate /var partition
16.6.18. Updating the bootloader using bootupd
16.6.19. Waiting for the bootstrap process to complete
16.6.20. Logging in to the cluster by using the CLI
16.6.21. Approving the certificate signing requests for your machines
   16.6.21.1. Initial Operator configuration
   16.6.21.2. Image registry removed during installation
   16.6.21.3. Image registry storage configuration
      16.6.21.3.1. Configuring block registry storage for VMware vSphere
   16.6.22. Completing installation on user-provisioned infrastructure
16.6.23. Backing up VMware vSphere volumes
16.6.24. Next steps

16.7. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK

16.7.1. Prerequisites
16.7.2. About installations in restricted networks
   16.7.2.1. Additional limits
16.7.3. Internet and Telemetry access for OpenShift Container Platform
16.7.4. VMware vSphere infrastructure requirements
16.7.5. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
16.7.6. Generating a key pair for cluster node SSH access
16.7.7. Adding vCenter root CA certificates to your system trust
16.7.8. Creating the RHCOS image for restricted network installations
16.7.9. Creating the installation configuration file
   16.7.9.1. Installation configuration parameters
      16.7.9.1.1. Required configuration parameters
      16.7.9.1.2. Network configuration parameters
      16.7.9.1.3. Optional configuration parameters
      16.7.9.1.4. Additional Google Cloud Platform (GCP) configuration parameters
      16.7.9.1.5. Additional VMware vSphere configuration parameters
      16.7.9.1.6. Optional VMware vSphere machine pool configuration parameters
   16.7.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
   16.7.9.3. Configuring the cluster-wide proxy during installation
16.7.10. Deploying the cluster
16.7.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
16.7.12. Logging in to the cluster by using the CLI
16.7.13. Disabling the default OperatorHub sources
16.7.14. Creating registry storage
  16.7.14.1. Image registry removed during installation
  16.7.14.2. Image registry storage configuration
    16.7.14.2.1. Configuring registry storage for VMware vSphere
  16.7.15. Next steps

16.8. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE
  16.8.1. Prerequisites
  16.8.2. About installations in restricted networks
    16.8.2.1. Additional limits
  16.8.3. Internet and Telemetry access for OpenShift Container Platform
  16.8.4. VMware vSphere infrastructure requirements
  16.8.5. Requirements for a cluster with user-provisioned infrastructure
    16.8.5.1. Required machines
    16.8.5.2. Minimum resource requirements
    16.8.5.3. Managing certificate signing requests
    16.8.5.4. Networking requirements for user-provisioned infrastructure
      16.8.5.4.1. Setting the cluster node hostnames through DHCP
      16.8.5.4.2. Network connectivity requirements
      Ethernet adaptor hardware address requirements
    16.8.5.5. User-provisioned DNS requirements
      16.8.5.5.1. Example DNS configuration for user-provisioned clusters
    16.8.5.6. Load balancing requirements for user-provisioned infrastructure
      16.8.5.6.1. Example load balancer configuration for user-provisioned clusters
  16.8.6. Preparing the user-provisioned infrastructure
  16.8.7. Validating DNS resolution for user-provisioned infrastructure
  16.8.8. Generating a key pair for cluster node SSH access
  16.8.9. Manually creating the installation configuration file
    16.8.9.1. Sample install-config.yaml file for VMware vSphere
    16.8.9.2. Configuring the cluster-wide proxy during installation
  16.8.10. Creating the Kubernetes manifest and Ignition config files
  16.8.11. Configuring chrony time service
  16.8.12. Extracting the infrastructure name
  16.8.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process
  16.8.14. Adding more compute machines to a cluster in vSphere
  16.8.15. Disk partitioning
    Creating a separate /var partition
  16.8.16. Updating the bootloader using bootupd
  16.8.17. Waiting for the bootstrap process to complete
  16.8.18. Logging in to the cluster by using the CLI
  16.8.19. Approving the certificate signing requests for your machines
  16.8.20. Initial Operator configuration
    16.8.20.1. Disabling the default OperatorHub sources
    16.8.20.2. Image registry storage configuration
      16.8.20.2.1. Configuring registry storage for VMware vSphere
      16.8.20.2.2. Configuring storage for the image registry in non-production clusters
      16.8.20.2.3. Configuring block registry storage for VMware vSphere
    16.8.21. Completing installation on user-provisioned infrastructure
    16.8.22. Backing up VMware vSphere volumes
  16.8.23. Next steps

16.9. UNINSTALLING A CLUSTER ON VSPHERE THAT USES INSTALLER-PROVISIONED INFRASTRUCTURE
### 16.10. USING THE VSPHERE PROBLEM DETECTOR OPERATOR

17.3.3. Internet and Telemetry access for OpenShift Container Platform
17.3.4. VMware vSphere infrastructure requirements
17.3.5. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
17.3.6. Generating a key pair for cluster node SSH access
17.3.7. Obtaining the installation program
17.3.8. Adding vCenter root CA certificates to your system trust
17.3.9. Creating the installation configuration file
   17.3.9.1. Installation configuration parameters
      17.3.9.1.1. Required configuration parameters
      17.3.9.1.2. Network configuration parameters
      17.3.9.1.3. Optional configuration parameters
      17.3.9.1.4. Additional Google Cloud Platform (GCP) configuration parameters
      17.3.9.1.5. Additional VMware vSphere configuration parameters
      17.3.9.1.6. Optional VMware vSphere machine pool configuration parameters
   17.3.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
17.3.10. Deploying the cluster
17.3.11. Installing the OpenShift CLI by downloading the binary
   Installing the OpenShift CLI on Linux
   Installing the OpenShift CLI on Windows
   Installing the OpenShift CLI on macOS
17.3.12. Logging in to the cluster by using the CLI
17.3.13. Creating registry storage
   17.3.13.1. Image registry removed during installation
   17.3.13.2. Image registry storage configuration
      17.3.13.2.1. Configuring registry storage for VMware vSphere
      17.3.13.2.2. Configuring block registry storage for VMware vSphere
   17.3.14. Backing up VMware vSphere volumes
17.3.15. Next steps

17.4. INSTALLING A CLUSTER ON VMC WITH NETWORK CUSTOMIZATIONS
17.4.1. Setting up VMC for vSphere
17.4.1.1. VMC Sizer tool
17.4.2. vSphere prerequisites
17.4.3. Internet and Telemetry access for OpenShift Container Platform
17.4.4. VMware vSphere infrastructure requirements
17.4.5. vCenter requirements
   Required vCenter account privileges
   Using OpenShift Container Platform with vMotion
   Cluster resources
   Cluster limits
   Networking requirements
   Required IP Addresses
   DNS records
17.4.6. Generating a key pair for cluster node SSH access
17.4.7. Obtaining the installation program
17.4.8. Adding vCenter root CA certificates to your system trust
17.4.9. Creating the installation configuration file
17.4.9.1. Installation configuration parameters
17.4.9.1.1. Required configuration parameters
17.4.9.1.2. Network configuration parameters
17.4.9.1.3. Optional configuration parameters
17.4.9.1.4. Additional Google Cloud Platform (GCP) configuration parameters
17.4.9.1.5. Additional VMware vSphere configuration parameters
17.4.9.1.6. Optional VMware vSphere machine pool configuration parameters
17.4.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster
17.4.10. Network configuration phases
17.4.11. Specifying advanced network configuration
17.4.12. Cluster Network Operator configuration
17.4.12.1. Cluster Network Operator configuration object
defaultNetwork object configuration
Configuration for the OpenShift SDN CNI cluster network provider
Configuration for the OVN-Kubernetes CNI cluster network provider
kubeProxyConfig object configuration
17.4.13. Deploying the cluster
17.4.14. Installing the OpenShift CLI by downloading the binary
Installing the OpenShift CLI on Linux
Installing the OpenShift CLI on Windows
Installing the OpenShift CLI on macOS
17.4.15. Logging in to the cluster by using the CLI
17.4.16. Creating registry storage
17.4.16.1. Image registry removed during installation
17.4.16.2. Image registry storage configuration
17.4.16.2.1. Configuring registry storage for VMware vSphere
17.4.16.2.2. Configuring block registry storage for VMware vSphere
17.4.17. Backing up VMware vSphere volumes
17.4.18. Next steps
17.5. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK
17.5.1. Setting up VMC for vSphere
17.5.1.1. VMC Sizer tool
17.5.2. vSphere prerequisites
17.5.3. About installations in restricted networks
17.5.3.1. Additional limits
17.5.4. Internet and Telemetry access for OpenShift Container Platform
17.5.5. VMware vSphere infrastructure requirements
17.5.6. vCenter requirements
Required vCenter account privileges
Using OpenShift Container Platform with vMotion
Cluster resources
Cluster limits
Networking requirements
Required IP Addresses
DNS records
17.5.7. Generating a key pair for cluster node SSH access
17.5.8. Adding vCenter root CA certificates to your system trust
17.5.9. Creating the RHCOS image for restricted network installations
17.5.10. Creating the installation configuration file
17.5.10.1. Installation configuration parameters
17.5.10.1.1. Required configuration parameters
17.5.10.1.2. Network configuration parameters
17.5.10.1.3. Optional configuration parameters
17.5.10.1.4. Additional Google Cloud Platform (GCP) configuration parameters

17.5.10.1.5. Additional VMware vSphere configuration parameters

17.5.10.1.6. Optional VMware vSphere machine pool configuration parameters

17.5.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster

17.5.10.3. Configuring the cluster-wide proxy during installation

17.5.11. Deploying the cluster

17.5.12. Installing the OpenShift CLI by downloading the binary

- Installing the OpenShift CLI on Linux
- Installing the OpenShift CLI on Windows
- Installing the OpenShift CLI on macOS

17.5.13. Logging in to the cluster by using the CLI

17.5.14. Disabling the default OperatorHub sources

17.5.15. Creating registry storage

- 17.5.15.1. Image registry removed during installation
- 17.5.15.2. Image registry storage configuration
- 17.5.15.2.1. Configuring registry storage for VMware vSphere

17.5.16. Next steps

17.6. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE

17.6.1. Setting up VMC for vSphere

- 17.6.1.1. VMC Sizer tool
- 17.6.2. vSphere prerequisites
- 17.6.3. Internet and Telemetry access for OpenShift Container Platform

17.6.4. VMware vSphere infrastructure requirements

17.6.5. Requirements for a cluster with user-provisioned infrastructure

- 17.6.5.1. Required machines
- 17.6.5.2. Minimum resource requirements
- 17.6.5.3. Managing certificate signing requests

17.6.4.5. Networking requirements for user-provisioned infrastructure

- 17.6.5.4.1. Setting the cluster node hostnames through DHCP
- 17.6.5.4.2. Network connectivity requirements

17.6.5.5. User-provisioned DNS requirements

- 17.6.5.5.1. Example DNS configuration for user-provisioned clusters

17.6.5.6. Load balancing requirements for user-provisioned infrastructure

- 17.6.5.6.1. Example load balancer configuration for user-provisioned clusters

17.6.6. Preparing the user-provisioned infrastructure

17.6.7. Validating DNS resolution for user-provisioned infrastructure

17.6.8. Generating a key pair for cluster node SSH access

17.6.9. Obtaining the installation program

17.6.10. Manually creating the installation configuration file

- 17.6.10.1. Sample install-config.yaml file for VMware vSphere
- 17.6.10.2. Configuring the cluster-wide proxy during installation

17.6.11. Creating the Kubernetes manifest and Ignition config files

17.6.12. Extracting the infrastructure name

17.6.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process

17.6.14. Adding more compute machines to a cluster in vSphere

17.6.15. Disk partitioning
- Creating a separate /var partition

17.6.16. Updating the bootloader using bootupd

17.6.17. Installing the OpenShift CLI by downloading the binary

- Installing the OpenShift CLI on Linux

1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

The OpenShift Container Platform installation program offers you flexibility. You can use the installation program to deploy a cluster on infrastructure that the installation program provisions and the cluster maintains or deploy a cluster on infrastructure that you prepare and maintain.

These two basic types of OpenShift Container Platform clusters are frequently called installer-provisioned infrastructure clusters and user-provisioned infrastructure clusters.

Both types of clusters have the following characteristics:

- Highly available infrastructure with no single points of failure is available by default
- Administrators maintain control over what updates are applied and when

You use the same installation program to deploy both types of clusters. The main assets generated by the installation program are the Ignition config files for the bootstrap, master, and worker machines. With these three configurations and correctly configured infrastructure, you can start an OpenShift Container Platform cluster.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installation. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel. The ultimate target is a running cluster. By meeting dependencies instead of running commands, the installation program is able to recognize and use existing components instead of running the commands to create them again.

The following diagram shows a subset of the installation targets and dependencies:

**Figure 1.1. OpenShift Container Platform installation targets and dependencies**

After installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. It includes the kubelet, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.8 cluster must use RHCOS, which
includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure
the machines. Operating system updates are delivered as an Atomic OSTree repository that is
embedded in a container image that is rolled out across the cluster by an Operator. Actual operating
system changes are made in-place on each machine as an atomic operation by using rpm-ostree.
Together, these technologies enable OpenShift Container Platform to manage the operating system
like it manages any other application on the cluster, via in-place upgrades that keep the entire platform
up-to-date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its
components and machines, including the operating system. Because of this, only the installation
program and the Machine Config Operator can change machines. The installation program uses Ignition
config files to set the exact state of each machine, and the Machine Config Operator completes more
changes to the machines, such as the application of new certificates or keys, after installation.

1.1.1. Installation process

When you install an OpenShift Container Platform cluster, you download the installation program from
the appropriate Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. This site
manages:

- REST API for accounts
- Registry tokens, which are the pull secrets that you use to obtain the required components
- Cluster registration, which associates the cluster identity to your Red Hat account to facilitate
  the gathering of usage metrics

In OpenShift Container Platform 4.8, the installation program is a Go binary file that performs a series
of file transformations on a set of assets. The way you interact with the installation program differs
depending on your installation type.

- For clusters with installer-provisioned infrastructure, you delegate the infrastructure
  bootstrapping and provisioning to the installation program instead of doing it yourself. The
  installation program creates all of the networking, machines, and operating systems that are
  required to support the cluster.
- If you provision and manage the infrastructure for your cluster, you must provide all of the
  cluster infrastructure and resources, including the bootstrap machine, networking, load
  balancing, storage, and individual cluster machines.

You use three sets of files during installation: an installation configuration file that is named install-
config.yaml, Kubernetes manifests, and Ignition config files for your machine types.

**IMPORTANT**

It is possible to modify Kubernetes and the Ignition config files that control the
underlying RHCOS operating system during installation. However, no validation is
available to confirm the suitability of any modifications that you make to these objects. If
you modify these objects, you might render your cluster non-functional. Because of this
risk, modifying Kubernetes and Ignition config files is not supported unless you are
following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are
wrapped into Ignition config files. The installation program uses these Ignition config files to create the
cluster.
The installation configuration files are all pruned when you run the installation program, so be sure to back up all configuration files that you want to use again.

**IMPORTANT**

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

**The installation process with installer-provisioned infrastructure**

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.

If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.

With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

**The installation process with user-provisioned infrastructure**

You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself, including:

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL worker machines to your cluster.

**Installation process details**

Because each machine in the cluster requires information about the cluster when it is provisioned, OpenShift Container Platform uses a temporary bootstrap machine during initial configuration to provide the required information to the permanent control plane. It boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines.
(also known as the master machines) that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:

**Figure 1.2. Creating the bootstrap, master, and worker machines**

After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for [Recovering from expired control plane certificates](#) for more information.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. (Requires manual intervention if you provision the infrastructure)

2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.

3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. (Requires manual intervention if you provision the infrastructure)

4. The temporary control plane schedules the production control plane to the production control plane machines.

5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.

6. The temporary control plane shuts down and passes control to the production control plane.

7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.
8. The installation program shuts down the bootstrap machine. (Requires manual intervention if you provision the infrastructure)

9. The control plane sets up the worker nodes.

10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a fully running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operation, including the creation of worker machines in supported environments.

**Installation scope**
The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

**Additional resources**

- See [Available cluster customizations](#) for details about OpenShift Container Platform configuration resources.

**1.2. SUPPORTED PLATFORMS FOR OPENSHIFT CLUSTERS**

In OpenShift Container Platform 4.8, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Amazon Web Services (AWS)
- Google Cloud Platform (GCP)
- Microsoft Azure
- Red Hat OpenStack Platform (RHOSP) version 13 and 16
  - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the [OpenShift Container Platform on RHOSP support matrix](#).
- Red Hat Virtualization (RHV)
- VMware vSphere
- VMware Cloud (VMC) on AWS

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

**IMPORTANT**

After installation, the following changes are not supported:

- Mixing cloud provider platforms
- Mixing cloud provider components, such as using a persistent storage framework from a differing platform than what the cluster is installed on
In OpenShift Container Platform 4.8, you can install a cluster that uses user-provisioned infrastructure on the following platforms:

- AWS
- Azure
- GCP
- RHOSP
- RHV
- VMware vSphere
- VMware Cloud on AWS
- Bare metal
- IBM Z or LinuxONE
- IBM Power Systems

With installations on user-provisioned infrastructure, each machine can have full internet access, you can place your cluster behind a proxy, or you can perform a restricted network installation. In a restricted network installation, you can download the images that are required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a restricted network installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The OpenShift Container Platform 4.x Tested Integrations page contains details about integration testing for different platforms.

Additional resources

- See Supported installation methods for different platforms for more information about the types of installations that are available for each supported platform.

- See Selecting a cluster installation method and preparing it for users for information about choosing an installation method and preparing the required resources.
CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and make sure you have all of the required resources to prepare the cluster for users.

2.1. SELECTING A CLUSTER INSTALLATION TYPE

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform (GCP)
- Red Hat OpenStack Platform (RHOSP) (RHOSP)
- Red Hat Virtualization (RHV) (RHV)
- IBM Z and LinuxONE
- IBM Z and LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same datacenter or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use OpenShift Dedicated or OpenShift Online. You can also use OpenShift as a managed service on Azure, AWS, IBM Cloud, or Google Cloud. For more information about managed services, see the OpenShift Products page.

2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves the Operators that package, deploy, and manage Kubernetes applications and the operating system...
that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines as part of the installation process for OpenShift Container Platform. See Comparing OpenShift Container Platform 3 and OpenShift Container Platform 4.

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see OpenShift Migration Best Practices. Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

### 2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called installer provisioned infrastructure installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to AWS, Azure, GCP, or VMC on AWS. These installation methods are the fastest way to deploy a production-capable OpenShift Container Platform cluster.

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for AWS, Azure, GCP, or VMC on AWS.

For installer-provisioned infrastructure installations, you can use an existing VPC in AWS, vNet in Azure, or VPC in GCP. You can also reuse part of your networking infrastructure so that your cluster in AWS, Azure, GCP, or VMC on AWS can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for RHOSP, RHOSP with Kuryr, RHV, vSphere, and bare metal.

If you want to reuse extensive cloud infrastructure, you can complete a user-provisioned infrastructure installation. With these installations, you manually deploy the machines that your cluster requires during the installation process. If you perform a user-provisioned infrastructure installation on AWS, Azure, GCP, or VMC on AWS, you can use the provided templates to help you stand up all of the required components. Otherwise, you can use the provider-agnostic installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you use RHOSP, RHOSP on SR-IOV, RHV, IBM Z or LinuxONE, IBM Power, or vSphere, use the specific installation instructions to deploy your cluster. If you use other supported hardware, follow the bare metal installation procedure.

### 2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The instructions are included in each installation procedure.
If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy a private cluster with installer-provisioned infrastructure on AWS, Azure, or GCP.

If you need to install your cluster that has limited access to the Internet, such as a disconnected or restricted network cluster, you can mirror the installation packages and install the cluster from them. Follow detailed instructions for user provisioned infrastructure installations into restricted networks for AWS, GCP, IBM Z or LinuxONE, IBM Z or LinuxONE with RHEL KVM, IBM Power, vSphere, VMC on AWS, or bare metal. You can also install a cluster into a restricted network using installer-provisioned infrastructure by following detailed instructions for AWS, GCP, VMC on AWS, RHOSP, RHV, and vSphere.

If you need to deploy your cluster to an AWS GovCloud region or Azure government region, you can configure those custom regions during an installer-provisioned infrastructure installation.

You can also configure the cluster machines to use FIPS Validated / Modules in Process cryptographic libraries during installation.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

### 2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION

Some configuration is not required to install the cluster but recommended before your users access the cluster. You can customize the cluster itself by customizing the Operators that make up your cluster and integrate your cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- Persistent storage
- An identity provider
- Monitoring core OpenShift Container Platform components

### 2.3. PREPARING YOUR CLUSTER FOR WORKLOADS

Depending on your workload needs, you might need to take extra steps before you begin deploying applications. For example, after you prepare infrastructure to support your application build strategy, you might need to make provisions for low-latency workloads or to protect sensitive workloads. You can also configure monitoring for application workloads. If you plan to run Windows workloads, you must enable hybrid networking with OVN-Kubernetes during the installation process; hybrid networking cannot be enabled after your cluster is installed.

### 2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS

You can perform different types of installations on different platforms.

**NOTE**

Not all installation options are supported for all platforms, as shown in the following tables.
### Table 2.1. Installer-provisioned infrastructure options

CHAPTER 3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. You can also use this procedure in unrestricted networks to ensure your clusters only use container images that have satisfied your organizational controls on external content.

IMPORTANT

You must have access to the internet to obtain the necessary container images. In this procedure, you place the mirror registry on a mirror host that has access to both your network and the Internet. If you do not have access to a mirror host, use the disconnected procedure to copy images to a device you can move across network boundaries with.

3.1. PREREQUISITES

- You must have a container image registry that supports Docker v2-2 in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
  - Red Hat Quay
  - JFrog Artifactory
  - Sonatype Nexus Repository
  - Harbor

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay for proof-of-concept purposes or by using the Quay Operator. If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat support.

3.2. ABOUT THE MIRROR REGISTRY

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a mirror registry. These actions use the same process. The release image, which contains the description of the content, and the images it references are all mirrored. In addition, the Operator catalog source image and the images that it references must be mirrored for each Operator that you use. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

The mirror registry can be any container registry that supports Docker v2-2. All major cloud provider registries, as well as Red Hat Quay, Artifactory, and others, have the necessary support. Using one of these registries ensures that OpenShift Container Platform can verify the integrity of each image in disconnected environments.

The mirror registry must be reachable by every machine in the clusters that you provision. If the registry is unreachable or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate a mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as
connected mirroring. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as disconnected mirroring.

3.3. PREPARING YOUR MIRROR HOST

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.

3.3.1. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:
   
   ```
   $ tar xvzf <file>
   ```
5. Place the oc binary in a directory that is on your PATH.
   
   To check your PATH, execute the following command:
   
   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```
3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:> path
   ```

   After you install the CLI, it is available using the `oc` command:

   ```
   C:> oc <command>
   ```

   **Installing the OpenShift CLI on macOS**
   You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

   **Procedure**

   1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

   2. Select your infrastructure provider, and, if applicable, your installation type.

   3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.

   4. Unpack and unzip the archive.

   5. Move the `oc` binary to a directory on your **PATH**.
      To check your **PATH**, open a terminal and execute the following command:

      ```
      $ echo $PATH
      ```

      After you install the CLI, it is available using the `oc` command:

      ```
      $ oc <command>
      ```

   **3.4. CONFIGURING CREDENTIALS THAT ALLOW IMAGES TO BE MIRRORED**

   Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

   **WARNING**

   Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.
WARNING
This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

Prerequisites

- You configured a mirror registry to use in your restricted network.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

Procedure

Complete the following steps on the installation host:

1. Download your `registry.redhat.io` pull secret from the Pull Secret page on the Red Hat OpenShift Cluster Manager site and save it to a `.json` file.

   ```bash
   $ echo -n '<user_name>:<password>' | base64 -w0
   BGVtbYk3ZHAtqXs=
   
   1 For `<user_name>` and `<password>`, specify the user name and password that you configured for your registry.

2. Generate the base64-encoded user name and password or token for your mirror registry:

   ```bash
   $ cat ./pull-secret.text | jq . > <path>/<pull-secret-file>
   
   1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

   The contents of the file resemble the following example:

   ```json
   {
   "auths": {
   "cloud.openshift.com": {
   "auth": "b3BlbnNo...",
   "email": "you@example.com"
   },
   "quay.io": {
   "auth": "b3BlbnNo...",
   "email": "you@example.com"
   },
   "registry.connect.redhat.com": {
   "auth": "NTE3Njg5Nj...",
   }
   ```
4. Edit the new file and add a section that describes your registry to it:

```
"auths": {
  "<mirror_registry>": {
    "auth": "<credentials>",
    "email": "you@example.com"
  },
  "cloud.openshift.com": {
    "auth": "b3BlbnNo...",
    "email": "you@example.com"
  },
  "quay.io": {
    "auth": "b3BlbnNo...",
    "email": "you@example.com"
  },
  "registry.connect.redhat.com": {
    "auth": "NTE3Njg5Nj...",
    "email": "you@example.com"
  },
  "registry.redhat.io": {
    "auth": "NTE3Njg5Nj...",
    "email": "you@example.com"
  }
}
```

1. For `<mirror_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:5000`

2. For `<credentials>`, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{
  "auths": {
    "<mirror_registry>": {
      "auth": "<credentials>",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

### 3.5. MIRRORING THE OPENSIGHT CONTAINER PLATFORM IMAGE REPOSITORY
Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

**Prerequisites**

- Your mirror host has access to the Internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the pull secret from the Pull Secret page on the Red Hat OpenShift Cluster Manager site and modified it to include authentication to your mirror repository.
- If you use self-signed certificates that do not set a Subject Alternative Name, you must precede the `oc` commands in this procedure with `GODEBUG=x509ignoreCN=0`. If you do not set this variable, the `oc` commands will fail with the following error:

  ```
  x509: certificate relies on legacy Common Name field, use SANs or temporarily enable Common Name matching with GODEBUG=x509ignoreCN=0
  ```

**Procedure**

Complete the following steps on the mirror host:

1. Review the OpenShift Container Platform downloads page to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the Repository Tags page.

2. Set the required environment variables:
   
   a. Export the release version:

      ```
      $ OCP_RELEASE=<release_version>
      ```

      For `<release_version>`, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as 4.5.4.

   b. Export the local registry name and host port:

      ```
      $ LOCAL_REGISTRY='<local_registry_host_name>:<local_registry_host_port>'
      ```

      For `<local_registry_host_name>`, specify the registry domain name for your mirror repository, and for `<local_registry_host_port>`, specify the port that it serves content on.

   c. Export the local repository name:

      ```
      $ LOCAL_REPOSITORY='<local_repository_name>'
      ```

      For `<local_repository_name>`, specify the name of the repository to create in your registry, such as `ocp4/openshift4`.

   d. Export the name of the repository to mirror:

      ```
      $ PRODUCT_REPO='openshift-release-dev'
      ```
For a production release, you must specify `openshift-release-dev`.

e. Export the path to your registry pull secret:

\[
\text{\$ LOCAL_SECRET_JSON} = \text{\langle path\_to\_pull\_secret\rangle}
\]

For `\text{\langle path\_to\_pull\_secret\rangle}`, specify the absolute path to and file name of the pull secret for your mirror registry that you created.

f. Export the release mirror:

\[
\text{\$ RELEASE\_NAME} = \text{\"ocp-release\"}
\]

For a production release, you must specify `ocp-release`.

g. Export the type of architecture for your server, such as `x86_64`:

\[
\text{\$ ARCHITECTURE} = \text{\langle server\_architecture\rangle}
\]

h. Export the path to the directory to host the mirrored images:

\[
\text{\$ REMOVABLE\_MEDIA\_PATH} = \text{\langle path\rangle}
\]

Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the internal container registry:

- If your mirror host does not have Internet access, take the following actions:
  i. Connect the removable media to a system that is connected to the Internet.
  ii. Review the images and configuration manifests to mirror:

\[
\text{\$ oc adm release mirror -a} \text{\$\{LOCAL\_SECRET\_JSON\}} \ \text{\--from=quay.io/\{PRODUCT\_REPO\}/\{RELEASE\_NAME\}/\{OCP\_RELEASE\}-\{ARCHITECTURE\}} \ \text{\--to=\{LOCAL\_REGISTRY\}/\{LOCAL\_REPOSITORY\}} \ \text{\--to-release-image=\{LOCAL\_REGISTRY\}/\{LOCAL\_REPOSITORY\}/\{OCP\_RELEASE\}-\{ARCHITECTURE\} \ \text{--dry-run}
\]

iii. Record the entire `imageContentSources` section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the `imageContentSources` section to the `install-config.yaml` file during installation.

iv. Mirror the images to a directory on the removable media:

\[
\text{\$ oc adm release mirror -a} \text{\$\{LOCAL\_SECRET\_JSON\}} \text{\--to-dir=\{REMOVABLE\_MEDIA\_PATH\}/mirror} \text{\quad quay.io/\{PRODUCT\_REPO\}/\{RELEASE\_NAME\}/\{OCP\_RELEASE\}-\{ARCHITECTURE\}}
\]
v. Take the media to the restricted network environment and upload the images to the local container registry.

```
$ oc image mirror -a ${LOCAL_SECRET_JSON} --from-dir=${REMOVABLE_MEDIA_PATH}/mirror 
  "file://openshift/release:${OCP_RELEASE}"
  ${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}
```

1 For REMOVABLE_MEDIA_PATH, you must use the same path that you specified when you mirrored the images.

- If the local container registry is connected to the mirror host, take the following actions:
  
  i. Directly push the release images to the local registry by using following command:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-
  image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE}
```

This command pulls the release information as a digest, and its output includes the imageContentSources data that you require when you install your cluster.

ii. Record the entire imageContentSources section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the imageContentSources section to the install-config.yaml file during installation.

```
NOTE

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.
```

4. To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:

- If your mirror host does not have Internet access, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install 
  "${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}"
```

- If the local container registry is connected to the mirror host, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install 
  "${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE}"
```
IMPORTANT

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active Internet connection.

If you are in a disconnected environment, use the --image flag as part of must-gather and point to the payload image.

5. For clusters using installer-provisioned infrastructure, run the following command:

   $ openshift-install

3.6. THE CLUSTER SAMPLES OPERATOR IN A DISCONNECTED ENVIRONMENT

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

3.6.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named imagstreamtag-to-image in the openshift-cluster-samples-operator namespace. The imagstreamtag-to-image config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is <image_stream_name>_<image_stream_tag_name>.

During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to Removed. If you choose to change it to Managed, it installs samples.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to Removed, you can create your mirrored registry, or determine which existing mirrored registry you want to use.
- Mirror the samples you want to the mirrored registry using the new config map as your guide.
- Add any of the image streams you did not mirror to the skippedImagestreams list of the Cluster Samples Operator configuration object.
- Set samplesRegistry of the Cluster Samples Operator configuration object to the mirrored registry.
- Then set the Cluster Samples Operator to Managed to install the image streams you have mirrored.

3.7. NEXT STEPS

- Mirror the OperatorHub images for the Operators that you want to install in your cluster.
● Install a cluster on infrastructure that you provision in your restricted network, such as on VMware vSphere, bare metal, or Amazon Web Services.

### 3.8. ADDITIONAL RESOURCES

● See Gathering data about specific features for more information about using must-gather.
CHAPTER 4. INSTALLING ON AWS

4.1. PREPARING TO INSTALL ON AWS

4.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

4.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See Configuring an AWS account for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for AWS for other options, including configuring the Cloud Credential Operator (CCO) to use the Amazon Web Services Security Token Service (AWS STS).

4.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

4.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- Installing a cluster quickly on AWS You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- Installing a customized cluster on AWS You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- Installing a cluster on AWS with network customizations You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- Installing a cluster on AWS in a restricted network You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the
installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.

- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.

- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

### 4.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.

- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

### 4.1.4. Next steps

- Configuring an AWS account

### 4.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

#### 4.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.
NOTE

If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see Registering Domain Names Using Amazon Route 53 in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See Making Amazon Route 53 the DNS Service for an Existing Domain in the AWS documentation.

3. Create a public hosted zone for your domain or subdomain. See Creating a Public Hosted Zone in the AWS documentation.
   Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

4. Extract the new authoritative name servers from the hosted zone records. See Getting the Name Servers for a Public Hosted Zone in the AWS documentation.

5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: Adding or Changing Name Servers or Glue Records.

6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain in the AWS documentation for an example high level procedure.

4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses us-gov-west-1 region for Route53 and tagging API clients.

The Ingress Operator uses https://tagging.us-gov-west-1.amazonaws.com as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the Service Endpoints in the AWS documentation about GovCloud (US).

IMPORTANT

Private, disconnected installations are not supported for AWS GovCloud when you install in the us-gov-east-1 region.

Example Route 53 configuration

```
platform:
  aws:
    region: us-gov-west-1
    serviceEndpoints:
      - name: ec2
        url: https://ec2.us-gov-west-1.amazonaws.com
      - name: elasticloadbalancing
        url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
      - name: route53
```
Route 53 defaults to https://route53.us-gov.amazonaws.com for both AWS GovCloud (US) regions.

Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

4.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default Service Limits affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of clusters available by default</th>
<th>Default AWS limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Limits</td>
<td>Varies</td>
<td>Varies</td>
<td>By default, each cluster creates the following instances:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- One bootstrap machine, which is removed after installation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three control plane nodes (also known as the master nodes)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Three worker nodes</td>
</tr>
</tbody>
</table>

These instance type counts are within a new account’s default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.

In most regions, the bootstrap and worker machines use an `m4.large` machines and the control plane machines use `m4.xlarge` instances. In some regions, including all regions that do not support these instance types, `m5.large` and `m5.xlarge` instances are used instead.
To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each availability zone within a region. Each private subnet requires a NAT Gateway, and each NAT gateway requires a separate elastic IP. Review the AWS region map to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit.

**IMPORTANT**

To use the us-east-1 region, you must increase the EIP limit for your account.

#### 4.2.3. Required AWS permissions for the IAM user

When you attach the AdministratorAccess policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 4.1. Required EC2 permissions for installation**

- ec2:AllocateAddress
- ec2:AssociateAddress
- ec2:AuthorizeSecurityGroupEgress
- ec2:AuthorizeSecurityGroupIngress
- ec2:CopyImage
- ec2:CreateNetworkInterface
- ec2:AttachNetworkInterface
- ec2:CreateSecurityGroup
- ec2:CreateTags
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteSnapshot
- ec2:DeleteTags
- ec2:DeregisterImage
- ec2:DescribeAccountAttributes
- ec2:DescribeAddresses
- ec2:DescribeAvailabilityZones
- ec2:DescribeDhcpOptions
- ec2:DescribeImages
- ec2:DescribeInstanceAttribute
- ec2:DescribeInstanceCreditSpecifications
- ec2:DescribeInstances
- ec2:DescribeInstanceTypes
- ec2:DescribeInternetGateways
- ec2:DescribeKeyPairs
- ec2:DescribeNatGateways
- ec2:DescribeNetworkAcls
- ec2:DescribeNetworkInterfaces
- ec2:DescribePrefixLists
- ec2:DescribeRegions
- ec2:DescribeRouteTables
- ec2:DescribeSecurityGroups
- ec2:DescribeSubnets
- ec2:DescribeTags
- ec2:DescribeVolumes
- ec2:DescribeVpcAttribute
- ec2:DescribeVpcClassicLink
- ec2:DescribeVpcClassicLinkDnsSupport
- ec2:DescribeVpcEndpoints
- ec2:DescribeVpcs
- ec2:GetEbsDefaultKmsKeyId
- ec2:ModifyInstanceAttribute
- ec2:ModifyNetworkInterfaceAttribute
- ec2:ReleaseAddress
Example 4.2. Required permissions for creating network resources during installation

- ec2:AssociateDhcpOptions
- ec2:AssociateRouteTable
- ec2:AttachInternetGateway
- ec2:CreateDhcpOptions
- ec2:CreateInternetGateway
- ec2:CreateNatGateway
- ec2:CreateRoute
- ec2:CreateRouteTable
- ec2:CreateSubnet
- ec2:CreateVpc
- ec2:CreateVpcEndpoint
- ec2:ModifySubnetAttribute
- ec2:ModifyVpcAttribute

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.3. Required Elastic Load Balancing permissions for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ConfigureHealthCheck
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateLoadBalancerListeners
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeregisterInstancesFromLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:DescribeInstanceHealth
- elasticloadbalancing:DescribeListeners
- elasticloadbalancing:DescribeLoadBalancerAttributes
- elasticloadbalancing:DescribeLoadBalancers
- elasticloadbalancing:DescribeTags
- elasticloadbalancing:DescribeTargetGroupAttributes
- elasticloadbalancing:DescribeTargetHealth
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
- elasticloadbalancing:ModifyTargetGroupAttributes
- elasticloadbalancing:RegisterInstancesWithLoadBalancer
- elasticloadbalancing:RegisterTargets
- elasticloadbalancing:SetLoadBalancerPoliciesOfListener

Example 4.4. Required IAM permissions for installation

- iam:AddRoleToInstanceProfile
- iam:CreateInstanceProfile
- iam:CreateRole
- iam:DeleteInstanceProfile
- iam:DeleteRole
- iam:DeleteRolePolicy
- iam:GetInstanceProfile
- iam:GetRole
- iam:GetRolePolicy
- iam:GetUser
• iam:ListInstanceProfilesForRole
• iam:ListRoles
• iam:ListUsers
• iam:PassRole
• iam:PutRolePolicy
• iam:RemoveRoleFromInstanceProfile
• iam:SimulatePrincipalPolicy
• iam:TagRole

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

Example 4.5. Required Route 53 permissions for installation

• route53:ChangeResourceRecordSets
• route53:ChangeTagsForResource
• route53:CreateHostedZone
• route53:DeleteHostedZone
• route53:GetChange
• route53:GetHostedZone
• route53:ListHostedZones
• route53:ListHostedZonesByName
• route53:ListResourceRecordSets
• route53:ListTagsForResource
• route53:UpdateHostedZoneComment

Example 4.6. Required S3 permissions for installation

• s3:CreateBucket
• s3:DeleteBucket
• s3:GetAccelerateConfiguration
• s3:GetBucketAcl
- s3:GetBucketCors
- s3:GetBucketLocation
- s3:GetBucketLogging
- s3:GetBucketObjectLockConfiguration
- s3:GetBucketReplication
- s3:GetBucketRequestPayment
- s3:GetBucketTagging
- s3:GetBucketVersioning
- s3:GetBucketWebsite
- s3:GetEncryptionConfiguration
- s3:GetLifecycleConfiguration
- s3:GetReplicationConfiguration
- s3:ListBucket
- s3:PutBucketAcl
- s3:PutBucketTagging
- s3:PutEncryptionConfiguration

Example 4.7. S3 permissions that cluster Operators require
- s3:DeleteObject
- s3:GetObject
- s3:GetObjectAcl
- s3:GetObjectTagging
- s3:GetObjectVersion
- s3:PutObject
- s3:PutObjectAcl
- s3:PutObjectTagging

Example 4.8. Required permissions to delete base cluster resources
- autoscaling:DescribeAutoScalingGroups
- ec2:DeleteNetworkInterface
Example 4.9. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
- ec2:DeleteRouteTable
- ec2:DeleteSubnet
- ec2:DeleteVpc
- ec2:DeleteVpcEndpoints
- ec2:DetachInternetGateway
- ec2:DisassociateRouteTable
- ec2:ReplaceRouteTableAssociation

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the tag:UntagResources permission to delete network resources.
Example 4.10. Additional IAM and S3 permissions that are required to create manifests

- **iam:**CreateAccessKey
- **iam:**CreateUser
- **iam:**DeleteAccessKey
- **iam:**DeleteUser
- **iam:**DeleteUserPolicy
- **iam:**GetUserPolicy
- **iam:**ListAccessKeys
- **iam:**PutUserPolicy
- **iam:**TagUser
- **iam:**GetUserPolicy
- **iam:**ListAccessKeys
- **s3:**PutBucketPublicAccessBlock
- **s3:**GetBucketPublicAccessBlock
- **s3:**PutLifecycleConfiguration
- **s3:**HeadBucket
- **s3:**ListBucketMultipartUploads
- **s3:**AbortMultipartUpload

Example 4.11. Optional permissions for instance and quota checks for installation

- **ec2:**DescribeInstanceTypeOfferings
- **servicequotas:**ListAWSDefaultServiceQuotas

4.2.4. Creating an IAM user

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the Creating an IAM User in Your AWS Account procedure in the AWS documentation, set the following options:

**Procedure**
1. Specify the IAM user name and select **Programmatic access**.

2. Attach the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

   **NOTE**
   
   While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.

4. Confirm that the user name that you specified is granted the **AdministratorAccess** policy.

5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.

   **IMPORTANT**
   
   You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials.

**Additional resources**

- See [Manually creating IAM for AWS](#) for steps to set the Cloud Credential Operator (CCO) to manual mode prior to installation. Use this mode in environments where the cloud identity and access management (IAM) APIs are not reachable, or if you prefer not to store an administrator-level credential secret in the cluster `kube-system` project.

**4.2.5. Required AWS permissions for IAM roles**

You have the option of defining your own IAM roles that are applied to the instance profiles of your machines created by the installation program. You can specify existing IAM roles by defining the `controlPlane.platform.aws.iamRole` and `compute.platform.aws.iamRoleThis` fields in the `install-config.yaml` file. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles.

The control plane and compute machines require the following IAM role permissions:

**Example 4.12. Required IAM role permissions for control plane instance profiles**

- `sts:AssumeRole`
- `ec2:AttachVolume`
- `ec2:AuthorizeSecurityGroupIngress`
- `ec2:CreateSecurityGroup`
- ec2:CreateTags
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteVolume
- ec2:Describe*
- ec2:DetachVolume
- ec2:ModifyInstanceAttribute
- ec2:ModifyVolume
- ec2:RevokeSecurityGroupIngress
- elasticloadbalancing:AddTags
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:CreateListener
- elasticloadbalancing:CreateLoadBalancer
- elasticloadbalancing:CreateLoadBalancerPolicy
- elasticloadbalancing:CreateLoadBalancerListeners
- elasticloadbalancing:CreateTargetGroup
- elasticloadbalancing:ConfigureHealthCheck
- elasticloadbalancing:DeleteListener
- elasticloadbalancing:DeleteLoadBalancer
- elasticloadbalancing:DeleteLoadBalancerListeners
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DeregisterInstancesFromLoadBalancer
- elasticloadbalancing:DeregisterTargets
- elasticloadbalancing:Describe*
- elasticloadbalancing:DetachLoadBalancerFromSubnets
- elasticloadbalancing:ModifyListener
- elasticloadbalancing:ModifyLoadBalancerAttributes
- elasticloadbalancing:ModifyTargetGroup
• elasticloadbalancing:ModifyTargetGroupAttributes
• elasticloadbalancing:RegisterInstancesWithLoadBalancer
• elasticloadbalancing:RegisterTargets
• elasticloadbalancing:SetLoadBalancerPoliciesForBackendServer
• elasticloadbalancing:SetLoadBalancerPoliciesOfListener
• kms:DescribeKey

Example 4.13. Required IAM role permissions for compute instance profiles

• sts:AssumeRole
• ec2:DescribeInstances
• ec2:DescribeRegions

4.2.6. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following public regions:

• **af-south-1** (Cape Town)
• **ap-east-1** (Hong Kong)
• **ap-northeast-1** (Tokyo)
• **ap-northeast-2** (Seoul)
• **ap-south-1** (Mumbai)
• **ap-southeast-1** (Singapore)
• **ap-southeast-2** (Sydney)
• **ca-central-1** (Central)
• **eu-central-1** (Frankfurt)
• **eu-north-1** (Stockholm)
• **eu-south-1** (Milan)
• **eu-west-1** (Ireland)
• **eu-west-2** (London)
• **eu-west-3** (Paris)
• **me-south-1** (Bahrain)
• **sa-east-1** (São Paulo)
- **us-east-1** (N. Virginia)
- **us-east-2** (Ohio)
- **us-west-1** (N. California)
- **us-west-2** (Oregon)

The following AWS GovCloud regions are supported:
- **us-gov-west-1**
- **us-gov-east-1**

The AWS C2S Secret Region is supported:
- **us-iso-east-1**

### 4.2.7. Next steps

- Install an OpenShift Container Platform cluster:
  - Quickly install a cluster with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure
  - Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates

### 4.3. MANUALLY CREATING IAM FOR AWS

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

#### 4.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the `credentialsMode` parameter in the `install-config.yaml` file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use the Amazon Web Services Security Token Service**
  You can use the CCO utility (**ccoctl**) to configure the cluster to use the Amazon Web Services Security Token Service (AWS STS). When the CCO utility is used to configure the cluster for STS, it assigns IAM roles that provide short-term, limited-privilege security credentials to components.

- **Manage cloud credentials manually**
  You can set the `credentialsMode` parameter for the CCO to **Manual** to manage cloud
credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**
  If you are using the CCO with the `credentialsMode` parameter set to Mint, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

Additional resources

- To learn how to use the CCO utility (ccoctl) to configure the CCO to use the AWS STS, see Using manual mode with STS.
- To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see Rotating or removing cloud provider credentials.
- For a detailed description of all available CCO credential modes and their supported platforms, see About the Cloud Credential Operator.

### 4.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster `kube-system` namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the `install-config.yaml` file:

   ```
   $ openshift-install create install-config --dir=<installation_directory>
   ```

2. Edit the `install-config.yaml` configuration file so that it contains the `credentialsMode` parameter set to Manual.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   ```
This line is added to set the `credentialsMode` parameter to `Manual`.

3. To generate the manifests, run the following command from the directory that contains the installation program:

   $ openshift-install create manifests --dir=<installation_directory>

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   $ openshift-install version

   **Example output**

   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on:

   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=aws

   This command creates a YAML file for each `CredentialsRequest` object.

**Sample `CredentialsRequest` object**

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: cloud-credential-operator-iam-ro
  namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: cloud-credential-operator-iam-ro-creds
    namespace: openshift-cloud-credential-operator
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
```
6. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

7. From the directory that contains the installation program, proceed with your cluster creation:

   ```bash
   $ openshift-install create cluster --dir=<installation_directory>
   ```

   **IMPORTANT**
   Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the Upgrading clusters with manually maintained credentials section of the installation content for your cloud provider.

### 4.3.3. Admin credentials root secret format

Each cloud provider uses a credentials root secret in the `kube-system` namespace by convention, which is then used to satisfy all credentials requests and create their respective secrets. This is done either by minting new credentials, with `mint mode`, or by copying the credentials root secret, with `passthrough mode`.

The format for the secret varies by cloud, and is also used for each `CredentialsRequest` secret.

**Amazon Web Services (AWS) secret format**

```yaml
apiVersion: v1
kind: Secret
metadata:
  namespace: kube-system
  name: aws-creds
stringData:
  aws_access_key_id: <AccessKeyID>
  aws_secret_access_key: <SecretAccessKey>
```

### 4.3.4. Upgrading clusters with manually maintained credentials

If credentials are added in a future release, the Cloud Credential Operator (CCO) upgradable status for a cluster with manually maintained credentials changes to `false`. For minor release, for example, from 4.7 to 4.8, this status prevents you from upgrading until you have addressed any updated permissions. For z-stream releases, for example, from 4.7.12 to 4.7.13, the upgrade is not blocked, but the credentials must still be updated for the new release.

Use the Administrator perspective of the web console to determine if the CCO is upgradeable.

1. Navigate to Administration → Cluster Settings.

2. To view the CCO status details, click cloud-credential in the Cluster Operators list.
3. If the Upgradeable status in the Conditions section is False, examine the CredentialsRequest custom resource for the new release and update the manually maintained credentials on your cluster to match before upgrading.

In addition to creating new credentials for the release image that you are upgrading to, you must review the required permissions for existing credentials and accommodate any new permissions requirements for existing components in the new release. The CCO cannot detect these mismatches and will not set upgradable to false in this case.

The Manually creating IAM section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.

### 4.3.5. Mint mode

Mint mode is the default and recommended Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS, GCP, and Azure.

In mint mode, the admin credential is stored in the kube-system namespace and then used by the CCO to process the CredentialsRequest objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires admin credential storage in a cluster kube-system secret.

### 4.3.6. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all CredentialsRequest objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.
4.3.7. Next steps

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on AWS with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure
  - Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates

4.4. INSTALLING A CLUSTER QUICKLY ON AWS

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

4.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials. Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

4.4.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).
Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service

### 4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```bash
$ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
```

Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

```bash
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

```bash
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

```bash
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`
Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.
4.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

   **1** For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   Provide values at the prompts:

   a. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   b. Select `aws` as the platform to target.

   c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
NOTE
The AWS access key ID and secret access key are stored in
~/.aws/credentials in the home directory of the current user on the
installation host. You are prompted for the credentials by the installation
program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

d. Select the AWS region to deploy the cluster to.
e. Select the base domain for the Route 53 service that you configured for your cluster.
f. Enter a descriptive name for your cluster.
g. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

NOTE
If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the kubeadmin user, display in your terminal.

Example output

INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s

NOTE
The cluster access and credential information also outputs to <installation_directory>/.openshift_install.log when an installation succeeds.

IMPORTANT
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.
IMPORTANT
You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the AdministratorAccess policy from the IAM account that you used to install the cluster.

NOTE
The elevated permissions provided by the AdministratorAccess policy are required only during installation.

Additional resources
- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

4.4.6. Installing the OpenShift CLI by downloading the binary
You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT
If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure
1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:
   ```
   $ tar xvzf <file>
   ```
5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:
   ```
   $ echo $PATH
   ```
After you install the CLI, it is available using the oc command:
```
$ oc <command>
```
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure
1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:
   ```
   C:\> path
   ```
   After you install the CLI, it is available using the oc command:
   ```
   C:\> oc <command>
   ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure
1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:
   ```
   $ echo $PATH
   ```
   After you install the CLI, it is available using the oc command:
   ```
   $ oc <command>
   ```

4.4.7. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.
Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

### 4.4.8. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

    **NOTE**

Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```
Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/.openshift_install.log` log file on the installation host.

**Example output**

```console
console  console-openshift-console.apps.<cluster_name>.<base_domain>  console
https  reencrypt/Redirect  None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See *Accessing the web console* for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.4.9. Next steps

- **Validating an installation.**
- **Customize your cluster.**
- If necessary, you can **opt out of remote health reporting**.
- If necessary, you can **remove cloud provider credentials**.

### 4.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

**NOTE**

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

### 4.5.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.
If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

### 4.5.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service.

### 4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes.
through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the 
~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>  
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.
NOTE
On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the ssh-agent:

```
$ ssh-add <path>/<file_name>
```

   1 Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.
IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory>
   ```

   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

ii. Select AWS as the platform to target.

iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the install-config.yaml file. You can find more information about the available parameters in the “Installation configuration parameters” section.
NOTE

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

2. In the `install-config.yaml` file:

   ```yaml
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

IMPORTANT

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.5.5.1.1. Required configuration parameters
Required installation configuration parameters are described in the following table:

Table 4.1. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{.metadata.name}</code>. <code>{.baseDomain}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, openstack, ovirt, vsphere. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
Get a pull secret from https://cloud.redhat.com/openshift/install/pull-secret to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

Table 4.2. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>
| pullSecret       | Get a pull secret from https://cloud.redhat.com/openshift/install/pull-secret to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io. | {  
|                  |                                                                              | "auths":{  
|                  |                                                                              | "cloud.openshift.com":{  
|                  |                                                                              |   "auth":"b3Blb="  
|                  |                                                                              |   "email":"you@example.com"  
|                  |                                                                              | },  
|                  |                                                                              | "quay.io":{  
|                  |                                                                              |   "auth":"b3Blb="  
|                  |                                                                              |   "email":"you@example.com"  
|                  |                                                                              | }  
|                  |                                                                              | } |

4.5.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.2. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td></td>
<td>NOTE</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: <strong>10.128.0.0/14</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
</tbody>
</table>
### 4.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16. NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

---

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.
<table>
<thead>

</tr>
</tbody>
</table>
Enable or disable FIPS mode. The default is **false** (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>

<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td>Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

### 4.5.5.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <strong>4000</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The instance type of the root volume.</td>
<td>Valid AWS EBS instance type, such as <code>io1</code>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <code>m4.2xlarge</code>. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RH COS AMI.</td>
<td>Any published or custom RH COS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m5.xlarge</code>. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>controlPlane.aws.region</code></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>platform.aws.amiID</code></td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>platform.aws.hostedZone</code></td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <code>Z3URY6TWQ91KVV</code>.</td>
</tr>
<tr>
<td><code>platform.aws.serviceEndpoints.name</code></td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td><code>platform.aws.serviceEndpoints.url</code></td>
<td>The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td><code>platform.aws.userTags</code></td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the &lt;key&gt;: &lt;value&gt; format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
</tbody>
</table>
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

---

4.5.5.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

### Example 4.14. Instance types for machines

<table>
<thead>
<tr>
<th>Instance type</th>

</table>

4.5.5.3. Sample customized install-config.yaml file for AWS

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
```
Required. The installation program prompts you for this value.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified
If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

4.5.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
**Important**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

   **NOTE**

   For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   **NOTE**

   To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **Example output**

   ```
   INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
   INFO Time elapsed: 36m22s
   ```

   **NOTE**

   The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kublet certificates. See the documentation for Recovering from expired control plane certificates for more information.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

4.5.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:
After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your `PATH`.
   To check your `PATH`, open the command prompt and execute the following command:

```
C:\> path
```

After you install the CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your `PATH`.
   To check your `PATH`, open a terminal and execute the following command:

```
$ echo $PATH
$ oc <command>
```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```
4.5.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

4.5.9. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**

   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.
2. List the OpenShift Container Platform web console route:

   $$ oc get routes -n openshift-console | grep 'console-openshift' $$

   **NOTE**
   
   Alternatively, you can obtain the OpenShift Container Platform route from the
   `<installation_directory>/.openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console console-openshift-console.apps.<cluster_name>.<base_domain> console
   https reencrypt/Redirect None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and
   log in as the **kubeadmin** user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the
  OpenShift Container Platform web console.

**4.5.10. Next steps**

- [Validating an installation](#).

- [Customize your cluster](#).

- If necessary, you can [opt out of remote health reporting](#).

- If necessary, you can [remove cloud provider credentials](#).

**4.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS**

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS)
with customized network configuration options. By customizing your network configuration, your cluster

can coexist with existing IP address allocations in your environment and integrate with existing MTU and
VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only
**kubeProxy** configuration parameters in a running cluster.

**4.6.1. Prerequisites**

- You reviewed details about the OpenShift Container Platform installation and update
  processes.

- You read the documentation on selecting a cluster installation method and preparing it for
  users.

- You configured an AWS account to host the cluster.
IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

4.6.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

4.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes
through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RH COS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

1. If the ssh-agent process is not already running for your local user, start it as a background task:

   $ eval "$(ssh-agent -s)"

   **Example output**

   Agent pid 31874

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the ssh-agent:

      $ ssh-add <path>/<file_name>  

   1. Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

   **Example output**

   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**4.6.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.
IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

$ tar xvf openshift-install-linux.tar.gz

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.6.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the install-config.yaml file before you create the manifest files:

- networking.networkType
- networking.clusterNetwork
- networking.serviceNetwork
- networking.machineNetwork

For more information on these fields, refer to Installation configuration parameters.

NOTE

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

Phase 2

After creating the manifest files by running openshift-install create manifests, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.
You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

4.6.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select **AWS** as the platform to target.

      iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

      iv. Select the AWS region to deploy the cluster to.
v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

2. In the `install-config.yaml` file:

   ```yaml
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 4.6.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.
**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 4.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.5. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apiVersion</code></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><code>baseDomain</code></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td><code>metadata</code></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td><code>metadata.name</code></td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
### Platform

The configuration for the specific platform upon which to perform the installation: **aws, baremetal, azure, openstack, ovirt, vsphere**. For additional information about platform.<platform> parameters, consult the table for your specific platform that follows.

### Pull Secret

Get a pull secret from [https://cloud.redhat.com/openshift/install/pull-secret](https://cloud.redhat.com/openshift/install/pull-secret) to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

---

### 4.6.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 4.6. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^((32 - 23) - 2)) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td></td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### 4.6.6.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.7. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

### IMPORTANT
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

### controlPlane.name
- **Required if you use controlPlane.**
- The name of the machine pool.
  - **Values:** master

### controlPlane.platform
- **Required if you use controlPlane.**
- Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the `compute.platform` parameter value.
  - **Values:** aws, azure, gcp, openstack, ovirt, vsphere, or {}
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;`).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

### NOTE

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fips</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Array of strings. Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><strong>imageContentSources.mirrors</strong></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```markdown
sshKey:
  <key1>
  <key2>
  <key3>
```

### 4.6.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

#### Table 4.8. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>compute.platform.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <strong>4000</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolu</code>me.type</td>
<td>The instance type of the root volume.</td>
<td>Valid AWS EBS instance type, such as <code>io1</code>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as <code>m4.2xlarge</code>. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RH COS AMI.</td>
<td>Any published or custom RH COS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m5.xlarge</code>. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>controlPlane.aws.region</code></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KV.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td>platform.aws.userTags</td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the &lt;key&gt;: &lt;value&gt; format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
</tbody>
</table>
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

### 4.6.6.2. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

#### Example 4.15. Instance types for machines

<table>
<thead>
<tr>

### 4.6.6.3. Sample customized install-config.yaml file for AWS

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane: 
compute: 
```
<table>
<thead>
<tr>
<th>Required. The installation program prompts you for this value.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified</td>
</tr>
</tbody>
</table>
3. If you do not provide these parameters and values, the installation program provides the default value.

4. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

5. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

6. To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

7. The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

8. The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

9. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

   **IMPORTANT**

   The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

10. You can optionally provide the sshKey value that you use to access the machines in your cluster.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

4.6.7. Cluster Network Operator configuration
The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named `cluster`. The CR specifies the fields for the Network API in the `operator.openshift.io` API group.

The CNO configuration inherits the following fields during cluster installation from the Network API in the `Network.config.openshift.io` API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.

- **serviceNetwork**
  - IP address pool for services.

- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

4.6.7.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>metadata.name</code></td>
<td>string</td>
<td>The name of the CNO object. This name is always <code>cluster</code>.</td>
</tr>
<tr>
<td><code>spec.clusterNetwork</code></td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <code>install-config.yaml</code> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
</tbody>
</table>
spec.serviceNetwork

A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:

```yaml
spec:
  serviceNetwork:
    - 172.30.0.0/14
```

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.

spec.defaultNetwork

Configures the Container Network Interface (CNI) cluster network provider for the cluster network.

spec.kubeProxyConfig

The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

### defaultNetwork object configuration

The values for the `defaultNetwork` object are defined in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either <code>OpenShiftSDN</code> or <code>OVNKubernetes</code>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong> OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</td>
</tr>
<tr>
<td>openshiftSDNConfig</td>
<td>object</td>
<td>This object is only valid for the OpenShift SDN cluster network provider.</td>
</tr>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.
Table 4.11. openshiftSDNConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>. The values <strong>Multitenant</strong> and <strong>Subnet</strong> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <strong>9001</strong>, and some have an MTU of <strong>1500</strong>, you must set this value to <strong>1450</strong>. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>vxlanPort</td>
<td>integer</td>
<td>The port to use for all VXLAN packets. The default value is <strong>4789</strong>. This value cannot be changed after cluster installation. If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number. On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <strong>9000</strong> and port <strong>9999</strong>.</td>
</tr>
</tbody>
</table>

Example OpenShift SDN configuration

Configuration for the OVN-Kubernetes CNI cluster network provider
The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

### Table 4.12. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>genevePort</td>
<td>integer</td>
<td>The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>ipsecConfig</td>
<td>object</td>
<td>Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>policyAuditConf</td>
<td>object</td>
<td>Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.</td>
</tr>
</tbody>
</table>

### Table 4.13. policyAuditConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50MB.</td>
</tr>
</tbody>
</table>
Field | Type | Description
---|---|---
destination | string | One of the following additional audit log targets:
libc
The libc `syslog()` function of the journald process on the host.
udp:<host>:<port>
A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.
unix:<file>
A Unix Domain Socket file specified by `<file>`.
null
Do not send the audit logs to any additional target.

syslogFacility | string | The syslog facility, such as kern, as defined by RFC5424. The default value is local0.

Example OVN-Kubernetes configuration

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}

kubeProxyConfig object configuration
The values for the `kubeProxyConfig` object are defined in the following table:

Table 4.14. `kubeProxyConfig` object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| iptablesSyncPeriod | string | The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.

NOTE
Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the `iptablesSyncPeriod` parameter is no longer necessary.
The minimum duration before refreshing `iptables` rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include `s`, `m`, and `h` and are described in the `Go time` package. The default value is:

```
kubeProxyConfig:
  proxyArguments:
    iptables-min-sync-period: -0s
```

### 4.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>
   ```

   `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   ```

3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

   ```yaml
   Specify a different VXLAN port for the OpenShift SDN network provider
   ```
Enable IPsec for the OVN-Kubernetes network provider

apiVersion: operator.openshift.io/v1
type: Network
metadata:
  name: cluster
spec:
defaultNetwork:
  ovdnKubernetesConfig:
    ipsecConfig: {}

4. Optional: Back up the manifests/cluster-network-03-config.yml file. The installation program consumes the manifests/ directory when you create the Ignition config files.

NOTE
For more information on using a Network Load Balancer (NLB) on AWS, see Configuring Ingress cluster traffic on AWS using a Network Load Balancer.

4.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

Prerequisites
- Create the install-config.yml file and complete any modifications to it.

Procedure
Create an Ingress Controller backed by an AWS NLB on a new cluster.

1. Change to the directory that contains the installation program and create the manifests:

   $ ./openshift-install create manifests --dir=<installation_directory>  

   For <installation_directory>, specify the name of the directory that contains the install-config.yml file for your cluster.

2. Create a file that is named cluster-ingress-default-ingresscontroller.yml in the <installation_directory>/manifests/ directory:

   $ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yml  

   For <installation_directory>, specify the name of the directory that contains the install-config.yml file for your cluster.
For `<installation_directory>`, specify the directory name that contains the `manifests/` directory for your cluster.

After creating the file, several network configuration files are in the `manifests/` directory, as shown:

```bash
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

**Example output**

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the `cluster-ingress-default-ingresscontroller.yaml` file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

```yaml
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  creationTimestamp: null
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      scope: External
      providerParameters:
        type: AWS
        aws:
          type: NLB
          type: LoadBalancerService
```

4. Save the `cluster-ingress-default-ingresscontroller.yaml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-ingress-default-ingresscontroller.yaml` file. The installation program deletes the `manifests/` directory when creating the cluster.

### 4.6.10. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**

- You defined `OVNKubernetes` for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.
Procedure

1. Change to the directory that contains the installation program and create the manifests:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>
   ```

   where:

   `<installation_directory>`
   
   Specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   EOF
   ```

   where:

   `<installation_directory>`
   
   Specifies the directory name that contains the `manifests/` directory for your cluster.

3. Open the `cluster-network-03-config.yml` file in an editor and configure OVN–Kubernetes with hybrid networking, such as in the following example:

   **Specify a hybrid networking configuration**

   ```
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnKubernetesConfig:
         hybridOverlayConfig:
           hybridClusterNetwork:
             cidr: 10.132.0.0/14
             hostPrefix: 23
             hybridOverlayVXLANPort: 9898
   ```

   **1** Specify the CIDR configuration used for nodes on the additional overlay network. The `hybridClusterNetwork` CIDR cannot overlap with the `clusterNetwork` CIDR.

   **2** Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.
NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom `hybridOverlayVXLANPort` value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the `cluster-network-03-config.yml` file and quit the text editor.

5. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program deletes the `manifests/` directory when creating the cluster.

NOTE

For more information on using Linux and Windows nodes in the same cluster, see Understanding Windows container workloads.

4.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

1. For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.
When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for `Recovering from expired control plane certificates` for more information.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

### 4.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of `oc`. 
Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:
   
   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

$ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the CLI, it is available using the oc command:

C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure
1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your **PATH**, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ``

   After you install the CLI, it is available using the `oc` command:

   ```
   $ oc <command>
   ```

### 4.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the **kubeadmin** credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

### 4.6.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.
Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**

   Alternatively, you can obtain the **kubeadmin** password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   ```
   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.6.15. Next steps

- **Validating an installation.**
- **Customize your cluster.**
- If necessary, you can **opt out of remote health reporting**.
- If necessary, you can **remove cloud provider credentials**.

4.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK
In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

4.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You mirrored the images for a disconnected installation to your registry and obtained the imageContentSources data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

**NOTE**

If you are configuring a proxy, be sure to also review this site list.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.
4.7.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the Internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s IAM service, require Internet access, so you might still require Internet access. Depending on your network, you might require less Internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the Internet and your closed network, or by using other methods that meet your restrictions.

4.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The ClusterVersion status includes an *Unable to retrieve available updates* error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

4.7.3. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.7.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints
If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC must meet the following characteristics:

- The VPC’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.
- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag.
- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer using your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses.

The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. Review the current Tag Restrictions in the AWS documentation to ensure that the installation program can add a tag to each subnet that you specify.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td><code>AWS::EC2::VPC</code></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::VPCEndpoint</code></td>
<td></td>
</tr>
<tr>
<td>Public subnets</td>
<td><code>AWS::EC2::Subnet</code></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::SubnetNetworkAclAssociation</code></td>
<td></td>
</tr>
</tbody>
</table>
### Internet gateway

- AWS::EC2::InternetGateway
- AWS::EC2::VPCGatewayAttachment
- AWS::EC2::RouteTable
- AWS::EC2::Route
- AWS::EC2::SubnetRouteTableAssociation
- AWS::EC2::NatGateway
- AWS::EC2::EIP

You must have a public Internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the Internet and are not required for some restricted network or proxy scenarios.

### Network access control

- AWS::EC2::NetworkAcl
- AWS::EC2::NetworkAclEntry

You must allow the VPC to access the following ports:

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

### Private subnets

- AWS::EC2::Subnet
- AWS::EC2::RouteTable
- AWS::EC2::SubnetRouteTableAssociation

Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

### 4.7.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
• You provide private subnets.

• The subnet CIDRs belong to the machine CIDR that you specified.

• You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

• You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

4.7.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, Internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.7.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

• You can install multiple OpenShift Container Platform clusters in the same VPC.

• ICMP ingress is allowed from the entire network.

• TCP 22 ingress (SSH) is allowed to the entire network.

• Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

• Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.7.4. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to obtain the images that are necessary to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).
Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

Additional resources

- See About remote health monitoring for more information about the Telemetry service

### 4.7.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N " " -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```
   Agent pid 31874
   ```

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`
Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your bastion host.
- Have the `imageContentSources` values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.

Procedure

1. Create the `install-config.yaml` file.
   
a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir=<installation_directory>  
   
   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   ```

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:
      
      i. Optional: Select an SSH key to use to access your cluster machines.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select **AWS** as the platform to target.

iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret that you obtained from the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site.

2. Edit the `install-config.yaml` file to provide the additional information that is required for an installation in a restricted network.

   a. Update the `pullSecret` value to contain the authentication information for your registry:

   ```yaml
   pullSecret: '{"auths":{"<bastion_host_name>:5000": {"auth": "<credentials>"}},"email": "you@example.com"}}'
   ```

   For `<bastion_host_name>`, specify the registry domain name that you specified in the certificate for your mirror registry, and for `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

   b. Add the `additionalTrustBundle` parameter and value.

   ```yaml
   additionalTrustBundle: |
   -----BEGIN CERTIFICATE-----
   ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
   -----END CERTIFICATE-----
   ```

   The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

   c. Define the subnets for the VPC to install the cluster in:

   ```yaml
   subnets:
   - subnet-1
   - subnet-2
   - subnet-3
   ```

   d. Add the image content resources, which look like this excerpt:

   ```yaml
   imageContentSources:
   ```
To complete these values, use the `imageContentSources` that you recorded during mirror registry creation.

3. Make any other modifications to the `install-config.yaml` file that you require. You can find more information about the available parameters in the Installation configuration parameters section.

4. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 4.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 4.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.15. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apiVersion</code></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, openstack, ovirt, vsphere. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;cloud.openshift.com&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;quay.io&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

CHAPTER 4. INSTALLING ON AWS
4.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.16. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider</td>
<td>Either OpenShiftSDN or</td>
</tr>
<tr>
<td>Type</td>
<td>Container Network Interface (CNI) plug-in to install.</td>
<td>OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td>A subnet prefix.</td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
</tbody>
</table>
### 4.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Table 4.17. Optional parameters</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Description</strong></th>
<th><strong>Values</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>compute.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use <strong>compute</strong>. The name of the machine pool.</td>
<td><strong>worker</strong></td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use <strong>compute</strong>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <strong>controlPlane.platform</strong> parameter value.</td>
<td><strong>aws</strong>, <strong>azure</strong>, <strong>gcp</strong>, <strong>openstack</strong>, <strong>ovirt</strong>, <strong>vsphere</strong>, or {}</td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <strong>MachinePool</strong> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <code>hypertreading</code>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td><code>Enabled</code> or <code>Disabled</code></td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td><code>master</code></td>
</tr>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td><code>aws</code>, <code>azure</code>, <code>gcp</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code></td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</td>
</tr>
</tbody>
</table>
### Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

#### Table 4.18. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.iops</td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.size</td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The instance type of the root volume.</td>
<td>Valid AWS EBS instance type, such as io1.</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as m4.2xlarge. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.type</td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m5.xlarge. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.zone</td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>controlPlane.aws.region</td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KVV.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td>platform.aws.userTags</td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the &lt;key&gt;: &lt;value&gt; format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
<tr>
<td>platform.aws.subnets</td>
<td>If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same machineNetwork[].cidr ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.</td>
<td>Valid subnet IDs.</td>
</tr>
</tbody>
</table>

### 4.7.6.2. Sample customized install-config.yaml file for AWS

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
```
credentialsMode: Mint
controlPlane: 3
hyperthreading: Enabled
name: master
platform:
  aws:
    zones:
    - us-west-2a
    - us-west-2b
    rootVolume:
      iops: 4000
      size: 500
      type: io1
      type: m5.xlarge
    replicas: 3
compute:
  - hyperthreading: Enabled
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1
      type: c5.4xlarge
    zones:
    - us-west-2c
    replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
  - hostPrefix: 23
machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
    userTags:
      adminContact: jdoe
      costCenter: 7536
subnets:
  - subnet-1
  - subnet-2
  - subnet-3
amiID: ami-96c6f8f7
serviceEndpoints:
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KV
Required. The installation program prompts you for this value.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, - , and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.
The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

Provide the contents of the certificate file that you used for your mirror registry.

Provide the `imageContentSources` section from the output of the command to mirror the repository.

### 4.7.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MiTM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MiTM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example,.y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

NOTE
The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

4.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT
You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir=<installation_directory> \  
  --log-level=info
```

1 For <installation_directory>, specify the location of your customized ./install-config.yaml file.

2 To view different installation details, specify warn, debug, or error instead of info.
NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wi5AL"
INFO Time elapsed: 36m22s```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/.openshift_install.log` when an installation succeeds.

IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kublet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

4.7.8. Installing the OpenShift CLI by downloading the binary
You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select Linux from the drop-down menu and click **Download command-line tools**.
4. Unpack the archive:
   
   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.
   
   To check your PATH, execute the following command:
   
   $ echo $PATH

After you install the CLI, it is available using the oc command:

$ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select Windows from the drop-down menu and click **Download command-line tools**.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   
   To check your PATH, open the command prompt and execute the following command:
   
   C:\> path

After you install the CLI, it is available using the oc command:

-
Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```bash
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:

```bash
$ oc <command>
```

4.7.9. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the kubeadm credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```
   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

Example output
4.7.10. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:

  ```
  system:admin
  $ oc patch OperatorHub cluster --type json \
  -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
  ```

TIP

Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Global Configuration → OperatorHub page, click the Sources tab, where you can create, delete, disable, and enable individual sources.

4.7.11. Next steps

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the must-gather tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.

4.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

In OpenShift Container Platform version 4.8, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

4.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.
IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

4.8.2. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.8.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC must meet the following characteristics:

- The VPC’s CIDR block must contain the Networking.MachineCIDR range, which is the IP address pool for cluster machines.
- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer using your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses.

The installation program modifies your subnets to add the `kubernetes.io/cluster/.*: shared` tag, so your subnets must have at least one free tag slot available for it. Review the current Tag Restrictions in the AWS documentation to ensure that the installation program can add a tag to each subnet that you specify.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>• <code>AWS::EC2::VPC</code></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>

<td>- AWS::EC2::SubnetRouteTableAssociation</td>
<td></td>
</tr>
</tbody>
</table>

4.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:
• All the subnets that you specify exist.

• You provide private subnets.

• The subnet CIDRs belong to the machine CIDR that you specified.

• You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

• You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

4.8.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, Internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

• You can install multiple OpenShift Container Platform clusters in the same VPC.

• ICMP ingress is allowed from the entire network.

• TCP 22 ingress (SSH) is allowed to the entire network.

• Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

• Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.8.3. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).
Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service.

### 4.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   $ eval "$(ssh-agent -s)"

   **Example output**

   Agent pid 31874

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the ssh-agent:

      $ ssh-add <path>/<file_name>  

      Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa
Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.
4.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.

   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir=<installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select **AWS** as the platform to target.

      iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

      iv. Select the AWS region to deploy the cluster to.

      v. Select the base domain for the Route 53 service that you configured for your cluster.

      vi. Enter a descriptive name for your cluster.
vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ``

2. In the `install-config.yaml` file:

   ```yaml
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ``

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

4.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.
**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 4.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.19. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;, &lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}, {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: `aws`, `baremetal`, `azure`, `openstack`, `ovirt`, `vsphere`. For additional information about `platform.<platform>` parameters, consult the table for your specific platform that follows.

Get a pull secret from [https://cloud.redhat.com/openshift/install/pull-secret](https://cloud.redhat.com/openshift/install/pull-secret) to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

### 4.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 4.20. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example: networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example: networking:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example: networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
### 4.8.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.21. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store.</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>This trust bundle may also be used when a proxy has been configured.</td>
<td></td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects.</td>
</tr>
<tr>
<td></td>
<td>For details, see the following &quot;Machine-pool&quot; table.</td>
<td></td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool.</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values are <code>amd64</code> (the default).</td>
<td></td>
</tr>
</tbody>
</table>
whether to enable or disable simultaneous multithreading, or *hyperthreading*, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>aws, azure, gcp, openstack, ovirt, vsphere, or {}</code></td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.hypertreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>controlPlane.name</code></td>
<td>Required if you use <code>controlPlane</code>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td><code>controlPlane.platform</code></td>
<td>Required if you use <code>controlPlane</code>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <code>compute.platform</code> parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>controlPlane.replicas</code></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>

<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
</tbody>
</table>

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>

212
### 4.8.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

#### Table 4.22. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolu</code>me.type</td>
<td>The instance type of the root volume.</td>
<td>Valid AWS EBS instance type, such as io1.</td>
</tr>
<tr>
<td><code>compute.platform.aws.type</code></td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as m4.2xlarge. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td><code>compute.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td><code>compute.aws.region</code></td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RH COS AMI.</td>
<td>Any published or custom RH COS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as m5.xlarge. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td><code>controlPlane.aws.region</code></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <strong>Z3URY6TWQ91KVV</strong>.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td>platform.aws.userTags</td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the <code>&lt;key&gt;: &lt;value&gt;</code> format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
</tbody>
</table>
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tbody>
</table>
### 4.8.6.3. Sample customized `install-config.yaml` file for AWS

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane: 
```

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.
hyperthreading: Enabled
name: master
platform:
  aws:
    zones:
    - us-west-2a
    - us-west-2b
  rootVolume:
    iops: 4000
    size: 500
    type: io1
    type: m5.xlarge
  replicas: 3
compute:
  - hyperthreading: Enabled
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1
      type: c5.4xlarge
    zones:
      - us-west-2c
    replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
    userTags:
      adminContact: jdoe
      costCenter: 7536
subnets:
  - subnet-1
  - subnet-2
  - subnet-3
amiID: ami-96c6f8f7
serviceEndpoints:
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KVV
Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.
IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

4.8.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

NOTE

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
```
proxy:
httpProxy: http://<username>:<pswd>@<ip>:<port>  
httpsProxy: https://<username>:<pswd>@<ip>:<port>  
noProxy: example.com  
additionalTrustBundle: |  
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>  
-----END CERTIFICATE-----

A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

NOTE
The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.

4.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory>
   --log-level=info
   
   1 For `<installation_directory>`, specify the location of your customized `install-config.yaml` file.
   
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.
   
   **NOTE**
   
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-W15AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kublet certificates. See the documentation for Recovering from expired control plane certificates for more information.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the `AdministratorAccess` policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the `AdministratorAccess` policy are required only during installation.

### 4.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of `oc`.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.

4. Unpack the archive:

   ```bash
   $ tar xvzf <file>
   ```

5. Place the `oc` binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure
1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

```
C:\> path
```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure
1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```
4.8.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   system:admin
   ```

4.8.10. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**
   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.
2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

   **Example output**

   console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
   https   reencrypt/Redirect   None

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

   Additional resources

   - See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.8.11. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

### 4.9. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.8, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

### 4.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You configured an AWS account to host the cluster.
IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

4.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the Internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.9.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to Internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the baseDomain for the cluster

The installation program does use the baseDomain that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.
4.9.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from Internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with `kubernetes.io/cluster/<cluster-infra-id>: shared` so that AWS can use them to create public load balancers.

4.9.3. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.9.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC must meet the following characteristics:

- The VPC’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.

- The VPC must not use the `kubernetes.io/cluster/.*: owned` tag.

- You must enable the `enableDnsSupport` and `enableDnsHostnames` attributes in your VPC so
that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer using your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the `platform.aws.hostedZone` field in the `install-config.yaml` file.

If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses.

The installation program modifies your subnets to add the `kubernetes.io/cluster/*/shared` tag, so your subnets must have at least one free tag slot available for it. Review the current Tag Restrictions in the AWS documentation to ensure that the installation program can add a tag to each subnet that you specify.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>· AWS::EC2::VPC · AWS::EC2::VPCEndpoint</td>

<td>• AWS::EC2::Subnet</td>
<td>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</td>
</tr>
<tr>
<td></td>
<td>• AWS::EC2::RouteTable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• AWS::EC2::SubnetRouteTableAssociation</td>
<td></td>
</tr>
</tbody>
</table>

### 4.9.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
● You provide private subnets.

● The subnet CIDRs belong to the machine CIDR that you specified.

● You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.

● You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

4.9.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, Internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.9.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

● You can install multiple OpenShift Container Platform clusters in the same VPC.

● ICMP ingress is allowed from the entire network.

● TCP 22 ingress (SSH) is allowed to the entire network.

● Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

● Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.9.4. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.
You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

**Additional resources**

- See About remote health monitoring for more information about the Telemetry service.

### 4.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:
Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```bash
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```bash
   Agent pid 31874
   ```

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the ssh-agent:

   ```bash
   $ ssh-add <path>/<file_name>
   ```

   **Example output**

   ```bash
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```
Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar xvf openshift-install-linux.tar.gz
   ```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.9.7. Manually creating the installation configuration file
For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the Internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   ```
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

   **NOTE**

   For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

4.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for
the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 4.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>apiVersion</strong></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <strong>v1</strong>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><strong>baseDomain</strong></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td><strong>metadata</strong></td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>metadata.name</strong></td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{.metadata.name}</code>). {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **aws, baremetal, azure, openstack, ovirt, vsphere.**

For additional information about `platform.<platform>` parameters, consult the table for your specific platform that follows.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <strong>aws, baremetal, azure, openstack, ovirt, vsphere.</strong> For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
| pullSecret  | Get a pull secret from [https://cloud.redhat.com/openshift/install/pull-secret](https://cloud.redhat.com/openshift/install/pull-secret) to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io. | ```json

      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
``` |

### 4.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.24. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
### Networking Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking.networkType</strong></td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td><strong>networking.clusterNetwork</strong></td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td><strong>networking.clusterNetwork.cidr</strong></td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td><strong>networking.clusterNetwork.hostPrefix</strong></td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^11 - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td><strong>networking.serviceNetwork</strong></td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td><strong>networking.machineNetwork</strong></td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
### 4.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.25. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or *hyperthreading*, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or <em>hyperthreading</em>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><strong>worker</strong></td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><strong>aws</strong>, <strong>azure</strong>, <strong>gcp</strong>, <strong>openstack</strong>, <strong>ovirt</strong>, <strong>vsphere</strong>, or <strong>{}</strong></td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td><strong>String</strong></td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fips</code></td>
<td>Enable or disable FIPS mode. The default is <code>false</code> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td><code>imageContentSources</code></td>
<td>Sources and repositories for the release–image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><code>imageContentSources.mirrors</code></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><code>publish</code></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
</tbody>
</table>
**sshKey**
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>sshKey</strong></td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>sshKey: &lt;key1&gt;</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>&lt;key2&gt;</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>&lt;key3&gt;</code></td>
</tr>
</tbody>
</table>

---

4.9.7.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

**Table 4.26. Optional AWS parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.platform.aws.amiID</code></td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>compute.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.iops</code></td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example <strong>4000</strong>.</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.size</code></td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example <strong>500</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>compute.platform.aws.rootVolume.type</code></td>
<td>The instance type of the root volume.</td>
<td>Valid AWS EBS instance type, such as <code>io1</code>.</td>

## Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.aws.amiID</td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RH COS AMI.</td>
<td>Any published or custom RH COS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>platform.aws.hostedZone</td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example Z3URY6TWQ91KV.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.name</td>
<td>The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.</td>
<td>Valid AWS service endpoint name.</td>
</tr>
<tr>
<td>platform.aws.serviceEndpoints.url</td>
<td>The AWS service endpoint URL. The URL must use the https protocol and the host must trust the certificate.</td>
<td>Valid AWS service endpoint URL.</td>
</tr>
<tr>
<td>platform.aws.userTags</td>
<td>A map of keys and values that the installation program adds as tags to all resources that it creates.</td>
<td>Any valid YAML map, such as key value pairs in the &lt;key&gt;: &lt;value&gt; format. For more information about AWS tags, see Tagging Your Amazon EC2 Resources in the AWS documentation.</td>
</tr>
</tbody>
</table>
If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same `machineNetwork[].cidr` ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.

### Valid subnet IDs.

4.9.7.3. Sample customized install-config.yaml file for AWS

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:  
```
hyperthreading: Enabled
name: master
platform:
  aws:
    zones:
    - us-west-2a
    - us-west-2b
rootVolume:
  iops: 4000
  size: 500
  type: io1
  type: m5.xlarge
replicas: 3
compute:
  - hyperthreading: Enabled
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1
      type: c5.4xlarge
    zones:
    - us-west-2c
replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-west-2
userTags:
  adminContact: jdoe
  costCenter: 7536
subnets:
  - subnet-1
  - subnet-2
  - subnet-3
amiID: ami-96c6f8f7
serviceEndpoints:
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KVV
fips: false
sshKey: ssh-ed25519 AAAA... Required. The installation program prompts you for this value.

Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.

To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and set iops to 2000.

If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.
4.9.7.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpProxy` value.

A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then `httpProxy` is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpsProxy` value.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

NOTE

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

NOTE

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

4.9.8. Deploying the cluster
You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

   **1** For `<installation_directory>`, specify the
   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```plaintext
   ... INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export
   KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
   INFO Time elapsed: 36m22s
   ```

   **NOTE**

   The cluster access and credential information also outputs to
   `<installation_directory>/.openshift_install.log` when an installation succeeds.
IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

4.9.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.
Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the CLI, it is available using the oc command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```

4.9.10. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
You installed the oc CLI.

### Procedure

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

### 4.9.11. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

### Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   **NOTE**

   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```bash
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   **NOTE**

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.
Example output

```
console  console-openshift-console.apps.<cluster_name>.<base_domain>  console
https  reencrypt/Redirect  None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

Additional resources

- See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

4.9.12. Next steps

- Validating an installation.
- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.

4.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT OR SECRET REGION

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) into a government or secret region. To configure the region, modify parameters in the `install-config.yaml` file before you install the cluster.

4.10.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an AWS account to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see Managing Access Keys for IAM Users in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
• If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

4.10.2. AWS government and secret regions

OpenShift Container Platform supports deploying a cluster to AWS GovCloud (US) regions and the AWS Commercial Cloud Services (C2S) Secret Region. These regions are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

These regions do not have published Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Images (AMI) to select, so you must upload a custom AMI that belongs to that region.

The following AWS GovCloud partitions are supported:

• us-gov-west-1
• us-gov-east-1

The following AWS Secret Region partition is supported:

• us-iso-east-1

The AWS government or secret region, and accompanying custom AMI, must be manually configured in the install-config.yaml file since RHCOS AMIs are not provided by Red Hat for those regions.

IMPORTANT

If you are deploying to the C2S Secret Region, you must also define a custom CA certificate in the additionalTrustBundle field of the install-config.yaml file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the AWS_CA_BUNDLE environment variable, or define the CA bundle in the ca_bundle field of the AWS config file.

4.10.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the Internet.

NOTE

Public zones are not supported in Route 53 in AWS GovCloud or Secret Regions. Therefore, clusters must be private if they are deployed to an AWS government or secret region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.
To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.10.3.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to Internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the baseDomain for the cluster

The installation program does use the baseDomain that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.10.3.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from Internet on 6443 (Kubernetes API port).

- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with kubernetes.io/cluster/<cluster-infra-id>: shared so that AWS can use them to create public load balancers.

4.10.4. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.
4.10.4.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC must meet the following characteristics:

- The VPC’s CIDR block must contain the Networking.MachineCIDR range, which is the IP address pool for cluster machines.
- The VPC must not use the kubernetes.io/cluster/.*: owned tag.
- You must enable the enableDnsSupport and enableDnsHostnames attributes in your VPC so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster’s internal DNS records. See DNS Support in Your VPC in the AWS documentation. If you prefer using your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the platform.aws.hostedZone field in the install-config.yaml file.

If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses.

The installation program modifies your subnets to add the kubernetes.io/cluster/.*: shared tag, so your subnets must have at least one free tag slot available for it. Review the current Tag Restrictions in the AWS documentation to ensure that the installation program can add a tag to each subnet that you specify.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- ec2.<region>.amazonaws.com
- elasticloadbalancing.<region>.amazonaws.com
- s3.<region>.amazonaws.com

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.
<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td>- AWS::EC2::VPC&lt;br&gt;- AWS::EC2::VPCEndpoint</td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td>Public subnets</td>
<td>- AWS::EC2::Subnet&lt;br&gt;- AWS::EC2::SubnetNetworkAclAssociation</td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td>Internet gateway</td>
<td>- AWS::EC2::InternetGateway&lt;br&gt;- AWS::EC2::VPCGatewayAttachment&lt;br&gt;- AWS::EC2::RouteTable&lt;br&gt;- AWS::EC2::Route&lt;br&gt;- AWS::EC2::SubnetRouteTableAssociation&lt;br&gt;- AWS::EC2::NatGateway&lt;br&gt;- AWS::EC2::EIP</td>
<td>You must have a public Internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the Internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td>Network access control</td>
<td>- AWS::EC2::NetworkAcl&lt;br&gt;- AWS::EC2::NetworkAclEntry</td>
<td>You must allow the VPC to access the following ports:</td>
</tr>
<tr>

<td></td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1024 - 65535</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 - 65535</td>
</tr>
</tbody>
</table>
### 4.10.4.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the `kubernetes.io/cluster/.*: shared` tag is removed from the subnets that it used.

### 4.10.4.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, Internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 4.10.4.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:
You can install multiple OpenShift Container Platform clusters in the same VPC.

ICMP ingress is allowed from the entire network.

TCP 22 ingress (SSH) is allowed to the entire network.

Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.10.5. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

4.10.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.
If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ``

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ``

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ``

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the **ssh-agent**:

   ```bash
   $ ssh-add <path>/<file_name>
   ```

   **Example output**

   `Identity added: /home/<you>/<path>/<file_name> (<computer_name>)`

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 4.10.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.
IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.10.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Amazon Web Services (AWS) into a region requiring a custom Red Hat Enterprise Linux CoreOS (RHCOS) AMI, you must manually generate your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`. 
NOTE
For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT
The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

4.10.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE
After installation, you cannot modify these parameters in the `install-config.yaml` file.

IMPORTANT
The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

4.10.8.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.27. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, openstack, ovirt, vsphere. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{     &quot;auths&quot;:{       &quot;cloud.openshift.com&quot;:{         &quot;auth&quot;:&quot;b3Blb=&quot;,         &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;       },       &quot;quay.io&quot;:{         &quot;auth&quot;:&quot;b3Blb=&quot;,         &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;       }     } }</td>
</tr>
</tbody>
</table>
4.10.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.28. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>--------</td>
</tr>
</tbody>
</table>
| networking.serviceNetwork | The IP address block for services. The default value is 172.30.0.0/16.       | An array with an IP address block in CIDR format. For example:     
|                        | The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network. | networking: 
|                        | serviceNetwork: - 172.30.0.0/16                                             |        |
| networking.machineNetwork | The IP address blocks for machines. An array of objects. For example:   |        |
|                        | If you specify multiple IP address blocks, the blocks must not overlap.     | networking: 
|                        | machineNetwork: - cidr: 10.0.0.0/16                                         |        |
| networking.machineNetwork.cidr | Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24. | An IP network block in CIDR notation. For example, 10.0.0.0/16. |
|                        | NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in. |        |

### 4.10.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.29. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes. Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
<td>Array</td>
</tr>
</tbody>
</table>

---

274
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>

<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>aws, azure, gcp, openstack, ovirt, vsphere, or {}</code></td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td><code>master</code></td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <strong>compute.platform</strong> parameter value.</td>
<td><code>aws, azure, gcp, openstack, ovirt, vsphere, or {}</code></td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is <strong>3</strong>, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td>false or true</td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a source and, optionally, mirrors, as described in the following rows of this table.</td>
</tr>
</tbody>
</table>
imageContentSources.source

Required if you use imageContentSources. Specify the repository that users refer to, for example, in image pull specifications.

String

imageContentSources.mirrors

Specify one or more repositories that may also contain the same images.

Array of strings

publish

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

Internal or External. To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.

sshKey

The SSH key or keys to authenticate access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

One or more keys. For example:

| sshKey: |
| <key1> |
| <key2> |
| <key3> |

4.10.8.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.30. Optional AWS parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.platform.aws.amiID</td>
<td>The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compute.platform.aws.iamRole</td>
<td>A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.iops</td>
<td>The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.</td>
<td>Integer, for example 4000.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.size</td>
<td>The size in GiB of the root volume.</td>
<td>Integer, for example 500.</td>
</tr>
<tr>
<td>compute.platform.aws.rootVolume.type</td>
<td>The instance type of the root volume.</td>
<td>Valid AWS EBS instance type, such as io1.</td>
</tr>
<tr>
<td>compute.platform.aws.type</td>
<td>The EC2 instance type for the compute machines.</td>
<td>Valid AWS instance type, such as m4.2xlarge. See the Instance types for machines table that follows.</td>
</tr>
<tr>
<td>compute.platform.aws.zones</td>
<td>The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.</td>
<td>A list of valid AWS availability zones, such as us-east-1c, in a YAML sequence.</td>
</tr>
<tr>
<td>compute.aws.region</td>
<td>The AWS region that the installation program creates compute resources in.</td>
<td>Any valid AWS region, such as us-east-1.</td>
</tr>
<tr>
<td>controlPlane.platform.aws.amiID</td>
<td>The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RH COS AMI.</td>
<td>Any published or custom RH COS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.iamRole</code></td>
<td>A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.</td>
<td>The name of a valid AWS IAM role.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.type</code></td>
<td>The EC2 instance type for the control plane machines.</td>
<td>Valid AWS instance type, such as <code>m5.xlarge</code>. See the <a href="#">Instance types for machines</a> table that follows.</td>
</tr>
<tr>
<td><code>controlPlane.platform.aws.zones</code></td>
<td>The availability zones where the installation program creates machines for the control plane machine pool.</td>
<td>A list of valid AWS availability zones, such as <code>us-east-1c</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><code>controlPlane.aws.region</code></td>
<td>The AWS region that the installation program creates control plane resources in.</td>
<td>Valid AWS region, such as <code>us-east-1</code>.</td>
</tr>
<tr>
<td><code>platform.aws.amiID</code></td>
<td>The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.</td>
<td>Any published or custom RHCOS AMI that belongs to the set AWS region.</td>
</tr>
<tr>
<td><code>platform.aws.hostedZone</code></td>
<td>An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.</td>
<td>String, for example <code>Z3URY6TWQ91KVV</code>.</td>
</tr>
</tbody>
</table>
## Supported AWS Machine Types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

### Example 4.18. Instance types for machines

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bootstrap</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>i3.large</td>
<td>x</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Instance type</td>

4.10.8.3. Sample customized install-config.yaml file for AWS

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
credentialsMode: Mint
controlPlane:
  name: master
  platform:
    aws:
      zones:
        - us-gov-west-1a
        - us-gov-west-1b
      rootVolume:
        iops: 4000
        size: 500
        type: io1
      type: m5.xlarge
      replicas: 3
      compute:
        - hyperthreading: Enabled
      name: worker
      platform:
        aws:
          rootVolume:
            iops: 2000
            size: 500
            type: io1
          type: c5.4xlarge
          zones:
            - us-gov-west-1c
          replicas: 3
      metadata:
        name: test-cluster
    networking:
      clusterNetwork:
        - cidr: 10.128.0.0/14
        hostPrefix: 23
      machineNetwork:
        - cidr: 10.0.0.0/16
      networkType: OpenShiftSDN
      serviceNetwork:
        - 172.30.0.0/16
```
platform:
  aws:
    region: us-gov-west-1
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: 11
      - subnet-1
      - subnet-2
      - subnet-3
    amiID: ami-96c6f8f7 12
    serviceEndpoints: 13
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KV 14
  fips: false 15
  sshKey: ssh-ed25519 AAAA... 16
  publish: Internal 17
  pullSecret: '{"auths": ...}' 18
  additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----

1 10 18 Required.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

3 If you do not provide these parameters and values, the installation program provides the default value.

4 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

5 Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

6 To configure faster storage for etcd, especially for larger clusters, set the storage type as io1 and

7

8

9

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as m4.2xlarge or m5.2xlarge, for your machines if you disable simultaneous multithreading.
If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the https protocol and the host must trust the certificate.

The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

How to publish the user-facing endpoints of your cluster. Set publish to Internal to deploy a private cluster, which cannot be accessed from the Internet. The default value is External.

The custom CA certificate. This is required when deploying to the AWS C2S Secret Region because the AWS API requires a custom CA trust bundle.

### 4.10.8.4. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you can upload a custom AMI prior to installing the cluster. This is required if you are deploying your cluster to an AWS government or secret region. AWS government and secret regions are supported by the AWS SDK.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the us-east-1 AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.
A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the `install-config.yaml` file.

### 4.10.8.5. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

**Prerequisites**

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

**Procedure**

1. Export your AWS profile as an environment variable:
   
   ```
   $ export AWS_PROFILE=<aws_profile>
   
   ```

   The AWS profile name that holds your AWS credentials, like `govcloud`.

2. Export the region to associate with your custom AMI as an environment variable:
   
   ```
   $ export AWS_DEFAULT_REGION=<aws_region>
   
   ```

   The AWS region, like `us-gov-east-1`.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:
   
   ```
   $ export RHCOS_VERSION=<version>
   
   ```

   The RHCOS VMDK version, like `4.8.0`.

4. Export the Amazon S3 bucket name as an environment variable:
   
   ```
   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
   
   ```

5. Create the `containers.json` file and define your RHCOS VMDK file:
   
   ```
   $ cat <<EOF > containers.json
   {
   "Description": "rhcos-$\{RHCOS_VERSION\}-x86_64-aws.x86_64",
   EOF
   ```
6. Import the RHCOS disk as an Amazon EBS snapshot:

   $ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION}  
   --description "<description>" \  
   --disk-container "file://<file_path>/containers.json" 2

1 The description of your RHCOS disk being imported, like rhcos-\${RHCOS_VERSION}-
   x86_64-aws.x86_64.

2 The file path to the JSON file describing your RHCOS disk. The JSON file should contain
   your Amazon S3 bucket name and key.

7. Check the status of the image import:

   $ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}

Example output

   {  
     "ImportSnapshotTasks": [ 
       {  
         "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
         "ImportTaskId": "import-snap-fh6i8uil",
         "SnapshotTaskDetail": {  
           "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
           "DiskImageSize": 819056640.0,
           "Format": "VMDK",
           "SnapshotId": "snap-06331325870076318",
           "Status": "completed",
           "UserBucket": {  
             "S3Bucket": "external-images",
             "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
           }
         }
       }
     ]
   }

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

   $ aws ec2 register-image  
   --region ${AWS_DEFAULT_REGION}  
   --architecture x86_64 1
The RHCOS VMDK architecture type, like x86_64, s390x, or ppc64le.

The Description from the imported snapshot.

The name of the RHCOS AMI.

The SnapshotID from the imported snapshot.

To learn more about these APIs, see the AWS documentation for importing snapshots and creating EBS-backed AMIs.

4.10.8.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

**NOTE**

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**
1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
noProxy: example.com 3
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----

... 4
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpProxy` value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then `httpProxy` is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpsProxy` value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.
4.10.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ``

   **1** For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```
The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 4.10.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.
4. Unpack the archive:
5. Place the `oc` binary in a directory that is on your PATH. To check your PATH, execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:

```
C:\> path
```

After you install the CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

OpenShift Container Platform 4.8 Installing
After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 4.10.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   `system:admin`

### 4.10.12. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

**Prerequisites**

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

**Procedure**

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

   ```bash
   $ cat <installation_directory>/auth/kubeadmin-password
   ```
2. List the OpenShift Container Platform web console route:

   $ oc get routes -n openshift-console | grep 'console-openshift'

   **NOTE**
   Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

   **Example output**
   ```
   console console-openshift-console.apps.<cluster_name>.<base_domain> console
   https reencrypt/Redirect None
   ```

   **Additional resources**
   - See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.10.13. Next steps

   - [Validating an installation](#).
   - [Customize your cluster](#).
   - If necessary, you can [opt out of remote health reporting](#).
   - If necessary, you can [remove cloud provider credentials](#).

4.11. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) that uses infrastructure that you provide.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company’s policies.
4.11.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You configured an AWS account to host the cluster.

- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.

- Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

4.11.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:
• Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.

• Access Quay.io to obtain the packages that are required to install your cluster.

• Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

Additional resources

• See About remote health monitoring for more information about the Telemetry service.

4.11.3. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the OpenShift Container Platform 4.x Tested Integrations page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

• An AWS Virtual Private Cloud (VPC)

• Networking and load balancing components

• Security groups and roles

• An OpenShift Container Platform bootstrap node

• OpenShift Container Platform control plane nodes

• An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

4.11.3.1. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The `kube-controller-manager` only approves the kubelet client CSRs. The `machine-approver` cannot guarantee the validity of a serving certificate that is requested by using
kubelet credentials because it cannot confirm that the correct machine issued the request. You must
determine and implement a method of verifying the validity of the kubelet serving certificate requests
and approving them.

4.11.3.2. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP
addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and
attach it to the subnet that the clusters are using. Create the following endpoints:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC</td>
<td><code>AWS::EC2::VPC</code></td>
<td>You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::VPCEndpoint</code></td>
<td></td>
</tr>
<tr>
<td>Public subnets</td>
<td><code>AWS::EC2::Subnet</code></td>
<td>Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.</td>
</tr>
<tr>
<td></td>
<td><code>AWS::EC2::SubnetNetworkAclAssociation</code></td>
<td></td>
</tr>
</tbody>
</table>
### Component

<table>
<thead>
<tr>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet gateway</td>
<td>You must have a public Internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the Internet and are not required for some restricted network or proxy scenarios.</td>
</tr>
<tr>
<td>Network access control</td>
<td>You must allow the VPC to access the following ports:</td>
</tr>
<tr>
<td>Private subnets</td>
<td>You must provide appropriate routes and tables for them.</td>
</tr>
</tbody>
</table>

### Network access control

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>

### Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster’s infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for `api`. 

---

<table>
<thead>
<tr>
<th>Port</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Inbound HTTP traffic</td>
</tr>
<tr>
<td>443</td>
<td>Inbound HTTPS traffic</td>
</tr>
<tr>
<td>22</td>
<td>Inbound SSH traffic</td>
</tr>
<tr>
<td>1024 - 65535</td>
<td>Inbound ephemeral traffic</td>
</tr>
<tr>
<td>0 - 65535</td>
<td>Outbound ephemeral traffic</td>
</tr>
</tbody>
</table>
<cluster_name>.<domain> must point to the external load balancer, and an entry for api-int. 
<cluster_name>.<domain> must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the 
Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for 
new machines. The targets will be the control plane nodes (also known as the master nodes). Port 6443 
must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must 
be accessible to nodes within the cluster.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>AWS::Route53::HostedZone</td>
<td>The hosted zone for your internal DNS.</td>
</tr>
<tr>
<td>etcd record sets</td>
<td>AWS::Route53::RecordSet</td>
<td>The registration records for etcd for your control plane machines.</td>
</tr>
<tr>
<td>Public load balancer</td>
<td>AWS::Elastic LoadBalancingV2::LoadBalancer</td>
<td>The load balancer for your public subnets.</td>
</tr>
<tr>
<td>External API server record</td>
<td>AWS::Route53::RecordSetGroup</td>
<td>Alias records for the external API server.</td>
</tr>
<tr>
<td>External listener</td>
<td>AWS::Elastic LoadBalancingV2::Listener</td>
<td>A listener on port 6443 for the external load balancer.</td>
</tr>
<tr>
<td>External target group</td>
<td>AWS::Elastic LoadBalancingV2::TargetGroup</td>
<td>The target group for the external load balancer.</td>
</tr>
<tr>
<td>Private load balancer</td>
<td>AWS::Elastic LoadBalancingV2::LoadBalancer</td>
<td>The load balancer for your private subnets.</td>
</tr>
<tr>
<td>Internal API server record</td>
<td>AWS::Route53::RecordSetGroup</td>
<td>Alias records for the internal API server.</td>
</tr>
<tr>
<td>Internal listener</td>
<td>AWS::Elastic LoadBalancingV2::Listener</td>
<td>A listener on port 22623 for the internal load balancer.</td>
</tr>
</tbody>
</table>
Internal target group

AWS::ElasticLoadBalancingV2::TargetGroup

The target group for the internal load balancer.

Internal listener

AWS::ElasticLoadBalancingV2::Listener

A listener on port 6443 for the internal load balancer.

Internal target group

AWS::ElasticLoadBalancingV2::TargetGroup

The target group for the internal load balancer.

## Security groups

The control plane and worker machines require access to the following ports:

<table>
<thead>
<tr>
<th>Group</th>
<th>Type</th>
<th>IP Protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>6443</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22623</td>
</tr>
<tr>
<td>WorkerSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td>BootstrapSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>19531</td>
</tr>
</tbody>
</table>

## Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a AWS::EC2::SecurityGroupIngress resource.

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterIngress Etcd</td>
<td>etcd</td>
<td>tcp</td>
<td>2379–2380</td>
</tr>
<tr>
<td>Ingress group</td>
<td>Description</td>
<td>IP protocol</td>
<td>Port range</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------</td>
<td>-------------</td>
<td>----------------</td>
</tr>
<tr>
<td>MasterIngress Vxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>
</tr>
<tr>
<td>MasterIngress WorkerVxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>
</tr>
<tr>
<td>MasterIngress Internal</td>
<td>Internal cluster communication and Kubernetes proxy metrics</td>
<td>tcp</td>
<td>9000 - 9999</td>
</tr>
<tr>
<td>MasterIngress WorkerInternal</td>
<td>Internal cluster communication</td>
<td>tcp</td>
<td>9000 - 9999</td>
</tr>
<tr>
<td>MasterIngress Kube</td>
<td>Kubernetes kubelet, scheduler and controller manager</td>
<td>tcp</td>
<td>10250 - 10259</td>
</tr>
<tr>
<td>MasterIngress WorkerKube</td>
<td>Kubernetes kubelet, scheduler and controller manager</td>
<td>tcp</td>
<td>10250 - 10259</td>
</tr>
<tr>
<td>MasterIngress IngressServices</td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
<tr>
<td>MasterIngress WorkerIngress Services</td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

**Worker Ingress**

The worker machines require the following Ingress groups. Each Ingress group is a AWS::EC2::SecurityGroupIngress resource.

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>WorkerIngress Vxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>
</tr>
<tr>
<td>WorkerIngress WorkerVxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>
</tr>
<tr>
<td>WorkerIngress Internal</td>
<td>Internal cluster communication</td>
<td>tcp</td>
<td>9000 - 9999</td>
</tr>
<tr>
<td>WorkerIngress WorkerInternal</td>
<td>Internal cluster communication</td>
<td>tcp</td>
<td>9000 - 9999</td>
</tr>
</tbody>
</table>
### Ingress group

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>WorkerIngress Kube</td>
<td>Kubernetes kubelet, scheduler, and controller manager</td>
<td>tcp</td>
<td>10250</td>
</tr>
<tr>
<td>WorkerIngress WorkerKube</td>
<td>Kubernetes kubelet, scheduler, and controller manager</td>
<td>tcp</td>
<td>10250</td>
</tr>
<tr>
<td>WorkerIngress IngressServices</td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
<tr>
<td>WorkerIngress WorkerIngress Services</td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

### Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following `AWS::IAM::Role` objects and provide a `AWS::IAM::InstanceProfile` for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

<table>
<thead>
<tr>
<th>Role</th>
<th>Effect</th>
<th>Action</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master</td>
<td>Allow</td>
<td>ec2:*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>elasticloadbalancing:*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>iam:PassRole</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>s3:GetObject</td>
<td>*</td>
</tr>
<tr>
<td>Worker</td>
<td>Allow</td>
<td>ec2:Describe*</td>
<td>*</td>
</tr>
<tr>
<td>Bootstrap</td>
<td>Allow</td>
<td>ec2:Describe*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>ec2:AttachVolume</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>ec2:DetachVolume</td>
<td>*</td>
</tr>
</tbody>
</table>

### 4.11.3.3. Cluster machines

You need `AWS::EC2::Instance` objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
Three control plane machines. The control plane machines are not governed by a machine set.

Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

4.11.3.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.19. Instance types for machines

<table>
<thead>
<tr>
<th>Instance type</th>

4.11.3.5. Required AWS permissions for the IAM user

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 4.20. Required EC2 permissions for installation**

- ec2:AllocateAddress
- ec2:AssociateAddress
- ec2:AuthorizeSecurityGroupEgress
- ec2:AuthorizeSecurityGroupIngress
- ec2:CopyImage
- ec2:CreateNetworkInterface
- ec2:AttachNetworkInterface
- ec2:CreateSecurityGroup
- ec2:CreateTags
- ec2:CreateVolume
- ec2:DeleteSecurityGroup
- ec2:DeleteSnapshot
- ec2:DeleteTags
- ec2:DeregisterImage
• ec2:DescribeAccountAttributes
• ec2:DescribeAddresses
• ec2:DescribeAvailabilityZones
• ec2:DescribeDhcpOptions
• ec2:DescribeImages
• ec2:DescribeInstanceAttribute
• ec2:DescribeInstanceCreditSpecifications
• ec2:DescribeInstances
• ec2:DescribeInstanceTypes
• ec2:DescribeInternetGateways
• ec2:DescribeKeyPairs
• ec2:DescribeNatGateways
• ec2:DescribeNetworkAcls
• ec2:DescribeNetworkInterfaces
• ec2:DescribePrefixLists
• ec2:DescribeRegions
• ec2:DescribeRouteTables
• ec2:DescribeSecurityGroups
• ec2:DescribeSubnets
• ec2:DescribeTags
• ec2:DescribeVolumes
• ec2:DescribeVpcAttribute
• ec2:DescribeVpcClassicLink
• ec2:DescribeVpcClassicLinkDnsSupport
• ec2:DescribeVpcEndpoints
• ec2:DescribeVpcs
• ec2:GetEbsDefaultKmsKeyId
• ec2:ModifyInstanceAttribute
• ec2:ModifyNetworkInterfaceAttribute
Example 4.21. Required permissions for creating network resources during installation

- ec2:AssociateDhcpOptions
- ec2:AssociateRouteTable
- ec2:AttachInternetGateway
- ec2:CreateDhcpOptions
- ec2:CreateInternetGateway
- ec2:CreateNatGateway
- ec2:CreateRoute
- ec2:CreateRouteTable
- ec2:CreateSubnet
- ec2:CreateVpc
- ec2:CreateVpcEndpoint
- ec2:ModifySubnetAttribute
- ec2:ModifyVpcAttribute

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.22. Required Elastic Load Balancing permissions for installation

- elasticloadbalancing:AddTags
- elasticloadbalancing:ApplySecurityGroupsToLoadBalancer
- elasticloadbalancing:AttachLoadBalancerToSubnets
- elasticloadbalancing:ConfigureHealthCheck
- elasticloadbalancing:CreateListener
• elasticloadbalancing:CreateLoadBalancer
• elasticloadbalancing:CreateLoadBalancerListeners
• elasticloadbalancing:CreateTargetGroup
• elasticloadbalancing:DeleteLoadBalancer
• elasticloadbalancing:DeregisterInstancesFromLoadBalancer
• elasticloadbalancing:DeregisterTargets
• elasticloadbalancing:DescribeInstanceHealth
• elasticloadbalancing:DescribeListeners
• elasticloadbalancing:DescribeLoadBalancerAttributes
• elasticloadbalancing:DescribeLoadBalancers
• elasticloadbalancing:DescribeTags
• elasticloadbalancing:DescribeTargetGroupAttributes
• elasticloadbalancing:DescribeTargetHealth
• elasticloadbalancing:ModifyLoadBalancerAttributes
• elasticloadbalancing:ModifyTargetGroup
• elasticloadbalancing:ModifyTargetGroupAttributes
• elasticloadbalancing:RegisterInstancesWithLoadBalancer
• elasticloadbalancing:RegisterTargets
• elasticloadbalancing:SetLoadBalancerPoliciesOfListener

Example 4.23. Required IAM permissions for installation

• iam:AddRoleToInstanceProfile
• iam:CreateInstanceProfile
• iam:CreateRole
• iam:DeleteInstanceProfile
• iam:DeleteRole
• iam:DeleteRolePolicy
• iam:GetInstanceProfile
• iam:GetRole
• iam:GetRolePolicy
• `iam:GetUser`
• `iam:ListInstanceProfilesForRole`
• `iam:ListRoles`
• `iam:ListUsers`
• `iam:PassRole`
• `iam:PutRolePolicy`
• `iam:RemoveRoleFromInstanceProfile`
• `iam:SimulatePrincipalPolicy`
• `iam:TagRole`

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

**Example 4.24. Required Route 53 permissions for installation**

• `route53:ChangeResourceRecordSets`
• `route53:ChangeTagsForResource`
• `route53:CreateHostedZone`
• `route53:DeleteHostedZone`
• `route53:GetChange`
• `route53:GetHostedZone`
• `route53:ListHostedZones`
• `route53:ListHostedZonesByName`
• `route53:ListResourceRecordSets`
• `route53:ListTagsForResource`
• `route53:UpdateHostedZoneComment`

**Example 4.25. Required S3 permissions for installation**

• `s3:CreateBucket`
• `s3:DeleteBucket`
• `s3:GetAccelerateConfiguration`
Example 4.26. S3 permissions that cluster Operators require

- s3:DeleteObject
- s3:GetObject
- s3:GetObjectAcl
- s3:GetObjectTagging
- s3:GetObjectVersion
- s3:PutObject
- s3:PutObjectAcl
- s3:PutObjectTagging
- s3:PutEncryptionConfiguration

Example 4.27. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
- ec2:DeleteNetworkInterface
- ec2:DeleteVolume
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DescribeTargetGroups
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:ListAttachedRolePolicies
- iam:ListInstanceProfiles
- iam:ListRolePolicies
- iam:ListUserPolicies
- s3:DeleteObject
- s3:ListBucketVersions
- tag:GetResources

Example 4.28. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
- ec2:DeleteRouteTable
- ec2:DeleteSubnet
- ec2:DeleteVpc
- ec2:DeleteVpcEndpoints
- ec2:DetachInternetGateway
- ec2:DisassociateRouteTable
- ec2:ReplaceRouteTableAssociation

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the tag:UntagResources permission to delete network resources.
Example 4.29. Additional IAM and S3 permissions that are required to create manifests

- iam:CreateAccessKey
- iam:CreateUser
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:DeleteUserPolicy
- iam:GetUserPolicy
- iam:ListAccessKeys
- iam:PutUserPolicy
- iam:TagUser
- iam:GetUserPolicy
- iam:ListAccessKeys
- s3:PutBucketPublicAccessBlock
- s3:GetBucketPublicAccessBlock
- s3:PutLifecycleConfiguration
- s3:HeadBucket
- s3:ListBucketMultipartUploads
- s3:AbortMultipartUpload

Example 4.30. Optional permissions for instance and quota checks for installation

- ec2:DescribeInstanceTypeOfferings
- servicequotas:ListAWSDefaultServiceQuotas

4.11.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure
1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**
   
   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**
   
   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar xvf openshift-install-linux.tar.gz
   ```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.11.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

   **IMPORTANT**
   
   Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE
   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   NOTE
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   Example output

      Agent pid 31874

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.
1. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

   **Example output**

   ```
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

### 4.11.6. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `/var` partition during the preparation phases of installation.

#### 4.11.6.1. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.

- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.

- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a `/var` directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because `/var` must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate `/var` partition by creating a machine config that is inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.
**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Prerequisites**

- If container storage is on the root partition, ensure that this root partition is mounted with the `pquota` option by including `rootflags=pquota` in the GRUB command line.

- If the container storage is on a partition that is mounted by `/etc/fstab`, ensure that the following mount option is included in the `/etc/fstab` file:

  ```
  /dev/sdb1 /var xfs defaults,pquota 0 0
  ```

- If the container storage is on a partition that is mounted by `systemd`, ensure that the `MachineConfig` object includes the following mount option as in this example:

  ```yaml
  spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/sdb
          partitions:
            - label: var
              sizeMiB: 240000
              startMiB: 0
          filesystems:
            - device: /dev/disk/by-partlabel/var
              format: xfs
              path: /var
      systemd:
        units:
          - contents: |
            [Unit]
            Before=local-fs.target
            [Mount]
            Where=/var
            What=/dev/disk/by-partlabel/var
            Options=defaults,pquota
            [Install]
            WantedBy=local-fs.target
          enabled: true
          name: var.mount
  ```

**Procedure**

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```
   $ mkdir $HOME/clusterconfig
   ```
2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
? SSH Public Key ...
$ ls $HOME/clusterconfig/openshift/
 99_kubeadmin-password-secret.yaml
 99_openshift-cluster-api_master-machines-0.yaml
 99_openshift-cluster-api_master-machines-1.yaml
 99_openshift-cluster-api_master-machines-2.yaml
...
```

3. Create a `MachineConfig` object and add it to a file in the `openshift` directory. For example, name the file `98-var-partition.yaml`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This attaches storage to a separate `/var` directory.

```
apiVersion: machineconfiguration.openshift.io/v1
kind: MachineConfig
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/<device_name> 1
        partitions:
          - sizeMiB: <partition_size>
            startMiB: <partition_start_offset> 2
      label: var
    filesystems:
      - path: /var
        device: /dev/disk/by-partlabel/var
        format: xfs
  systemd:
    units:
      - name: var.mount
        enabled: true
        contents: |
          [Unit]
          Before=local-fs.target
          [Mount]
          Where=/var
          What=/dev/disk/by-partlabel/var
          [Install]
          WantedBy=local-fs.target
```

1. The storage device name of the disk that you want to partition.
2. The storage partition size in MiB and start offset in MiB.
When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up.

4. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

   ```
   $ openshift-install create ignition-configs --dir $HOME/clusterconfig
   $ ls $HOME/clusterconfig/
   auth bootstrap.ign master.ign metadata.json worker.ign
   ```

   Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

4.11.6.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster.

- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the `install-config.yaml` file manually.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory> 1
   ```

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.
NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

ii. Select aws as the platform to target.

iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

NOTE
The AWS access key ID and secret access key are stored in ~/.aws/credentials in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Optional: Back up the install-config.yaml file.

IMPORTANT
The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources
- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

4.11.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites
- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to
hosting cloud provider APIs. You added sites to the **Proxy** object’s **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
     noProxy: example.com 3
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
   ...
   ```

   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpProxy` value.

   2 A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then `httpProxy` is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpsProxy` value.

   3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use * to bypass the proxy for all destinations.

   4 If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then
creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 4.11.6.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program.
- You created the install-config.yaml installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:
For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
   name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone: 1
       id: mycluster-100419-private-zone
     publicZone: 2
       id: example.openshift.com
   status: {}
   ```
If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

   $ ./openshift-install create ignition-configs --dir=<installation_directory>  

   For <installation_directory>, specify the same installation directory.

   Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadm-password** and **kubeconfig** files are created in the ./<installation_directory>/auth directory:

   ├── auth  
   │   └── kubeadm-password  
   │   └── kubeconfig  
   │       └── bootstrap.ign  
   │           └── master.ign  
   │               └── metadata.json  
   │                   └── worker.ign  

### 4.11.7. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

**Procedure**

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

  $ jq -r .infraID <installation_directory>/metadata.json  

  For <installation_directory>, specify the path to the directory that you stored the installation files in.

**Example output**

-
The output of this command is your cluster name and a random string.

4.11.8. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   
   
   
   
   
   
   
   
   
   
   
   
   
   
   
   ]
   ```

   1. The CIDR block for the VPC.
   2. Specify a CIDR block in the format `x.x.x.x/16-24`.
   3. The number of availability zones to deploy the VPC in.
4. Specify an integer between 1 and 3.
5. The size of each subnet in each availability zone.
6. Specify an integer between 5 and 13, where 5 is $27$ and 13 is $19$.

2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

   ```
   IMPORTANT
   You must enter the command on a single line.
   ```

   ```
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   ```

   - `<name>` is the name for the CloudFormation stack, such as `cluster-vpc`. You need the name of this stack if you remove the cluster.
   - `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.
   - `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   **Example output**

   ```
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
   ```

4. Confirm that the template components exist:

   ```
   $ aws cloudformation describe-stacks --stack-name <name>
   ```

   After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of your VPC.</td>
</tr>
<tr>
<td>PublicSubnetIds</td>
<td>The IDs of the new public subnets.</td>
</tr>
<tr>
<td>PrivateSubnetIds</td>
<td>The IDs of the new private subnets.</td>
</tr>
</tbody>
</table>
4.11.8.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

Example 4.31. CloudFormation template for the VPC

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^(((0-9|[1-9][0-9]?)1[0-9][0-9]?)2[0-4][0-9]25[0-5])\(3\)(0-9|[1-9][0-9]?)1[0-9][0-9]?)2[0-4][0-9]25[0-5])\((16-9)[2([0-4])\\$ ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number
  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label: "Network Configuration"
    Parameters:

Outputs:
Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

4.11.9. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the `install-config.yaml` file for your cluster. You can obtain details about your hosted zone by running the following command:

   ```
   $ aws route53 list-hosted-zones-by-name --dns-name <route53_domain>
   ```

   For the `<route53_domain>`, specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster.

   Example output

   ```
   mycluster.example.com. False 100
   HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
   /hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
   ```

   In the example output, the hosted zone ID is `Z21IXYZABCZ2A4`.

2. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   {
   "ParameterKey": "ClusterName", 1
   "ParameterValue": "mycluster" 2
   },
   {
   "ParameterKey": "InfrastructureName", 3
   "ParameterValue": "mycluster-<random_string>" 4
   },
   {
   "ParameterKey": "HostedZoneld", 5
   "ParameterValue": "<random_string>" 6
   },
   {
   "ParameterKey": "HostedZoneName", 7
   "ParameterValue": "example.com" 8
   },
   {
   "ParameterKey": "PublicSubnets", 9
   "ParameterValue": "subnet-<random_string>" 10
   },
   {
   "ParameterKey": "PrivateSubnets", 11
   "ParameterValue": "subnet-<random_string>" 12
   },
   {
   "ParameterKey": "VpcId", 13
   "ParameterValue": "vpc-<random_string>" 14
   }
   ]
   ```
A short, representative cluster name to use for host names, etc.

Specify the cluster name that you used when you generated the `install-config.yaml` file for the cluster.

The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

The Route 53 public zone ID to register the targets with.

Specify the Route 53 public zone ID, which as a format similar to `Z21IXYZABCZ2A4`. You can obtain this value from the AWS console.

The Route 53 zone to register the targets with.

Specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

The public subnets that you created for your VPC.

Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

3. Copy the template from the CloudFormation template for the network and load balancers section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

   **IMPORTANT**

   If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` in the CloudFormation template to use `CNAME` records. Records of type `ALIAS` are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

   **IMPORTANT**

   You must enter the command on a single line.
$ aws cloudformation create-stack --stack-name <name>  
  --template-body file://<template>.yaml  
  --parameters file://<parameters>.json  
  --capabilities CAPABILITY_NAMED_IAM

1. `<name>` is the name for the CloudFormation stack, such as `cluster-dns`. You need the name of this stack if you remove the cluster.

2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrivateHostedZoneId</td>
<td>Hosted zone ID for the private DNS.</td>
</tr>
<tr>
<td>ExternalApiLoadBalancerName</td>
<td>Full name of the external API load balancer.</td>
</tr>
<tr>
<td>InternalApiLoadBalancerName</td>
<td>Full name of the internal API load balancer.</td>
</tr>
<tr>
<td>ApiServerDnsName</td>
<td>Full host name of the API server.</td>
</tr>
<tr>
<td>RegisterNlbIpTargetssLambda</td>
<td>Lambda ARN useful to help register/deregister IP targets for these load balancers.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ExternalApiTargetGroupArn</td>
<td>ARN of external API target group.</td>
</tr>
<tr>
<td>InternalApiTargetGroupArn</td>
<td>ARN of internal API target group.</td>
</tr>
<tr>
<td>InternalServiceTargetGroupArn</td>
<td>ARN of internal service target group.</td>
</tr>
</tbody>
</table>

### 4.11.9.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

**Example 4.32. CloudFormation template for the network and load balancers**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
ClusterName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, representative cluster name to use for host names and other identifying names.
  Type: String

InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String

HostedZoneId:
  Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.
  Type: String

HostedZoneName:
  Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.
  Type: String
  Default: "example.com"

PublicSubnets:
  Description: The internet-facing subnets.
PrivateSubnets:
Description: The internal subnets.
Type: List<AWS::EC2::Subnet::Id>

VpcId:
Description: The VPC-scoped resources will belong to this VPC.
Type: AWS::EC2::VPC::Id

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: default: "Cluster Information"
  Parameters:
  - ClusterName
  - InfrastructureName
- Label: default: "Network Configuration"
  Parameters:
  - VpcId
  - PublicSubnets
  - PrivateSubnets
- Label: default: "DNS"
  Parameters:
  - HostedZoneName
  - HostedZoneId
ParameterLabels:
  ClusterName:
    default: "Cluster Name"
  InfrastructureName:
    default: "Infrastructure Name"
  VpcId:
    default: "VPC ID"

            event['ResourceProperties']['[InfrastructureName'] + event['ResourceProperties']['[Subnets'][0]])
    Runtime: "python3.7"
IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

Timeout: 120

RegisterPublicSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
  - ServiceToken: !GetAtt RegisterSubnetTags.Arn
  - InfrastructureName: !Ref InfrastructureName
  - Subnets: !Ref PublicSubnets

RegisterPrivateSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
  - ServiceToken: !GetAtt RegisterSubnetTags.Arn
  - InfrastructureName: !Ref InfrastructureName
  - Subnets: !Ref PrivateSubnets

Outputs:
  PrivateHostedZoneId:
    Description: Hosted zone ID for the private DNS, which is required for private records.
    Value: !Ref IntDns
  ExternalApiLoadBalancerName:
    Description: Full name of the external API load balancer.
    Value: !GetAtt ExtApiElb.LoadBalancerFullName
  InternalApiLoadBalancerName:
    Description: Full name of the internal API load balancer.
    Value: !GetAtt IntApiElb.LoadBalancerFullName
  ApiServerDnsName:
    Description: Full hostname of the API server, which is required for the Ignition config files.
    Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]
  RegisterNlbIpTargetsLambda:
    Description: Lambda ARN useful to help register or deregister IP targets for these load balancers.
    Value: !GetAtt RegisterNlbIpTargets.Arn
  ExternalApiTargetGroupArn:
    Description: ARN of the external API target group.
    Value: !Ref ExternalApiTargetGroup
  InternalApiTargetGroupArn:
    Description: ARN of the internal API target group.
    Value: !Ref InternalApiTargetGroup
  InternalServiceTargetGroupArn:
    Description: ARN of the internal service target group.
    Value: !Ref InternalServiceTargetGroup
4.11.10. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   {
     "ParameterKey": "InfrastructureName", 1
     "ParameterValue": "mycluster-<random_string>" 2
   },
   {
     "ParameterKey": "VpcCidr", 3
     "ParameterValue": "10.0.0.0/16" 4
   },
   {
     "ParameterKey": "PrivateSubnets", 5
     "ParameterValue": "subnet-<random_string>" 6
   },
   {
     "ParameterKey": "VpcId", 7
   }
   ```

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.
- You can view details about your hosted zones by navigating to the AWS Route 53 console.
- See Listing public hosted zones in the AWS documentation for more information about listing public hosted zones.
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

The CIDR block for the VPC.

Specify the CIDR block parameter that you used for the VPC that you defined in the form `x.x.x.x/16-24`.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

2. Copy the template from the CloudFormation template for security objects section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

   **IMPORTANT**

   You must enter the command on a single line.

   ```
   $ aws cloudformation create-stack --stack-name <name>  
   --template-body file://<template>.yaml  
   --parameters file://<parameters>.json  
   --capabilities CAPABILITY_NAMED_IAM
   ```

   `<name>` is the name for the CloudFormation stack, such as `cluster-sec`. You need the name of this stack if you remove the cluster.

   `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.
Example output

arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db

4. Confirm that the template components exist:

```bash
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>MasterSecurityGroupId</th>
<th>Master Security Group ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>WorkerSecurityGroupId</td>
<td>Worker Security Group ID</td>
</tr>
<tr>
<td>MasterInstanceProfile</td>
<td>Master IAM Instance Profile</td>
</tr>
<tr>
<td>WorkerInstanceProfile</td>
<td>Worker IAM Instance Profile</td>
</tr>
</tbody>
</table>

4.11.10.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

**Example 4.33. CloudFormation template for security objects**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^((\[0-9]||[1-9][0-9]||[1-9][0-9][2]||[0-4][0-9][0-9][25][0-5])\.)\([0-9]-25[0-5]\)/(\[1-6-9][2][0-4]\))$
```
ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
Default: 10.0.0.0/16
Description: CIDR block for VPC.
Type: String
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
PrivateSubnets:
  Description: The internal subnets.
  Type: List<AWS::EC2::Subnet::Id>

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
    - Label:
      default: "Cluster Information"
    Parameters:
      - InfrastructureName
  - Label:
    default: "Network Configuration"
    Parameters:
      - VpcId
      - VpcCidr
      - PrivateSubnets
  ParameterLabels:
    InfrastructureName:
      default: "Infrastructure Name"
    VpcId:
      default: "VPC ID"
    VpcCidr:
      default: "VPC CIDR"
    PrivateSubnets:
      default: "Private Subnets"

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

4.11.11. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, stream metadata provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the coreos print-stream-json sub-command of openshift-install to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the openshift-install binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official stream-metadata-go library at https://github.com/coreos/stream-metadata-go. You can also view example code in the library.

- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.

- From a command-line utility that handles JSON data, such as jq:
Print the current `x86_64` AMI for an AWS region, such as `us-west-1`:

```bash
$ openshift-install coreos print-stream-json | jq -r 
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

**Example output**

ami-0d3e625f84626bbda

The output of this command is the AWS AMI ID for the `us-west-1` region. The AMI must belong to the same region as the cluster.

### 4.11.12. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions that you can manually specify for your OpenShift Container Platform nodes.

**NOTE**

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

#### Table 4.31. RHCOS AMIs

### 4.11.12.1. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you can upload a custom AMI prior to installing the cluster. This is required if you are deploying your cluster to an AWS government or secret region. AWS government and secret regions are supported by the AWS SDK.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the `us-east-1` AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the `install-config.yaml` file.

### 4.11.12.2. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

**Prerequisites**

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM service role.
You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.

You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer.

Procedure

1. Export your AWS profile as an environment variable:

   ```bash
   $ export AWS_PROFILE=<aws_profile>
   ``

   The AWS profile name that holds your AWS credentials, like `govcloud`.

2. Export the region to associate with your custom AMI as an environment variable:

   ```bash
   $ export AWS_DEFAULT_REGION=<aws_region>
   ```

   The AWS region, like `us-gov-east-1`.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

   ```bash
   $ export RHCOS_VERSION=<version>
   ```

   The RHCOS VMDK version, like `4.8.0`.

4. Export the Amazon S3 bucket name as an environment variable:

   ```bash
   $ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
   ```

5. Create the `containers.json` file and define your RHCOS VMDK file:

   ```json
   $ cat <<EOF > containers.json
   {
     "Description": "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64",
     "Format": "vmdk",
     "UserBucket": {
       "S3Bucket": "${VMIMPORT_BUCKET_NAME}"
     }
   }
   EOF
   ```

6. Import the RHCOS disk as an Amazon EBS snapshot:

   ```bash
   $ aws ec2 import-snapshot --region $(AWS_DEFAULT_REGION) \
   --description "<description>" \ 
   --disk-container "file://<file_path>/containers.json"
   ```
The description of your RHCOS disk being imported, like `rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64`.

The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```bash
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

Example output

```json
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 81905640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```bash
$ aws ec2 register-image \
--region ${AWS_DEFAULT_REGION} \
--architecture x86_64 \1
--description "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \2
--ena-support \
--name "rhcos-$(RHCOS_VERSION)-x86_64-aws.x86_64" \3
--virtualization-type hvm \
--root-device-name '/dev/xvda' \
--block-device-mappings 'DeviceName=/dev/xvda,Ebs=
{DeleteOnTermination=true,SnapshotId=<snapshot_ID>[' \4

1 The RHCOS VMDK architecture type, like `x86_64`, `s390x`, or `ppc64le`.
2 The **Description** from the imported snapshot.
3 The name of the RHCOS AMI.
The SnapshotID from the imported snapshot.

To learn more about these APIs, see the AWS documentation for importing snapshots and creating EBS-backed AMIs.

### 4.11.13. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

**NOTE**

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

**Procedure**

1. Provide a location to serve the `bootstrap.ign` Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster’s region and upload the Ignition config file to it.

**IMPORTANT**

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

**IMPORTANT**

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the `s3://` schema.
NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

a. Create the bucket:

```bash
$ aws s3 mb s3://<cluster-name>-infra
```

<cluster-name>-infra is the bucket name. When creating the `install-config.yaml` file, replace `<cluster-name>` with the name specified for the cluster.

b. Upload the `bootstrap.ign` Ignition config file to the bucket:

```bash
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

c. Verify that the file uploaded:

```bash
$ aws s3 ls s3://<cluster-name>-infra/
```

Example output

```
2019-04-03 16:15:16    314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  }
]
```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.

Specify a valid `AWS::EC2::Image::Id` value.

CIDR block to allow SSH access to the bootstrap node.

Specify a CIDR block in the format `x.x.x.x/16-24`.

The public subnet that is associated with your VPC to launch the bootstrap node into.

```json
{
  "ParameterKey": "MasterSecurityGroupId",
  "ParameterValue": "sg-<random_string>",
}
{
  "ParameterKey": "VpcId",
  "ParameterValue": "vpc-<random_string>",
}
{
  "ParameterKey": "BootstrapIgnitionLocation",
  "ParameterValue": "s3://<bucket_name>/bootstrap.ign",
}
{
  "ParameterKey": "AutoRegisterELB",
  "ParameterValue": "yes",
}
{
  "ParameterKey": "RegisterNlbIpTargetsLambdaArn",
}
{
  "ParameterKey": "ExternalApiTargetGroupArn",
}
{
  "ParameterKey": "InternalApiTargetGroupArn",
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>",
}
{
  "ParameterKey": "InternalServiceTargetGroupArn",
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>",
}
}`
Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The master security group ID (for registering temporary rules)

Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The VPC created resources will belong to.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

Location to fetch bootstrap Ignition config file from.

Specify the S3 bucket and file name in the form `s3://<bucket_name>/bootstrap.ign`.

Whether or not to register a network load balancer (NLB).

Specify `yes` or `no`. If you specify `yes`, you must provide a Lambda Amazon Resource Name (ARN) value.

The ARN for NLB IP target registration lambda group.

Specify the `RegisterNlbIpTargetsLambda` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for external API load balancer target group.

Specify the `ExternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal API load balancer target group.

Specify the `InternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal service load balancer target group.

Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

3. Copy the template from the CloudFormation template for the bootstrap machine section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

   ![IMPORTANT](image)

   You must enter the command on a single line.
<name> is the name for the CloudFormation stack, such as `cluster-bootstrap`. You need the name of this stack if you remove the cluster.

<template> is the relative path to and name of the CloudFormation template YAML file that you saved.

<parameters> is the relative path to and name of the CloudFormation parameters JSON file.

You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

## Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap Instanceld</td>
<td>The bootstrap Instance ID.</td>
</tr>
<tr>
<td>Bootstrap PublicIp</td>
<td>The bootstrap node public IP address.</td>
</tr>
<tr>
<td>Bootstrap PrivateIp</td>
<td>The bootstrap node private IP address.</td>
</tr>
</tbody>
</table>

### 4.11.13.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

#### Example 4.34. CloudFormation template for the bootstrap machine

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)
Parameters:
```

368
InfrastructureName:
  AllowedPattern: '^([a-zA-Z][a-zA-Z0-9-]{0,26})$'
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String
RhcosAmi:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
  Type: AWS::EC2::Image::Id
AllowedBootstrapSshCidr:
  ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
  Default: 0.0.0.0/0
  Description: CIDR block to allow SSH access to the bootstrap node.
  Type: String
PublicSubnet:
  Description: The public subnet to launch the bootstrap node into.
  Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
  Description: The master security group ID for registering temporary rules.
  Type: AWS::EC2::SecurityGroup::Id
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
BootstrapIgnitionLocation:
  Default: s3://my-s3-bucket/bootstrap.ign
  Description: Ignition config file location.
  Type: String
AutoRegisterELB:
  Default: "yes"
  AllowedValues:
    - "yes"
    - "no"
  Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
  Type: String
RegisterNlbIpTargetsLambdaArn:
  Description: ARN for NLB IP target registration lambda.
  Type: String
ExternalApiTargetGroupArn:
  Description: ARN for external API load balancer target group.
  Type: String
InternalApiTargetGroupArn:
  Description: ARN for internal API load balancer target group.
  Type: String
InternalServiceTargetGroupArn:
  Description: ARN for internal service load balancer target group.
  Type: String

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
    - Label:
default: "Cluster Information"
Parameters:
- InfrastructureName
- Label:
  default: "Host Information"
Parameters:
- RhcosAmi
- BootstrapIgnititionLocation
- MasterSecurityGroupId
- Label:
  default: "Network Configuration"
Parameters:
- VpcId
- AllowedBootstrapSshCidr
- PublicSubnet
- Label:
  default: "Load Balancer Automation"
Parameters:
- AutoRegisterELB
- RegisterNlbIpTargetsLambdaArn
- ExternalApiTargetGroupArn
- InternalApiTargetGroupArn
- InternalServiceTargetGroupArn
ParameterLabels:
InfrastructureName:

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

- See RHCOS AMIs for the AWS infrastructure for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

4.11.14. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.
You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   {
     "ParameterKey": "InfrastructureName", 1
     "ParameterValue": "mycluster-<random_string>" 2
   },
   {
     "ParameterKey": "RhcosAmi", 3
     "ParameterValue": "ami-<random_string>" 4
   },
   {
     "ParameterKey": "AutoRegisterDNS", 5
     "ParameterValue": "yes" 6
   },
   {
     "ParameterKey": "PrivateHostedZoneld", 7
     "ParameterValue": "<random_string>" 8
   },
   {
     "ParameterKey": "PrivateHostedZoneName", 9
     "ParameterValue": "mycluster.example.com" 10
   }
   ```
{"ParameterKey": "Master0Subnet", "ParameterValue": "subnet-<random_string>"
},
{"ParameterKey": "Master1Subnet", "ParameterValue": "subnet-<random_string>"
},
{"ParameterKey": "Master2Subnet", "ParameterValue": "subnet-<random_string>"
},
{"ParameterKey": "MasterSecurityGroupId", "ParameterValue": "sg-<random_string>"
},
{"ParameterKey": "IgnitionLocation", "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
},
{"ParameterKey": "CertificateAuthorities", "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz="
},
{"ParameterKey": "MasterInstanceProfileName", "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>"
},
{"ParameterKey": "MasterInstanceType", "ParameterValue": "m5.xlarge"
},
{"ParameterKey": "AutoRegisterELB", "ParameterValue": "yes"
},
{"ParameterKey": "RegisterNlbIpTargetsLambdaArn", "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:<dns_stack_name>-RegisterNlbIpTargets-<random_string>"
},
{"ParameterKey": "ExternalApiTargetGroupArn", "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>"
},
{"ParameterKey": "InternalApiTargetGroupArn", "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>"}
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

CurrentRed Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.

Specify an `AWS::EC2::Image::Id` value.

Whether or not to perform DNS etcd registration.

Specify `yes` or `no`. If you specify `yes`, you must provide hosted zone information.

The Route 53 private zone ID to register the etcd targets with.

Specify the `PrivateHostedZoneId` value from the output of the CloudFormation template for DNS and load balancing.

The Route 53 zone to register the targets with.

Specify `<cluster_name>.<domain_name>` where `<domain_name>` is the Route 53 base domain that you used when you generated `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

A subnet, preferably private, to launch the control plane machines on.

Specify a subnet from the `PrivateSubnets` value from the output of the CloudFormation template for DNS and load balancing.

The master security group ID to associate with control plane nodes (also known as the master nodes).

Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The location to fetch control plane Ignition config file from.

Specify the generated Ignition config file location, `https://api-int.<cluster_name>.<domain_name>:22623/config/master`.

The base64 encoded certificate authority string to use.

Specify the value from the `master.ign` file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC...xYz==`.

The IAM profile to associate with control plane nodes.
Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.

- The type of AWS instance to use for the control plane machines.

- Allowed values:
  - m4.xlarge
  - m4.2xlarge
  - m4.4xlarge
  - m4.10xlarge
  - m4.16xlarge
  - m5.xlarge
  - m5.2xlarge
  - m5.4xlarge
  - m5.8xlarge
  - m5.12xlarge
  - m5.16xlarge
  - m5a.xlarge
  - m5a.2xlarge
  - m5a.4xlarge
  - m5a.8xlarge
  - m5a.10xlarge
  - m5a.16xlarge
  - c4.2xlarge
  - c4.4xlarge
  - c4.8xlarge
  - c5.2xlarge
  - c5.4xlarge
  - c5.9xlarge
  - c5.12xlarge
  - c5.18xlarge
  - c5.24xlarge
Whether or not to register a network load balancer (NLB).

Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.

The ARN for NLB IP target registration lambda group.
Specify the RegisterNlbIpTargetsLambda value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an

31

The ARN for external API load balancer target group.

32

Specify the ExternalApiTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an

AWS GovCloud region.

33

The ARN for internal API load balancer target group.

34

Specify the InternalApiTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an

AWS GovCloud region.

35

The ARN for internal service load balancer target group.

36

Specify the InternalServiceTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

2. Copy the template from the CloudFormation template for control plane machines section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.

3. If you specified an `m5` instance type as the value for MasterInstanceType, add that instance type to the MasterInstanceType.AllowedValues parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

    IMPORTANT

You must enter the command on a single line.

    $ aws cloudformation create-stack --stack-name <name> 1
    --template-body file://<template>.yaml 2
    --parameters file://<parameters>.json 3

1. `<name>` is the name for the CloudFormation stack, such as `cluster-control-plane`. You need the name of this stack if you remove the cluster.

2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

Example output

    arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
NOTE
The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

   $ aws cloudformation describe-stacks --stack-name <name>

### 4.11.14.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

#### Example 4.35. CloudFormation template for control plane machines

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
- InfrastructureName:
  - AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$  
  - MaxLength: 27  
  - MinLength: 1  
  - ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.  
  - Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.  
  - Type: String
- RhcosAmi:
  - Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.  
  - Type: AWS::EC2::Image::Id
- AutoRegisterDNS:
  - Default: "yes"  
  - AllowedValues:  
    - "yes"  
    - "no"  
  - Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone information?  
  - Type: String
- PrivateHostedZoneId:
  - Description: The Route53 private zone ID to register the etcd targets with, such as Z21IXYZABCZ2A4.  
  - Type: String
- PrivateHostedZoneName:
  - Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit the trailing period.  
  - Type: String
- Master0Subnet:
  - Description: The subnets, recommend private, to launch the master nodes into.  
  - Type: AWS::EC2::Subnet::Id
- Master1Subnet:
  - Description: The subnets, recommend private, to launch the master nodes into.  
  - Type: AWS::EC2::Subnet::Id
- Master2Subnet:
  - Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

MasterSecurityGroupId:
  Description: The master security group ID to associate with master nodes.
  Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:
  Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master
  Description: Ignition config file location.
  Type: String

CertificateAuthorities:
  Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
  Description: Base64 encoded certificate authority string to use.
  Type: String

MasterInstanceProfileName:
  Description: IAM profile to associate with master nodes.
  Type: String

MasterInstanceType:
  Default: m5.xlarge
  Type: String

  AllowedValues:
  - "m4.xlarge"
  - "m4.2xlarge"
  - "m4.4xlarge"
  - "m4.10xlarge"
  - "m4.16xlarge"
  - "m5.xlarge"
  - "m5.2xlarge"
  - "m5.4xlarge"
  - "m5.8xlarge"
  - "m5.12xlarge"
  - "m5.16xlarge"
  - "m5a.xlarge"
  - "m5a.2xlarge"
  - "m5a.4xlarge"
  - "m5a.8xlarge"
  - "m5a.10xlarge"
  - "m5a.16xlarge"
  - "c4.2xlarge"
  - "c4.4xlarge"
  - "c4.8xlarge"
  - "c5.2xlarge"
  - "c5.4xlarge"
  - "c5.9xlarge"
  - "c5.12xlarge"
  - "c5.16xlarge"
  - "c5a.2xlarge"
  - "c5a.4xlarge"
  - "c5a.8xlarge"
  - "c5a.12xlarge"
  - "c5a.16xlarge"
  - "r4.xlarge"
  - "r4.2xlarge"
  - "r4.4xlarge"
  - "r4.8xlarge"
  - "r4.16xlarge"
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**
- **r5.24xlarge**
- **r5a.xlarge**
- **r5a.2xlarge**
- **r5a.4xlarge**
- **r5a.8xlarge**
- **r5a.12xlarge**
- **r5a.16xlarge**
- **r5a.24xlarge**

**AutoRegisterELB:**
Default: "yes"
AllowedValues:
- "yes"
- "no"
Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
Type: String

**RegisterNlbIpTargetsLambdaArn:**
Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

**ExternalApiTargetGroupArn:**
Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

**InternalApiTargetGroupArn:**
Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

**InternalServiceTargetGroupArn:**
Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String

**Metadata:**

Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

4.11.15. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

**IMPORTANT**

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

**NOTE**

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

   ```json
   [
     {
       "ParameterKey": "InfrastructureName",  
       "ParameterValue": "mycluster-<random_string>"
     },
   ]
   ```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.

Specify an `AWS::EC2::Image::Id` value.

A subnet, preferably private, to launch the worker nodes on.

Specify a subnet from the `PrivateSubnets` value from the output of the CloudFormation template for DNS and load balancing.

The worker security group ID to associate with worker nodes.

Specify the `WorkerSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The location to fetch bootstrap Ignition config file from.

Specify the generated Ignition config location, `https://api-int.<cluster_name>..<domain_name>:22623/config/worker`.
Base64 encoded certificate authority string to use.

Specify the value from the worker.ign file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC…xYz==`.

The IAM profile to associate with worker nodes.

Specify the `WorkerInstanceProfile` parameter value from the output of the CloudFormation template for the security group and roles.

The type of AWS instance to use for the control plane machines.

Allowed values:
- m4.large
- m4.xlarge
- m4.2xlarge
- m4.4xlarge
- m4.10xlarge
- m4.16xlarge
- m5.large
- m5.xlarge
- m5.2xlarge
- m5.4xlarge
- m5.8xlarge
- m5.12xlarge
- m5.16xlarge
- m5a.large
- m5a.xlarge
- m5a.2xlarge
- m5a.4xlarge
- m5a.8xlarge
- m5a.10xlarge
- m5a.16xlarge
- c4.large
- c4.xlarge
> c4.2xlarge
> c4.4xlarge
> c4.8xlarge
> c5.large
> c5.xlarge
> c5.2xlarge
> c5.4xlarge
> c5.9xlarge
> c5.12xlarge
> c5.18xlarge
> c5.24xlarge
> c5a.large
> c5a.xlarge
> c5a.2xlarge
> c5a.4xlarge
> c5a.8xlarge
> c5a.12xlarge
> c5a.16xlarge
> c5a.24xlarge
> r4.large
> r4.xlarge
> r4.2xlarge
> r4.4xlarge
> r4.8xlarge
> r4.16xlarge
> r5.large
> r5.xlarge
> r5.2xlarge
> r5.4xlarge
• r5.8xlarge
• r5.12xlarge
• r5.16xlarge
• r5.24xlarge
• r5a.large
• r5a.xlarge
• r5a.2xlarge
• r5a.4xlarge
• r5a.8xlarge
• r5a.12xlarge
• r5a.16xlarge
• r5a.24xlarge
• t3.large
• t3.xlarge
• t3.2xlarge
• t3a.large
• t3a.xlarge
• t3a.2xlarge

2. Copy the template from the CloudFormation template for worker machines section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

3. If you specified an m5 instance type as the value for WorkerInstanceType, add that instance type to the WorkerInstanceType.AllowedValues parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent a worker node:

   **IMPORTANT**

   You must enter the command on a single line.

   ```shell
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml \ 2
   --parameters file://<parameters>.json 3
   ```
1. `<name>` is the name for the CloudFormation stack, such as `cluster-worker-1`. You need the name of this stack if you remove the cluster.

2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

**Example output**

```
```

**NOTE**

The CloudFormation template creates a stack that represents one worker node.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

6. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

### 4.11.15.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

**Example 4.36. CloudFormation template for worker machines**

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
InfrastructureName:
  AllowedPattern: '[a-zA-Z][a-zA-Z0-9-]{0,26}[$]
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
Type: String
RhcosAmi:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
```
Type: AWS::EC2::Image::Id
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id
Description: The master security group ID to associate with master nodes.
Type: AWS::EC2::SecurityGroup::Id
Description: Ignition config file location.
Type: String
Description: Base64 encoded certificate authority string to use.
Type: String
Description: IAM profile to associate with master nodes.
Type: String
Description: EBS data disk
Type: String

```

You can view details about the CloudFormation stacks that you create by navigating to the AWS CloudFormation console.

4.11.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

   ```bash
   $ ./openshift-install wait-for bootstrap-complete --dir=<installation_directory> \
     --log-level=info
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at https://api.mycluster.example.com:6443...
INFO API v1.19.0+9f84db3 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a FATAL warning, your OpenShift Container Platform control plane has initialized.
NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

Additional resources

- See Monitoring installation progress for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See Gathering bootstrap node diagnostic data for information about troubleshooting issues related to the bootstrap process.
- You can view details about the running instances that are created by using the AWS EC2 console.

4.11.17. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:

   \$ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   \$ echo $PATH

   After you install the CLI, it is available using the oc command:

   \$ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.
Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the CLI, it is available using the oc command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```

4.11.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   $ oc whoami
   
   Example output
   
   system:admin

4.11.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

   $ oc get nodes

   Example output

   NAME     STATUS  ROLES     AGE   VERSION
   master-0 Ready master 63m v1.21.0
   master-1 Ready master 63m v1.21.0
   master-2 Ready master 64m v1.21.0
   worker-0  NotReady worker 76s v1.21.0
   worker-1  NotReady worker 70s v1.21.0

   The output lists all of the machines that you created.

   NOTE

   The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.
2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```bash
$ oc get csr
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-8b2br</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-8vnps</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. Once the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  ```bash
  $ oc adm certificate approve <csr_name> ①
  ```

  ① **<csr_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:
Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

   ```bash
   $ oc get csr
   
   Example output
   
   NAME   AGE     REQUESTOR                                  CONDITION
   csr-bfd72 5m26s  system:node:ip-10-0-50-126.us-east-2.compute.internal Pending
   csr-c57lv 5m26s  system:node:ip-10-0-95-157.us-east-2.compute.internal Pending
   ...
   
   5. If the remaining CSRs are not approved, and are in the Pending status, approve the CSRs for your cluster machines:

   - To approve them individually, run the following command for each valid CSR:
     
     ```bash
     $ oc adm certificate approve <csr_name>
     ```

     `<csr_name>` is the name of a CSR from the list of current CSRs.

   - To approve all pending CSRs, run the following command:
     
     ```bash
     $ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}" | xargs oc adm certificate approve
     ```

6. After all client and server CSRs have been approved, the machines have the Ready status. Verify this by running the following command:

   ```bash
   $ oc get nodes
   
   Example output
   
   NAME   STATUS  ROLES   AGE   VERSION
   master-0 Ready master 73m v1.21.0
   master-1 Ready master 73m v1.21.0
   master-2 Ready master 74m v1.21.0
   worker-0 Ready worker 11m v1.21.0
   worker-1 Ready worker 11m v1.21.0
NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the Ready status.

Additional information

- For more information on CSRs, see Certificate Signing Requests.

4.11.20. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

Prerequisites

- Your control plane has initialized.

Procedure

1. Watch the cluster components come online:

   ```
   $ watch -n5 oc get clusteroperators
   ```

Example output

<table>

2. Configure the Operators that are not available.

4.11.20.1. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

You can configure registry storage for user-provisioned infrastructure in AWS to deploy OpenShift Container Platform to hidden regions. See [Configuring the registry for AWS user-provisioned infrastructure](#) for more information.

4.11.20.1.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

**Prerequisites**

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY_STORAGE_S3_ACCESSKEY**
  - **REGISTRY_STORAGE_S3_SECRETKEY**

**Procedure**

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a **Bucket Lifecycle Policy** to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in `configs.imageregistry.operator.openshift.io/cluster`:

   ```bash
   $ oc edit configs.imageregistry.operator.openshift.io/cluster
   ```

   **Example configuration**
4.11.20.1.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec":
{"storage":{"emptyDir":{}}}}'
```

If you run this command before the Image Registry Operator initializes its components, the `oc patch` command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

4.11.21. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

Prerequisites

- You completed the initial Operator configuration for your cluster.

Procedure
1. Delete the bootstrap resources. If you used the CloudFormation template, delete its stack:

- Delete the stack by using the AWS CLI:

  ```
  $ aws cloudformation delete-stack --stack-name <name> ¹
  ``

  ¹ `<name>` is the name of your bootstrap stack.

- Delete the stack by using the AWS CloudFormation console.

4.11.22. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.

- You installed the OpenShift CLI (`oc`).

- You installed the `jq` package.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix)](#).

Procedure

1. Determine the routes to create.

   - To create a wildcard record, use `*.apps.<cluster_name>.<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.

   - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

     ```
     $ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host} 
     {"\n"}{end}{end}' routes
     ```

   **Example output**

   ```
   oauth-openshift.apps.<cluster_name>.<domain_name>
   console-openshift-console.apps.<cluster_name>.<domain_name>
   downloads-openshift-console.apps.<cluster_name>.<domain_name>
   alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
   grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
   prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
   ```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the `EXTERNAL-IP` column:
3. Locate the hosted zone ID for the load balancer:

   $ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>").CanonicalHostedZoneNameID'

   For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

   Example output

   Z3AADJGX6KTTL2

   The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster’s domain:

   $ aws route53 list-hosted-zones-by-name \
   --dns-name "<domain_name>" \n   --query 'HostedZones[? Config.PrivateZone != `true` && Name == `<domain_name>`.].Id' \n   --output text

   For `<domain_name>`, specify the Route 53 base domain for your OpenShift Container Platform cluster.

   Example output

   /hostedzone/Z3URY6TWQ91KVV

   The public hosted zone ID for your domain is shown in the command output. In this example, it is Z3URY6TWQ91KVV.

5. Add the alias records to your private zone:

   $ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --change-batch '{
     "Changes": [
       {
         "Action": "CREATE",
         "ResourceRecordSet": {
           "Name": "\052.apps.<cluster_domain>",
           "Type": "A",
           "SetType": "A",
           "Value": 
             ["<public_ip>"]
         }
       }]
   }'

   For `<private_hosted_zone_id>`, replace with the hosted zone ID for your private zone.

   For `<cluster_domain>`, replace with your OpenShift Container Platform cluster's domain.

   For `<public_ip>`, replace with the public IP address assigned by AWS, as shown in the load balancer hosted zone ID output.

   Example output

   Changes:
     - Action: CREATE
       ResourceRecordSet:
         Name: \052.apps.<cluster_domain>
         Type: A
         SetType: A
         Value:
           - <public_ip>
For `<private_hosted_zone_id>`, specify the value from the output of the CloudFormation template for DNS and load balancing.

For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```bash
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --change-batch '{
  "Changes": [
    {
      "Action": "CREATE",
      "ResourceRecordSet": {
        "Name": "\052.apps.<cluster_domain>",
        "Type": "A",
        "AliasTarget": {
          "HostedZoneId": "<hosted_zone_id>",
          "DNSName": "<external_ip>.",
          "EvaluateTargetHealth": false
        }
      }
    }
  ]
}'
```

1. For `<public_hosted_zone_id>`, specify the public hosted zone for your domain.

2. For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

3. For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

4. For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.
4.11.23. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the oc CLI.

Procedure

- From the directory that contains the installation program, complete the cluster installation:

```bash
$ ./openshift-install --dir=<installation_directory> wait-for install-complete
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-Wt6NL"
INFO Time elapsed: 1s
```

**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

4.11.24. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites
• You have access to the installation host.

• You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the kubeadmin user from the kubeadmin-password file on the installation host:

   ```
   $ cat <installation_directory>/auth/kubeadmin-password
   ```

   NOTE

   Alternatively, you can obtain the kubeadmin password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

   ```
   $ oc get routes -n openshift-console | grep 'console-openshift'
   ```

   NOTE

   Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

Example output

   ```
   console   console-openshift-console.apps.<cluster_name>.<base_domain>   console
   https   reencrypt/Redirect   None
   ```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the kubeadmin user.

4.11.25. Additional resources

• See Accessing the web console for more details about accessing and understanding the OpenShift Container Platform web console.

• See Working with stacks in the AWS documentation for more information about AWS CloudFormation stacks.

4.11.26. Next steps

• Validating an installation.

• Customize your cluster.

• If necessary, you can opt out of remote health reporting.

• If necessary, you can remove cloud provider credentials.
4.12. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.8, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

**IMPORTANT**

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires Internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company’s policies.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

4.12.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update processes](#).
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [created a mirror registry on your mirror host](#) and obtained the `imageContentSources` data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You [configured an AWS account](#) to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.
You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix) in the AWS documentation.

If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

NOTE

Be sure to also review this site list if you are configuring a proxy.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

4.12.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the Internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s IAM service, require Internet access, so you might still require Internet access. Depending on your network, you might require less Internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the Internet and your closed network, or by using other methods that meet your restrictions.

IMPORTANT

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

4.12.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The ClusterVersion status includes an Unable to retrieve available updates error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

4.12.3. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to obtain the images that are necessary to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to
the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

Additional resources

- See About remote health monitoring for more information about the Telemetry service.

**4.12.4. Required AWS infrastructure components**

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the OpenShift Container Platform 4.x Tested Integrations page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node
Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

4.12.4.1. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The `kube-controller-manager` only approves the kubelet client CSRs. The `machine-approver` cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

4.12.4.2. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- `ec2.<region>.amazonaws.com`
- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

<table>
<thead>
<tr>
<th>Component</th>

<td>• AWS::EC2::RouteTable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• AWS::EC2::SubnetRouteTableAssociation</td>
<td></td>
</tr>
</tbody>
</table>
Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster’s infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for `api.<cluster_name>.<domain>` must point to the external load balancer, and an entry for `api-int.<cluster_name>.<domain>` must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes (also known as the master nodes). Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

<table>
<thead>
<tr>
<th>Component</th>
<th>AWS type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>AWS::Route53::HostedZone</td>
<td>The hosted zone for your internal DNS.</td>
</tr>

</tr>
</tbody>
</table>
Internal listener
AWS::ElasticLoadBalancingV2::Listener
A listener on port 22623 for the internal load balancer.

Internal target group
AWS::ElasticLoadBalancingV2::TargetGroup
The target group for the internal load balancer.

Internal listener
AWS::ElasticLoadBalancingV2::Listener
A listener on port 6443 for the internal load balancer.

Internal target group
AWS::ElasticLoadBalancingV2::TargetGroup
The target group for the internal load balancer.

**Security groups**

The control plane and worker machines require access to the following ports:

<table>
<thead>
<tr>
<th>Group</th>
<th>Type</th>
<th>IP Protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroup</td>
<td>AWS::EC2::SecurityGroup</td>
<td>icmp</td>

<td>AWS::EC2::SecurityGroup</td>
<td>tcp</td>
<td>22</td>
</tr>
<tr>
<td></td>
<td></td>
<td>tcp</td>
<td>19531</td>
</tr>
</tbody>
</table>

**Control plane Ingress**

The control plane machines require the following Ingress groups. Each Ingress group is an AWS::EC2::SecurityGroupIngress resource.
### Master Ingress

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterIngress Etcld</td>
<td>etcd</td>

<td>30000 - 32767</td>
</tr>
<tr>
<td>MasterIngress WorkerIngressServices</td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

### Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a `AWS::EC2::SecurityGroupIngress` resource.

<table>
<thead>
<tr>
<th>Ingress group</th>
<th>Description</th>
<th>IP protocol</th>
<th>Port range</th>
</tr>
</thead>
<tbody>
<tr>
<td>WorkerIngress Vxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>
</tr>
<tr>
<td>WorkerIngress WorkerVxlan</td>
<td>Vxlan packets</td>
<td>udp</td>
<td>4789</td>
</tr>
<tr>
<td>WorkerIngress Internal</td>
<td>Internal cluster communication</td>
<td>tcp</td>
<td>9000 - 9999</td>
</tr>
</tbody>
</table>
### Ingress group

<table>

<td>Kubernetes kubelet, scheduler, and controller manager</td>
<td>tcp</td>
<td>10250</td>
</tr>
<tr>
<td><strong>WorkerIngressIngressServices</strong></td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
<tr>
<td><strong>WorkerIngressWorkerIngressServices</strong></td>
<td>Kubernetes Ingress services</td>
<td>tcp</td>
<td>30000 - 32767</td>
</tr>
</tbody>
</table>

### Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

<table>
<thead>
<tr>
<th>Role</th>
<th>Effect</th>
<th>Action</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Master</strong></td>
<td>Allow</td>
<td>ec2:*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>
<td>elasticloadbalancing:*</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Allow</td>

### 4.12.4.3. Cluster machines
You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

### 4.12.4.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

#### Example 4.37. Instance types for machines

<table>
<thead>
<tr>

4.12.4.5. Required AWS permissions for the IAM user

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 4.38. Required EC2 permissions for installation**

- `ec2:AllocateAddress`
- `ec2:AssociateAddress`
- `ec2:AuthorizeSecurityGroupEgress`
- `ec2:AuthorizeSecurityGroupIngress`
- `ec2:CopyImage`
- `ec2:CreateNetworkInterface`
- `ec2:AttachNetworkInterface`
- `ec2:CreateSecurityGroup`
- `ec2:CreateTags`
- `ec2:CreateVolume`
- `ec2:DeleteSecurityGroup`
- `ec2:DeleteSnapshot`
- `ec2:DeleteTags`
- `ec2:DeregisterImage`
- `ec2:DescribeAccountAttributes`
- `ec2:DescribeAddresses`
- `ec2:DescribeAvailabilityZones`
- `ec2:DescribeDhcpOptions`
- `ec2:DescribeImages`
- `ec2:DescribeInstanceAttribute`
- `ec2:DescribeInstanceCreditSpecifications`
- `ec2:DescribeInstances`
- `ec2:DescribeInstanceTypes`
- `ec2:DescribeInternetGateways`
- `ec2:DescribeKeyPairs`
- `ec2:DescribeNatGateways`
- `ec2:DescribeNetworkAcls`
- `ec2:DescribeNetworkInterfaces`
- `ec2:DescribePrefixLists`
- `ec2:DescribeRegions`
- `ec2:DescribeRouteTables`
- `ec2:DescribeSecurityGroups`
- `ec2:DescribeSubnets`
- `ec2:DescribeTags`
- `ec2:DescribeVolumes`
- `ec2:DescribeVpcAttribute`
- `ec2:DescribeVpcClassicLink`
- `ec2:DescribeVpcClassicLinkDnsSupport`
- `ec2:DescribeVpcEndpoints`
- `ec2:DescribeVpcs`
• `ec2:GetEbsDefaultKmsKeyId`
• `ec2:ModifyInstanceId`
• `ec2:ModifyNetworkInterfaceAttribute`
• `ec2:ReleaseAddress`
• `ec2:RevokeSecurityGroupEgress`
• `ec2:RevokeSecurityGroupIngress`
• `ec2:RunInstances`
• `ec2:TerminateInstances`

Example 4.39. Required permissions for creating network resources during installation

• `ec2:AssociateDhcpOptions`
• `ec2:AssociateRouteTable`
• `ec2:AttachInternetGateway`
• `ec2:CreateDhcpOptions`
• `ec2:CreateInternetGateway`
• `ec2:CreateNatGateway`
• `ec2:CreateRoute`
• `ec2:CreateRouteTable`
• `ec2:CreateSubnet`
• `ec2:CreateVpc`
• `ec2:CreateVpcEndpoint`
• `ec2:ModifySubnetAttribute`
• `ec2:ModifyVpcAttribute`

NOTE

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.40. Required Elastic Load Balancing permissions for installation

• `elasticloadbalancing:AddTags`
• `elasticloadbalancing:ApplySecurityGroupsToLoadBalancer`
• elasticloadbalancing:AttachLoadBalancerToSubnets
• elasticloadbalancing:ConfigureHealthCheck
• elasticloadbalancing:CreateListener
• elasticloadbalancing:CreateLoadBalancer
• elasticloadbalancing:CreateLoadBalancerListeners
• elasticloadbalancing:CreateTargetGroup
• elasticloadbalancing:DeleteLoadBalancer
• elasticloadbalancing:DeregisterInstancesFromLoadBalancer
• elasticloadbalancing:DeregisterTargets
• elasticloadbalancing:DescribeInstanceHealth
• elasticloadbalancing:DescribeListeners
• elasticloadbalancing:DescribeLoadBalancerAttributes
• elasticloadbalancing:DescribeLoadBalancers
• elasticloadbalancing:DescribeTags
• elasticloadbalancing:DescribeTargetGroupAttributes
• elasticloadbalancing:DescribeTargetHealth
• elasticloadbalancing:ModifyLoadBalancerAttributes
• elasticloadbalancing:ModifyTargetGroup
• elasticloadbalancing:ModifyTargetGroupAttributes
• elasticloadbalancing:RegisterInstancesWithLoadBalancer
• elasticloadbalancing:RegisterTargets
• elasticloadbalancing:SetLoadBalancerPoliciesOfListener

Example 4.41. Required IAM permissions for installation

• iam:AddRoleToInstanceProfile
• iam:CreateInstanceProfile
• iam:CreateRole
• iam:DeleteInstanceProfile
• iam:DeleteRole
• iam:DeleteRolePolicy
- iam:GetInstanceProfile
- iam:GetRole
- iam:GetRolePolicy
- iam:GetUser
- iam:ListInstanceProfilesForRole
- iam:ListRoles
- iam:ListUsers
- iam:PassRole
- iam:PutRolePolicy
- iam:RemoveRoleFromInstanceProfile
- iam:SimulatePrincipalPolicy
- iam:TagRole

NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the `iam:CreateServiceLinkedRole` permission.

Example 4.42. Required Route 53 permissions for installation

- route53:ChangeResourceRecordSets
- route53:ChangeTagsForResource
- route53:CreateHostedZone
- route53:DeleteHostedZone
- route53:GetChange
- route53:GetHostedZone
- route53:ListHostedZones
- route53:ListHostedZonesByName
- route53:ListResourceRecordSets
- route53:ListTagsForResource
- route53:UpdateHostedZoneComment

Example 4.43. Required S3 permissions for installation
Example 4.44. S3 permissions that cluster Operators require

- s3:DeleteObject
- s3:GetObject
- s3:GetObjectAcl
- s3:GetObjectTagging
- s3:GetObjectVersion
- s3:PutObject
- s3:PutObjectAcl
- s3:PutObjectTagging
Example 4.45. Required permissions to delete base cluster resources

- autoscaling:DescribeAutoScalingGroups
- ec2:DeleteNetworkInterface
- ec2:DeleteVolume
- elasticloadbalancing:DeleteTargetGroup
- elasticloadbalancing:DescribeTargetGroups
- iam:DeleteAccessKey
- iam:DeleteUser
- iam:ListAttachedRolePolicies
- iam:ListInstanceProfiles
- iam:ListRolePolicies
- iam:ListUserPolicies
- s3:DeleteObject
- s3:ListBucketVersions
- tag:GetResources

Example 4.46. Required permissions to delete network resources

- ec2:DeleteDhcpOptions
- ec2:DeleteInternetGateway
- ec2:DeleteNatGateway
- ec2:DeleteRoute
- ec2:DeleteRouteTable
- ec2:DeleteSubnet
- ec2:DeleteVpc
- ec2:DeleteVpcEndpoints
- ec2:DetachInternetGateway
- ec2:DisassociateRouteTable
- ec2:ReplaceRouteTableAssociation
NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the `tag:UntagResources` permission to delete network resources.

Example 4.47. Additional IAM and S3 permissions that are required to create manifests

- `iam:CreateAccessKey`
- `iam:CreateUser`
- `iam:DeleteAccessKey`
- `iam:DeleteUser`
- `iam:DeleteUserPolicy`
- `iam:GetUserPolicy`
- `iam:GetUserPolicy`
- `iam:ListAccessKeys`
- `iam:PutUserPolicy`
- `iam:TagUser`
- `iam:GetUserPolicy`
- `s3:PutBucketPublicAccessBlock`
- `s3:PutLifecycleConfiguration`
- `s3:AbortMultipartUpload`
- `s3:HeadBucket`
- `s3:ListBucketMultipartUploads`

Example 4.48. Optional permissions for instance and quota checks for installation

- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

4.12.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added
to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
   
   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.
   
   **NOTE**
   
   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
   
2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   
   For example, run the following to view the ~/.ssh/id_rsa.pub public key:
   
   ```bash
   $ cat ~/.ssh/id_rsa.pub
   
3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.
NOTE

On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

$ eval "$\{ssh-agent -s\}"

Example output

Agent pid 31874

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the ssh-agent:

$ ssh-add <path>/<file_name>

Example output

Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

4.12.6. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the install-config.yaml file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate var partition during the preparation phases of installation.

4.12.6.1. Optional: Creating a separate /var partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the /var partition or a subdirectory of /var. For example:

- /var/lib/containers: Holds container-related content that can grow as more images and containers are added to a system.
- /var/lib/etcd: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.

- /var: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a /var directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because /var must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate /var partition by creating a machine config that is inserted during the openshift-install preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate /var partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Prerequisites**

- If container storage is on the root partition, ensure that this root partition is mounted with the pquota option by including `rootflags=pquota` in the GRUB command line.

- If the container storage is on a partition that is mounted by /etc/fstab, ensure that the following mount option is included in the /etc/fstab file:

```
/dev/sdb1 /var xfs defaults,pquota 0 0
```

- If the container storage is on a partition that is mounted by systemd, ensure that the MachineConfig object includes the following mount option as in this example:

```yaml
spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/sdb
          partitions:
            - label: var
              sizeMiB: 240000
              startMiB: 0
              filesystems:
                - device: /dev/disk/by-partlabel/var
                  format: xfs
                  path: /var
      systemd:
        units:
          - contents:
              [Unit]
              Before=local-fs.target
              [Mount]
              Where=/var
```
Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```bash
$ mkdir $HOME/clusterconfig
```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

```bash
$ openshift-install create manifests --dir $HOME/clusterconfig
? SSH Public Key ...
$ ls $HOME/clusterconfig/openshift/
  99_kubeadmin-password-secret.yaml
  99_openshift-cluster-api_master-machines-0.yaml
  99_openshift-cluster-api_master-machines-1.yaml
  99_openshift-cluster-api_master-machines-2.yaml
...
```

3. Create a `MachineConfig` object and add it to a file in the `openshift` directory. For example, name the file `98-var-partition.yaml`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This attaches storage to a separate `/var` directory.

```yaml
apiVersion: machineconfiguration.openshift.io/v1
kind: MachineConfig
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
name: 98-var-partition
spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/<device_name>  ①
donfiguration
          partitions:
            - sizeMiB: <partition_size>
              startMiB: <partition_start_offset>  ②
donfiguration
              label: var
            filesystems:
              - path: /var
                device: /dev/disk/by-partlabel/var
                format: xfs
              systemd:
                units:
                  - name: var.mount
```
1. The storage device name of the disk that you want to partition.

2. When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

4. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

   ```
   $ openshift-install create ignition-configs --dir $HOME/clusterconfig
   $ ls $HOME/clusterconfig/
   auth  bootstrap.ign  master.ign  metadata.json  worker.ign
   ```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 4.12.6.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.

- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the `install-config.yaml` file manually.

**Procedure**

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

      ```
      $ ./openshift-install create install-config --dir=<installation_directory>
      ```
For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select `aws` as the platform to target.

iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

iv. Select the AWS region to deploy the cluster to.

v. Select the base domain for the Route 53 service that you configured for your cluster.

vi. Enter a descriptive name for your cluster.

vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Edit the `install-config.yaml` file to provide the additional information that is required for an installation in a restricted network.

a. Update the `pullSecret` value to contain the authentication information for your registry:

```
pullSecret: {'"auths":{"<local_registry>":{"auth": "<credentials>","email": "you@example.com"}}}
```
For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

b. Add the `additionalTrustBundle` parameter and value. The value must be the contents of the certificate file that you used for your mirror registry, which can be an exiting, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

```
additionalTrustBundle: |
-----BEGIN CERTIFICATE-----
ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
-----END CERTIFICATE-----
```

c. Add the image content resources:

```
imageContentSources:
- mirrors:
  - `<local_registry>/<local_repository_name>/release`
    source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - `<local_registry>/<local_repository_name>/release`
    source: quay.io/openshift-release-dev/ocp-v4.0-art-dev
```

Use the `imageContentSources` section from the output of the command to mirror the repository or the values that you used when you mirrored the content from the media that you brought into your restricted network.

d. Optional: Set the publishing strategy to `Internal`:

```
publish: Internal
```

By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Optional: Back up the `install-config.yaml` file.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- See Configuration and credential file settings in the AWS documentation for more information about AWS profile and credential configuration.

4.12.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.
Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

NOTE

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticsearch.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
   noProxy: example.com 3
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
     ...
   
   1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpProxy` value.
   2 A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then `httpProxy` is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpsProxy` value.
   3
   ```
A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For

If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 4.12.6.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.
- You created the `install-config.yaml` installation configuration file.
Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>  
   ```

   Example output

   ```
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: install_dir/manifests and install_dir/openshift
   ```

   For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*_.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*_.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the mastersSchedulable parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the mastersSchedulable parameter and ensure that it is set to `false`.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the privateZone and publicZone sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
   name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone:  
       id: mycluster-100419-private-zone
   ```
6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

   $ ./openshift-install create ignition-configs --dir=<installation_directory>  

   For `<installation_directory>`, specify the same installation directory.

   Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

   ├── auth
   │   └── kubeadmin-password
   ├── kubeconfig
   ├── bootstrap.ign
   │   ├── metadata.json
   │   └── worker.ign

### 4.12.7. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the `jq` package.

**Procedure**

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

   $ jq -r .infraID <installation_directory>/metadata.json
For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6
```

The output of this command is your cluster name and a random string.

### 4.12.8. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

```
[
    { 
        "ParameterKey": "VpcCidr", 1
        "ParameterValue": "10.0.0.0/16" 2
    },
    { 
        "ParameterKey": "AvailabilityZoneCount", 3
        "ParameterValue": "1" 4
    },
    { 
        "ParameterKey": "SubnetBits", 5
        "ParameterValue": "12" 6
    }
]
```
The CIDR block for the VPC.

Specify a CIDR block in the format `x.x.x.x/16-24`.

The number of availability zones to deploy the VPC in.

Specify an integer between 1 and 3.

The size of each subnet in each availability zone.

Specify an integer between 5 and 13, where 5 is `/27` and 13 is `/19`.

2. Copy the template from the CloudFormation template for the VPC section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

   IMPORTANT
   You must enter the command on a single line.

   ```
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file:///<template>.yaml 2
   --parameters file:///<parameters>.json 3
   ```

   `<name>` is the name for the CloudFormation stack, such as `cluster-vpc`. You need the name of this stack if you remove the cluster.

   `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   Example output

   ```
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
   ```

4. Confirm that the template components exist:

   ```
   $ aws cloudformation describe-stacks --stack-name <name>
   ```

   After the StackStatus displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

   | VpcId   | The ID of your VPC. |
PublicSubnetIds | The IDs of the new public subnets.
--- | ---
PrivateSubnetIds | The IDs of the new private subnets.

### 4.12.8.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

**Example 4.49. CloudFormation template for the VPC**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^((0-9)[1-9][0-9])2[0-4][0-9][25][0-5]
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String

  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number

  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: default: "Network Configuration"
  Parameters:
    - VpcCidr
    - SubnetBits
- Label: default: "Availability Zones"
  Parameters:
    - AvailabilityZoneCount

4.12.9. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
You generated the Ignition config files for your cluster.

You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the `install-config.yaml` file for your cluster. You can obtain details about your hosted zone by running the following command:

   ```bash
   $ aws route53 list-hosted-zones-by-name --dns-name <route53_domain>  
   ```

   For the `<route53_domain>`, specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster.

**Example output**

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is `Z21IXYZABCZ2A4`.

2. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "ClusterName", "ParameterValue": "mycluster"
  },
  {
    "ParameterKey": "InfrastructureName", "ParameterValue": "mycluster-<random_string>"
  },
  {
    "ParameterKey": "HostedZoneId", "ParameterValue": "<random_string>
  },
  {
    "ParameterKey": "HostedZoneName", "ParameterValue": "example.com"
  },
  {
    "ParameterKey": "PublicSubnets", "ParameterValue": "subnet-<random_string>
  },
  {
    "ParameterKey": "PrivateSubnets", "ParameterValue": "subnet-<random_string>
  },
  {
    "ParameterKey": "VpcId"
  }
]
```
A short, representative cluster name to use for host names, etc.

Specify the cluster name that you used when you generated the `install-config.yaml` file for the cluster.

The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

The Route 53 public zone ID to register the targets with.

Specify the Route 53 public zone ID, which as a format similar to `Z21IXYZABCZ2A4`. You can obtain this value from the AWS console.

The Route 53 zone to register the targets with.

Specify the Route 53 base domain that you used when you generated the `install-config.yaml` file for the cluster. Do not include the trailing period (`.`) that is displayed in the AWS console.

The public subnets that you created for your VPC.

Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

3. Copy the template from the CloudFormation template for the network and load balancers section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

   **IMPORTANT**

   If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiserverRecord` in the CloudFormation template to use CNAME records. Records of type ALIAS are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:
IMPORTANT

You must enter the command on a single line.

```bash
$ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   --capabilities CAPABILITY_NAMED_IAM 4
```

1. `<name>` is the name for the CloudFormation stack, such as `cluster-dns`. You need the name of this stack if you remove the cluster.

2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-
5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrivateHostedZoneId</td>
<td>Hosted zone ID for the private DNS.</td>
</tr>
<tr>
<td>ExternalApiLoadBalancerName</td>
<td>Full name of the external API load balancer.</td>
</tr>
<tr>
<td>InternalApiLoadBalancerName</td>
<td>Full name of the internal API load balancer.</td>
</tr>
<tr>
<td>ApiServerDnsName</td>
<td>Full host name of the API server.</td>
</tr>
<tr>
<td>parameter</td>
<td>description</td>
</tr>
<tr>

### 4.12.9.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

#### Example 4.50. CloudFormation template for the network and load balancers

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
ClusterName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, representative cluster name to use for host names and other identifying names.
  Type: String

InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
  Type: String

HostedZoneId:
  Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.
  Type: String

HostedZoneName:  
```
Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.
Type: String
Default: "example.com"

PublicSubnets:
Description: The internet-facing subnets.
Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:
Description: The internal subnets.
Type: List<AWS::EC2::Subnet::Id>

VpcId:
Description: The VPC-scoped resources will belong to this VPC.
Type: AWS::EC2::VPC::Id

Metadata:
AWS::CloudFormation::Interface:
ParameterGroups:
- Label: default: "Cluster Information"
Parameters:
  - ClusterName
  - InfrastructureName
- Label: default: "Network Configuration"
Parameters:
  - VpcId
  - PublicSubnets
  - PrivateSubnets
- Label: default: "DNS"
Parameters:
  - HostedZoneName
  - HostedZoneId

ParameterLabels:
ClusterName: default: "Cluster Name"
InfrastructureName: default: "Infrastructure Name"
VpcId:
  default: "VPC ID"
PublicSubnets:
  default: "Public Subnets"
PrivateSubnets:
  default: "Private Subnets"
HostedZoneName:
  default: "Public Hosted Zone Name"
HostedZoneId:
  default: "Public Hosted Zone ID"

Resources:
ExtApiElb:
  Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:
  Name: !Join ["-", [!Ref InfrastructureName, "ext"]]
  IpAddressType: ipv4
  Subnets: !Ref PublicSubnets
Type: network

IntApiElb:
  Type: AWS::ElasticLoadBalancingV2::LoadBalancer
  Properties:
    Name: !Join ["-", [!Ref InfrastructureName, "int"]]
    Scheme: internal
    IpAddressType: ipv4
    Subnets: !Ref PrivateSubnets
    Type: network

IntDns:
  Type: "AWS::Route53::HostedZone"
  Properties:
    HostedZoneConfig:
      Comment: "Managed by CloudFormation"
    Name: !Join [".", [!Ref ClusterName, !Ref HostedZoneName]]
    HostedZoneTags:
      - Key: Name
        Value: !Join ["-", [!Ref InfrastructureName, "int"]]
      - Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]

responseData = {}
cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData, event['ResourceProperties']['InfrastructureName']+event['ResourceProperties']['Subnets'][0])
  Runtime: "python3.7"
  Timeout: 120

RegisterPublicSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PublicSubnets

RegisterPrivateSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PrivateSubnets

Outputs:
  PrivateHostedZoneId:
    Description: Hosted zone ID for the private DNS, which is required for private records.
    Value: !Ref IntDns
  ExternalApiLoadBalancerName:
    Description: Full name of the external API load balancer.
    Value: !GetAtt ExtApiElb.LoadBalancer FullName
  InternalApiLoadBalancerName:
    Description: Full name of the internal API load balancer.
    Value: !GetAtt IntApiElb.LoadBalancerFullName
  ApiServerDnsName:
    Description: Full hostname of the API server, which is required for the Ignition config files.
    Value: !Join [ ",", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]
  RegisterNlbIpTargetsLambda:
    Description: Lambda ARN useful to help register or deregister IP targets for these load balancers.
    Value: !GetAtt RegisterNlbIpTargets.Arn
  ExternalApiTargetGroupArn:
    Description: ARN of the external API target group.
    Value: !Ref ExternalApiTargetGroup
  InternalApiTargetGroupArn:
    Description: ARN of the internal API target group.
    Value: !Ref InternalApiTargetGroup
  InternalServiceTargetGroupArn:
    Description: ARN of the internal service target group.
    Value: !Ref InternalServiceTargetGroup
IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the `InternalApiServerRecord` to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

4.12.10. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

**NOTE**

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

   ```json
   [
   
   {
   "ParameterKey": "InfrastructureName", 1
   "ParameterValue": "mycluster-<random_string>" 2
   },
   
   {
   "ParameterKey": "VpcCidr", 3
   "ParameterValue": "10.0.0.0/16" 4
   
   ```
The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

The CIDR block for the VPC.

Specify the CIDR block parameter that you used for the VPC that you defined in the form `x.x.x.x/16-24`.

The private subnets that you created for your VPC.

Specify the `PrivateSubnetIds` value from the output of the CloudFormation template for the VPC.

The VPC that you created for the cluster.

Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

2. Copy the template from the CloudFormation template for security objects section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

   __IMPORTANT__

   You must enter the command on a single line.

   $ aws cloudformation create-stack --stack-name <name>  
   --template-body file://<template>.yaml  
   --parameters file://<parameters>.json  
   --capabilities CAPABILITY_NAMED_IAM

   **<name>** is the name for the CloudFormation stack, such as `cluster-sec`. You need the name of this stack if you remove the cluster.

   **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

Example output

```
arwn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterSecurityGroupId</td>
<td>Master Security Group ID</td>
</tr>
<tr>
<td>WorkerSecurityGroupId</td>
<td>Worker Security Group ID</td>
</tr>
<tr>
<td>MasterInstanceProfile</td>
<td>Master IAM Instance Profile</td>
</tr>
<tr>
<td>WorkerInstanceProfile</td>
<td>Worker IAM Instance Profile</td>
</tr>
</tbody>
</table>

4.12.10.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

Example 4.51. CloudFormation template for security objects

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
```
ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
Type: String
VpcCidr:
  ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
Default: 10.0.0.0/16
Description: CIDR block for VPC.
Type: String
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
PrivateSubnets:
  Description: The internal subnets.
  Type: List<AWS::EC2::Subnet::Id>

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label: default:
      "Cluster Information"
    Parameters:
      - InfrastructureName
  - Label: default:
      "Network Configuration"
    Parameters:
      - VpcId
      - VpcCidr
      - PrivateSubnets
  ParameterLabels:
    InfrastructureName:
      default: "Infrastructure Name"
    VpcId:
      default: "VPC ID"
    VpcCidr:
      default: "VPC CIDR"
    PrivateSubnets:
      default: "Private Subnets"

Resources:
MasterSecurityGroup:
  Type: AWS::EC2::SecurityGroup
  Properties:
    GroupDescription: Cluster Master Security Group
    SecurityGroupIngress:
      - IpProtocol: icmp

        VpcId: !Ref VpcId

MasterIngressEtcd:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: etcd
    FromPort: 2379
    ToPort: 2380
    IpProtocol: tcp

MasterIngressVxlan:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Vxlan packets
    FromPort: 4789
    ToPort: 4789
    IpProtocol: udp

MasterIngressWorkerVxlan:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: Vxlan packets
    FromPort: 4789
    ToPort: 4789
    IpProtocol: udp

MasterIngressGeneve:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: Geneve packets
  FromPort: 6081
  ToPort: 6081
  IpProtocol: udp

MasterIngressWorkerGeneve:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Geneve packets
  FromPort: 6081
  ToPort: 6081
  IpProtocol: udp

MasterIngressIpsecIke:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec IKE packets
  FromPort: 500
  ToPort: 500
  IpProtocol: udp

MasterIngressIpsecNat:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec NAT-T packets
  FromPort: 4500
  ToPort: 4500
  IpProtocol: udp

MasterIngressIpsecEsp:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec ESP packets
  IpProtocol: 50

MasterIngressWorkerIpsecIke:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt MasterSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: IPsec IKE packets
  FromPort: 500
  ToPort: 500
  IpProtocol: udp
MasterIngressWorkerIpsecNat:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: IPsec NAT-T packets
    FromPort: 4500
    ToPort: 4500
    IpProtocol: udp

MasterIngressWorkerIpsecEsp:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: IPsec ESP packets
    IpProtocol: 50

MasterIngressInternal:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Internal cluster communication
    FromPort: 9000
    ToPort: 9999
    IpProtocol: tcp

MasterIngressWorkerInternal:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: Internal cluster communication
    FromPort: 9000
    ToPort: 9999
    IpProtocol: tcp

MasterIngressInternalUDP:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Internal cluster communication
    FromPort: 9000
    ToPort: 9999
    IpProtocol: udp

MasterIngressWorkerInternalUDP:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: Internal cluster communication
    FromPort: 9000
ToPort: 9999
IpProtocol: udp

MasterIngressKube:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Kubernetes kubernetes, scheduler and controller manager
    FromPort: 10250
    ToPort: 10259
    IpProtocol: tcp

MasterIngressWorkerKube:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: Kubernetes kubernetes, scheduler and controller manager
    FromPort: 10250
    ToPort: 10259
    IpProtocol: tcp

MasterIngressIngressServices:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Kubernetes ingress services
    FromPort: 30000
    ToPort: 32767
    IpProtocol: tcp

MasterIngressWorkerIngressServices:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
    Description: Kubernetes ingress services
    FromPort: 30000
    ToPort: 32767
    IpProtocol: tcp

MasterIngressIngressServicesUDP:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt MasterSecurityGroup.GroupId
    SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
    Description: Kubernetes ingress services
    FromPort: 30000
    ToPort: 32767
    IpProtocol: udp

MasterIngressWorkerIngressServicesUDP:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
GroupId: !GetAtt MasterSecurityGroup.GroupId
SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
Description: Kubernetes ingress services
FromPort: 30000
ToPort: 32767
IpProtocol: udp

WorkerIngressVxlan:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Vxlan packets
  FromPort: 4789
  ToPort: 4789
  IpProtocol: udp

WorkerIngressMasterVxlan:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Vxlan packets
  FromPort: 4789
  ToPort: 4789
  IpProtocol: udp

WorkerIngressGeneve:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Geneve packets
  FromPort: 6081
  ToPort: 6081
  IpProtocol: udp

WorkerIngressMasterGeneve:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: Geneve packets
  FromPort: 6081
  ToPort: 6081
  IpProtocol: udp

WorkerIngressIpsecIke:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: IPsec IKE packets
  FromPort: 500
  ToPort: 500
  IpProtocol: udp
WorkerIngressIpsecNat:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: IPsec NAT-T packets
  FromPort: 4500
  ToPort: 4500
  IpProtocol: udp

WorkerIngressIpsecEsp:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt WorkerSecurityGroup.GroupId
  Description: IPsec ESP packets
  IpProtocol: 50

WorkerIngressMasterIpsecIke:
Type: AWS::EC2::SecurityGroupIngress
Properties:
  GroupId: !GetAtt WorkerSecurityGroup.GroupId
  SourceSecurityGroupId: !GetAtt MasterSecurityGroup.GroupId
  Description: IPsec IKE packets

      Action:
      - "sts:AssumeRole"
4.12.11. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, stream metadata provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the `coreos print-stream-json` sub-command of `openshift-install` to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the `openshift-install` binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

**Procedure**

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official `stream-metadata-go` library at https://github.com/coreos/stream-metadata-go. You can also view example code in the library.
• From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.

• From a command-line utility that handles JSON data, such as jq:
  
  `$ openshift-install coreos print-stream-json | jq -r '.architectures.x86_64.images.aws.regions["us-west-1"].image'`

  **Example output**

  ami-0d3e625f84626bbda

  The output of this command is the AWS AMI ID for the **us-west-1** region. The AMI must belong to the same region as the cluster.

### 4.12.12. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions that you can manually specify for your OpenShift Container Platform nodes.

**NOTE**

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

**Table 4.32. RHCOS AMIs**

</table>

### 4.12.13. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

#### NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

**Procedure**

1. Provide a location to serve the `bootstrap.ign` Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster’s region and upload the Ignition config file to it.

**IMPORTANT**

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

**IMPORTANT**

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the `s3://` schema.

**NOTE**

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

a. Create the bucket:

```bash
$ aws s3 mb s3://<cluster-name>-infra
```

1. `<cluster-name>-infra` is the bucket name. When creating the `install-config.yaml` file, replace `<cluster-name>` with the name specified for the cluster.

b. Upload the `bootstrap.ign` Ignition config file to the bucket:

```bash
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign
```

1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

c. Verify that the file uploaded:

```bash
$ aws s3 ls s3://<cluster-name>-infra/
```

Example output
2. Create a JSON file that contains the parameter values that the template requires:

```json
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroupId", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcId", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  },
  {
    "ParameterKey": "RegisterNlbIpTargetsLambdaArn", 17
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:<dns_stack_name>-RegisterNlbIpTargets-<random_string>" 18
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 19
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 21
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
  }]
```
1. The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

2. Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

3. Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.

4. Specify a valid `AWS::EC2::Image::Id` value.

5. CIDR block to allow SSH access to the bootstrap node.

6. Specify a CIDR block in the format `x.x.x.x/16-24`.

7. The public subnet that is associated with your VPC to launch the bootstrap node into.

8. Specify the `PublicSubnetIds` value from the output of the CloudFormation template for the VPC.

9. The master security group ID (for registering temporary rules)

10. Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

11. The VPC created resources will belong to.

12. Specify the `VpcId` value from the output of the CloudFormation template for the VPC.

13. Location to fetch bootstrap Ignition config file from.

14. Specify the S3 bucket and file name in the form `s3://<bucket_name>/bootstrap.ign`.

15. Whether or not to register a network load balancer (NLB).

16. Specify `yes` or `no`. If you specify `yes`, you must provide a Lambda Amazon Resource Name (ARN) value.

17. The ARN for NLB IP target registration lambda group.

18. Specify the `RegisterNlbIpTargetsLambda` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

19. The ARN for external API load balancer target group.

20. Specify the `ExternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

21. The ARN for internal API load balancer target group.

```json
{
    "ParameterKey": "InternalServiceTargetGroupArn",
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
    <account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>",
}
```
Specify the `InternalApiTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

The ARN for internal service load balancer target group.

Specify the `InternalServiceTargetGroupArn` value from the output of the CloudFormation template for DNS and load balancing. Use `arn:aws-us-gov` if deploying the cluster to an AWS GovCloud region.

3. Copy the template from the CloudFormation template for the bootstrap machine section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

   **IMPORTANT**
   You must enter the command on a single line.

   ```bash
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   --capabilities CAPABILITY_NAMED_IAM 4
   ```

   1. `<name>` is the name for the CloudFormation stack, such as `cluster-bootstrap`. You need the name of this stack if you remove the cluster.

   2. `<template>` is the relative path to and name of the CloudFormation template YAML file that you saved.

   3. `<parameters>` is the relative path to and name of the CloudFormation parameters JSON file.

   4. You must explicitly declare the `CAPABILITY_NAMED_IAM` capability because the provided template creates some `AWS::IAM::Role` and `AWS::IAM::InstanceProfile` resources.

   **Example output**

   ```bash
   arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
   ```

5. Confirm that the template components exist:

   ```bash
   $ aws cloudformation describe-stacks --stack-name <name>
   ```

   After the `StackStatus` displays `CREATE_COMPLETE`, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:
### 4.12.13.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

**Example 4.52. CloudFormation template for the bootstrap machine**

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z]\[a-zA-Z0-9-]\\(0,26))$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AllowedBootstrapSshCidr:
    AllowedPattern: ^\([0-9]\[1-9]\[0-9]\\(0-9]\\(0-9](2[0-4]|[0-9]25[0-5])\\(0-32\\(0-9]?\\(2[0-4]\[0-9]\\(2[0-4][0-9][3-2])$\)
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
    Default: 0.0.0.0/0
    Description: CIDR block to allow SSH access to the bootstrap node.
    Type: String
  PublicSubnet:
    Description: The public subnet to launch the bootstrap node into.
    Type: AWS::EC2::Subnet::Id
  MasterSecurityGroupId:
    Description: The master security group ID for registering temporary rules.
    Type: AWS::EC2::SecurityGroup::Id
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  BootstrapIgnitionLocation:
    Default: s3://my-s3-bucket/bootstrap.ign
    Description: Ignition config file location.
    Type: String
```
AutoRegisterELB:
  Default: "yes"
  AllowedValues:
  - "yes"
  - "no"
  Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
  Type: String

RegisterNlbIpTargetsLambdaArn:
  Description: ARN for NLB IP target registration lambda.
  Type: String

ExternalApiTargetGroupArn:
  Description: ARN for external API load balancer target group.

    TargetIp: !GetAtt BootstrapInstance.PrivateIp

Outputs:
  BootstrapInstanceId:

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

**Procedure**

1. Create a JSON file that contains the parameter values that the template requires:

```json
Description: Bootstrap Instance ID.
Value: !Ref BootstrapInstance

BootstrapPublicIp:
Description: The bootstrap node public IP address.
Value: !GetAtt BootstrapInstance.PublicIp

BootstrapPrivatelp:
Description: The bootstrap node private IP address.
Value: !GetAtt BootstrapInstance.Privatelp
```

**Additional resources**

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.

Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.

Specify an `AWS::EC2::Image::Id` value.

Whether or not to perform DNS etcd registration.

Specify `yes` or `no`. If you specify `yes`, you must provide hosted zone information.

The Route 53 private zone ID to register the etcd targets with.

Specify the `PrivateHostedZoneId` value from the output of the CloudFormation template for DNS and load balancing.

The Route 53 zone to register the targets with.

Specify `<cluster_name>.<domain_name>` where `<domain_name>` is the Route 53 base domain that you used when you generated `install-config.yaml` file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

A subnet, preferably private, to launch the control plane machines on.
Specify a subnet from the `PrivateSubnets` value from the output of the CloudFormation template for DNS and load balancing.

The master security group ID to associate with control plane nodes (also known as the master nodes).

Specify the `MasterSecurityGroupId` value from the output of the CloudFormation template for the security group and roles.

The location to fetch control plane Ignition config file from.

Specify the generated Ignition config file location, `https://api-int.<cluster_name>.<domain_name>:22623/config/master`.

The base64 encoded certificate authority string to use.

Specify the value from the `master.ign` file that is in the installation directory. This value is the long string with the format `data:text/plain;charset=utf-8;base64,ABC…xYz==`.

The IAM profile to associate with control plane nodes.

Specify the `MasterInstanceProfile` parameter value from the output of the CloudFormation template for the security group and roles.

The type of AWS instance to use for the control plane machines.

Allowed values:

- m4.xlarge
- m4.2xlarge
- m4.4xlarge
- m4.10xlarge
- m4.16xlarge
- m5.xlarge
- m5.2xlarge
- m5.4xlarge
- m5.8xlarge
- m5.12xlarge
- m5.16xlarge
- m5a.xlarge
- m5a.2xlarge
- m5a.4xlarge
- m5a.8xlarge
- m5a.10xlarge
- m5a.16xlarge
- c4.2xlarge
- c4.4xlarge
- c4.8xlarge
- c5.2xlarge
- c5.4xlarge
- c5.9xlarge
- c5.12xlarge
- c5.18xlarge
- c5.24xlarge
- c5a.2xlarge
- c5a.4xlarge
- c5a.8xlarge
- c5a.12xlarge
- c5a.16xlarge
- c5a.24xlarge
- r4.xlarge
- r4.2xlarge
- r4.4xlarge
- r4.8xlarge
- r4.16xlarge
- r5.xlarge
- r5.2xlarge
- r5.4xlarge
- r5.8xlarge
- r5.12xlarge
- r5.16xlarge
- r5.24xlarge
Whether or not to register a network load balancer (NLB).

Specify yes or no. If you specify yes, you must provide a Lambda Amazon Resource Name (ARN) value.

The ARN for NLB IP target registration lambda group.

Specify the RegisterNlbIpTargetsLambda value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

The ARN for external API load balancer target group.

Specify the ExternalApiTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

The ARN for internal API load balancer target group.

Specify the InternalApiTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

The ARN for internal service load balancer target group.

Specify the InternalServiceTargetGroupArn value from the output of the CloudFormation template for DNS and load balancing. Use arn:aws-us-gov if deploying the cluster to an AWS GovCloud region.

2. Copy the template from the CloudFormation template for control plane machines section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.

3. If you specified an m5 instance type as the value for MasterInstanceType, add that instance type to the MasterInstanceType.AllowedValues parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

   IMPORTANT
   You must enter the command on a single line.
<name> is the name for the CloudFormation stack, such as `cluster-control-plane`. You need the name of this stack if you remove the cluster.

<template> is the relative path to and name of the CloudFormation template YAML file that you saved.

<parameters> is the relative path to and name of the CloudFormation parameters JSON file.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

**NOTE**

The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

#### Example 4.53. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
  Type: String
RhcosAmi:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
  Type: AWS::EC2::Image::Id
AutoRegisterDNS:
  Default: "yes"
  AllowedValues:
```
- "yes"
- "no"

Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone information?
Type: String

PrivateHostedZoneId:
Description: The Route53 private zone ID to register the etcd targets with, such as Z21IXYZABCZ2A4.
Type: String

PrivateHostedZoneName:
Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit the trailing period.
Type: String

Master0Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

Master1Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

Master2Subnet:
Description: The subnets, recommend private, to launch the master nodes into.
Type: AWS::EC2::Subnet::Id

MasterSecurityGroupId:
Description: The master security group ID to associate with master nodes.
Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:
Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master
Description: Ignition config file location.
Type: String

CertificateAuthorities:
Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
Description: Base64 encoded certificate authority string to use.
Type: String

MasterInstanceProfileName:
Description: IAM profile to associate with master nodes.
Type: String

MasterInstanceType:
Default: m5.xlarge
Type: String
AllowedValues:
- "m4.xlarge"
- "m4.2xlarge"
- "m4.4xlarge"
- "m4.10xlarge"
- "m4.16xlarge"
- "m5.xlarge"
- "m5.2xlarge"
- "m5.4xlarge"
- "m5.8xlarge"
- "m5.12xlarge"
- "m5.16xlarge"
- "m5a.xlarge"
- "m5a.2xlarge"
- "m5a.4xlarge"
- "m5a.8xlarge"
- "m5a.10xlarge"
- "m5a.16xlarge"
- "c4.2xlarge"
- "c4.4xlarge"
- "c4.8xlarge"
- "c5.2xlarge"
- "c5.4xlarge"
- "c5.9xlarge"
- "c5.12xlarge"
- "c5.18xlarge"
- "c5.24xlarge"
- "c5a.2xlarge"
- "c5a.4xlarge"
- "c5a.8xlarge"
- "c5a.12xlarge"
- "c5a.16xlarge"
- "c5a.24xlarge"
- "r4.xlarge"
- "r4.2xlarge"
- "r4.4xlarge"
- "r4.8xlarge"
- "r4.16xlarge"
- "r5.xlarge"
- "r5.2xlarge"
- "r5.4xlarge"
- "r5.8xlarge"
- "r5.12xlarge"
- "r5.16xlarge"
- "r5.24xlarge"
- "r5a.xlarge"
- "r5a.2xlarge"
- "r5a.4xlarge"
- "r5a.8xlarge"
- "r5a.12xlarge"
- "r5a.16xlarge"
- "r5a.24xlarge"

AutoRegisterELB:
Default: "yes"
AllowedValues:
- "yes"
- "no"
Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
Type: String
RegisterNlbIpTargetsLambdaArn:
Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String
ExternalApiTargetGroupArn:
Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String
InternalApiTargetGroupArn:
Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.
Type: String
InternalServiceTargetGroupArn:
Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select “no” for AutoRegisterELB.

Type: String

    TTL: 60
4.12.15. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

**IMPORTANT**

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

**NOTE**

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
• You created the bootstrap machine.
• You created the control plane machines.

**Procedure**

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcosAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "WorkerSecurityGroupId", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker" 10
  },
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  },
  {
    "ParameterKey": "WorkerInstanceProfileName", 13
    "ParameterValue": "" 14
  },
  {
    "ParameterKey": "WorkerInstanceType", 15
    "ParameterValue": "m4.2xlarge" 16
  }
]
```

1. The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
2. Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format `<cluster-name>-<random-string>`.
3. Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
4. Specify an **AWS::EC2::Image::Id** value.

5. A subnet, preferably private, to launch the worker nodes on.

6. Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.

7. The worker security group ID to associate with worker nodes.

8. Specify the **WorkerSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.

9. The location to fetch bootstrap Ignition config file from.

10. Specify the generated Ignition config location, **https://api-int.<cluster_name>.<domain_name>:22623/config/worker**.

11. Base64 encoded certificate authority string to use.

12. Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC…xYz==**.

13. The IAM profile to associate with worker nodes.

14. Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.

15. The type of AWS instance to use for the control plane machines.

16. Allowed values:

   - **m4.large**
   - **m4.xlarge**
   - **m4.2xlarge**
   - **m4.4xlarge**
   - **m4.10xlarge**
   - **m4.16xlarge**
   - **m5.large**
   - **m5.xlarge**
   - **m5.2xlarge**
   - **m5.4xlarge**
   - **m5.8xlarge**
   - **m5.12xlarge**
   - **m5.16xlarge**
   - **m5a.large**
- m5a.xlarge
- m5a.2xlarge
- m5a.4xlarge
- m5a.8xlarge
- m5a.10xlarge
- m5a.16xlarge
- c4.large
- c4.xlarge
- c4.2xlarge
- c4.4xlarge
- c4.8xlarge
- c5.large
- c5.xlarge
- c5.2xlarge
- c5.4xlarge
- c5.9xlarge
- c5.12xlarge
- c5.18xlarge
- c5.24xlarge
- c5a.large
- c5a.xlarge
- c5a.2xlarge
- c5a.4xlarge
- c5a.8xlarge
- c5a.12xlarge
- c5a.16xlarge
- c5a.24xlarge
- r4.large
- r4.xlarge
2. Copy the template from the CloudFormation template for worker machines section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.
3. If you specified an m5 instance type as the value for `WorkerInstanceType`, add that instance type to the `WorkerInstanceType.AllowedValues` parameter in the CloudFormation template.

4. Launch the CloudFormation template to create a stack of AWS resources that represent a worker node:

   **IMPORTANT**

   You must enter the command on a single line.

   ```
   $ aws cloudformation create-stack --stack-name <name> 1
   --template-body file://<template>.yaml 2
   --parameters file://<parameters>.json 3
   
   1 <name> is the name for the CloudFormation stack, such as `cluster-worker-1`. You need the name of this stack if you remove the cluster.
   
   2 <template> is the relative path to and name of the CloudFormation template YAML file that you saved.
   
   3 <parameters> is the relative path to and name of the CloudFormation parameters JSON file.
   
   Example output
   

   **NOTE**

   The CloudFormation template creates a stack that represents one worker node.

5. Confirm that the template components exist:

   ```
   $ aws cloudformation describe-stacks --stack-name <name>
   ```

6. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

   **IMPORTANT**

   You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

4.12.15.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

   **Example 4.54. CloudFormation template for worker machines**
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
InfrastructureName:
  AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
  MaxLength: 27
  MinLength: 1
  ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
  Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
  Type: String
RhcosAmi:
  Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
  Type: AWS::EC2::Image::Id
Subnet:
  Description: The subnets, recommend private, to launch the master nodes into.
  Type: AWS::EC2::Subnet::Id
WorkerSecurityGroupId:
  Description: The master security group ID to associate with master nodes.
  Type: AWS::EC2::SecurityGroup::Id
IgnitionLocation:
  Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
  Description: Ignition config file location.
  Type: String
CertificateAuthorities:
  Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
  Description: Base64 encoded certificate authority string to use.
  Type: String
WorkerInstanceProfileName:
  Description: IAM profile to associate with master nodes.
  Type: String
WorkerInstanceType:
  Default: m5.large
  Type: String
  AllowedValues:
  - "m4.large"
  - "m4.xlarge"
  - "m4.2xlarge"
  - "m4.4xlarge"
  - "m4.10xlarge"
  - "m4.16xlarge"
  - "m5.large"
  - "m5.xlarge"
  - "m5.2xlarge"
  - "m5.4xlarge"
  - "m5.8xlarge"
  - "m5.12xlarge"
  - "m5.16xlarge"
  - "m5a.large"
  - "m5a.xlarge"
  - "m5a.2xlarge"
  - "m5a.4xlarge"
  - "m5a.8xlarge"
  - "m5a.10xlarge"
  - "m5a.16xlarge"
- "c4.large"
- "c4.xlarge"
- "c4.2xlarge"
- "c4.4xlarge"
- "c4.8xlarge"
- "c5.large"
- "c5.xlarge"
- "c5.2xlarge"
- "c5.4xlarge"
- "c5.9xlarge"
- "c5.12xlarge"
- "c5.18xlarge"
- "c5.24xlarge"
- "c5a.large"
- "c5a.xlarge"
- "c5a.2xlarge"
- "c5a.4xlarge"
- "c5a.8xlarge"
- "c5a.12xlarge"
- "c5a.16xlarge"
- "c5a.24xlarge"
- "r4.large"
- "r4.xlarge"
- "r4.2xlarge"
- "r4.4xlarge"
- "r4.8xlarge"
- "r4.16xlarge"
- "r5.large"
- "r5.xlarge"
- "r5.2xlarge"
- "r5.4xlarge"
- "r5.8xlarge"
- "r5.12xlarge"
- "r5.16xlarge"
- "r5.24xlarge"
- "r5a.large"
- "r5a.xlarge"
- "r5a.2xlarge"
- "r5a.4xlarge"
- "r5a.8xlarge"
- "r5a.12xlarge"
- "r5a.16xlarge"
- "r5a.24xlarge"
- "t3.large"
- "t3.xlarge"
- "t3.2xlarge"
- "t3a.large"
- "t3a.xlarge"
- "t3a.2xlarge"

4.12.16. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running `aws configure`.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

   ```bash
   $ ./openshift-install wait-for bootstrap-complete --dir=<installation_directory> \  
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

Example output

```
CA_BUNDLE: !Ref CertificateAuthorities,
)
Tags:
  - Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
    Value: "shared"

Outputs:
  PrivateIP:
    Description: The compute node private IP address.
    Value: !GetAtt Worker0.PrivateIp
```
INFO Waiting up to 20m0s for the Kubernetes API at https://api.mycluster.example.com:6443...
INFO API v1.19.0+9f84db3 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s

If the command exits without a FATAL warning, your OpenShift Container Platform control plane has initialized.

NOTE
After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

Additional resources

- See Monitoring installation progress for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.

- See Gathering bootstrap node diagnostic data for information about troubleshooting issues related to the bootstrap process.

4.12.17. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.

- You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   1 For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   $ oc whoami

   Example output

   system:admin
4.12.18. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

   ```bash
   $ oc get nodes
   ```

   **Example output**

   ```text
   NAME      STATUS    ROLES   AGE  VERSION
   master-0  Ready     master  63m  v1.21.0
   master-1  Ready     master  63m  v1.21.0
   master-2  Ready     master  64m  v1.21.0
   worker-0  NotReady  worker  76s  v1.21.0
   worker-1  NotReady  worker  70s  v1.21.0
   ```

   The output lists all of the machines that you created.

   **NOTE**

   The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

   ```bash
   $ oc get csr
   ```

   **Example output**

   ```text
   NAME        AGE     REQUESTOR                                           CONDITION
   csr-8b2br   15m     system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
   csr-8vnps   15m     system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
   ...
   ```

   In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:
NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. Once the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the machine-approver if the Kubelet requests a new certificate with identical parameters.

NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the oc exec, oc rsh, and oc logs commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the node-bootstrapper service account in the system:node or system:admin groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  $ oc adm certificate approve <csr_name>

  <csr_name> is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

  $ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve

NOTE

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

  $ oc get csr

Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>
5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:
  
  ```
  $ oc adm certificate approve <csr_name>  
  ```

  `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:
  
  ```
  $ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}} | xargs oc adm certificate approve  
  ```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes  
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>74m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.21.0</td>
</tr>
</tbody>
</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

**Additional information**

- For more information on CSRs, see [Certificate Signing Requests](#).

### 4.12.19. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

**Prerequisites**

- Your control plane has initialized.

**Procedure**

1. Watch the cluster components come online:

   ```
   $ watch -n5 oc get clusteroperators  
   ```
Example output

<table>
<thead>
<tr>

</tbody>
</table>

2. Configure the Operators that are not available.

4.12.19.1. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:

```bash
$ oc patch OperatorHub cluster --type json \
  -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```
**TIP**

Alternatively, you can use the web console to manage catalog sources. From the **Administration → Cluster Settings → Global Configuration → OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

### 4.12.19.2. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

#### 4.12.19.2.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

**Prerequisites**

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY_STORAGE_S3_ACCESSKEY**
  - **REGISTRY_STORAGE_S3_SECRETKEY**

**Procedure**

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a **Bucket Lifecycle Policy** to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

   ```bash
   $ oc edit configs.imageregistry.operator.openshift.io/cluster
   
   Example configuration
   
   ```
   ```yaml
   storage:
   s3:
     bucket: <bucket-name>
     region: <region-name>
   ```
To secure your registry images in AWS, block public access to the S3 bucket.

### 4.12.19.2.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

**Procedure**

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec":
{"storage":{"emptyDir":{}}}}'
```

**WARNING**

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the `oc patch` command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

### 4.12.20. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

**Prerequisites**

- You completed the initial Operator configuration for your cluster.

**Procedure**

1. Delete the bootstrap resources. If you used the CloudFormation template, delete its stack:

   - Delete the stack by using the AWS CLI:

   ```
   $ aws cloudformation delete-stack --stack-name <name>
   ```
<name> is the name of your bootstrap stack.

- Delete the stack by using the AWS CloudFormation console.

### 4.12.21. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (oc).
- You installed the jq package.
- You downloaded the AWS CLI and installed it on your computer. See Install the AWS CLI Using the Bundled Installer (Linux, macOS, or Unix).

#### Procedure

1. Determine the routes to create.
   - To create a wildcard record, use `*.apps.<cluster_name>.<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.
   - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

   ```
   Example output
   
   $ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}{end}' routes
   oauth-openshift.apps.<cluster_name>.<domain_name>
calendar-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
   
   $ oc -n openshift-ingress get service router-default
   
   Example output
   
<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
</tr>
</thead>
<tbody>
<tr>
<td>oauth-openshift</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>console-openshift</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>downloads-opensh</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>alertmanager-main</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>grafana-opensh</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>prometheus-k8s</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
   ```
3. Locate the hosted zone ID for the load balancer:

```bash
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>").CanonicalHostedZoneNameID'
```

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

**Example output**

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster’s domain:

```bash
$ aws route53 list-hosted-zones-by-name \
   --dns-name "<domain_name>" \
   --query 'HostedZones[? Config.PrivateZone != `true` && Name == 
   `<domain_name>.`].Id' \
   --output text
```

For `<domain_name>`, specify the Route 53 base domain for your OpenShift Container Platform cluster.

**Example output**

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is `Z3URY6TWQ91KVV`.

5. Add the alias records to your private zone:

```bash
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --change-batch '{
   "Changes": [
      {
         "Action": "CREATE",
         "ResourceRecordSet": {
            "Name": ".apps.<cluster_domain>",
            "Type": "A",
            "AliasTarget": {
               "HostedZoneId": "<hosted_zone_id>",
               "DNSName": ".<external_ip>",
               "EvaluateTargetHealth": false
            }
         }
      }
   ]
}'
```

OpenShift Container Platform 4.8 Installing
For `<private_hosted_zone_id>`, specify the value from the output of the CloudFormation template for DNS and load balancing.

For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.

For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

   ```bash
   $ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --change-batch '{
     "Changes": [
       {
         "Action": "CREATE",
         "ResourceRecordSet": {
           "Name": "\052.apps.<cluster_domain>",
           "Type": "A",
           "AliasTarget": {
             "HostedZoneId": "<hosted_zone_id>",
             "DNSName": "<external_ip>",
             "EvaluateTargetHealth": false
           }
         }
       }
     ]
   }'
   ```

   1. For `<public_hosted_zone_id>`, specify the public hosted zone for your domain.
   2. For `<cluster_domain>`, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
   3. For `<hosted_zone_id>`, specify the public hosted zone ID for the load balancer that you obtained.
   4. For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

4.12.22. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.
Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.

- You installed the `oc` CLI.

Procedure

1. From the directory that contains the installation program, complete the cluster installation:

   ```
   $ ./openshift-install --dir=<installation_directory> wait-for install-complete
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   **Example output**

   ```
   INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to initialize...
   INFO Waiting up to 10m0s for the openshift-console route to be created...
   INFO Install complete!
   INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-Wt6NL"
   INFO Time elapsed: 1s
   ```

   **IMPORTANT**

   The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for `Recovering from expired control plane certificates` for more information.

2. Register your cluster on the [Cluster registration](#) page.

4.12.23. Logging in to the cluster by using the web console

The `kubeadmin` user exists by default after an OpenShift Container Platform installation. You can log into your cluster as the `kubeadmin` user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.

- You completed a cluster installation and all cluster Operators are available.
Procedure

1. Obtain the password for the `kubeadmin` user from the `kubeadmin-password` file on the installation host:

```bash
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**
Alternatively, you can obtain the `kubeadmin` password from the `<installation_directory>/openshift_install.log` log file on the installation host.

2. List the OpenShift Container Platform web console route:

```bash
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**
Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

**Example output**

```plaintext
console     console-openshift-console.apps.<cluster_name>.<base_domain>            console
https   reencrypt/Redirect   None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the `kubeadmin` user.

**4.12.24. Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

**4.12.25. Next steps**

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the `must-gather` tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.
- If necessary, you can remove cloud provider credentials.
4.13. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

4.13.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

**NOTE**

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

**Prerequisites**

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

**Procedure**

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

   ```
   $ ./openshift-install destroy cluster \
   --dir=<installation_directory> --log-level=info
   ```

   **1** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   **2** To view different details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

2. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.

4.13.2. Deleting AWS resources with the Cloud Credential Operator utility

To clean up resources after uninstalling an OpenShift Container Platform cluster with the Cloud Credential Operator (CCO) in manual mode with STS, you can use the CCO utility (`ccoctl`) to remove the AWS resources that `ccoctl` created during installation.

**Prerequisites**

- Extract and prepare the `ccoctl` binary.
• Install an OpenShift Container Platform cluster with the CCO in manual mode with STS.

**Procedure**

• Delete the AWS resources that `ccoctl` created:

  ```
  $ ccoctl aws delete --name=<name> --region=<aws_region>
  ```

  where:

  - `<name>` matches the name used to originally create and tag the cloud resources.
  - `<aws-region>` is the AWS region in which cloud resources will be deleted.

**Example output:**

```
2021/04/08 17:50:41 Identity Provider object .well-known/openid-configuration deleted from the bucket <name>-oidc
2021/04/08 17:50:42 Identity Provider object keys.json deleted from the bucket <name>-oidc
2021/04/08 17:50:43 Identity Provider bucket <name>-oidc deleted
2021/04/08 17:51:05 Policy <name>-openshift-cloud-credential-operator-cloud-credential-o associated with IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o deleted
2021/04/08 17:51:05 IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o deleted
2021/04/08 17:51:07 IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials deleted
2021/04/08 17:51:08 Policy <name>-openshift-image-registry-installer-cloud-credentials associated with IAM Role <name>-openshift-image-registry-installer-cloud-credentials deleted
2021/04/08 17:51:08 IAM Role <name>-openshift-image-registry-installer-cloud-credentials deleted
2021/04/08 17:51:10 IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:11 IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
```

**Verification**

You can verify that the resources are deleted by querying AWS. For more information, refer to AWS documentation.
CHAPTER 5. INSTALLING ON AZURE

5.1. PREPARING TO INSTALL ON AZURE

5.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

5.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See Configuring an Azure account for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for Azure for other options.

5.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when
creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

5.1.4. Next steps

- Configuring an Azure account

5.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

5.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default Azure subscription and service limits, quotas, and constraints affect your ability to install OpenShift Container Platform clusters.

**IMPORTANT**

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.
<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vCPU</td>
<td>40</td>
<td>20 per region</td>
<td>A default cluster requires 40 vCPUs, so you must increase the account limit. By default, each cluster creates the following instances:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• One bootstrap machine, which is removed after installation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Three control plane machines</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Three compute machines</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Because the bootstrap machine uses <strong>Standard_D4s_v3</strong> machines, which use 4 vCPUs, the control plane machines use <strong>Standard_D8s_v3</strong> virtual machines, which use 8 vCPUs, and the worker machines use <strong>Standard_D4s_v3</strong> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>By default, the installation program distributes control plane and compute machines across <strong>all availability zones</strong> within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.</td>
</tr>
<tr>
<td>VNet</td>
<td>1</td>
<td>1000 per region</td>
<td>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</td>
</tr>
<tr>
<td>Network interfaces</td>
<td>6</td>
<td>65,536 per region</td>
<td>Each default cluster requires six network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</td>
</tr>
<tr>
<td>Component</td>
<td>Number of components required by default</td>
<td>Default Azure limit</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Network security groups</td>
<td>2</td>
<td>5000</td>
<td>Each default cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>control plane</strong> Allows the control plane machines to be reached on port 6443 from anywhere</td>
</tr>
<tr>
<td>Network load balancers</td>
<td>3</td>
<td>1000 per region</td>
<td>Each cluster creates the following load balancers:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>default</strong> Public IP address that load balances requests to ports 80 and 443 across worker machines</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>external</strong> Public IP address that load balances requests to port 6443 across control plane machines</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If your applications create more Kubernetes LoadBalancer service objects, your cluster uses more load balancers.</td>
</tr>
<tr>
<td>Public IP addresses</td>
<td>3</td>
<td></td>
<td>Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.</td>
</tr>
<tr>
<td>Private IP addresses</td>
<td>7</td>
<td></td>
<td>The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.</td>
</tr>
</tbody>
</table>
### 5.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

   **NOTE**
   
   For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.

3. Configure DNS for your domain. Follow the steps in the Tutorial: Host your domain in Azure DNS in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.

   Use an appropriate root domain, such as `openshiftcorp.com`, or subdomain, such as `clusters.openshiftcorp.com`.

4. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain.

### 5.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click **Help + support** in the lower left corner.

2. Click **New support request** and then select the required values:
a. From the Issue type list, select Service and subscription limits (quotas)

b. From the Subscription list, select the subscription to modify.

c. From the Quota type list, select the quota to increase. For example, select Compute-VM (cores-vCPUs) subscription limit increases to increase the number of vCPUs, which is required to install a cluster.

d. Click Next: Solutions.

3. On the Problem Details page, provide the required information for your quota increase:

   a. Click Provide details and provide the required details in the Quota details window.

   b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.

4. Click Next: Review + create and then click Create.

5.2.4. Required Azure roles

Your Microsoft Azure account must have the following roles for the subscription that you use:

- User Access Administrator

To set roles on the Azure portal, see the Manage access to Azure resources using RBAC and the Azure portal in the Azure documentation.

5.2.5. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

**Prerequisites**

- Install or update the Azure CLI.

- Install the jq package.

- Your Azure account has the required roles for the subscription that you use.

**Procedure**

1. Log in to the Azure CLI:

   ```bash
   $ az login
   ```

   Log in to Azure in the web console by using your credentials.

2. If your Azure account uses subscriptions, ensure that you are using the right subscription.

   a. View the list of available accounts and record the tenantId value for the subscription you want to use for your cluster:

   ```bash
   $ az account list --refresh
   ```
Example output

```
[
  {
    "cloudName": "AzureCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

b. View your active account details and confirm that the \texttt{tenantId} value matches the subscription you want to use:

```
$ az account show
```

Example output

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

Ensure that the value of the \texttt{tenantId} parameter is the UUID of the correct subscription.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id>
```

Substitute the value of the \texttt{id} for the subscription that you want to use for \texttt{<id>}

d. If you changed the active subscription, display your account information again:

```
$ az account show
```

Example output

```
```
3. Record the values of the `tenantId` and `id` parameters from the previous output. You need these values during OpenShift Container Platform installation.

4. Create the service principal for your account:

   ```
   $ az ad sp create-for-rbac --role Contributor --name <service_principal>
   ```

   Replace `<service_principal>` with the name to assign to the service principal.

5. Record the values of the `appId` and `password` parameters from the previous output. You need these values during OpenShift Container Platform installation.

6. Grant additional permissions to the service principal.

   - You must always add the **Contributor** and **User Access Administrator** roles to the app registration service principal so the cluster can assign credentials for its components.

   - To operate the Cloud Credential Operator (CCO) in **mint mode**, the app registration service principal also requires the **Azure Active Directory** `Graph/Application.ReadWrite.OwnedBy` API permission.

   - To operate the CCO in **passthrough mode**, the app registration service principal does not require additional API permissions.
For more information about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

NOTE

If you limit the service principal scope of the OpenShift Container Platform installation program to an already existing Azure resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying a cluster using the installation program deletes this resource group.

a. To assign the User Access Administrator role, run the following command:

```bash
$ az role assignment create --role "User Access Administrator" \
--assignee-object-id $(az ad sp list --filter "appId eq '<appId>'" \
| jq '.[0].objectId' -r)
```

Replace `<appId>` with the `appId` parameter value for your service principal.

b. To assign the Azure Active Directory Graph permission, run the following command:

```bash
$ az ad app permission add --id <appId> \
--api 00000002-0000-0000-c000-000000000000 \
--api-permissions 824c81eb-e3f8-4ee6-8f6d-de7f50d565b7=Role
```

Replace `<appId>` with the `appId` parameter value for your service principal.

Example output

Invoking "az ad app permission grant --id 46d33abc-b8a3-46d8-8c84-f0fd58177435 --api 00000002-0000-0000-c000-000000000000" is needed to make the change effective

For more information about the specific permissions that you grant with this command, see the GUID Table for Windows Azure Active Directory Permissions.

c. Approve the permissions request. If your account does not have the Azure Active Directory tenant administrator role, follow the guidelines for your organization to request that the tenant administrator approve your permissions request.

```bash
$ az ad app permission grant --id <appId>
```

Replace `<appId>` with the `appId` parameter value for your service principal.

5.2.6. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription. The following Azure regions were tested and validated in OpenShift Container Platform version 4.6.1:

Supported Azure public regions
- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)
- westeurope (West Europe)
- westindia (West India)
- westus (West US)
- westus2 (West US 2)

**Supported Azure Government regions**
Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- usgovtexas (US Gov Texas)
- usgovvirginia (US Gov Virginia)

You can reference all available MAG regions in the Azure documentation. Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 5.2.7. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can install a customized cluster or quickly install a cluster with default options.

### 5.3. MANUALLY CREATING IAM FOR AZURE

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster kube-system namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

#### 5.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the credentialsMode parameter in the install-config.yaml file.

If you prefer not to store an administrator-level credential secret in the cluster kube-system project, you can set the credentialsMode parameter for the CCO to Manual when installing OpenShift Container Platform and manage your cloud credentials manually.

Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

**Additional resources**

For a detailed description of all available CCO credential modes and their supported platforms, see About the Cloud Credential Operator.

#### 5.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in
environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster `kube-system` namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the `install-config.yaml` file:

   ```bash
   $ openshift-install create install-config --dir=<installation_directory>
   ```

2. Edit the `install-config.yaml` configuration file so that it contains the `credentialsMode` parameter set to `Manual`.

   **Example install-config.yaml configuration file**

   ```yaml
   apiVersion: v1
   baseDomain: cluster1.example.com
   credentialsMode: Manual
   compute:
     - architecture: amd64
       hyperthreading: Enabled
   ...
   
   1 This line is added to set the `credentialsMode` parameter to `Manual`.

3. To generate the manifests, run the following command from the directory that contains the installation program:

   ```bash
   $ openshift-install create manifests --dir=<installation_directory>
   ```

   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   ```bash
   $ openshift-install version
   ```

   **Example output**

   ```bash
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ```

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on:

   ```bash
   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=azure
   ```

   This command creates a YAML file for each `CredentialsRequest` object.
Sample CredentialsRequest object

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
name: openshift-image-registry-azure
namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
```

6. Create YAML files for secrets in the openshift-install manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the spec.secretRef for each CredentialsRequest object. The format for the secret data varies for each cloud provider.

7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir=<installation_directory>
```

**IMPORTANT**

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the Upgrading clusters with manually maintained credentials section of the installation content for your cloud provider.

### 5.3.3. Admin credentials root secret format

Each cloud provider uses a credentials root secret in the kube-system namespace by convention, which is then used to satisfy all credentials requests and create their respective secrets. This is done either by minting new credentials, with mint mode, or by copying the credentials root secret, with passthrough mode.

The format for the secret varies by cloud, and is also used for each CredentialsRequest secret.

**Microsoft Azure secret format**

```yaml
apiVersion: v1
kind: Secret
metadata:
  namespace: kube-system
  name: azure-credentials
stringData:
  azure_subscription_id: <SubscriptionID>
  azure_client_id: <ClientID>
```
On Microsoft Azure, the credentials secret format includes two properties that must contain the cluster’s infrastructure ID, generated randomly for each cluster installation. This value can be found after running create manifests:

Example output

```
mycluster-2mpcn
```

This value would be used in the secret data as follows:

```
azure_resource_prefix: mycluster-2mpcn
azure_resourcegroup: mycluster-2mpcn-rg
```

5.3.4. Upgrading clusters with manually maintained credentials

If credentials are added in a future release, the Cloud Credential Operator (CCO) upgradable status for a cluster with manually maintained credentials changes to false. For minor release, for example, from 4.7 to 4.8, this status prevents you from upgrading until you have addressed any updated permissions. For z-stream releases, for example, from 4.7.12 to 4.7.13, the upgrade is not blocked, but the credentials must still be updated for the new release.

Use the Administrator perspective of the web console to determine if the CCO is upgradeable.

1. Navigate to Administration → Cluster Settings.
2. To view the CCO status details, click cloud-credential in the Cluster Operators list.
3. If the Upgradeable status in the Conditions section is False, examine the CredentialsRequest custom resource for the new release and update the manually maintained credentials on your cluster to match before upgrading.

In addition to creating new credentials for the release image that you are upgrading to, you must review the required permissions for existing credentials and accommodate any new permissions requirements for existing components in the new release. The CCO cannot detect these mismatches and will not set upgradable to false in this case.

The Manually creating IAM section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.

5.3.5. Mint mode

Mint mode is the default and recommended Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS, GCP, and Azure.
In mint mode, the `admin` credential is stored in the `kube-system` namespace and then used by the CCO to process the `CredentialsRequest` objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires `admin` credential storage in a cluster `kube-system` secret.

5.3.6. Next steps

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on Azure with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure

5.4. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.8, you can install a cluster on Microsoft Azure that uses the default configuration options.

5.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.4.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.
You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>
   ```
1. Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   `$ cat <path>/<file_name>.pub`

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   `$ cat ~/.ssh/id_rsa.pub`

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      `$ eval "$(ssh-agent -s)"`

   **Example output**

      Agent pid 31874

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the ssh-agent:

      `$ ssh-add <path>/<file_name>`

      **Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa**

      **Example output**

      Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

**Next steps**
5.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar xvf openshift-install-linux.tar.gz
   ```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT

You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \  
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   2 To view different installation details, specify warn, debug, or error instead of info.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

a. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

b. Select azure as the platform to target.

c. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

   - **azure subscription id** The subscription ID to use for the cluster. Specify the id value in your account output.
   - **azure tenant id** The tenant ID. Specify the tenantId value in your account output.
• **azure service principal client id** The value of the `appId` parameter for the service principal.

• **azure service principal client secret** The value of the `password` parameter for the service principal.

d. Select the region to deploy the cluster to.

e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

f. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see **Resolve reserved resource name errors** in the Azure documentation.

g. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.
Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

   After you install the CLI, it is available using the oc command:

   ```
   C:\> oc <command>
   ```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```

**5.4.7. Logging in to the cluster by using the CLI**

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   $ oc whoami

   Example output

   system:admin

5.4.8. Next steps

   • Customize your cluster.

   • If necessary, you can opt out of remote health reporting.

5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the install-config.yaml file before you install the cluster.

5.5.1. Prerequisites

   • You reviewed details about the OpenShift Container Platform installation and update processes.

   • You read the documentation on selecting a cluster installation method and preparing it for users.

   • You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.

   • If you use a firewall, you configured it to allow the sites that your cluster requires access to.

   • If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.5.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of
updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**
1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$(ssh-agent -s)"
   ```

   **Example output**

   ```
   Agent pid 31874
   ```

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`
Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   `$ tar xvf openshift-install-linux.tar.gz`

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.
5.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
   a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir=<installation_directory>
```

   1. For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

   ii. Select **azure** as the platform to target.

   iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

   - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
   - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
   - **azure service principal client id** The value of the **appId** parameter for the service principal.
• **azure service principal client secret** The value of the **password** parameter for the service principal.

iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

vii. Paste the pull secret that you obtained from the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site.

2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the **ovirt-config.yaml** file and the **install-config.yaml** file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

2. In the **install-config.yaml** file:

   ```
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.
The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 5.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

#### IMPORTANT

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 5.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt; &lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, openstack, ovirt, vsphere. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td></td>
</tr>
</tbody>
</table>

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

5.5.5.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.2. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the `networking` object after installation.
### 5.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.3. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use <strong>compute</strong>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use <strong>compute</strong>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <strong>controlPlane.platform</strong> parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <strong>MachinePool</strong> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
</tbody>
</table>
The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
<tr>
<td></td>
<td>dynamically tries to determine the capabilities of the provided credentials,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>with a preference for mint mode on the platforms where multiple modes are</td>
<td></td>
</tr>
<tr>
<td></td>
<td>supported.</td>
<td></td>
</tr>
</tbody>
</table>
**fips**
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><strong>imageContentSources.mirrors</strong></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
</tbody>
</table>
How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

**publish**

How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

**Internal** or **External**. To deploy a private cluster, which cannot be accessed from the internet, set publish to **Internal**. The default value is **External**.

**sshKey**

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

---

5.5.5.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 5.4. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>controlPlane.platform.azure.osDisk.diskSizeGB</strong></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The minimum supported disk size is <strong>1024</strong>.</td>
</tr>
<tr>
<td><strong>platform.azure.domainResourceGroupName</strong></td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example <strong>production_cluster</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform.azure.computeSubnet</code></td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example <code>10.0.0.0/16</code>.</td>
</tr>
<tr>
<td><code>platform.azure.cloud Name</code></td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <code>AzurePublicCloud</code> is used.</td>
<td>Any valid cloud environment, such as <code>AzurePublicCloud</code> or <code>AzureUSGovernmentCloud</code>.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

5.5.5.2. Sample customized `install-config.yaml` file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hypethreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        type: Standard_D8s_v3
      replicas: 3
compute:
- hypethreading: Enabled
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512
      zones:
        - "1"
        - "2"
        - "3"
```
replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
  machineNetwork:
    - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    outboundType: Loadbalancer
cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}''
fips: false
sshKey: ssh-ed25519 AAAA...

1 Required. The installation program prompts you for this value.
2 If you do not provide these parameters and values, the installation program provides the default value.
3 The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.
4 Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

5 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.
6 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
7 Specify the name of the resource group that contains the DNS zone for your base domain.
Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

### 5.5.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

2. For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

3. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.
NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-W75AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/.openshift_install.log` when an installation succeeds.

IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kublet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.5.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of `oc`.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.

4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the **oc** binary in a directory that is on your **PATH**.
   To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the **oc** command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```

### 5.5.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites
- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

#### Procedure

1. Export the kubeadmin credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

### 5.5.9. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.8, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only kubeProxy configuration parameters in a running cluster.

5.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials. Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

5.6.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name> 1

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

```
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> ①
```

① Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.6.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space
Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**
   
   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**
   
   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar xvf openshift-install-linux.tar.gz
   $ ./openshift-install create install-config --dir=<installation_directory>
   ```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create the `install-config.yaml` file.
   
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory>  
   ```
For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:
   
i. Optional: Select an SSH key to use to access your cluster machines.

   **NOTE**

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

   ii. Select `azure` as the platform to target.

   iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

      - **azure subscription id** The subscription ID to use for the cluster. Specify the `id` value in your account output.
      - **azure tenant id** The tenant ID. Specify the `tenantId` value in your account output.
      - **azure service principal client id** The value of the `appId` parameter for the service principal.
      - **azure service principal client secret** The value of the `password` parameter for the service principal.

   iv. Select the region to deploy the cluster to.

   v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

   vi. Enter a descriptive name for your cluster.

   **IMPORTANT**

   All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see `Resolve reserved resource name errors` in the Azure documentation.
vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the install-config.yaml file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the ovirt-config.yaml file and the install-config.yaml file. If they do not appear, add them as follows:

1. In the ~/.ovirt/ovirt-config.yaml file:

```yaml
[ovirt_ca_bundle]: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA>
    -----END CERTIFICATE-----
    -----BEGIN CERTIFICATE-----
    <INTERMEDIATE_CA>
    -----END CERTIFICATE-----
```

2. In the install-config.yaml file:

```yaml
[additionalTrustBundle]: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA>
    -----END CERTIFICATE-----
    -----BEGIN CERTIFICATE-----
    <INTERMEDIATE_CA>
    -----END CERTIFICATE-----
```

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.

**IMPORTANT**

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the install-config.yaml installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the install-config.yaml file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the install-config.yaml file.
IMPORTANT

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.5. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **aws, baremetal, azure, openstack, ovirt, vsphere.**

For additional information about platform.<platform> parameters, consult the table for your specific platform that follows.

---

### pullSecret

Get a pull secret from https://cloud.redhat.com/openshift/install/pull-secret to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

---

### 5.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.6. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot modify parameters specified by the **networking** object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.network Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
</tbody>
</table>
5.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use <code>networking.machineNetwork</code>. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
</tbody>
</table>

NOTE: Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### Table 5.7. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compute.hyperthreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td><strong>compute.name</strong></td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><strong>compute.platform</strong></td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td><strong>aws, azure, gcp, openstack, ovirt, vsphere, or{}</strong></td>
</tr>
<tr>
<td><strong>compute.replicas</strong></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><strong>controlPlane</strong></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><strong>controlPlane.architectu re</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>

<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fips</strong></td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). <td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td><strong>String</strong></td>
</tr>
<tr>
<td><strong>imageContentSources.mirrors</strong></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><strong>publish</strong></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <strong>publish</strong> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
### sshKey

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

---

#### 5.6.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 5.8. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platfrom.azur.osDisk.diskSizeGB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The minimum supported disk size is <strong>1024</strong>.</td>
</tr>
<tr>
<td><code>platform.azure.baseDomainResourceGroupName</code></td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example <strong>production_cluster</strong>.</td>
</tr>
<tr>
<td><code>platform.azure.resourceGroupName</code></td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example <strong>existing_resource_group</strong>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;]</td>
</tr>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
<tr>
<td>platform.azure.computeSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
<tr>
<td>platform.azure.cloudName</td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.</td>
<td>Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.
5.6.5.2. Sample customized `install-config.yaml` file for Azure

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        type: Standard_D8s_v3
      replicas: 3
  compute:
    - hyperthreading: Enabled
    - name: worker
      platform:
        azure:
          type: Standard_D2s_v3
          osDisk:
            diskSizeGB: 512
          zones:
            - "1"
            - "2"
            - "3"
      replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: centralus
    resourceGroupName: existing_resource_group
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
```
pullSecret: '{"auths": ...}'
fips: false
sshKey: ssh-ed25519 AAAA...

1. Required. The installation program prompts you for this value.
2. If you do not provide these parameters and values, the installation program provides the default value.

3. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

4. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

5. You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

6. Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

7. Specify the name of the resource group that contains the DNS zone for your base domain.

8. Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

9. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

10. You can optionally provide the sshKey value that you use to access the machines in your cluster.
NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

5.6.6. Network configuration phases
There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1
You can customize the following network-related fields in the install-config.yaml file before you create the manifest files:

- networking.networkType
- networking.clusterNetwork
- networking.serviceNetwork
- networking.machineNetwork

For more information on these fields, refer to Installation configuration parameters.

NOTE
Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

Phase 2
After creating the manifest files by running openshift-install create manifests, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the install-config.yaml file during phase 2. However, you can further customize the cluster network provider during phase 2.

5.6.7. Specifying advanced network configuration
You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

IMPORTANT
Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

Prerequisites
- You have created the install-config.yaml file and completed any modifications to it.
Procedure

1. Change to the directory that contains the installation program and create the manifests:

   $ ./openshift-install create manifests --dir=<installation_directory>  

   <installation_directory> specifies the name of the directory that contains the install-config.yaml file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named cluster-network-03-config.yml in the <installation_directory>/manifests/ directory:

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       openshiftSDNConfig:
         vxlanPort: 4800
   ```

3. Specify the advanced network configuration for your cluster in the cluster-network-03-config.yml file, such as in the following examples:

   **Specify a different VXLAN port for the OpenShift SDN network provider**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       openshiftSDNConfig:
         vxlanPort: 4800
   ```

   **Enable IPsec for the OVN-Kubernetes network provider**

   ```yaml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
     defaultNetwork:
       ovnKubernetesConfig:
         ipsecConfig: {}
   ```

4. Optional: Back up the manifests/cluster-network-03-config.yml file. The installation program consumes the manifests/ directory when you create the Ignition config files.

5.6.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named cluster. The CR specifies the fields for the Network API in the operator.openshift.io API group.
The CNO configuration inherits the following fields during cluster installation from the Network API in the Network.config.openshift.io API group and these fields cannot be changed:

**clusterNetwork**
- IP address pools from which pod IP addresses are allocated.

**serviceNetwork**
- IP address pool for services.

**defaultNetwork.type**
- Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`.

### 5.6.8.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <code>cluster</code>.</td>
</tr>
<tr>
<td>spec.clusterNetwork</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td>spec:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>clusterNetwork</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- cidr:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- hostPrefix:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>spec.serviceNetwork</td>
<td>array</td>
<td>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</td>
</tr>
<tr>
<td>spec:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>serviceNetwork</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- cidr:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- hostPrefix:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can customize this field only in the `install-config.yaml` file before you create the manifests. The value is read-only in the manifest file.
spec.defaultNetwork object configuration
The values for the `defaultNetwork` object are defined in the following table:

**Table 5.10. defaultNetwork object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</td>
</tr>
<tr>
<td>openshiftSDNConfig</td>
<td>object</td>
<td>This object is only valid for the OpenShift SDN cluster network provider.</td>
</tr>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

Configuration for the OpenShift SDN CNI cluster network provider
The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 5.11. openshiftSDNConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is <strong>NetworkPolicy</strong>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>Field</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>vxlanPort</td>
<td>integer</td>
<td>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation. If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number. On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</td>
</tr>
</tbody>
</table>

Example OpenShift SDN configuration

```yaml

defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 5.12. ovnKubernetesConfig object
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>integer</td>
<td>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU. If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes. If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>genevePort</td>
<td>integer</td>
<td>The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>ipsecConfig</td>
<td>object</td>
<td>Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.</td>
</tr>
<tr>
<td>policyAuditConfig</td>
<td>object</td>
<td>Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.</td>
</tr>
</tbody>
</table>

Table 5.13. `policyAuditConfig` object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50MB.</td>
</tr>
</tbody>
</table>
One of the following additional audit log targets:

- **libc**
  The libc `syslog()` function of the journald process on the host.

- **udp:<host>:<port>**
  A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.

- **unix:<file>**
  A Unix Domain Socket file specified by `<file>`.

- **null**
  Do not send the audit logs to any additional target.

**syslogFacility**

The syslog facility, such as `kern`, as defined by RFC5424. The default value is `local0`.

### Example OVN-Kubernetes configuration

```yaml
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

**kubeProxyConfig object configuration**

The values for the `kubeProxyConfig` object are defined in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>iptablesSyncPeriod</code></td>
<td>string</td>
<td>The refresh period for <code>iptables</code> rules. The default value is <code>30s</code>. Valid suffixes include <code>s</code>, <code>m</code>, and <code>h</code> and are described in the <a href="https://golang.org/pkg/time/">Go time package documentation</a>.</td>
</tr>
</tbody>
</table>

**NOTE**

Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the `iptablesSyncPeriod` parameter is no longer necessary.
### 5.6.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

**IMPORTANT**

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

**Prerequisites**

- You defined `OVNKubernetes` for the `networking.networkType` parameter in the `install-config.yaml` file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```bash
   $ ./openshift-install create manifests --dir=<installation_directory>
   ```
   
   where:

   `<installation_directory>`

   Specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `cluster-network-03-config.yml` in the `<installation_directory>/manifests/` directory:

   ```bash
   $ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
   apiVersion: operator.openshift.io/v1
   kind: Network
   metadata:
     name: cluster
   spec:
   EOF
   ```

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxyArguments.iptables-min-sync-period</td>
<td>array</td>
<td>The minimum duration before refreshing <code>iptables</code> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <code>s</code>, <code>m</code>, and <code>h</code> and are described in the <code>Go time</code> package. The default value is:</td>
</tr>
</tbody>
</table>

```
kubeProxyConfig:
  proxyArguments:
    iptables-min-sync-period:
      - 0s
```
where:

<installation_directory>

Specifies the directory name that contains the manifests/ directory for your cluster.

3. Open the cluster-network-03-config.yml file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

**Specify a hybrid networking configuration**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
defaultNetwork:
ovnKubernetesConfig:
hybridOverlayConfig:
  hybridClusterNetwork: 1
  - cidr: 10.132.0.0/14
    hostPrefix: 23
  hybridOverlayVXLANPort: 9898 2
```

1. Specify the CIDR configuration used for nodes on the additional overlay network. The hybridClusterNetwork CIDR cannot overlap with the clusterNetwork CIDR.

2. Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default 4789 port. For more information on this requirement, see the Microsoft documentation on Pod-to-pod connectivity between hosts is broken.

**NOTE**

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom hybridOverlayVXLANPort value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the cluster-network-03-config.yml file and quit the text editor.

5. Optional: Back up the manifests/cluster-network-03-config.yml file. The installation program deletes the manifests/ directory when creating the cluster.

### 5.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.
Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**
The cluster access and credential information also outputs to 
`<installation_directory>/openshift_install.log` when an installation succeeds.
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.
Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:> path
   ```

After you install the CLI, it is available using the oc command:

```
C:> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```

5.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

```
$ oc whoami
```

**Example output**

```
system:admin
```

### 5.6.13. Next steps

- Customize your cluster.

- If necessary, you can opt out of remote health reporting.

### 5.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

In OpenShift Container Platform version 4.8, you can install a cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

#### 5.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.

- You read the documentation on selecting a cluster installation method and preparing it for users.

- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

#### 5.7.2. About reusing a VNet for your OpenShift Container Platform cluster
In OpenShift Container Platform 4.8, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

**IMPORTANT**

The use of an existing VNet requires the use of the updated Azure Private DNS (preview) feature. See [Announcing Preview Refresh for Azure DNS Private Zones](#) for more information about the limitations of this feature.

### 5.7.2.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.

- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide two private subnets, one for the control plane machines and one for the compute machines.

- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

### 5.7.2.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

**Table 5.15. Required ports**

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows communication to the machine config server</td>
<td></td>
<td>x</td>
</tr>
</tbody>
</table>

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### 5.7.2.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application
resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

5.7.2.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

5.7.3. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

5.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.
IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

   ```
   $ eval "$(ssh-agent -s)"
   ```

Example output
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the **ssh-agent**:

   ```bash
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 5.7.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   $ tar xvf openshift-install-linux.tar.gz

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the install-config.yaml file.

   a. Change to the directory that contains the installation program and run the following command:

      $ ./openshift-install create install-config --dir=<installation_directory>  

      For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

      **IMPORTANT**

      Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      **NOTE**

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

      ii. Select azure as the platform to target.
iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

- **azure subscription id** The subscription ID to use for the cluster. Specify the `id` value in your account output.
- **azure tenant id** The tenant ID. Specify the `tenantId` value in your account output.
- **azure service principal client id** The value of the `appId` parameter for the service principal.
- **azure service principal client secret** The value of the `password` parameter for the service principal.

iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.

vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.
NOTE

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the ovirt-config.yaml file and the install-config.yaml file. If they do not appear, add them as follows:

1. In the ~/.ovirt/ovirt-config.yaml file:

   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----

2. In the install-config.yaml file:

   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.

IMPORTANT

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the install-config.yaml installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the install-config.yaml file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the install-config.yaml file.

IMPORTANT

The openshift-install command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.7.6.1.1. Required configuration parameters
Required installation configuration parameters are described in the following table:

### Table 5.16. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>, <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### pullSecret

Get a pull secret from https://cloud.redhat.com/openshift/install/pull-secret to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

---

5.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.17. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the networking object after installation.</td>
</tr>
<tr>
<td>networking.network.Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
|                            | The default value is **10.128.0.0/14** with a host prefix of /23. | networking:
|                            | If you specify multiple IP address blocks, the blocks must not overlap. |        |
|                            |                                                  | clusterNetwork:
|                            |                                                  | - cidr: 10.128.0.0/14
<p>|                            |                                                  |  hostPrefix: 23                          |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block. An IPv4 network.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: machineNetwork: - cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
</tbody>
</table>

### 5.7.6.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.18. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following “Machine-pool” table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>aws</code>, <code>azure</code>, <code>gcp</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>, or <code>{}</code></td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (“”).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference content*. 
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you are using Azure File storage, you cannot enable FIPS mode.</td>
<td></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td><strong>String</strong></td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <strong>publish</strong> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
### Parameter: `sshKey`

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```yaml
sshKey:
  <key1>
  <key2>
  <key3>
```

---

5.7.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 5.19. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platform.azure.osDisk.diskSizeGB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The minimum supported disk size is 1024.</td>
</tr>
<tr>
<td><code>platform.azure.baseDomainResourceGroupName</code></td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example <code>production_cluster</code>.</td>
</tr>
<tr>
<td><code>platform.azure.resourceGroupName</code></td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example <code>existing_resource_group</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>

<tr>
<td>platform.azure.cloudName</td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.</td>
<td>Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

5.7.6.2. Sample customized install-config.yaml file for Azure
You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane: 
  hyperthreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        type: Standard_D8s_v3
      replicas: 3
    compute: 
      - hyperthreading: Enabled
        name: worker
        platform:
          azure:
            type: Standard_D2s_v3
            osDisk:
              diskSizeGB: 512
            zones: 
              - "1"
              - "2"
              - "3"
          replicas: 5
        metadata:
          name: test-cluster
  networking:
    clusterNetwork:
      - cidr: 10.128.0.0/14
        hostPrefix: 23
      machineNetwork:
        - cidr: 10.0.0.0/16
        networkType: OpenShiftSDN
      serviceNetwork:
        - 172.30.0.0/16
    platform:
      azure:
        baseDomainResourceGroupName: resource_group
        region: centralus
        resourceGroupName: existing_resource_group
        networkResourceGroupName: vnet_resource_group
        virtualNetwork: vnet
        controlPlaneSubnet: control Plane_subnet
        computeSubnet: compute_subnet
        outboundType: Loadbalancer
```
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.
IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

5.7.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
```
proxy:
httpProxy: http://<username>:<pswd>@<ip>:<port> 1
httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
noProxy: example.com 3
additionalTrustBundle: <-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
... 4

1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme
must be http. If you use an MITM transparent proxy network that does not require
additional proxy configuration but requires additional CAs, you must not specify an
httpProxy value.

2 A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not
specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an
MITM transparent proxy network that does not require additional proxy configuration but
requires additional CAs, you must not specify an httpsProxy value.

3 A comma-separated list of destination domain names, IP addresses, or other network
CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For
example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all
destinations.

4 If provided, the installation program generates a config map that is named user-ca-bundle
in the openshift-config namespace that contains one or more additional CA certificates
that are required for proxying HTTPS connections. The Cluster Network Operator then
creates a trusted-ca-bundle config map that merges these contents with the Red Hat
Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the
trustedCA field of the Proxy object. The additionalTrustBundle field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If
you use an MITM transparent proxy network that does not require additional proxy
configuration but requires additional CAs, you must provide the MITM CA certificate.

NOTE
The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings
in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still
created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be
created.

5.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT

You can run the create cluster command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the location of your customized `.install-config.yaml` file.

   2 To view different installation details, specify warn, debug, or error instead of info.

   NOTE
   
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the kubeadmin user, display in your terminal.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.

   To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.
Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

   After you install the CLI, it is available using the oc command:

   ```
   C:\> oc <command>
   ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```

5.7.9. Logging in to the cluster by using the CLI
You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
You installed the `oc` CLI.

Procedure

1. Export the `kubeadmin` credentials:
   
   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   
   1
   ```
   
   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   
   Example output
   
   system:admin
   ```

5.7.10. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

5.8. INSTALLING A PRIVATE CLUSTER ON AZURE

In OpenShift Container Platform version 4.8, you can install a private cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

5.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

5.8.2. Private clusters
You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the Internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.8.2.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster’s private DNS records. The cluster’s machines use \texttt{168.63.129.16} internally for DNS resolution. For more information, see \texttt{What is Azure Private DNS?} and \texttt{What is IP address 168.63.129.16?} in the Azure documentation.

The cluster still requires access to Internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A \texttt{BaseDomainResourceGroup}, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.8.2.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

5.8.2.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the Internet. This allows you to skip the creation of public IP addresses and the public load balancer.
You can configure user-defined routing by modifying parameters in the `install-config.yaml` file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the Internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the Internet is possible to pull container images, unless using an internal registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the Configuring your firewall section.

There are several pre-existing networking setups that are supported for Internet access using user-defined routing.

**Private cluster with network address translation**

You can use Azure VNET network address translation (NAT) to provide outbound Internet access for the subnets in your cluster. You can reference Create a NAT gateway using Azure CLI in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with Azure Firewall**

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about providing user-defined routing with Azure Firewall in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with a proxy configuration**

You can use a proxy with user-defined routing to allow egress to the Internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with `0.0.0.0/0` populated automatically by Azure, all Azure API requests are routed over Azure’s internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

**Private cluster with no Internet access**

You can have VNets with no access to the Internet if your cluster has access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs
With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

### 5.8.3. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

![IMPORTANT]

The use of an existing VNet requires the use of the updated Azure Private DNS (preview) feature. See [Announcing Preview Refresh for Azure DNS Private Zones](#) for more information about the limitations of this feature.

### 5.8.3.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.
To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

5.8.3.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

**Table 5.20. Required ports**

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>22623</td>
<td>Allows communication to the machine config server</td>
<td></td>
<td>x</td>
</tr>
</tbody>
</table>

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

5.8.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.
The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

5.8.3.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

5.8.4. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

5.8.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.
If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ eval "$(ssh-agent -s)"
   Example output
   Agent pid 31874
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

   **Example output**

   ```bash
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

5.8.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.
Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar xvf openshift-install-linux.tar.gz
   ```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.8.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the Internet, you must manually generate your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`. 
NOTE

For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.8.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

IMPORTANT

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.8.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.21. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the &lt;metadata.name&gt;.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource ObjectMeta, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}.{{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, openstack, ovirt, vsphere. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auths&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;cloud.openshift.com&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;quay.io&quot;:{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;auth&quot;:&quot;b3Blb=&quot;,</td>

<td>&quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>
5.8.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.22. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.network_type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NOTE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

### 5.8.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool” table.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>aws, azure, gcp, openstack, ovirt, vsphere, or{}</code></td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td><strong>controlPlane.architecture</strong></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <strong>amd64</strong> (the default).</td>
<td>String</td>
</tr>
<tr>
<td><strong>controlPlane.hypertreading</strong></td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hypertreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. <strong>IMPORTANT</strong> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td><strong>Enabled</strong> or <strong>Disabled</strong></td>
</tr>
<tr>
<td><strong>controlPlane.name</strong></td>
<td>Required if you use <strong>controlPlane</strong>. The name of the machine pool.</td>
<td><strong>master</strong></td>
</tr>
<tr>
<td><strong>controlPlane.platform</strong></td>
<td>Required if you use <strong>controlPlane</strong>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <strong>compute.platform</strong> parameter value.</td>
<td><strong>aws</strong>, <strong>azure</strong>, <strong>gcp</strong>, <strong>openstack</strong>, <strong>ovirt</strong>, <strong>vsphere</strong>, or **{}``</td>
</tr>
<tr>
<td><strong>controlPlane.replicas</strong></td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is <strong>3</strong>, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| credentialsMode      | The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported. | **NOTE**
Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content. |
<p>| fips                 | Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead. | <strong>false</strong> or <strong>true</strong>                                        |
| imageContentSources  | Sources and repositories for the release-image content.                                                                                                                                                     | <strong>Array of objects.</strong> Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><code>imageContentSources.mirrors</code></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><code>publish</code></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
<tr>
<td><code>sshKey</code></td>
<td>The SSH key or keys to authenticate access your cluster machines.</td>
<td>One or more keys. For example:</td>
</tr>
</tbody>
</table>

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

### 5.8.7.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 5.24. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platform.azure.osDisk.diskSizeGB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The minimum supported disk size is 1024.</td>
</tr>
<tr>
<td><code>platform.azure.baseDomainResourceGroupName</code></td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example <code>production_cluster</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>platform.azure.resourceGroupName</td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example existing_resource_group.</td>
</tr>
<tr>
<td>platform.azure.outboundType</td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td>LoadBalancer or UserDefinedRouting. The default is LoadBalancer.</td>
</tr>
<tr>
<td>platform.azure.region</td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as centralus.</td>
</tr>
<tr>
<td>platform.azure.zone</td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example [&quot;1&quot;, &quot;2&quot;, &quot;3&quot;].</td>
</tr>
<tr>
<td>platform.azure.networkResourceGroupName</td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the platform.azure.baseDomainResourceGroupName.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.virtualNetwork</td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.azure.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example 10.0.0.0/16.</td>
</tr>
</tbody>
</table>
The name of the existing subnet in your VNet that you want to deploy your compute machines to.

Valid CIDR, for example 10.0.0.0/16.

The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value AzurePublicCloud is used.

Any valid cloud environment, such as AzurePublicCloud or AzureUSGovernmentCloud.

NOTE

You cannot customize Azure Availability Zones or Use tags to organize your Azure resources with an Azure cluster.

5.8.7.2. Sample customized install-config.yaml file for Azure

You can customize the install-config.yaml file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        type: Standard_D8s_v3
      replicas: 3
  compute:
    - hyperthreading: Enabled
      name: worker
      platform:
        azure:
          type: Standard_D2s_v3
          osDisk:
            diskSizeGB: 512
          zones:
            - "1"
            - "2"
            - "3"
```

CHAPTER 5. INSTALLING ON AZURE
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, `-`, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as Standard_D8s_v3, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.
Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the Internet. The default value is `External`.

5.8.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to
bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
    ...
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an **httpProxy** value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then **httpProxy** is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an **httpsProxy** value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat
Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

## 5.8.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the create cluster command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \ 1
   --log-level=info 2
   ```

   1. For <installation_directory>, specify the
   2. To view different installation details, specify warn, debug, or error instead of info.
NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

Example output

```
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.8.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of `oc`.
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.

4. Unpack the archive:

   `$ tar xvzf <file>`

5. Place the **oc** binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   `$ echo $PATH`

After you install the CLI, it is available using the **oc** command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.

   To check your **PATH**, open the command prompt and execute the following command:

   `C:\> path`

After you install the CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

$ oc <command>

5.8.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   $ oc whoami

   **Example output**

   system:admin

5.8.11. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.8, you can install a cluster on Microsoft Azure into a government region. To configure the government region, you modify parameters in the install-config.yaml file before you install the cluster.

5.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster and determined the tested and validated government region to deploy the cluster to.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

5.9.2. Azure government regions

OpenShift Container Platform supports deploying a cluster to Microsoft Azure Government (MAG) regions. MAG is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure. MAG is composed of government-only data center regions, all granted an Impact Level 5 Provisional Authorization.

Installing to a MAG region requires manually configuring the Azure Government dedicated cloud instance and region in the install-config.yaml file. You must also update your service principal to reference the appropriate government environment.

**NOTE**

The Azure government region cannot be selected using the guided terminal prompts from the installation program. You must define the region manually in the install-config.yaml file. Remember to also set the dedicated cloud instance, like AzureUSGovernmentCloud, based on the region specified.

5.9.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the Internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.
To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

5.9.3.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster’s private DNS records. The cluster’s machines use 168.63.129.16 internally for DNS resolution. For more information, see What is Azure Private DNS? and What is IP address 168.63.129.16? in the Azure documentation.

The cluster still requires access to Internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A BaseDomainResourceGroup, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

5.9.3.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

5.9.3.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the Internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the install-config.yaml file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the Internet.
- Public IPs for the public load balancer.
• Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

• Egress to the Internet is possible to pull container images, unless using an internal registry mirror.

• The cluster can access Azure APIs.

• Various allowlist endpoints are configured. You can reference these endpoints in the Configuring your firewall section.

There are several pre-existing networking setups that are supported for Internet access using user-defined routing.

**Private cluster with network address translation**

You can use Azure VNET network address translation (NAT) to provide outbound Internet access for the subnets in your cluster. You can reference Create a NAT gateway using Azure CLI in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with Azure Firewall**

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about providing user-defined routing with Azure Firewall in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

**Private cluster with a proxy configuration**

You can use a proxy with user-defined routing to allow egress to the Internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with 0.0.0.0/0 populated automatically by Azure, all Azure API requests are routed over Azure’s internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

**Private cluster with no Internet access**

You can have VNets with no access to the Internet if your cluster has access to the following:

• An internal registry mirror that allows for pulling container images

• Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

**5.9.4. About reusing a VNet for your OpenShift Container Platform cluster**

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.
By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

**IMPORTANT**

The use of an existing VNet requires the use of the updated Azure Private DNS (preview) feature. See [Announcing Preview Refresh for Azure DNS Private Zones](#) for more information about the limitations of this feature.

### 5.9.4.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICs for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet’s CIDR block must contain the `Networking.MachineCIDR` range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide two private subnets, one for the control plane machines and one for the compute machines.
The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

5.9.4.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.25. Required ports

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
<th>Control plane</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>Allows HTTP traffic</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>443</td>
<td>Allows HTTPS traffic</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>6443</td>
<td>Allows communication to the control plane machines</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>22623</td>
<td>Allows communication to the machine config server</td>
<td></td>
<td>x</td>
</tr>
</tbody>
</table>

**NOTE**

Since cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

5.9.4.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.
5.9.4.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

5.9.5. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

5.9.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.
IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `/openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$(ssh-agent -s)"
   ```

   Example output
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name>  \(\text{1}\)
   ``

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

   **Example output**

   ```none
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.9.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.
4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.9.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure into a government region, you must manually generate your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

**NOTE**

You must name this configuration file `install-config.yaml`.

**NOTE**

For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.
IMPORTANT

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

5.9.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the `install-config.yaml` file.

IMPORTANT

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

5.9.8.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.26. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>.&lt;baseDomain&gt; format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <strong>ObjectMeta</strong>, from which only the <strong>name</strong> parameter is consumed.</td>
<td>Object</td>
</tr>
</tbody>
</table>
| metadata.name  | The name of the cluster. DNS records for the cluster are all subdomains of **{{.metadata.name}}.**  
|                | **{{.baseDomain}}**.                                                          | String of lowercase letters, hyphens (-), and periods (.), such as dev.                    |
| platform       | The configuration for the specific platform upon which to perform the installation: **aws**,  
|                | **baremetal**, **azure**, **openstack**, **ovirt**, **vsphere**. For additional information about **platform.<platform>** parameters, consult the table for your specific platform that follows. | Object                                                                                   |
| pullSecret     | Get a pull secret from [https://cloud.redhat.com/openshift/install/pull-secret](https://cloud.redhat.com/openshift/install/pull-secret) to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io. | {  
|                |   "auths":{                                                             |   "cloud.openshift.com":{                                                             |
|                |     "auth":"b3Blb=",                                                 |     "email":"you@example.com"                                                        |
|                |     "email":"you@example.com"                                         |   },  
|                |   "quay.io":{                                                           |   "auth":"b3Blb=",                                                                |
|                |     "email":"you@example.com"                                         |   }  
|                | }                                                                        | }                                                                                         |
|                |                                                                          |                                                                          |

### 5.9.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.27. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>

<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>- cidr: 10.0.0.0/16</strong></td>
</tr>
</tbody>
</table>
**networking.machinNetwork.cidr**

Required if you use `networking.machinNetwork`. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation.

For example, 10.0.0.0/16.

**NOTE**

Set the `networking.machinNetwork` to match the CIDR that the preferred NIC resides in.

---

### 5.9.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.28. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute.hyperthreading</code></td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td><code>compute.name</code></td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td><code>compute.platform</code></td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td><code>compute.replicas</code></td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td><code>controlPlane</code></td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><code>controlPlane.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hypertreading</strong>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use <strong>controlPlane</strong>. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use <strong>controlPlane</strong>. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <strong>compute.platform</strong> parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <code>false</code> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><code>Internal</code> or <code>External</code>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <code>Internal</code>. The default value is <code>External</code>.</td>
</tr>
</tbody>
</table>
The SSH key or keys to authenticate access your cluster machines.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sshKey</code></td>
<td>The SSH key or keys to authenticate access your</td>
<td>One or more keys. For example:</td>
</tr>
<tr>
<td></td>
<td>cluster machines.</td>
<td><code>sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</code></td>
</tr>
</tbody>
</table>

### 5.9.8.14. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

**Table 5.29. Additional Azure parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controlPlane.platform.azure.osDisk.diskSizeGB</code></td>
<td>The Azure disk size for the VM.</td>
<td>Integer that represents the size of the disk in GB. The minimum supported disk size is 1024.</td>
</tr>
<tr>
<td><code>platform.azure.baseDomainResourceGroupName</code></td>
<td>The name of the resource group that contains the DNS zone for your base domain.</td>
<td>String, for example <code>production_cluster</code>.</td>
</tr>
<tr>
<td><code>platform.azure.resourceGroupName</code></td>
<td>The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.</td>
<td>String, for example <code>existing_resource_group</code>.</td>
</tr>
</tbody>
</table>
### Parameter Description Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>platform.azure.outboundType</strong></td>
<td>The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.</td>
<td><strong>LoadBalancer</strong> or <strong>UserDefinedRouting</strong>. The default is <strong>LoadBalancer</strong>.</td>
</tr>
<tr>
<td><strong>platform.azure.region</strong></td>
<td>The name of the Azure region that hosts your cluster.</td>
<td>Any valid region name, such as <strong>centralus</strong>.</td>
</tr>
<tr>
<td><strong>platform.azure.zone</strong></td>
<td>List of availability zones to place machines in. For high availability, specify at least two zones.</td>
<td>List of zones, for example <code>[&quot;1&quot;, &quot;2&quot;, &quot;3&quot;]</code>.</td>
</tr>
<tr>
<td><strong>platform.azure.networkResourceGroupName</strong></td>
<td>The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <strong>platform.azure.baseDomainResourceGroupName</strong>.</td>
<td>String.</td>
</tr>
<tr>
<td><strong>platform.azure.virtualNetwork</strong></td>
<td>The name of the existing VNet that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td><strong>platform.azure.controlPlaneSubnet</strong></td>
<td>The name of the existing subnet in your VNet that you want to deploy your control plane machines to.</td>
<td>Valid CIDR, for example <strong>10.0.0.0/16</strong>.</td>
</tr>
<tr>
<td><strong>platform.azure.computeSubnet</strong></td>
<td>The name of the existing subnet in your VNet that you want to deploy your compute machines to.</td>
<td>Valid CIDR, for example <strong>10.0.0.0/16</strong>.</td>
</tr>
<tr>
<td><strong>platform.azure.cloudName</strong></td>
<td>The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <strong>AzurePublicCloud</strong> is used.</td>
<td>Any valid cloud environment, such as <strong>AzurePublicCloud</strong> or <strong>AzureUSGovernmentCloud</strong>.</td>
</tr>
</tbody>
</table>

**NOTE**

You cannot customize **Azure Availability Zones** or **Use tags to organize your Azure resources** with an Azure cluster.
5.9.8.2. Sample customized install-config.yaml file for Azure

You can customize the install-config.yaml file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your install-config.yaml file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hypethreading: Enabled
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024
        type: Standard_D8s_v3
      replicas: 3
compute:
  - hypethreading: Enabled
    name: worker
    platform:
      azure:
        type: Standard_D2s_v3
        osDisk:
          diskSizeGB: 512
      zones:
        - "1"
        - "2"
        - "3"
      replicas: 5
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group
    region: usgovvirginia
    resourceGroupName: existing_resource_group
    networkResourceGroupName: vnet_resource_group
    virtualNetwork: vnet
  controlPlaneSubnet: control_plane_subnet
```
Required.

If you do not provide these parameters and values, the installation program provides the default value.

The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, `-`, and the first line of the **controlPlane** section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard_D8s_v3**, for your machines if you disable simultaneous multithreading.

You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes (also known as the master nodes) is 1024 GB.

Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

Specify the name of the resource group that contains the DNS zone for your base domain.

Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

If you use an existing VNet, specify the name of the resource group that contains it.

If you use an existing VNet, specify its name.

If you use an existing VNet, specify the name of the subnet to host the control plane machines.

If you use an existing VNet, specify the name of the subnet to host the compute machines.

You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

Specify the name of the Azure cloud environment to deploy your cluster to. Set **AzureUSGovernmentCloud** to deploy to a Microsoft Azure Government (MAG) region. The
AzureUSGovernmentCloud to deploy to a Microsoft Azure Government (MAG) region. The default value is AzurePublicCloud.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

**NOTE**
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

How to publish the user-facing endpoints of your cluster. Set publish to Internal to deploy a private cluster, which cannot be accessed from the Internet. The default value is External.

5.9.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the install-config.yaml file.

Prerequisites

- You have an existing install-config.yaml file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s spec.noProxy field to bypass the proxy if necessary.

**NOTE**
The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com.
endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
  noProxy: example.com
additionalTrustBundle:
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpProxy` value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then `httpProxy` is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpsProxy` value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a `trusted-ca-bundle` config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the `trustedCA` field of the `Proxy` object. The `additionalTrustBundle` field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.
The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.9.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir=<installation_directory> \  
   --log-level=info
   ```

   **1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
```
NOTE
The cluster access and credential information also outputs to <installation_directory>/openshift_install.log when an installation succeeds.

IMPORTANT
The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT
You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

5.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT
If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux
You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:

   $ tar xvzf <file>
5. Place the `oc` binary in a directory that is on your PATH. To check your PATH, execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:

```
C:\> path
```

After you install the CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH. To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the `oc` command:
5.9.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

5.9.12. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

5.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster on Microsoft Azure by using infrastructure that you provide.

Several Azure Resource Manager (ARM) templates are provided to assist in completing these steps or to help model your own.
The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 5.10.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured an Azure account to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See Install the Azure CLI in the Azure documentation. The documentation below was last tested using version 2.2.0 of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

### 5.10.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.10.3. Configuring your Azure project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

---

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

---

### 5.10.3.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

---

**IMPORTANT**

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

---

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of components required by default</th>
<th>Default Azure limit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
A default cluster requires 40 vCPUs, so you must increase the account limit.

By default, each cluster creates the following instances:

- One bootstrap machine, which is removed after installation
- Three control plane machines
- Three compute machines

Because the bootstrap machine uses **Standard_D4s_v3** machines, which use 4 vCPUs, the control plane machines use **Standard_D8s_v3** virtual machines, which use 8 vCPUs, and the worker machines use **Standard_D4s_v3** virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.

To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.

By default, the installation program distributes control plane and compute machines across all availability zones within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

<table>
<thead>

### 5.10.3.2. Configuring a public DNS zone in Azure
To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

   **NOTE**

   For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.

3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.

   Use an appropriate root domain, such as `openshiftcorp.com`, or subdomain, such as `clusters.openshiftcorp.com`.

4. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain.

You can view Azure’s DNS solution by visiting this example for creating DNS zones.

### 5.10.3.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click **Help + support** in the lower left corner.

2. Click **New support request** and then select the required values:

   a. From the **Issue type** list, select **Service and subscription limits (quotas)**

   b. From the **Subscription** list, select the subscription to modify.

   c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.

   d. Click **Next: Solutions**.

3. On the **Problem Details** page, provide the required information for your quota increase:
a. Click **Provide details** and provide the required details in the **Quota details** window.

b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.

4. Click **Next: Review + create** and then click **Create**.

### 5.10.3.4. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The `kube-controller-manager` only approves the kubelet client CSRs. The `machine-approver` cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

### 5.10.3.5. Required Azure roles

Your Microsoft Azure account must have the following roles for the subscription that you use:

- **User Access Administrator**

To set roles on the Azure portal, see the Manage access to Azure resources using RBAC and the Azure portal in the Azure documentation.

### 5.10.3.6. Creating a service principal

Because OpenShift Container Platform and its installation program must create Microsoft Azure resources through Azure Resource Manager, you must create a service principal to represent it.

#### Prerequisites

- Install or update the Azure CLI.
- Install the `jq` package.
- Your Azure account has the required roles for the subscription that you use.

#### Procedure

1. Log in to the Azure CLI:
   ```bash
   $ az login
   ```
   Log in to Azure in the web console by using your credentials.

2. If your Azure account uses subscriptions, ensure that you are using the right subscription.
   a. View the list of available accounts and record the `tenantId` value for the subscription you want to use for your cluster:
   ```bash
   $ az account list --refresh
   ```
   **Example output**
b. View your active account details and confirm that the `tenantId` value matches the subscription you want to use:

```
$ az account show
```

**Example output**

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-de3f6b6a8ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

Ensure that the value of the `tenantId` parameter is the UUID of the correct subscription.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <id>  
```

Substitute the value of the `id` for the subscription that you want to use for `<id>`.

d. If you changed the active subscription, display your account information again:

```
$ az account show
```

**Example output**

```
{
```

```
3. Record the values of the **tenantId** and **id** parameters from the previous output. You need these values during OpenShift Container Platform installation.

4. Create the service principal for your account:

   ```bash
   $ az ad sp create-for-rbac --role Contributor --name <service_principal>
   ``

   Replace `<service_principal>` with the name to assign to the service principal.

   **Example output**

   ```json
   {
     "appId": "8bd0d04d-0ac2-43a8-928d-705c598c6956",
     "displayName": "<service_principal>",
     "name": "http://<service_principal>",
     "password": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
     "tenant": "6048c7e9-b2ad-488d-a54e-dc3f6be6a7ee"
   }
   ``

5. Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.

6. Grant additional permissions to the service principal.

   - You must always add the **Contributor** and **User Access Administrator** roles to the app registration service principal so the cluster can assign credentials for its components.

   - To operate the Cloud Credential Operator (CCO) in **mint mode**, the app registration service principal also requires the **Azure Active Directory Graph/Application.ReadWrite.OwnedBy** API permission.

   - To operate the CCO in **passthrough mode**, the app registration service principal does not require additional API permissions.

   For more information about CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
NOTE
If you limit the service principal scope of the OpenShift Container Platform installation program to an already existing Azure resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying a cluster using the installation program deletes this resource group.

a. To assign the User Access Administrator role, run the following command:

```
$ az role assignment create --role "User Access Administrator" \  
--assignee-object-id $(az ad sp list --filter "appld eq '<appld>'" \  
| jq '.[0].objectId' -r)
```

Replace `<appld>` with the `appld` parameter value for your service principal.

b. To assign the Azure Active Directory Graph permission, run the following command:

```
$ az ad app permission add --id <appld> \  
--api 00000002-0000-0000-c000-000000000000 \  
--api-permissions 824c81eb-e3f8-4ee6-8f6d-de7f50d565b7=Role
```

Replace `<appld>` with the `appld` parameter value for your service principal.

Example output

```
Invoking "az ad app permission grant --id 46d33abc-b8a3-46d8-8c84-f0fd58177435 --api 00000002-0000-0000-c000-000000000000" is needed to make the change effective
```

For more information about the specific permissions that you grant with this command, see the GUID Table for Windows Azure Active Directory Permissions.

c. Approve the permissions request. If your account does not have the Azure Active Directory tenant administrator role, follow the guidelines for your organization to request that the tenant administrator approve your permissions request.

```
$ az ad app permission grant --id <appld> \  
--api 00000002-0000-0000-c000-000000000000
```

Replace `<appld>` with the `appld` parameter value for your service principal.

5.10.3.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription. The following Azure regions were tested and validated in OpenShift Container Platform version 4.6.1:

Supported Azure public regions

- **australiacentral** (Australia Central)
- australiaeast (Australia East)
- australiasoutheast (Australia South East)
- brazilsouth (Brazil South)
- canadacentral (Canada Central)
- canadaeast (Canada East)
- centralindia (Central India)
- centralus (Central US)
- eastasia (East Asia)
- eastus (East US)
- eastus2 (East US 2)
- francecentral (France Central)
- germanywestcentral (Germany West Central)
- japaneast (Japan East)
- japanwest (Japan West)
- koreacentral (Korea Central)
- koreasouth (Korea South)
- northcentralus (North Central US)
- northeurope (North Europe)
- norwayeast (Norway East)
- southafricanorth (South Africa North)
- southcentralus (South Central US)
- southeastasia (Southeast Asia)
- southindia (South India)
- switzerlandnorth (Switzerland North)
- uaenorth (UAE North)
- uksouth (UK South)
- ukwest (UK West)
- westcentralus (West Central US)
- westeurope (West Europe)
• **westindia** (West India)

• **westus** (West US)

• **westus2** (West US 2)

**Supported Azure Government regions**

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

• **usgovtexas** (US Gov Texas)

• **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the Azure documentation. Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 5.10.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar xvf openshift-install-linux.tar.gz
   ```
5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

5.10.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
```

Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```
For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

```bash
$ cat ~/.ssh/id_rsa.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```bash
$ eval "$(ssh-agent -s)"
```

**Example output**

Agent pid 31874

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

```bash
$ ssh-add <path>/<file_name>
```

Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

Identity added: `/home/<you>/<path>/<file_name> (<computer_name>)`

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

**5.10.6. Creating the installation files for Azure**

To install OpenShift Container Platform on Microsoft Azure using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `var` partition during the preparation phases of installation.

**5.10.6.1. Optional: Creating a separate /var partition**
It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the /var partition or a subdirectory of /var. For example:

- /var/lib/containers: Holds container-related content that can grow as more images and containers are added to a system.
- /var/lib/etcd: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- /var: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a /var directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because /var must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate /var partition by creating a machine config that is inserted during the openshift-install preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate /var partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Prerequisites**

- If container storage is on the root partition, ensure that this root partition is mounted with the pquota option by including rootflags=pquota in the GRUB command line.
- If the container storage is on a partition that is mounted by /etc/fstab, ensure that the following mount option is included in the /etc/fstab file:

  ```
  /dev/sdb1   /var   xfs defaults,pquota 0 0
  ```

- If the container storage is on a partition that is mounted by systemd, ensure that the MachineConfig object includes the following mount option as in this example:

  ```
  spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/sdb
        partitions:
          - label: var
          sizeMiB: 240000
          startMiB: 0
        filesystems:
          - device: /dev/disk/by-partlabel/var
  ```
Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```bash
   $ mkdir $HOME/clusterconfig
   ``

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   ```bash
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ? SSH Public Key ...
   $ ls $HOME/clusterconfig/openshift/
   99_kubeadmin-password-secret.yaml
   99_openshift-cluster-api_master-machines-0.yaml
   99_openshift-cluster-api_master-machines-1.yaml
   99_openshift-cluster-api_master-machines-2.yaml
   ...
   
   3. Create a `MachineConfig` object and add it to a file in the `openshift` directory. For example, name the file `98-var-partition.yaml`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This attaches storage to a separate `/var` directory.

   ```yaml
   apiVersion: machineconfiguration.openshift.io/v1
   kind: MachineConfig
   metadata:
     labels:
       machineconfiguration.openshift.io/role: worker
     name: 98-var-partition
   spec:
     config:
       ignition:
         version: 3.2.0
       storage:
         disks:
           - device: /dev/<device_name>  # 1
             partitions:
               - sizeMiB: <partition_size>
   ```
The storage device name of the disk that you want to partition.

When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

4. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth  bootstrap.ign  master.ign  metadata.json  worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

5.10.6.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir=<installation_directory>
```
For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select azure as the platform to target.

iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:

- `azure subscription id` The subscription ID to use for the cluster. Specify the `id` value in your account output.
- `azure tenant id` The tenant ID. Specify the `tenantId` value in your account output.
- `azure service principal client id` The value of the `appId` parameter for the service principal.
- `azure service principal client secret` The value of the `password` parameter for the service principal.

iv. Select the region to deploy the cluster to.

v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.

vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see Resolve reserved resource name errors in the Azure documentation.
vii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

2. In the `install-config.yaml` file:

   ```yaml
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

5.10.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.
The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> ①
     httpsProxy: https://<username>:<pswd>@<ip>:<port> ②
     noProxy: example.com ③
     additionalTrustBundle: |
       -----BEGIN CERTIFICATE-----
       <MY_TRUSTED_CA_CERT>
       -----END CERTIFICATE-----
   ...
   ```

   ① A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

   ② A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

   ③ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example,.y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

   ④ If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `Cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 5.10.6.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure.

**NOTE**

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Export common variables found in the `install-config.yaml` to be used by the provided ARM templates:

   ```bash
   $ export CLUSTER_NAME=<cluster_name>  
   $ export AZURE_REGION=<azure_region>  
   $ export SSH_KEY=<ssh_key>  
   $ export BASE_DOMAIN=<base_domain>  
   $ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group>  
   ```

   1. The value of the `.metadata.name` attribute from the `install-config.yaml` file.
   2. The region to deploy the cluster into, for example `centralus`. This is the value of the `.platform.azure.region` attribute from the `install-config.yaml` file.
   3. The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the `.sshKey` attribute from the `install-config.yaml` file.
The base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster. This is the value of the `.baseDomain` attribute from the `install-config.yaml` file.

The resource group where the public DNS zone exists. This is the value of the `.platform.azure.baseDomainResourceGroupName` attribute from the `install-config.yaml` file.

For example:

```bash
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster
```

2. Export the kubeadm credentials:

```bash
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

5.10.6.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program.
- You created the `install-config.yaml` installation configuration file.

**Procedure**
1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```bash
$ ./openshift-install create manifests --dir=<installation_directory>
```

**Example output**

```bash
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: install_dir/manifests and install_dir/openshift
```

For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```bash
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```bash
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```yaml
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
```
If you do so, you must add ingress DNS records manually in a later step.

6. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:

   a. Export the infrastructure ID by using the following command:

   ```
   $ export INFRA_ID=<infra_id>
   ```

   The OpenShift Container Platform cluster has been assigned an identifier (`INFRA_ID`) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the `.status.infrastructureName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

   b. Export the resource group by using the following command:

   ```
   $ export RESOURCE_GROUP=<resource_group>
   ```

   All resources created in this Azure deployment exists as part of a resource group. The resource group name is also based on the `INFRA_ID`, in the form of `<cluster_name>-<random_string>-rg`. This is the value of the `.status.platformStatus.azure.resourceGroupName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

7. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

   ```
   $ ./openshift-install create ignition-configs --dir=<installation_directory>
   ```

   For `<installation_directory>`, specify the same installation directory.

   Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

   ```
   ├── auth
   │   ├── kubeadmin-password
   │   └── kubeconfig
   ├── bootstrap.ign
   └── worker.ign
   ```
### Creating the Azure resource group and identity

You must create a Microsoft Azure **resource group** and an identity for that resource group. These are both used during the installation of your OpenShift Container Platform cluster on Azure.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Create the resource group in a supported Azure region:

   ```
   $ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
   ```

2. Create an Azure identity for the resource group:

   ```
   $ az identity create -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity
   ```

   This is used to grant the required access to Operators in your cluster. For example, this allows the Ingress Operator to create a public IP and its load balancer. You must assign the Azure identity to a role.

3. Grant the Contributor role to the Azure identity:

   a. Export the following variables required by the Azure role assignment:

      ```
      $ export PRINCIPAL_ID=`az identity show -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity --query principalId --out tsv`
      
      $ export RESOURCE_GROUP_ID=`az group show -g ${RESOURCE_GROUP} --query id --out tsv`
      ```

   b. Assign the Contributor role to the identity:

      ```
      $ az role assignment create --assignee "${PRINCIPAL_ID}" --role 'Contributor' --scope "${RESOURCE_GROUP_ID}"`
      ```

### Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally; therefore, you must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

```
1. Create an Azure storage account to store the VHD cluster image:

```
$ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
```

**WARNING**

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your `CLUSTER_NAME` variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see Resolve errors for storage account names in the Azure documentation.

2. Export the storage account key as an environment variable:

```
$ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query '[0].value' -o tsv`
```

3. Choose the RHCOS version to use and export the URL of its VHD to an environment variable:

```
$ export VHD_URL=`curl -s https://raw.githubusercontent.com/openshift/installer/release-4.8/data/data/rhcos.json | jq -r .azure.url`
```

**IMPORTANT**

The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Copy the chosen VHD to a blob:

```
$ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa
$ az storage blob copy start --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --destination-blob "rhcos.vhd" --destination-container vhd --source-uri "${VHD_URL}"
```

To track the progress of the VHD copy task, run this script:

```
status="unknown"
while [ "$status" != "success" ]
do
    status= az storage blob show --container-name vhd --name "rhcos.vhd" --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -o tsv --query
```

5. Create a blob storage container and upload the generated `bootstrap.ign` file:

```bash
$ az storage container create --name files --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --public-access blob

$ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"
```

### 5.10.9. Example for creating DNS zones

DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, *Azure’s DNS solution* is used, so you will create a new public DNS zone for external (internet) visibility and a private DNS zone for internal cluster resolution.

**NOTE**
The public DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the public DNS zone; be sure the installation config you generated earlier reflects that scenario.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Create the new public DNS zone in the resource group exported in the `BASE_DOMAIN_RESOURCE_GROUP` environment variable:

   ```bash
   $ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
   
   You can skip this step if you are using a public DNS zone that already exists.
   
2. Create the private DNS zone in the same resource group as the rest of this deployment:

   ```bash
   $ az network private-dns zone create -g ${RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
   
   You can learn more about configuring a public DNS zone in *Azure* by visiting that section.

### 5.10.10. Creating a VNet in Azure

You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform...
You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Copy the template from the ARM template for the VNet section of this topic and save it as `01_vnet.json` in your cluster’s installation directory. This template describes the VNet that your cluster requires.

2. Create the deployment by using the `az` CLI:
   
   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/01_vnet.json" \
   --parameters baseName="${INFRA_ID}"
   
   1 The base name to be used in resource names; this is usually the cluster’s infrastructure ID.
   ```

3. Link the VNet template to the private DNS zone:
   
   ```bash
   $ az network private-dns link vnet create -g ${RESOURCE_GROUP} -z 
   ${CLUSTER_NAME}.${BASE_DOMAIN} -n ${INFRA_ID}-network-link -v 
   "${INFRA_ID}-vnet" -e false
   ```

5.10.10.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

**Example 5.1. 01_vnet.json ARM template**

```json
{
   "$schema" : "https://schema.management.azure.com/schemas/2015-01- 
01/deploymentTemplate.json#",
   "contentVersion" : "1.0.0.0",
   "parameters" : {
   "baseName" : {
   "type" : "string",
   "minLength" : 1,
   "metadata" : {
```
"description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
}

"variables" : {
"location" : "[resourceGroup().location]",
"virtualNetworkName" : "{concat(parameters('baseName'), '-vnet')}",
"addressPrefix" : "10.0.0.0/16",
"masterSubnetName" : "{concat(parameters('baseName'), '-master-subnet')}",
"masterSubnetPrefix" : "10.0.0.0/24",
"nodeSubnetName" : "{concat(parameters('baseName'), '-worker-subnet')}",
"nodeSubnetPrefix" : "10.0.1.0/24",
"clusterNsgName" : "{concat(parameters('baseName'), '-nsg')}",
}

"resources" : [
{
  "apiVersion" : "2018-12-01",
  "type" : "Microsoft.Network/virtualNetworks",
  "name" : "{variables('virtualNetworkName')}",
  "location" : "{variables('location')}",
  "dependsOn" : [
    "{concat('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))}",
  ],
  "properties" : {
    "addressSpace" : {
      "addressPrefixes" : ["{variables('addressPrefix')}"],
    },
    "subnets" : [
      {"name" : "{variables('masterSubnetName')}"},
      "properties" : {
        "addressPrefix" : "{variables('masterSubnetPrefix')}",
        "serviceEndpoints" : [],
        "networkSecurityGroup" : {
          "id" : "[resourceId('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))]"
        }
      },
      {"name" : "{variables('nodeSubnetName')}"},
      "properties" : {
        "addressPrefix" : "{variables('nodeSubnetPrefix')}",
        "serviceEndpoints" : [],
        "networkSecurityGroup" : {
          "id" : "[resourceId('Microsoft.Network/networkSecurityGroups', variables('clusterNsgName'))]"
        }
      }
    ]
  }
}
5.10.11. Deploying the RHCOS cluster image for the Azure infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure for your OpenShift Container Platform nodes.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

Procedure

1. Copy the template from the ARM template for image storage section of this topic and save it as `02_storage.json` in your cluster’s installation directory. This template describes the image storage that your cluster requires.

2. Export the RHCOS VHD blob URL as a variable:

   ```bash
   $ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
   ``

3. Deploy the cluster image:
The blob URL of the RHCOS VHD to be used to create master and worker machines.

The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

5.10.11.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

Example 5.2. 02_storage.json ARM template

```json
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {
      "baseName": {
        "type": "string",
        "minLength": 1,
        "metadata": {
          "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
        }
      },
      "vhdBlobURL": {
        "type": "string",
        "metadata": {
          "description": "URL pointing to the blob where the VHD to be used to create master and worker machines is located"
        }
      }
    },
    "variables": {
      "location": "[resourceGroup().location]",
      "imageName": "[concat(parameters('baseName'), '-image')]"
    },
    "resources": [
      {
        "apiVersion": "2018-06-01",
        "type": "Microsoft.Compute/images",
        "name": "[variables('imageName')]",
        "location": "[variables('location')]",
        "properties": {
          "storageProfile": {
            "osDisk": {
              "osType": "Linux",
              "osState": "Generalized",
              "blobUri": "[parameters('vhdBlobURL')]",
              "storageAccountType": "Standard_LRS"
            }
          }
        }
      }
    ]
}
```
5.10.12. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in \textcolor{red}{\textit{initramfs}} during boot to fetch their Ignition config files.

5.10.12.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as \texttt{localhost} or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

5.10.12.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

\textbf{IMPORTANT}

In connected OpenShift Container Platform environments, all nodes are required to have Internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 5.30. Ports used for all-machine to all-machine communications

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Description</th>
</tr>

5.10.13. Creating networking and load balancing components in Azure

You must configure networking and load balancing in Microsoft Azure for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.

**Procedure**
1. Copy the template from the ARM template for the network and load balancers section of this topic and save it as `03_infra.json` in your cluster’s installation directory. This template describes the networking and load balancing objects that your cluster requires.

2. Create the deployment by using the `az` CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/03_infra.json" \
   --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASE_DOMAIN}" \
   --parameters baseName="${INFRA_ID}"
   ```

   1. The name of the private DNS zone.
   2. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

3. Create an `api` DNS record in the public zone for the API public load balancer. The `$(BASE_DOMAIN_RESOURCE_GROUP)` variable must point to the resource group where the public DNS zone exists.

   a. Export the following variable:

   ```bash
   $ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query 
   "[?name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
   ```

   b. Create the DNS record in a new public zone:

   ```bash
   $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
   ```

   c. If you are adding the cluster to an existing public zone, you can create the DNS record in it instead:

   ```bash
   $ az network dns record-set a add-record -g ${BASE_DOMAINRESOURCE_GROUP} -z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
   ```

5.10.13.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

Example 5.3. 03_infra.json ARM template

```json
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {
    "baseName": {
      "type": "string",
      "minLength": 1,
      "metadata": {
        "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
```
"privateDNSZoneName": {
  "type": "string",
  "metadata": {
    "description": "Name of the private DNS zone"
  }
},
"variables": {
  "location": "{resourceGroup().location}'",
  "virtualNetworkName": "{concat(parameters('baseName'), '-vnet')}'",
  "virtualNetworkID": "{resourceId('Microsoft.Network/virtualNetworks', variables('virtualNetworkName'))}'",
  "masterSubnetName": "{concat(parameters('baseName'), '-master-subnet')}'",
  "masterSubnetRef": "{concat(variables('virtualNetworkID'), '/subnets/', variables('masterSubnetName'))}'",
  "masterPublicIpAddressName": "{concat(parameters('baseName'), '-master-pip')}'",
  "masterPublicIpAddressID": "{resourceId('Microsoft.Network/publicIPAddresses', variables('masterPublicIpAddressName'))}'",
  "masterLoadBalancerName": "{concat(parameters('baseName'), '-public-lb')}'",
  "masterLoadBalancerID": "{resourceId('Microsoft.Network/loadBalancers', variables('masterLoadBalancerName'))}'",
  "internalLoadBalancerName": "{concat(parameters('baseName'), '-internal-lb')}'",
  "internalLoadBalancerID": "{resourceId('Microsoft.Network/loadBalancers', variables('internalLoadBalancerName'))}'",
  "skuName": "Standard"
},
"resources": [
  {
    "apiVersion": "2018-12-01",
    "type": "Microsoft.Network/publicIPAddresses",
    "name": "{variables('masterPublicIpAddressName')}'",
    "location": "{variables('location')}'",
    "sku": {
      "name": "{variables('skuName')}'
    },
    "properties": {
      "publicIPAddressAllocationMethod": "Static",
      "dnsSettings": {
        "domainNameLabel": "{variables('masterPublicIpAddressName')}'
      }
    }
  },
  {
    "apiVersion": "2018-12-01",
    "type": "Microsoft.Network/loadBalancers",
    "name": "{variables('masterLoadBalancerName')}'",
    "location": "{variables('location')}'",
    "sku": {
      "name": "{variables('skuName')}'
    },
    "dependsOn": [
      "{concat('Microsoft.Network/publicIPAddresses/', variables('masterPublicIpAddressName'))}'
    ],
    "properties": {
      "frontendIPConfigurations": [ 

```json
{
  "name": "public-lb-ip",
  "properties": {
    "publicIPAddress": {
      "id": "[variables('masterPublicIpAddressID')]"
    }
  }
},

}
5.10.14. Creating the bootstrap machine in Azure

You must create the bootstrap machine in Microsoft Azure to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

NOTE

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.

Procedure

1. Copy the template from the ARM template for the bootstrap machine section of this topic and save it as 04_bootstrap.json in your cluster’s installation directory. This template describes the bootstrap machine that your cluster requires.

2. Export the following variables required by the bootstrap machine deployment:

```json
{
  "apiVersion": "2018-09-01",
  "type": "Microsoft.Network/privateDns Zones/A",
  "name": "[concat(parameters('privateDNSZoneName'), '/api-int')]",
  "location": "[variables('location')]",
  "dependsOn": [
    "[concat('Microsoft.Network/loadBalancers/', variables('internalLoadBalancerName'))]]
},
"properties": {
  "ttl": 60,
  "aRecords": [
    {
      "ipv4Address": "[reference(variables('internalLoadBalancerName')).frontendIPConfigurations[0].properties.privateIPAddress]"
    }
  ]
}
}``
Create the deployment by using the `az` CLI:

```bash
$ export BOOTSTRAP_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -n "bootstrap.ign" -o tsv`
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d \n`
```

3. Create the deployment by using the `az` CLI:

```bash
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/04_bootstrap.json" \
--parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \
--parameters sshKeyData="${SSH_KEY}" \n--parameters baseName="${INFRA_ID}" 
```

1. The bootstrap Ignition content for the bootstrap cluster.
2. The SSH RSA public key file as a string.
3. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

5.10.14.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

**Example 5.4. 04_bootstrap.json ARM template**

```json
{
   "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
   "contentVersion": "1.0.0.0",
   "parameters": {
      "baseName": {
         "type": "string",
         "minLength": 1,
         "metadata": {
            "description": "Base name to be used in resource names (usually the cluster's Infra ID)"
         }
      },
      "bootstrapIgnition": {
         "type": "string",
         "minLength": 1,
         "metadata": {
            "description": "Bootstrap ignition content for the bootstrap cluster"
         }
      },
      "sshKeyData": {
         "type": "securestring",
         "metadata": {
            "description": "SSH RSA public key file as a string."
         }
      },
      "bootstrapVMSize": {
         "type": "string",
```

5.10.15. Creating the control plane machines in Azure

You must create the control plane machines in Microsoft Azure for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

**Procedure**

1. Copy the template from the ARM template for control plane machines section of this topic and save it as `05_masters.json` in your cluster’s installation directory. This template describes the control plane machines that your cluster requires.

2. Export the following variable needed by the control plane machine deployment:

   ```bash
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d 'n'
   $ export SSH_KEY=`cat <installation_directory>/ssh.rsa.pub`
   $
   ```

3. Create the deployment by using the `az` CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/05_masters.json" \
   --parameters masterIgnition="${MASTER_IGNITION}" \n
   $ export SSH_KEY=`cat <installation_directory>/ssh.rsa.pub`
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d 'n'
   $
   ```

   The Ignition content for the control plane nodes (also known as the master nodes).
   The SSH RSA public key file as a string.
The name of the private DNS zone to which the control plane nodes are attached.

The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

5.10.15.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

Example 5.5. 05_masters.json ARM template

```json
{
    "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
    "contentVersion": "1.0.0.0",
    "parameters": {
        "baseName": {
            "type": "string",
            "minLength": 1,
            "metadata": {
                "description": "Base name to be used in resource names (usually the cluster’s Infra ID)"
            }
        },
        "masterIgnition": {
            "type": "string",
            "metadata": {
                "description": "Ignition content for the master nodes"
            }
        },
        "numberOfMasters": {
            "type": "int",
            "defaultValue": 3,
            "minValue": 2,
            "maxValue": 30,
            "metadata": {
                "description": "Number of OpenShift masters to deploy"
            }
        },

                }
            }
        }
    }
}
5.10.16. Wait for bootstrap completion and remove bootstrap resources in Azure

After you create all of the required infrastructure in Microsoft Azure, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure
1. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install wait-for bootstrap-complete --dir=<installation_directory> \
   --log-level info
   
   For `<installation_directory>`, specify the path to the directory that you stored the 
   installation files in.

   To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

   ```bash
   $ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --name bootstrap_ssh_in
   $ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
   $ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
   $ az vm delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
   $ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap_OSDisk --no-wait --yes
   $ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-wait
   $ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name ${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
   $ az network public-ip delete -g ${INFRA_ID}-bootstrap-ssh-pip
   
   5.10.17. Creating additional worker machines in Azure

   You can create worker machines in Microsoft Azure for your cluster to use by launching individual 
   instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can 
   also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift 
   Container Platform.

   In this example, you manually launch one instance by using the Azure Resource Manager (ARM) 
   template. Additional instances can be launched by including additional resources of type 
   `06_workers.json` in the file.

   **NOTE**

   If you do not use the provided ARM template to create your worker machines, you must 
   review the provided information and manually create the infrastructure. If your cluster 
   does not initialize correctly, you might have to contact Red Hat support with your 
   installation logs.

   **Prerequisites**

   - Configure an Azure account.
   - Generate the Ignition config files for your cluster.
   - Create and configure a VNet and associated subnets in Azure.
Create and configure networking and load balancers in Azure.
Create control plane and compute roles.
Create the bootstrap machine.
Create the control plane machines.

Procedure

1. Copy the template from the ARM template for worker machines section of this topic and save it as 06_workers.json in your cluster’s installation directory. This template describes the worker machines that your cluster requires.

2. Export the following variable needed by the worker machine deployment:

   `$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d "\n"

3. Create the deployment by using the az CLI:

   ```bash
   $ az deployment group create -g ${RESOURCE_GROUP} \
   --template-file "<installation_directory>/06_workers.json" \
   --parameters workerIgnition="${WORKER_IGNITION}" \
   --parameters sshKeyData="${SSH_KEY}" \
   --parameters baseName="${INFRA_ID}"
   ```

   1. The Ignition content for the worker nodes.
   2. The SSH RSA public key file as a string.
   3. The base name to be used in resource names; this is usually the cluster’s infrastructure ID.

5.10.17.1. ARM template for worker machines

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

Example 5.6. 06_workers.json ARM template

```json
{
   "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
   "contentVersion": "1.0.0.0",
   "parameters": {
      "baseName": {
         "type": "string",
         "minLength": 1,
         "metadata": {
            "description": "Base name to be used in resource names (usually the cluster’s Infra ID)"
         }
      },
      "workerIgnition": {
         "type": "string",
         "metadata": {

}
5.10.18. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```
After you install the CLI, it is available using the `oc` command:

```
C:> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH.
   
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

### 5.10.19. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

**Procedure**

1. Export the `kubeadmin` credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```
Example output

```
$ oc get nodes
```

### 5.10.20. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

**Prerequisites**

- You added machines to your cluster.

**Procedure**

1. Confirm that the cluster recognizes the machines:

   Example output

   ```
   NAME      STATUS    ROLES   AGE  VERSION
   master-0  Ready     master  63m  v1.21.0
   master-1  Ready     master  63m  v1.21.0
   master-2  Ready     master  64m  v1.21.0
   worker-0  NotReady  worker  76s  v1.21.0
   worker-1  NotReady  worker  70s  v1.21.0
   ```

   The output lists all of the machines that you created.

   **NOTE**

   The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

   Example output

   ```
   NAME       AGE       REQUESTOR                                                  CONDITION
   csr-8b2br   15m   system:serviceaccount:openshift-machine-config-operator:node-bootstrapper  Pending
   csr-8vnps   15m   system:serviceaccount:openshift-machine-config-operator:node-bootstrapper  Pending
   ...
   ```

   In this example, two machines are joining the cluster. You might see more approved CSRs in the list.
3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. Once the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec, oc rsh, and oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  ```
  $ oc adm certificate approve <csr_name>  
  ```

  `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

  ```
  $ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{\"\n\"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve  
  ```

**NOTE**

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr  
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
</tbody>
</table>
CHAPTER 5. INSTALLING ON AZURE

csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
5. If the remaining CSRs are not approved, and are in the Pending status, approve the CSRs for
your cluster machines:
To approve them individually, run the following command for each valid CSR:
$ oc adm certificate approve <csr_name> 1
1

<csr_name> is the name of a CSR from the list of current CSRs.

To approve all pending CSRs, run the following command:
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}
{{end}}{{end}}' | xargs oc adm certificate approve
6. After all client and server CSRs have been approved, the machines have the Ready status.
Verify this by running the following command:
$ oc get nodes

Example output
NAME
master-0
master-1
master-2
worker-0
worker-1

STATUS ROLES AGE VERSION
Ready master 73m v1.21.0
Ready master 73m v1.21.0
Ready master 74m v1.21.0
Ready worker 11m v1.21.0
Ready worker 11m v1.21.0

NOTE
It can take a few minutes after approval of the server CSRs for the machines to
transition to the Ready status.
Additional information
For more information on CSRs, see Certificate Signing Requests .

5.10.21. Adding the Ingress DNS records
If you removed the DNS Zone configuration when creating Kubernetes manifests and generating
Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can
create either a wildcard *.apps.{baseDomain}. or specific records. You can use A, CNAME, and other
records per your requirements.
Prerequisites
You deployed an OpenShift Container Platform cluster on Microsoft Azure by using
infrastructure that you provisioned.

733


• Install the OpenShift CLI (oc).
• Install the jq package.
• Install or update the Azure CLI.

Procedure

1. Confirm the Ingress router has created a load balancer and populated the EXTERNAL-IP field:

   $ oc -n openshift-ingress get service router-default

   **Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>router-default</td>
<td>LoadBalancer</td>
<td>172.30.20.10</td>
<td>35.130.120.110</td>
<td>80:32288/TCP,443:31215/TCP</td>
<td>20</td>
</tr>
</tbody>
</table>

2. Export the Ingress router IP as a variable:

   $ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`

3. Add a *.apps record to the public DNS zone.
   a. If you are adding this cluster to a new public zone, run:

      $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300
   b. If you are adding this cluster to an already existing public zone, run:

      $ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300

4. Add a *.apps record to the private DNS zone:
   a. Create a *.apps record by using the following command:

      $ az network private-dns record-set a create -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps --ttl 300
   b. Add the *.apps record to the private DNS zone by using the following command:

      $ az network private-dns record-set a add-record -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER}

If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the cluster’s current routes:

$ oc get --all-namespaces -o jsonpath='{{range .items[*]}}{{range .status.ingress[*]}.host|"n"}{{end}}{{end}}' routes
Example output

oauth-openshift.apps.cluster.basedomain.com
console-openshift-console.apps.cluster.basedomain.com
downloads-openshift-console.apps.cluster.basedomain.com
alertmanager-main-openshift-monitoring.apps.cluster.basedomain.com
grafana-openshift-monitoring.apps.cluster.basedomain.com
prometheus-k8s-openshift-monitoring.apps.cluster.basedomain.com

5.10.22. Completing an Azure installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Microsoft Azure user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure infrastructure.
- Install the `oc` CLI and log in.

Procedure

- Complete the cluster installation:

  ```
  $ ./openshift-install --dir=<installation_directory> wait-for install-complete
  ```

  Example output

  ```
  INFO Waiting up to 30m0s for the cluster to initialize...
  ```

  For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

  IMPORTANT

  The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

5.11. UNINSTALLING A CLUSTER ON AZURE

You can remove a cluster that you deployed to Microsoft Azure.

5.11.1. Removing a cluster that uses installer-provisioned infrastructure
You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```bash
$ ./openshift-install destroy cluster \
--dir=<installation_directory> --log-level=info 1 2
```

1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. To view different details, specify `warn`, `debug`, or `error` instead of `info`.

NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

2. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.
6.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.

6.1.2. Requirements for installing OpenShift Container Platform on GCP

Before installing OpenShift Container Platform on Google Cloud Platform (GCP), you must create a service account and configure a GCP project. See Configuring a GCP project for details about creating a project, enabling API services, configuring DNS, GCP account limits, and supported GCP regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, see Manually creating IAM for GCP for other options.

6.1.3. Choosing a method to install OpenShift Container Platform on GCP

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

6.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on GCP** You can install OpenShift Container Platform on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on GCP** You can install a customized cluster on GCP infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available post-installation.

- **Installing a cluster on GCP with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.

- **Installing a cluster on GCP in a restricted network** You can install OpenShift Container Platform on GCP on installer-provisioned infrastructure by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an
active internet connection to obtain the software components. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the GCP APIs.

- **Installing a cluster into an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing GCP Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits on creating new accounts or infrastructure.

- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing GCP VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

### 6.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on GCP infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on GCP with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP infrastructure that you provide. You can use the provided Deployment Manager templates to assist with the installation.

- **Installing a cluster with shared VPC on user-provisioned infrastructure in GCP** You can use the provided Deployment Manager templates to create GCP resources in a shared VPC infrastructure.

- **Installing a cluster on GCP in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP in a restricted network with user-provisioned infrastructure. By creating an internal mirror of the installation release content, you can install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content.

### 6.1.4. Next steps

- Configuring a GCP project

### 6.2. CONFIGURING A GCP PROJECT

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

#### 6.2.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

**Procedure**

- Create a project to host your OpenShift Container Platform cluster. See Creating and Managing Projects in the GCP documentation.
IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the `api-int.<cluster_name>.<base_domain>` URL; the Premium Tier is required for internal load balancing.

6.2.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See Enabling services in the GCP documentation.

<table>
<thead>
<tr>
<th>API service</th>
<th>Console service name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compute Engine API</td>
<td><code>compute.googleapis.com</code></td>
</tr>
<tr>
<td>Google Cloud APIs</td>
<td><code>cloudapis.googleapis.com</code></td>
</tr>
<tr>
<td>Cloud Resource Manager API</td>
<td><code>cloudresourcemanager.googleapis.com</code></td>
</tr>
<tr>
<td>Google DNS API</td>
<td><code>dns.googleapis.com</code></td>
</tr>
<tr>
<td>IAM Service Account Credentials API</td>
<td><code>iamcredentials.googleapis.com</code></td>
</tr>
<tr>
<td>Identity and Access Management (IAM) API</td>
<td><code>iam.googleapis.com</code></td>
</tr>
<tr>
<td>Service Management API</td>
<td><code>servicemanagement.googleapis.com</code></td>
</tr>
<tr>
<td>Service Usage API</td>
<td><code>serviceusage.googleapis.com</code></td>
</tr>
<tr>
<td>Google Cloud Storage JSON API</td>
<td><code>storage-api.googleapis.com</code></td>
</tr>
<tr>
<td>Cloud Storage</td>
<td><code>storage-component.googleapis.com</code></td>
</tr>
</tbody>
</table>

6.2.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform
cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

**Procedure**

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

   **NOTE**
   If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](https://domains.google.com).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](https://cloud.google.com/dns/docs/public-zones) in the GCP documentation.
   Use an appropriate root domain, such as `openshiftcorp.com`, or subdomain, such as `clusters.openshiftcorp.com`.

3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](https://cloud.google.com/dns/docs/lookup) in the GCP documentation.
   You typically have four name servers.

4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](https://domains.google.com/?page=custom_nameservers).

5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](https://cloud.google.com/dns/docs/migrate) in the GCP documentation.

6. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain. This process might include a request to your company’s IT department or the division that controls the root domain and DNS services for your company.

**6.2.4. GCP account limits**

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default Quotas do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

**Table 6.2. GCP resources used in a default cluster**

<table>
<thead>
<tr>
<th>Service</th>
<th>Component</th>
<th>Location</th>
<th>Total resources required</th>
<th>Resources removed after bootstrap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service account</td>
<td>IAM</td>
<td>Global</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>Firewall rules</td>
<td>Compute</td>
<td>Global</td>
<td>11</td>
<td>1</td>
</tr>
<tr>
<td>Service</td>
<td>Component</td>
<td>Location</td>
<td>Total resources required</td>
<td>Resources removed after bootstrap</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------</td>
<td>----------</td>
<td>--------------------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>Forwarding rules</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>In-use global IP addresses</td>
<td>Compute</td>
<td>Global</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>Health checks</td>
<td>Compute</td>
<td>Global</td>
<td>3</td>
<td>0</td>
</tr>
<tr>
<td>Images</td>
<td>Compute</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Networks</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Static IP addresses</td>
<td>Compute</td>
<td>Region</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>Routers</td>
<td>Compute</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Routes</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Subnetworks</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Target pools</td>
<td>Compute</td>
<td>Global</td>
<td>3</td>
<td>0</td>
</tr>
<tr>
<td>CPUs</td>
<td>Compute</td>
<td>Region</td>
<td>28</td>
<td>4</td>
</tr>
<tr>
<td>Persistent disk SSD (GB)</td>
<td>Compute</td>
<td>Region</td>
<td>896</td>
<td>128</td>
</tr>
</tbody>
</table>

**NOTE**

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- **asia-east2**
- **asia-northeast2**
- **asia-south1**
- **australia-southeast1**
You can increase resource quotas from the GCP console, but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

### 6.2.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

**Prerequisites**

- You created a project to host your cluster.

**Procedure**

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See [Creating a service account](#) in the GCP documentation.

2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

   **NOTE**

   While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See [Creating service account keys](#) in the GCP documentation.
   The service account key is required to create a cluster.

#### 6.2.5.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:
Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 6.3. GCP service account permissions

<table>
<thead>
<tr>
<th>Account</th>
<th>Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Plane</td>
<td>roles/compute.instanceAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.networkAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.securityAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
<tr>
<td></td>
<td>roles/iam.serviceAccountUser</td>
</tr>
<tr>
<td>Compute</td>
<td>roles/compute.viewer</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
</tbody>
</table>

6.2.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)
6.2.7. Next steps

- Install an OpenShift Container Platform cluster on GCP. You can install a customized cluster or quickly install a cluster with default options.

6.3. MANUALLY CREATING IAM FOR GCP

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

6.3.1. Alternatives to storing administrator-level secrets in the **kube-system** project
The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the `credentialsMode` parameter in the `install-config.yaml` file.

If you prefer not to store an administrator-level credential secret in the cluster `kube-system` project, you can choose one of the following options when installing OpenShift Container Platform:

- **Manage cloud credentials manually**
  You can set the `credentialsMode` parameter for the CCO to `Manual` to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**
  If you are using the CCO with the `credentialsMode` parameter set to `Mint`, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

  **NOTE**
  Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

**Additional resources**

To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see [Rotating or removing cloud provider credentials](#).

For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

**6.3.2. Manually create IAM**

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster `kube-system` namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the `install-config.yaml` file:

   ```bash
   $ openshift-install create install-config --dir=<installation_directory>
   ```
2. Edit the `install-config.yaml` configuration file so that it contains the `credentialsMode` parameter set to `Manual`.

**Example install-config.yaml configuration file**

```yaml
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual
compute:
  - architecture: amd64
    hyperthreading: Enabled
...
```

1. This line is added to set the `credentialsMode` parameter to `Manual`.

3. To generate the manifests, run the following command from the directory that contains the installation program:

   ```
   $ openshift-install create manifests --dir=<installation_directory>
   ```

   1. For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your `openshift-install` binary is built to use:

   ```
   $ openshift-install version
   ```

   **Example output**

   ```
   release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
   ```

5. Locate all `CredentialsRequest` objects in this release image that target the cloud you are deploying on:

   ```
   $ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --credentials-requests --cloud=gcp
   ```

   This command creates a YAML file for each `CredentialsRequest` object.

**Sample CredentialsRequest object**

```yaml
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
name: openshift-image-registry-gcs
namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
```
6. Create YAML files for secrets in the `openshift-install` manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the `spec.secretRef` for each `CredentialsRequest` object. The format for the secret data varies for each cloud provider.

7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir=<installation_directory>
```

**IMPORTANT**

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the *Upgrading clusters with manually maintained credentials* section of the installation content for your cloud provider.

### 6.3.3. Admin credentials root secret format

Each cloud provider uses a credentials root secret in the `kube-system` namespace by convention, which is then used to satisfy all credentials requests and create their respective secrets. This is done either by minting new credentials, with *mint mode*, or by copying the credentials root secret, with *passthrough mode*.

The format for the secret varies by cloud, and is also used for each `CredentialsRequest` secret.

**Google Cloud Platform (GCP) secret format**

```yaml
apiVersion: v1
kind: Secret
metadata:
  namespace: kube-system
  name: gcp-credentials
stringData:
  service_account.json: <ServiceAccount>
```

### 6.3.4. Upgrading clusters with manually maintained credentials

If credentials are added in a future release, the Cloud Credential Operator (CCO) *upgradable* status for a cluster with manually maintained credentials changes to *false*. For minor release, for example, from 4.7 to 4.8, this status prevents you from upgrading until you have addressed any updated permissions. For z-stream releases, for example, from 4.7.12 to 4.7.13, the upgrade is not blocked, but the credentials must still be updated for the new release.

Use the *Administrator* perspective of the web console to determine if the CCO is upgradeable.
1. Navigate to Administration → Cluster Settings.

2. To view the CCO status details, click cloud-credential in the Cluster Operators list.

3. If the Upgradeable status in the Conditions section is False, examine the CredentialsRequest custom resource for the new release and update the manually maintained credentials on your cluster to match before upgrading.

In addition to creating new credentials for the release image that you are upgrading to, you must review the required permissions for existing credentials and accommodate any new permissions requirements for existing components in the new release. The CCO cannot detect these mismatches and will not set upgradeable to false in this case.

The Manually creating IAM section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.

6.3.5. Mint mode

Mint mode is the default and recommended Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS, GCP, and Azure.

In mint mode, the admin credential is stored in the kube-system namespace and then used by the CCO to process the CredentialsRequest objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires admin credential storage in a cluster kube-system secret.

6.3.6. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all CredentialsRequest objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.
Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

6.3.7. Next steps

- Install an OpenShift Container Platform cluster:
  - Installing a cluster quickly on GCP with default options on installer-provisioned infrastructure
  - Install a cluster with cloud customizations on installer-provisioned infrastructure
  - Install a cluster with network customizations on installer-provisioned infrastructure

6.4. INSTALLING A CLUSTER QUICKLY ON GCP

In OpenShift Container Platform version 4.8, you can install a cluster on Google Cloud Platform (GCP) that uses the default configuration options.

6.4.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.4.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.
IMPORTANT

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

6.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The ./openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N " -f <path>/<file_name>  

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   NOTE

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.
2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the /openshift-install gather command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

      **Example output**

      Agent pid 31874

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the ssh-agent:

      $ ssh-add <path>/<file_name>

      Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

      **Example output**

      Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

   2. Set the GOOGLE_APPLICATION_CREDENTIALS environment variable to the full path to your service account private key file.

      $ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"

   3. Verify that the credentials were applied.

      $ gcloud auth list

**Next steps**
- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 6.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ tar xvf openshift-install-linux.tar.gz
   ```

5. From the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.
IMPORTANT
You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
   - The `GOOGLE_CREDENTIALS`, `GOOGLE_CLOUD_KEYFILE_JSON`, or `GCP_KEYFILE_JSON` environment variables
   - The `~/.gcp/osServiceAccount.json` file
   - The `gcloud cli` default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
```

   1. For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   2. To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

IMPORTANT
Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

a. Optional: Select an SSH key to use to access your cluster machines.

NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.
b. Select `gcp` as the platform to target.

c. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

d. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

e. Select the region to deploy the cluster to.

f. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

g. Enter a descriptive name for your cluster. If you provide a name that is longer than 6 characters, only the first 6 characters will be used in the infrastructure ID that is generated from the cluster name.

h. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.
IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kublet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
   - If you assigned the Owner role to your service account, you can remove that role and replace it with the Viewer role.
   - If you included the Service Account Key Admin role, you can remove it.

6.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:

   $ echo $PATH
After you install the CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

```bash
C:\> path
```

After you install the CLI, it is available using the `oc` command:

```bash
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your **PATH**.
   To check your **PATH**, open a terminal and execute the following command:

```bash
$ echo $PATH
```

After you install the CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

### 6.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The
**kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

**Procedure**

1. Export the **kubeadmin** credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   **1** For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```bash
   system:admin
   ```

**6.4.8. Next steps**

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

**6.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS**

In OpenShift Container Platform version 4.8, you can install a customized cluster on infrastructure that the installation program provisions on Google Cloud Platform (GCP). To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

**6.5.1. Prerequisites**

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 6.5.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `/openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.
NOTE
You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   $ ssh-keygen -t ed25519 -N '' -f <path>/<file_name>

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**
   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   $ cat <path>/<file_name>.pub

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   $ cat ~/.ssh/id_rsa.pub

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

   **NOTE**
   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the ssh-agent process is not already running for your local user, start it as a background task:

      $ eval "$(ssh-agent -s)"

   **Example output**

      Agent pid 31874

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.
1. Add your SSH private key to the **ssh-agent**:

   ```
   $ ssh-add <path>/<file_name>
   ```

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

**Example output**

   ```
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

2. Set the **GOOGLE_APPLICATION_CREDENTIALS** environment variable to the full path to your service account private key file.

   ```
   $ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
   ```

3. Verify that the credentials were applied.

   ```
   $ gcloud auth list
   ```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.5.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.
Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory>
   ```

   **For `<installation_directory>`**, specify the directory name to store the files that the installation program creates.

   **IMPORTANT**

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.
NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

ii. Select gcp as the platform to target.

iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

v. Select the region to deploy the cluster to.

vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

vii. Enter a descriptive name for your cluster.

viii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the install-config.yaml file. You can find more information about the available parameters in the "Installation configuration parameters" section.

NOTE

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the ovirt-config.yaml file and the install-config.yaml file. If they do not appear, add them as follows:

1. In the ~/.ovirt/ovirt-config.yaml file:

   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----

2. In the install-config.yaml file:

   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.
The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 6.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apiVersion</code></td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td><code>baseDomain</code></td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <strong>ObjectMeta</strong>, from which only the <strong>name</strong> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}.{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td>{  &quot;auths&quot;:{  &quot;cloud.openshift.com&quot;:{},  &quot;auth&quot;:&quot;b3Blb=&quot;,  &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot; },  &quot;quay.io&quot;:{  &quot;auth&quot;:&quot;b3Blb=&quot;,  &quot;email&quot;:&quot;<a href="mailto:you@example.com">you@example.com</a>&quot; }  }</td>
</tr>
</tbody>
</table>

### 6.5.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 6.5. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
</table>

764
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
networking.machineNetwork.cidr

Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.

An IP network block in CIDR notation. For example, 10.0.0.0/16.

NOTE

Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.

6.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.6. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or *hyperthreading*, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>

<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <strong>publish</strong> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
### 6.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 6.7. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.gcp.network</td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.gcp.type</td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td>platform.gcp.zones</td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td>platform.gcp.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.computeSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
</tbody>
</table>

- **sshKey**: The SSH key or keys to authenticate access your cluster machines.

  **NOTE**
  For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

  One or more keys. For example:

  ```
  sshKey:
  <key1>
  <key2>
  <key3>
  ```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
</tbody>
</table>

6.5.5.2. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

---

### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane: 2 3
```
hyperthreading: Enabled
name: master
platform:
gcp:
  type: n2-standard-4
zones:
  - us-central1-a
  - us-central1-c
osDisk:
  diskType: pd-ssd
diskSizeGB: 256
encryptionKey:
  name: worker-key
kmsKey:
  keyRing: test-machine-keys
  location: global
  projectID: project-id
replicas: 3
compute:
  - hyperthreading: Enabled
name: worker
platform:
gcp:
  type: n2-standard-4
zones:
  - us-central1-a
  - us-central1-c
osDisk:
  diskType: pd-standard
diskSizeGB: 128
encryptionKey:
  name: worker-key
kmsKey:
  keyRing: test-machine-keys
  location: global
  projectID: project-id
replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
gcp:
  projectID: openshift-production
  region: us-central1
  pullSecret: '{"auths": ...}'
fips: false
sshKey: ssh-ed25519 AAAA...
Required. The installation program prompts you for this value.

If you do not provide these parameters and values, the installation program provides the default value.

The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as n1-standard-8, for your machines if you disable simultaneous multithreading.

Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the service-<project_number>@compute-system.iam.gserviceaccount.com pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

You can optionally provide the sshKey value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

6.5.6. Additional resources
Enabling customer-managed encryption keys for a machine set

6.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**
You can run the `create cluster` command of the installation program only once, during initial installation.

Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
   - The `GOOGLE_CREDENTIALS`, `GOOGLE_CLOUD_KEYFILE_JSON`, or `GCLOUD_KEYFILE_JSON` environment variables
   - The `~/.gcp/osServiceAccount.json` file
   - The `gcloud cli` default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \[1
   --log-level=info  \[2
   For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
   To view different installation details, specify warn, debug, or error instead of info.
   ```

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
...```
NOTE

The cluster access and credential information also outputs to
<installation_directory>/.openshift_install.log when an installation succeeds.

IMPORTANT

The Ignition config files that the installation program generates contain
certificates that expire after 24 hours, which are then renewed at that time. If the
cluster is shut down before renewing the certificates and the cluster is later
restarted after the 24 hours have elapsed, the cluster automatically recovers the
expired certificates. The exception is that you must manually approve the
pending node-bootstrapper certificate signing requests (CSRs) to recover
kubelet certificates. See the documentation for Recovering from expired control
plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation
program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used
to install the cluster.

   • If you assigned the Owner role to your service account, you can remove that role and
     replace it with the Viewer role.

   • If you included the Service Account Key Admin role, you can remove it.

6.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-
line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands
in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure
1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   \$ tar xzvf <file>

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:

   \$ echo $PATH

After you install the CLI, it is available using the oc command:

\$ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH. To check your PATH, open the command prompt and execute the following command:

   C:\> path

After you install the CLI, it is available using the oc command:

   C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```bash
   $ echo $PATH
   ```

   After you install the CLI, it is available using the `oc` command:

   ```bash
   $ oc <command>
   ```

### 6.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.

#### Procedure

1. Export the `kubeadmin` credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

#### 6.5.10. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

### 6.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS
In OpenShift Container Platform version 4.8, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Google Cloud Platform (GCP). By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

You must set most of the network configuration parameters during installation, and you can modify only `kubeProxy` configuration parameters in a running cluster.

### 6.6.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 6.6.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access Quay.io to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.
6.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the ~/.ssh/authorized_keys list for the core user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user core. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The /openshift-install gather command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>  
   ```

   1 Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```
3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the ./openshift-install gather command.

NOTE
On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

a. If the ssh-agent process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the ssh-agent:

```
$ ssh-add <path>/<file_name>
```

1. Specify the path and file name for your SSH private key, such as ~/.ssh/id_rsa

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

2. Set the GOOGLE_APPLICATION_CREDENTIALS environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

3. Verify that the credentials were applied.

```
$ gcloud auth list
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.6.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**
You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ tar xvf openshift-install-linux.tar.gz
   ```

5. From the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:
For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

ii. Select `gcp` as the platform to target.

iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

v. Select the region to deploy the cluster to.

vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

vii. Enter a descriptive name for your cluster.

viii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.
NOTE
If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   
2. In the `install-config.yaml` file:

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

IMPORTANT
The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.6.5.1. Installation configuration parameters
Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

NOTE
After installation, you cannot modify these parameters in the `install-config.yaml` file.

IMPORTANT
The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.6.5.1.1. Required configuration parameters
Required installation configuration parameters are described in the following table:

### Table 6.8. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt; &lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}} &lt;baseDomain&gt;</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### pullSecret

Get a pull secret from [https://cloud.redhat.com/openshift/install/pull-secret](https://cloud.redhat.com/openshift/install/pull-secret) to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

---

### 6.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.9. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>networking</strong></td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td><strong>networking.network</strong></td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either <strong>OpenShiftSDN</strong> or <strong>OVNKubernetes</strong>. The default value is <strong>OpenShiftSDN</strong>.</td>
</tr>
<tr>
<td><strong>networking.clusterNetwork</strong></td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
</tbody>
</table>
|                       | The default value is **10.128.0.0/14** with a host prefix of **/23**. | networking:
|                       | If you specify multiple IP address blocks, the blocks must not overlap. | clusterNetwork:
|                       | - cidr: **10.128.0.0/14** hostPrefix: **23** |

**NOTE**

You cannot modify parameters specified by the **networking** object after installation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to 23 then each node is assigned a /23 subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of 23 provides 510 ($2^{32} - 2^2$) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is 23.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>

<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use <code>networking.machineNetwork</code>. An IP address block.</td>
<td>An IP network block in CIDR notation.</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NOTE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set the <code>networking.machineNetwork</code> to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

6.6.5.13. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.10. Optional parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>IMPORTANT</td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td>publish</td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
### 6.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>platform.gcp.network</strong></td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td><strong>platform.gcp.type</strong></td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td><strong>platform.gcp.zones</strong></td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><strong>platform.gcp.controlPlaneSubnet</strong></td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td><strong>platform.gcp.computeSubnet</strong></td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td><strong>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.name</strong></td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td><strong>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</strong></td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
</tbody>
</table>

#### sshKey

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```
### 6.6.5.2. Sample customized install-config.yaml file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hypethreading: Enabled
  name: master
  platform:
    gcp:
      type: n2-standard-4
```
zones:
- us-central1-a
- us-central1-c

osDisk:
  diskType: pd-ssd
diskSizeGB: 256

encryptionKey: 5

kmsKey:
  name: worker-key
  keyRing: test-machine-keys
  location: global
  projectID: project-id

replicas: 3

compute: 6 7

- hyperthreading: Enabled 8

name: worker

platform:

  gcp:
    type: n2-standard-4
    zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
diskSizeGB: 128

encryptionKey: 9

kmsKey:
  name: worker-key
  keyRing: test-machine-keys
  location: global
  projectID: project-id

replicas: 3

metadata:

  name: test-cluster 10

networking: 11

  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16

platform:

  gcp:
    projectID: openshift-production 12
    region: us-central1 13
    pullSecret: '{"auths": ...}' 14
    fips: false 15
    sshKey: ssh-ed25519 AAAA... 16

---

1 10 12 13 14 Required. The installation program prompts you for this value.
1 2 6 11 If you do not provide these parameters and values, the installation program provides the default value.
The **controlPlane** section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section

Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as `n1-standard-8`, for your machines if you disable simultaneous multithreading.

Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the `service-<project_number>@compute-system.iam.gserviceaccount.com` pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### 6.6.6. Additional resources

- Enabling customer-managed encryption keys for a machine set

### 6.6.7. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

**Phase 1**
You can customize the following network-related fields in the `install-config.yaml` file before you create the manifest files:

- `networking.networkType`
- `networking.clusterNetwork`
- `networking.serviceNetwork`
- `networking.machineNetwork`

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

**Phase 2**

After creating the manifest files by running `openshift-install create manifests`, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the `install-config.yaml` file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 6.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the `install-config.yaml` file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>  
   ```

   The `<installation_directory>` specifies the name of the directory that contains the `install-config.yaml` file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named `clusternetwork-03-config.yml` in the `<installation_directory>/manifests` directory:
3. Specify the advanced network configuration for your cluster in the `cluster-network-03-config.yml` file, such as in the following examples:

**Specify a different VXLAN port for the OpenShift SDN network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
defaultNetwork:
  openshiftSDNConfig:
    vxlanPort: 4800
```

**Enable IPsec for the OVN-Kubernetes network provider**

```yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
defaultNetwork:
  ovnKubernetesConfig:
    ipsecConfig: {}
```

4. Optional: Back up the `manifests/cluster-network-03-config.yml` file. The installation program consumes the `manifests/` directory when you create the Ignition config files.

**6.6.9. Cluster Network Operator configuration**

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named `cluster`. The CR specifies the fields for the `Network` API in the `operator.openshift.io` API group.

The CNO configuration inherits the following fields during cluster installation from the `Network` API in the `Network.config.openshift.io` API group and these fields cannot be changed:

- **clusterNetwork**
  - IP address pools from which pod IP addresses are allocated.

- **serviceNetwork**
  - IP address pool for services.

- **defaultNetwork.type**
  - Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the `defaultNetwork` object in the CNO object named `cluster`. 
### 6.6.9.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

#### Table 6.12. Cluster Network Operator configuration object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata.name</td>
<td>string</td>
<td>The name of the CNO object. This name is always <code>cluster</code>.</td>
</tr>
<tr>
<td>spec.clusterNet</td>
<td>array</td>
<td>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.0.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.128.32.0/19</td>
</tr>
<tr>
<td></td>
<td></td>
<td>hostPrefix: 23</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <code>install-config.yaml</code> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.serviceNet</td>
<td>array</td>
<td>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>spec:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can customize this field only in the <code>install-config.yaml</code> file before you create the manifests. The value is read-only in the manifest file.</td>
</tr>
<tr>
<td>spec.defaultNet</td>
<td>object</td>
<td>Configures the Container Network Interface (CNI) cluster network provider for the cluster network.</td>
</tr>
<tr>
<td>spec.kubeProxy</td>
<td>object</td>
<td>The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.</td>
</tr>
</tbody>
</table>

#### defaultNetwork object configuration

The values for the `defaultNetwork` object are defined in the following table:

#### Table 6.13. defaultNetwork object

```
spec:
  clusterNetwork:
    - cidr: 10.128.0.0/19
    hostPrefix: 23
    - cidr: 10.128.32.0/19
    hostPrefix: 23

spec:
  serviceNetwork:
    - 172.30.0.0/14
```
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>string</td>
<td>Either OpenShiftSDN or OVNKubernetes. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</td>
</tr>
</tbody>
</table>

**NOTE**

OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.

<table>
<thead>
<tr>
<th>openshiftSDNConfig</th>
<th>object</th>
<th>This object is only valid for the OpenShift SDN cluster network provider.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ovnKubernetesConfig</td>
<td>object</td>
<td>This object is only valid for the OVN-Kubernetes cluster network provider.</td>
</tr>
</tbody>
</table>

### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 6.14. openshiftSDNConfig object**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>string</td>
<td>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy.</td>
</tr>
</tbody>
</table>

The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.
The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.

This value cannot be changed after cluster installation.

The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.

If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.

On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

### Table 6.15. ovnKubernetesConfig object

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
### mtu

**Type:** integer  

The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.

If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.

If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.

This value cannot be changed after cluster installation.

### genevePort

**Type:** integer  

The port to use for all Geneve packets. The default value is 6081. This value cannot be changed after cluster installation.

### ipsecConfig

**Type:** object  

Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.

### policyAuditConfig

**Type:** object  

Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rateLimit</td>
<td>integer</td>
<td>The maximum number of messages to generate every second per node. The default value is 20 messages per second.</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>integer</td>
<td>The maximum size for the audit log in bytes. The default value is 50000000 or 50MB.</td>
</tr>
</tbody>
</table>
One of the following additional audit log targets:

- **libc**
  - The libc `syslog()` function of the journald process on the host.
- **udp:<host>:<port>**
  - A syslog server. Replace `<host>:<port>` with the host and port of the syslog server.
- **unix:<file>**
  - A Unix Domain Socket file specified by `<file>`.
- **null**
  - Do not send the audit logs to any additional target.

The syslog facility, such as `kern`, as defined by RFC5424. The default value is `local0`.

**Example OVN-Kubernetes configuration**

```yaml
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

**kubeProxyConfig object configuration**

The values for the `kubeProxyConfig` object are defined in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>iptablesSyncPeriod</code></td>
<td>string</td>
<td>The refresh period for <code>iptables</code> rules. The default value is <code>30s</code>. Valid suffixes include <code>s</code>, <code>m</code>, and <code>h</code> and are described in the Go <code>time</code> package documentation.</td>
</tr>
</tbody>
</table>

**NOTE**

Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the `iptablesSyncPeriod` parameter is no longer necessary.
The minimum duration before refreshing `iptables` rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include `s`, `m`, and `h` and are described in the `Go time` package. The default value is:

```
kubeProxyConfig:
  proxyArguments:
    iptables-min-sync-period:
      - 0s
```

### 6.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \  
   --log-level=info
   
   1 For `<installation_directory>`, specify the
   
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.
   
   **NOTE**

   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.
When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 6.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (`oc`) to interact with OpenShift Container Platform from a command-line interface. You can install `oc` on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of `oc`, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of `oc`.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (`oc`) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH. To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH. To check your PATH, execute the following command:

   C:\> path

After you install the CLI, it is available using the oc command:

   C:\> oc <command>

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

   $ tar xvzf <file>

   $ echo $PATH

   $ oc <command>
5. Move the **oc** binary to a directory on your **PATH**. To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

**Procedure**

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

   Example output

   ```
   system:admin
   ```

### 6.6.13. Next steps

- Customize your cluster.
- If necessary, you can [opt out of remote health reporting](#).

### 6.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK

In OpenShift Container Platform 4.8, you can install a cluster on Google Cloud Platform (GCP) in a restricted network by creating an internal mirror of the installation release content on an existing Google Virtual Private Cloud (VPC).
6.7.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You mirrored the images for a disconnected installation to your registry and obtained the imageContentSources data for your version of OpenShift Container Platform.

NOTE

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in GCP. While installing a cluster in a restricted network that uses installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- If you use a firewall, you configured it to allow the sites that your cluster requires access to. While you might need to grant access to more sites, you must grant access to 
  *googleapis.com and accounts.google.com.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.7.2. About installations in restricted networks

In OpenShift Container Platform 4.8, you can perform an installation that does not require an active connection to the Internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service’s IAM service, require Internet access, so you might still require Internet access. Depending on your network, you might require less Internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the Internet and your closed network, or by using other methods that meet your restrictions.

6.7.2.1. Additional limits
Clusters in restricted networks have the following additional limitations and restrictions:

- The `ClusterVersion` status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 6.7.3. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to obtain the images that are necessary to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 6.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.
If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
   ```

   Specify the path and file name, such as ~/.ssh/id_rsa, of the new SSH key. If you have an existing key pair, ensure your public key is in the your ~/.ssh directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the ed25519 algorithm. Instead, create a key that uses the rsa or ecdsa algorithm.

2. View the public SSH key:

   ```bash
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the ~/.ssh/id_rsa.pub public key:

   ```bash
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as ~/.ssh/id_rsa and ~/.ssh/id_dsa are managed automatically.

   a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

   ```bash
   ```
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name>
   ``

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

   **Example output**
   
   ```
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

2. Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

   ```bash
   $ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
   ``

3. Verify that the credentials were applied.

   ```bash
   $ gcloud auth list
   ``

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.7.5. Creating the installation configuration file**

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your bastion host.

- Have the `imageContentSources` values that were generated during mirror registry creation.

- Obtain the contents of the certificate for your mirror registry.

**Procedure**

1. Create the `install-config.yaml` file.
a. Change to the directory that contains the installation program and run the following command:

```bash
$ ./openshift-install create install-config --dir=<installation_directory>
```

For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

ii. Select `gcp` as the platform to target.

iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

v. Select the region to deploy the cluster to.

vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

vii. Enter a descriptive name for your cluster.

viii. Paste the pull secret that you obtained from the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site.

2. Edit the `install-config.yaml` file to provide the additional information that is required for an installation in a restricted network.

a. Update the `pullSecret` value to contain the authentication information for your registry:

```yaml
pullSecret: 
  "{"auths":{"<bastion_host_name>:5000": {"auth": "<credentials>" ,"email": "you@example.com"}}}"
```
For `<bastion_host_name>`, specify the registry domain name that you specified in the certificate for your mirror registry, and for `<credentials>`, specify the base64-encoded username and password for your mirror registry.

b. Add the `additionalTrustBundle` parameter and value.

```
additionalTrustBundle:
  -----BEGIN CERTIFICATE-----
ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ
  -----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

c. Define the network and subnets for the VPC to install the cluster in under the parent `platform.gcp` field:

```
network: <existing_vpc>
controlPlaneSubnet: <control_plane_subnet>
computeSubnet: <compute_subnet>
```

For `platform.gcp.network`, specify the name for the existing Google VPC. For `platform.gcp.controlPlaneSubnet` and `platform.gcp.computeSubnet`, specify the existing subnets to deploy the control plane machines and compute machines, respectively.

d. Add the image content resources, which look like this excerpt:

```
imageContentSources:
  - mirrors:
    - `<bastion_host_name>`:5000/<repo_name>/release
      source: quay.example.com/openshift-release-dev/ocp-release
    - mirrors:
      - `<bastion_host_name>`:5000/<repo_name>/release
      source: registry.example.com/ocp/release
```

To complete these values, use the `imageContentSources` that you recorded during mirror registry creation.

3. Make any other modifications to the `install-config.yaml` file that you require. You can find more information about the available parameters in the `Installation configuration parameters` section.

4. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.7.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s
platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.7.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

### Table 6.18. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is <strong>v1</strong>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;._&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}._{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as <code>dev</code>.</td>
</tr>
</tbody>
</table>
The configuration for the specific platform upon which to perform the installation: **aws, baremetal, azure, openstack, ovirt, vsphere**.

For additional information about `platform.<platform>` parameters, consult the table for your specific platform that follows.

### pullSecret

Get a pull secret from https://cloud.redhat.com/openshift/install/pull-secret to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.

```json
{
  "auths":{
    "cloud.openshift.com":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    },
    "quay.io":{
      "auth":"b3Blb=",
      "email":"you@example.com"
    }
  }
}
```

### 6.7.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.19. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>The default value is <strong>10.128.0.0/14</strong> with a host prefix of <strong>/23</strong>.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use <code>networking.clusterNetwork</code>. An IP address block.</td>
<td>- cidr: <strong>10.128.0.0/14</strong></td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td>hostPrefix: <strong>23</strong></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if <code>hostPrefix</code> is set to <strong>23</strong> then each node is assigned a <code>/23</code> subnet out of the given <code>cidr</code>. A <code>hostPrefix</code> value of <strong>23</strong> provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>The default value is <strong>23</strong>.</td>
<td>The default value is <strong>23</strong>.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is <strong>172.30.0.0/16</strong>.</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>172.30.0.0/16</strong></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt. For libvirt, the default value is 192.168.126.0/24.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>

### 6.7.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

#### Table 6.20. Optional parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
### compute.hyperthreading
Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**
If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use compute. The name of the machine pool.</td>
<td>worker</td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use compute. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to 2. The default value is 3.</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>

<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or{}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
</tbody>
</table>
The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>
Enable or disable FIPS mode. The default is `false` (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>fips</td>
<td>Sources and repositories for the release-image content.</td>
<td><code>false</code> or <code>true</code></td>
</tr>
<tr>
<td>imageContentSources</td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td>imageContentSources.source</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>imageContentSources.mirrors</td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
</tbody>
</table>
How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.

To deploy a private cluster, which cannot be accessed from the internet, set publish to Internal. The default value is External.

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

One or more keys. For example:

```yaml
sshKey:
  <key1>
  <key2>
  <key3>
```

### 6.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 6.21. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.gcp.network</td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.gcp.type</td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td>platform.gcp.zones</td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in <strong>YAML sequence.</strong></td>
</tr>
<tr>
<td>platform.gcp.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.computeSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
</tbody>
</table>

6.7.5.2. Sample customized install-config.yaml file for GCP

You can customize the install-config.yaml file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.
### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
default:
  apiVersion: v1
  baseDomain: example.com

controlPlane:
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
  osDisk:
    dishType: pd-ssd
    diskSizeGB: 256
    encryptionKey: 5
    kmsKey:
      name: worker-key
      keyRing: test-machine-keys
      location: global
      projectID: project-id
  replicas: 3

compute:
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
  osDisk:
    diskType: pd-standard
    diskSizeGB: 128
    encryptionKey: 9
    kmsKey:
      name: worker-key
      keyRing: test-machine-keys
      location: global
      projectID: project-id
  replicas: 3

metadata:
  name: test-cluster

networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
```

822
<table>
<thead>
<tr>
<th>Required. The installation program prompts you for this value.</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you do not provide these parameters and values, the installation program provides the default value.</td>
</tr>
<tr>
<td>The <strong>controlPlane</strong> section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the <strong>compute</strong> section must begin with a hyphen, <code>-</code>, and the first line of the <strong>controlPlane</strong> section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.</td>
</tr>
<tr>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to <strong>Disabled</strong>. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.</td>
</tr>
<tr>
<td><strong>IMPORTANT</strong></td>
</tr>
<tr>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as <strong>n1-standard-8</strong>, for your machines if you disable simultaneous multithreading.</td>
</tr>
<tr>
<td>Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the <strong>service-&lt;project_number&gt;@compute-system.iam.gserviceaccount.com</strong> pattern. For more information on granting the correct permissions for your service account, see &quot;Machine management&quot; → &quot;Creating machine sets&quot; → &quot;Creating a machine set on GCP&quot;.</td>
</tr>
</tbody>
</table>
13 Specify the name of an existing VPC.

14 Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.

15 Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.

16 For `<local_registry>`, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, `registry.example.com` or `registry.example.com:5000`. For `<credentials>`, specify the base64-encoded user name and password for your mirror registry.

17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.

18 You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

19 Provide the contents of the certificate file that you used for your mirror registry.

20 Provide the `imageContentSources` section from the output of the command to mirror the repository.

### 6.7.5.3. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

**Prerequisites**

- You created the `install-config.yaml` and complete any modifications to it.

**Procedure**

Create an Ingress Controller with global access on a new GCP cluster.

1. Change to the directory that contains the installation program and create a manifest file:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>
   ```
For `<installation_directory>`, specify the name of the directory that contains the `install-config.yaml` file for your cluster.

After creating the file, several network configuration files are in the `manifests/` directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

**Example output**

```
cluster-ingress-default-ingresscontroller.yaml
```

2. Open the `cluster-ingress-default-ingresscontroller.yaml` file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

**Sample clientAccess configuration to Global**

```
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global
        type: GCP
      scope: Internal
      type: LoadBalancerService
```

2. Global access is only available to Ingress Controllers using internal load balancers.

### 6.7.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.
NOTE

The Proxy object status.noProxy field is populated with the values of the networking.machineNetwork[].cidr, networking.clusterNetwork[].cidr, and networking.serviceNetwork[] fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object status.noProxy field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the ec2.<region>.amazonaws.com, elasticloadbalancing.<region>.amazonaws.com, and s3.<region>.amazonaws.com endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your install-config.yaml file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port> 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
     noProxy: example.com 3
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     <MY_TRUSTED_CA_CERT>
     -----END CERTIFICATE-----
     ...
   
1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless
the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**
The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**
Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 6.7.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**
You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**
- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
   - The `GOOGLE_CREDENTIALS`, `GOOGLE_CLOUD_KEYFILE.JSON`, or `GCloud_KEYFILE.JSON` environment variables
   - The `~/.gcp/osServiceAccount.json` file
   - The `gcloud cli` default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \
   --log-level=info
   ```
For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```plaintext
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
   
   - If you assigned the *Owner* role to your service account, you can remove that role and replace it with the *Viewer* role.
If you included the **Service Account Key Admin** role, you can remove it.

### 6.7.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.
4. Unpack the archive:
   - $ tar xvzf <file>
5. Place the **oc** binary in a directory that is on your **PATH**.
   - To check your **PATH**, execute the following command:
   - $ echo $PATH

After you install the CLI, it is available using the **oc** command:

- $ oc <command>

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
   - To check your **PATH**, open the command prompt and execute the following command:
After you install the CLI, it is available using the oc command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the oc command:

```
$ oc <command>
```

### 6.7.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

**Procedure**

1. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:
6.7.9. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding `disableAllDefaultSources: true` to the `OperatorHub` object:

```
$ oc patch OperatorHub cluster --type json \
   -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

TIP

Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Global Configuration → OperatorHub page, click the Sources tab, where you can create, delete, disable, and enable individual sources.

6.7.10. Next steps

- Validate an installation.
- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the must-gather tool.
- Learn how to use Operator Lifecycle Manager (OLM) on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.

6.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC

In OpenShift Container Platform version 4.8, you can install a cluster into an existing Virtual Private Cloud (VPC) on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

6.8.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
You read the documentation on selecting a cluster installation method and preparing it for users.

You configured a GCP project to host the cluster.

If you use a firewall, you configured it to allow the sites that your cluster requires access to.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

### 6.8.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.8.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.
If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The \texttt{./openshift-install gather} command also requires the SSH public key to be in place on the cluster nodes.

\textbf{IMPORTANT}

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

\textbf{NOTE}

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

\textbf{Procedure}

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

\begin{verbatim}
$ ssh-keygen -t ed25519 -N " -f <path>/<file_name>  
\end{verbatim}

Specify the path and file name, such as \texttt{~/.ssh/id_rsa}, of the new SSH key. If you have an existing key pair, ensure your public key is in the your \texttt{~/.ssh} directory.

\textbf{NOTE}

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the \texttt{x86_64} architecture, do not create a key that uses the \texttt{ed25519} algorithm. Instead, create a key that uses the \texttt{rsa} or \texttt{ecdsa} algorithm.

2. View the public SSH key:

\begin{verbatim}
$ cat <path>/<file_name>.pub
\end{verbatim}

For example, run the following to view the \texttt{~/.ssh/id_rsa.pub} public key:

\begin{verbatim}
$ cat ~/.ssh/id_rsa.pub
\end{verbatim}

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the \texttt{./openshift-install gather} command.

\textbf{NOTE}

On some distributions, default SSH private key identities such as \texttt{~/.ssh/id_rsa} and \texttt{~/.ssh/id_dsa} are managed automatically.

a. If the \texttt{ssh-agent} process is not already running for your local user, start it as a background task:

\begin{verbatim}
$ ssh-agent
\end{verbatim}
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

   ```bash
   $ ssh-add <path>/<file_name>
   ``

   Example output

   ```bash
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```

2. Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

   ```bash
   $ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
   ``

3. Verify that the credentials were applied.

   ```bash
   $ gcloud auth list
   ```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

6.8.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.
IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```bash
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

6.8.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```bash
   $ ./openshift-install create install-config --dir=<installation_directory>
   ```

   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

b. At the prompts, provide the configuration details for your cloud:

   i. Optional: Select an SSH key to use to access your cluster machines.

   NOTE

   For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

   ii. Select *gcp* as the platform to target.

   iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

   iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

   v. Select the region to deploy the cluster to.

   vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

   vii. Enter a descriptive name for your cluster.

   viii. Paste the pull secret that you obtained from the *Pull Secret* page on the Red Hat OpenShift Cluster Manager site.

2. Modify the *install-config.yaml* file. You can find more information about the available parameters in the "Installation configuration parameters" section.
NOTE

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the ovirt-config.yaml file and the install-config.yaml file. If they do not appear, add them as follows:

1. In the ~/.ovirt/ovirt-config.yaml file:

```
[ovirt_ca_bundle]: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA>
    -----END CERTIFICATE-----
    -----BEGIN CERTIFICATE-----
    <INTERMEDIATE_CA>
    -----END CERTIFICATE-----
```

2. In the install-config.yaml file:

```
[additionalTrustBundle]: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA>
    -----END CERTIFICATE-----
    -----BEGIN CERTIFICATE-----
    <INTERMEDIATE_CA>
    -----END CERTIFICATE-----
```

3. Back up the install-config.yaml file so that you can use it to install multiple clusters.

IMPORTANT

The install-config.yaml file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.8.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the install-config.yaml installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the install-config.yaml file to provide more details about the platform.

NOTE

After installation, you cannot modify these parameters in the install-config.yaml file.

IMPORTANT

The openshift-install command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.8.5.1.1. Required configuration parameters
Required installation configuration parameters are described in the following table:

### Table 6.22. Required parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <em>install-config.yaml</em> content. The current version is <code>v1</code>. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code>, <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <a href="https://kubernetes.io/docs/concepts/api-conventions/#metadata">ObjectMeta</a>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>{{.metadata.name}}</code>. <code>{{.baseDomain}}</code>.</td>
<td>String of lowercase letters, hyphens (<code>-</code>), and periods (<code>.</code>), such as <code>dev</code>.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <code>aws</code>, <code>baremetal</code>, <code>azure</code>, <code>openstack</code>, <code>ovirt</code>, <code>vsphere</code>. For additional information about <code>platform.&lt;platform&gt;</code> parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
</tbody>
</table>
### 6.8.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

#### Table 6.23. Network parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td><code>{  &quot;auths&quot;:{  &quot;cloud.openshift.com&quot;:{    &quot;auth&quot;:&quot;b3Blb=&quot;,    &quot;email&quot;:&quot;you@example.com&quot;  },  &quot;quay.io&quot;:{    &quot;auth&quot;:&quot;b3Blb=&quot;,    &quot;email&quot;:&quot;you@example.com&quot;  } } }</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>networking</th>
<th>The configuration for the cluster network.</th>
<th>Object</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking.networkType</td>
<td>The cluster network provider Containe Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods.</td>
<td>An array of objects. For example: networking:</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.128.0.0/14 with a host prefix of /23.</td>
<td>clusterNetwork:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>- cidr: 10.128.0.0/14</td>
</tr>
<tr>
<td></td>
<td></td>

<tr>
<td>networking.clusterNetwork.cidr</td>
<td>Required if you use networking.clusterNetwork. An IP address block.</td>
<td>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32.</td>
</tr>
<tr>
<td></td>
<td>An IPv4 network.</td>
<td></td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if</td>
<td>A subnet prefix.</td>
</tr>
<tr>
<td></td>
<td>hostPrefix is set to 23 then each node is assigned a /23 subnet out of the</td>
<td>The default value is 23.</td>
</tr>
<tr>
<td></td>
<td>given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP</td>
<td></td>
</tr>
<tr>
<td></td>
<td>addresses.</td>
<td></td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16</td>
<td>An array with an IP address block in CIDR format. For example:</td>
</tr>
<tr>
<td></td>
<td>The OpenShift SDN and OVN-Kubernetes network providers support only a single</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td>IP address block for the service network.</td>
<td>serviceNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 172.30.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork</td>
<td>The IP address blocks for machines.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td>If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>networking:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>machineNetwork:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- cidr: 10.0.0.0/16</td>
</tr>
<tr>
<td>networking.machineNetwork.cidr</td>
<td>Required if you use networking.machineNetwork. An IP address block.</td>
<td>An IP network block in CIDR notation. For example, 10.0.0.0/16.</td>
</tr>
<tr>
<td></td>
<td>The default value is 10.0.0.0/16 for all platforms other than libvirt.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For libvirt, the default value is 192.168.126.0/24.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in.</td>
</tr>
</tbody>
</table>

### 6.8.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.24. Optional parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalTrustBundle</td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td>compute</td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of <code>MachinePool</code> objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>compute.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
<tr>
<td>compute.hyperthreading</td>
<td>Whether to enable or disable simultaneous multithreading, or <strong>hyperthreading</strong>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td></td>
<td><strong>IMPORTANT</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td></td>
</tr>
<tr>
<td>compute.name</td>
<td>Required if you use <code>compute</code>. The name of the machine pool.</td>
<td><code>worker</code></td>
</tr>
<tr>
<td>compute.platform</td>
<td>Required if you use <code>compute</code>. Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <code>controlPlane.platform</code> parameter value.</td>
<td><code>aws, azure, gcp, openstack, ovirt, vsphere, or {}</code></td>
</tr>
<tr>
<td>compute.replicas</td>
<td>The number of compute machines, which are also known as worker machines, to provision.</td>
<td>A positive integer greater than or equal to <code>2</code>. The default value is <code>3</code>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controlPlane</td>
<td>The configuration for the machines that comprise the control plane.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td>controlPlane.architecture</td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are amd64 (the default).</td>
<td>String</td>
</tr>
<tr>
<td>controlPlane.hypertreading</td>
<td>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</td>
<td>Enabled or Disabled</td>
</tr>
<tr>
<td>controlPlane.name</td>
<td>Required if you use controlPlane. The name of the machine pool.</td>
<td>master</td>
</tr>
<tr>
<td>controlPlane.platform</td>
<td>Required if you use controlPlane. Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.</td>
<td>aws, azure, gcp, openstack, ovirt, vsphere, or {}</td>
</tr>
<tr>
<td>controlPlane.replicas</td>
<td>The number of control plane machines to provision.</td>
<td>The only supported value is 3, which is the default value.</td>
</tr>
</tbody>
</table>
### credentialsMode

The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (“”).</td>
</tr>
</tbody>
</table>
**fips**
Enable or disable FIPS mode. The default is **false** (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**
The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**
If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>imageContentSources</strong></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <strong>source</strong> and, optionally, <strong>mirrors</strong>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><strong>imageContentSources.source</strong></td>
<td>Required if you use <strong>imageContentSources</strong>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><strong>imageContentSources.mirrors</strong></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><strong>publish</strong></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <strong>publish</strong> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
### 6.8.5.14. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 6.25. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>platform.gcp.network</strong></td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td><strong>platform.gcp.type</strong></td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td><strong>platform.gcp.zones</strong></td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td><strong>platform.gcp.controlPlaneSubnet</strong></td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td><strong>platform.gcp.computeSubnet</strong></td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td><strong>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.name</strong></td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td><strong>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</strong></td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on <a href="#">Cloud KMS locations</a>.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.location</td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on <a href="#">Cloud KMS locations</a>.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td>compute.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</td>
<td>For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
</tbody>
</table>

### 6.8.5.2. Sample customized `install-config.yaml` file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane:
  hypethreading: Enabled
  name: master
  platform:
    gcp:
      type: n2-standard-4
```

846
zones:
- us-central1-a
- us-central1-c

osDisk:
  diskType: pd-ssd
diskSizeGB: 256
encryptionKey: 5
  kmsKey:
    name: worker-key
    keyRing: test-machine-keys
    location: global
    projectId: project-id
replicas: 3
compute: 6
  - hyperthreading: Enabled 8
name: worker
platform:
gcp:
  type: n2-standard-4
zones:
- us-central1-a
- us-central1-c
osDisk:
  diskType: pd-standard
diskSizeGB: 128
encryptionKey: 9
  kmsKey:
    name: worker-key
    keyRing: test-machine-keys
    location: global
    projectId: project-id
replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
- cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
gcp:
  projectId: openshift-production 11
region: us-central1 12
network: existing_vpc 13
  controlPlaneSubnet: controlPlaneSubnet 14
computeSubnet: computeSubnet 15
pullSecret: '{"auths": ...}' 16
fips: false 17
sshKey: ssh-ed25519 AAAA... 18
1. **Required.** The installation program prompts you for this value.

2. If you do not provide these parameters and values, the installation program provides the default value.

3. The **controlPlane** section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, `-`, and the first line of the **controlPlane** section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

4. Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

   **IMPORTANT**

   If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

5. **Optional:** The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the `service-<project_number>@compute-system.iam.gserviceaccount.com` pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

6. Specify the name of an existing VPC.

7. Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.

8. Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.

9. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

   **IMPORTANT**

   The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

10. You can optionally provide the **sshKey** value that you use to access the machines in your cluster.
NOTE
For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

6.8.5.3. Create an Ingress Controller with global access on GCP
You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

Prerequisites
- You created the `install-config.yaml` and complete any modifications to it.

Procedure
Create an Ingress Controller with global access on a new GCP cluster.

1. Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir=<installation_directory>  
```

   1 For `<installation_directory>`, specify the name of the directory that contains the `install-config.yaml` file for your cluster.

After creating the file, several network configuration files are in the `manifests/` directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

Example output
```
cluster-ingress-default-ingresscontroller.yaml
```

2. Open the `cluster-ingress-default-ingresscontroller.yaml` file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

Sample clientAccess configuration to Global

```
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global  
          type: GCP
          scope: Internal  
          type: LoadBalancerService
```

   1 Set `gcp.clientAccess` to `Global`.  
   2
6.8.6. Additional resources

- Enabling customer-managed encryption keys for a machine set

6.8.6.1. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

NOTE

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>  # 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port>  # 2
     noProxy: example.com  # 3
   additionalTrustBundle: |
     -----BEGIN CERTIFICATE-----
     -----END CERTIFICATE-----
   ```
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

Only the Proxy object named cluster is supported, and no additional proxies can be created.

6.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

You can run the create cluster command of the installation program only once, during initial installation.
Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
   - The `GOOGLE_CREDENTIALS`, `GOOGLE_CLOUD_KEYFILE_JSON`, or `GCloud_KEYFILE_JSON` environment variables
   - The `~/.gcp/osServiceAccount.json` file
   - The `gcloud cli` default credentials

2. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```bash
   $ ./openshift-install create cluster --dir=<installation_directory> \\
   --log-level=info
   ```

   **1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.

   **2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

   **NOTE**
   If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

   When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

   **Example output**

   ```bash
   ...  
   INFO Install complete! 
   INFO To access the cluster as the system:admin user when using 'oc', run 'export 
   KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig' 
   INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com 
   INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wi5AL" 
   INFO Time elapsed: 36m22s 
   ```
NOTE

The cluster access and credential information also outputs to 
<installation_directory>/openshift_install.log when an installation succeeds.

IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
   - If you assigned the Owner role to your service account, you can remove that role and replace it with the Viewer role.
   - If you included the Service Account Key Admin role, you can remove it.

6.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.
4. Unpack the archive:

   $ tar xvzf <file>
5. Place the `oc` binary in a directory that is on your `PATH`. To check your `PATH`, execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your `PATH`. To check your `PATH`, open the command prompt and execute the following command:

```
C:\> path
```

After you install the CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your `PATH`. To check your `PATH`, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the `oc` command:
6.8.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

**Procedure**

1. Export the **kubeadmin** credentials:

   ```bash
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```
   
   1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

   ```bash
   $ oc whoami
   ```

   **Example output**

   ```
   system:admin
   ```

6.8.10. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.9. INSTALLING A PRIVATE CLUSTER ON GCP

In OpenShift Container Platform version 4.8, you can install a private cluster into an existing VPC on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

6.9.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You configured a GCP project to host the cluster.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

6.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the Internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

To deploy a private cluster, you must use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

Additionally, you must deploy a private cluster from a machine that has access the API services for the cloud you provision to, the hosts on the network that you provision, and to the internet to obtain installation media. You can use any machine that meets these access requirements and follows your company’s guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

6.9.2.1. Private clusters in GCP

To create a private cluster on Google Cloud Platform (GCP), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

The cluster still requires access to Internet to access the GCP APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public network load balancers, which support public ingress
- A public DNS zone that matches the baseDomain for the cluster

The installation program does use the baseDomain that you specify to create a private DNS zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

Because it is not possible to limit access to external load balancers based on source tags, the private cluster uses only internal load balancers to allow access to internal instances.
The internal load balancer relies on instance groups rather than the target pools that the network load balancers use. The installation program creates instance groups for each zone, even if there is no instance in that group.

- The cluster IP address is internal only.
- One forwarding rule manages both the Kubernetes API and machine config server ports.
- The backend service is comprised of each zone’s instance group and, while it exists, the bootstrap instance group.
- The firewall uses a single rule that is based on only internal source ranges.

6.9.2.1. Limitations

No health check for the Machine config server, `/healthz`, runs because of a difference in load balancer functionality. Two internal load balancers cannot share a single IP address, but two network load balancers can share a single external IP address. Instead, the health of an instance is determined entirely by the `/readyz` check on port 6443.

6.9.3. About using a custom VPC

In OpenShift Container Platform 4.8, you can deploy a cluster into an existing VPC in Google Cloud Platform (GCP). If you do, you must also use existing subnets within the VPC and routing rules.

By deploying OpenShift Container Platform into an existing GCP VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company’s guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself.

6.9.3.1. Requirements for using your VPC

The installation program will no longer create the following components:

- VPC
- Subnets
- Cloud router
- Cloud NAT
- NAT IP addresses

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC and subnets must meet the following characteristics:

- The VPC must be in the same GCP project that you deploy the OpenShift Container Platform cluster to.
- To allow access to the Internet from the control plane and compute machines, you must configure cloud NAT on the subnets to allow egress to it. These machines do not have a public
address. Even if you do not require access to the Internet, you must allow egress to the VPC network to obtain the installation program and images. Because multiple cloud NATs cannot be configured on the shared subnets, the installation program cannot configure it.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist and belong to the VPC that you specified.
- The subnet CIDRs belong to the machine CIDR.
- You must provide a subnet to deploy the cluster control plane and compute machines to. You can use the same subnet for both machine types.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted.

### 6.9.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or Ingress rules.

The GCP credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage, and nodes.

### 6.9.3.3. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is preserved by firewall rules that reference the machines in your cluster by the cluster’s infrastructure ID. Only traffic within the cluster is allowed.

If you deploy multiple clusters to the same VPC, the following components might share access between clusters:

- The API, which is globally available with an external publishing strategy or available throughout the network in an internal publishing strategy
- Debugging tools, such as ports on VM instances that are open to the machine CIDR for SSH and ICMP access

### 6.9.4. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the [Red Hat OpenShift Cluster Manager (OCM)](https://access.redhat.com/documentation/en-us/red_hat_open_shift/4.8/html-single/installing#internet-telemetry-access-openshift-container-platform).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use `subscription watch` to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.
You must have Internet access to:

- Access the **Red Hat OpenShift Cluster Manager** page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access **Quay.io** to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as **AWS key pairs**.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```bash
   $ ssh-keygen -t ed25519 -N " -f <path> </file_name>
   ```
Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the x86_64 architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   
   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:
   
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `.openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

   ```
   $ eval "$(ssh-agent -s)"
   
   Example output
   
   Agent pid 31874
   ```

   If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

   1. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   **Example output**

   ```
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
   ```
2. Set the **GOOGLE_APPLICATION_CREDENTIALS** environment variable to the full path to your service account private key file.

   `export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"`

3. Verify that the credentials were applied.

   `gcloud auth list`

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 6.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

   **IMPORTANT**

   The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

   **IMPORTANT**

   Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

   `$ tar xvf openshift-install-linux.tar.gz`

5. From the **Pull Secret** page on the Red Hat OpenShift Cluster Manager site, download your
6.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the Internet, you must manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   ```bash
   mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

   **NOTE**

   For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.
6.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster’s platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

6.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;</code> . <code>&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as <code>example.com</code>.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the name parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}}. {{.baseDomain}}.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: aws, baremetal, azure, openstack, ovirt, vsphere. For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>

</tr>
</tbody>
</table>

**6.9.7.1.2. Network configuration parameters**

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.27. Network parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong> You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.network</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork.cidr</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example: networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</td>
</tr>
<tr>
<td>networking.clusterNetwork.hostPrefix</td>
<td>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides 510 (2^(32 - 23) - 2) pod IP addresses.</td>
<td>A subnet prefix. The default value is 23.</td>
</tr>
<tr>
<td>networking.serviceNetwork</td>
<td>The IP address block for services. The default value is 172.30.0.0/16. The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</td>
<td>An array with an IP address block in CIDR format. For example: networking: serviceNetwork: - 172.30.0.0/16</td>
</tr>
</tbody>
</table>
### networking.machine

**networking.machineNetwork**

The IP address blocks for machines.

If you specify multiple IP address blocks, the blocks must not overlap.

An array of objects. For example:

```
networking:
  machineNetwork:
    - cidr: 10.0.0.0/16
```

### networking.machineNetwork.cidr

Required if you use `networking.machineNetwork`. An IP address block. The default value is `10.0.0.0/16` for all platforms other than libvirt. For libvirt, the default value is `192.168.126.0/24`.

An IP network block in CIDR notation.

For example, `10.0.0.0/16`.

**NOTE**

Set the `networking.machineNetwork` to match the CIDR that the preferred NIC resides in.

### 6.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.28. Optional parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>additionalTrustBundle</code></td>
<td>A PEM-encoded X.509 certificate bundle that is added to the nodes’ trusted certificate store. This trust bundle may also be used when a proxy has been configured.</td>
<td>String</td>
</tr>
<tr>
<td><code>compute</code></td>
<td>The configuration for the machines that comprise the compute nodes.</td>
<td>Array of MachinePool objects. For details, see the following &quot;Machine-pool&quot; table.</td>
</tr>
<tr>
<td><code>compute.architecture</code></td>
<td>Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <code>amd64</code> (the default).</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether to enable or disable simultaneous multithreading, or **hyperthreading**, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.

<table>
<thead>

<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>credentialsMode</td>
<td>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</td>
<td>Mint, Passthrough, Manual, or an empty string (&quot;&quot;&quot;).</td>
</tr>
</tbody>
</table>

**NOTE**

Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the Cloud Credential Operator entry in the Red Hat Operators reference content.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fips</code></td>
<td>Enable or disable FIPS mode. The default is <strong>false</strong> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</td>
<td><strong>false</strong> or <strong>true</strong></td>
</tr>
</tbody>
</table>

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86_64** architecture.

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

<table>
<thead>
<tr>

<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageContentSources</code></td>
<td>Sources and repositories for the release-image content.</td>
<td>Array of objects. Includes a <code>source</code> and, optionally, <code>mirrors</code>, as described in the following rows of this table.</td>
</tr>
<tr>
<td><code>imageContentSources.source</code></td>
<td>Required if you use <code>imageContentSources</code>. Specify the repository that users refer to, for example, in image pull specifications.</td>
<td>String</td>
</tr>
<tr>
<td><code>imageContentSources.mirrors</code></td>
<td>Specify one or more repositories that may also contain the same images.</td>
<td>Array of strings</td>
</tr>
<tr>
<td><code>publish</code></td>
<td>How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.</td>
<td><strong>Internal</strong> or <strong>External</strong>. To deploy a private cluster, which cannot be accessed from the internet, set <code>publish</code> to <strong>Internal</strong>. The default value is <strong>External</strong>.</td>
</tr>
</tbody>
</table>
### sshKey

The SSH key or keys to authenticate access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.

One or more keys. For example:

```
sshKey:
  <key1>
  <key2>
  <key3>
```

---

### 6.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

**Table 6.29. Additional GCP parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform.gcp.network</td>
<td>The name of the existing VPC that you want to deploy your cluster to.</td>
<td>String.</td>
</tr>
<tr>
<td>platform.gcp.type</td>
<td>The GCP machine type.</td>
<td>The GCP machine type.</td>
</tr>
<tr>
<td>platform.gcp.zones</td>
<td>The availability zones where the installation program creates machines for the specified MachinePool.</td>
<td>A list of valid GCP availability zones, such as <code>us-central1-a</code>, in a YAML sequence.</td>
</tr>
<tr>
<td>platform.gcp.controlPlaneSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your control plane machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>platform.gcp.computeSubnet</td>
<td>The name of the existing subnet in your VPC that you want to deploy your compute machines to.</td>
<td>The subnet name.</td>
</tr>
<tr>
<td>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.name</td>
<td>The name of the customer managed encryption key to be used for control plane machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</code></td>
<td>For control plane machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.location</code></td>
<td>For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td><code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</code></td>
<td>For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKey.name</code></td>
<td>The name of the customer managed encryption key to be used for compute machine disk encryption.</td>
<td>The encryption key name.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKey.keyRing</code></td>
<td>For compute machines, the name of the KMS key ring to which the KMS key belongs.</td>
<td>The KMS key ring name.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKey.location</code></td>
<td>For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google’s documentation on Cloud KMS locations.</td>
<td>The GCP location for the key ring.</td>
</tr>
<tr>
<td><code>compute.platform.gcp.osDisk.encryptionKey.kmsKey.projectID</code></td>
<td>For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.</td>
<td>The GCP project ID.</td>
</tr>
</tbody>
</table>

### 6.9.7.2. Sample customized `install-config.yaml` file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.

```yaml
apiVersion: v1
baseDomain: example.com
controlPlane: 2 3
```
hyperthreading: Enabled
name: master
platform:
gcp:
  type: n2-standard-4
  zones:
  - us-central1-a
  - us-central1-c
osDisk:
  diskType: pd-ssd
diskSizeGB: 256
encryptionKey:
  name: worker-key
  kmsKey:
    name: worker-key
    keyRing: test-machine-keys
    location: global
    projectID: project-id
replicas: 3
compute: 6

- hyperthreading: Enabled
name: worker
platform:
gcp:
  type: n2-standard-4
  zones:
  - us-central1-a
  - us-central1-c
osDisk:
  diskType: pd-standard
diskSizeGB: 128
encryptionKey:
  name: worker-key
  kmsKey:
    name: worker-key
    keyRing: test-machine-keys
    location: global
    projectID: project-id
replicas: 3
metadata:
  name: test-cluster
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
gcp:
  projectID: openshift-production
  region: us-central1
  network: existing_vpc
  controlPlaneSubnet: control_plane_subnet
  computeSubnet: compute_subnet
pullSecret: '{"auths": ...}'
fips: false
sshKey: ssh-ed25519 AAAA...
publish: Internal

10. Required. The installation program prompts you for this value.

6. If you do not provide these parameters and values, the installation program provides the default value.

7. The controlPlane section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the compute section must begin with a hyphen, -, and the first line of the controlPlane section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

8. Whether to enable or disable simultaneous multithreading, or hyperthreading. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to Disabled. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as n1-standard-8, for your machines if you disable simultaneous multithreading.

9. Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the service-<project_number>-@compute-system.iam.gserviceaccount.com pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

13. Specify the name of an existing VPC.

14. Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.

15. Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.

17. Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the x86_64 architecture.
You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

How to publish the user-facing endpoints of your cluster. Set `publish` to `Internal` to deploy a private cluster, which cannot be accessed from the Internet. The default value is `External`.

### 6.9.8. Additional resources

- Enabling customer-managed encryption keys for a machine set

### 6.9.8.1. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
```
A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

NOTE
The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

NOTE
Only the Proxy object named cluster is supported, and no additional proxies can be created.
You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the `create cluster` command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

   ```
   $ ./openshift-install create cluster --dir=<installation_directory> \\
   --log-level=info
   ```

   1 For `<installation_directory>`, specify the
   2 To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the `kubeadmin` user, display in your terminal.

**Example output**

```
... INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubecfg'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"
INFO Time elapsed: 36m22s
```
IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

6.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   $ tar xvzf <file>

5. Place the oc binary in a directory that is on your PATH.
   To check your PATH, execute the following command:

   $ echo $PATH

After you install the CLI, it is available using the oc command:

   $ oc <command>

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.
Procedure

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.

4. Unzip the archive with a ZIP program.

5. Move the `oc` binary to a directory that is on your **PATH**.
   To check your **PATH**, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

Procedure

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.

4. Unpack and unzip the archive.

5. Move the `oc` binary to a directory on your **PATH**.
   To check your **PATH**, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

**6.9.11. Logging in to the cluster by using the CLI**

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

**Prerequisites**

- You deployed an OpenShift Container Platform cluster.
You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

6.9.12. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.

6.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster on Google Cloud Platform (GCP) that uses infrastructure that you provide.

The steps for performing a user-provided infrastructure install are outlined here. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

6.10.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
You read the documentation on selecting a cluster installation method and preparing it for users.

If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can manually create and maintain IAM credentials.

NOTE
Be sure to also review this site list if you are configuring a proxy.

6.10.2. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The kube-controller-manager only approves the kubelet client CSRs. The machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

6.10.3. Configuring your GCP project

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

6.10.3.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

Procedure

- Create a project to host your OpenShift Container Platform cluster. See Creating and Managing Projects in the GCP documentation.

IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the api-int.<cluster_name>.<base_domain> URL; the Premium Tier is required for internal load balancing.

6.10.3.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites
• You created a project to host your cluster.

Procedure

• Enable the following required API services in the project that hosts your cluster. See Enabling services in the GCP documentation.

Table 6.30. Required API services

<table>
<thead>
<tr>
<th>API service</th>
<th>Console service name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Deployment Manager V2 API</td>
<td>deploymentmanager.googleapis.com</td>
</tr>
<tr>
<td>Compute Engine API</td>
<td>compute.googleapis.com</td>
</tr>
<tr>
<td>Google Cloud APIs</td>
<td>cloudapis.googleapis.com</td>
</tr>
<tr>
<td>Cloud Resource Manager API</td>
<td>cloudresourcemanager.googleapis.com</td>
</tr>
<tr>
<td>Google DNS API</td>
<td>dns.googleapis.com</td>
</tr>
<tr>
<td>IAM Service Account Credentials API</td>
<td>iamcredentials.googleapis.com</td>
</tr>
<tr>
<td>Identity and Access Management (IAM) API</td>
<td>iam.googleapis.com</td>
</tr>
<tr>
<td>Service Management API</td>
<td>servicemanagement.googleapis.com</td>
</tr>
<tr>
<td>Service Usage API</td>
<td>serviceusage.googleapis.com</td>
</tr>
<tr>
<td>Google Cloud Storage JSON API</td>
<td>storage-api.googleapis.com</td>
</tr>
<tr>
<td>Cloud Storage</td>
<td>storage-component.googleapis.com</td>
</tr>
</tbody>
</table>

6.10.3.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.
NOTE

If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see Google Domains.

2. Create a public hosted zone for your domain or subdomain in your GCP project. See Creating public zones in the GCP documentation. Use an appropriate root domain, such as openshiftcorp.com, or subdomain, such as clusters.openshiftcorp.com.

3. Extract the new authoritative name servers from the hosted zone records. See Look up your Cloud DNS name servers in the GCP documentation. You typically have four name servers.

4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: How to switch to custom name servers.

5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See Migrating to Cloud DNS in the GCP documentation.

6. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain. This process might include a request to your company’s IT department or the division that controls the root domain and DNS services for your company.

6.10.3.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default Quotas do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

Table 6.31. GCP resources used in a default cluster

<table>
<thead>
<tr>
<th>Service</th>
<th>Component</th>
<th>Location</th>
<th>Total resources required</th>
<th>Resources removed after bootstrap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service account</td>
<td>IAM</td>
<td>Global</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>Firewall rules</td>
<td>Networking</td>
<td>Global</td>
<td>11</td>
<td>1</td>
</tr>
<tr>
<td>Forwarding rules</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Health checks</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Images</td>
<td>Compute</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Networks</td>
<td>Networking</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>
### 6.10.3.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides

<table>
<thead>
<tr>
<th>Service</th>
<th>Component</th>
<th>Location</th>
<th>Total resources required</th>
<th>Resources removed after bootstrap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routers</td>
<td>Networking</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Routes</td>
<td>Networking</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Subnetworks</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Target pools</td>
<td>Networking</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
</tbody>
</table>

**NOTE**

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- asia-east2
- asia-northeast2
- asia-south1
- australia-southeast1
- europe-north1
- europe-west2
- europe-west3
- europe-west6
- northamerica-northeast1
- southamerica-east1
- us-west2

You can increase resource quotas from the [GCP console](https://console.cloud.google.com), but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.
OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

**Prerequisites**

- You created a project to host your cluster.

**Procedure**

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See Creating a service account in the GCP documentation.

2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the Owner role to it. See Granting roles to a service account for specific resources.

   **NOTE**

   While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See Creating service account keys in the GCP documentation.

   The service account key is required to create a cluster.

**6.10.3.5.1. Required GCP permissions**

When you attach the Owner role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

**Required roles for the installation program**

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

**Required roles for creating network resources during installation**

- DNS Administrator

**Required roles for user-provisioned GCP infrastructure**
- Deployment Manager Editor
- Service Account Key Admin

**Optional roles**

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

**Table 6.32. GCP service account permissions**

<table>
<thead>
<tr>
<th>Account</th>
<th>Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Control Plane</strong></td>
<td>roles/compute.instanceAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.networkAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.securityAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
<tr>
<td></td>
<td>roles/iam.serviceAccountUser</td>
</tr>
<tr>
<td><strong>Compute</strong></td>
<td>roles/compute.viewer</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
</tbody>
</table>

**6.10.3.6. Supported GCP regions**

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- asia-east1 (Changhua County, Taiwan)
- asia-east2 (Hong Kong)
- asia-northeast1 (Tokyo, Japan)
- asia-northeast2 (Osaka, Japan)
- asia-northeast3 (Seoul, South Korea)
- asia-south1 (Mumbai, India)
- asia-southeast1 (Jurong West, Singapore)
- asia-southeast2 (Jakarta, Indonesia)
- australia-southeast1 (Sydney, Australia)
- europe-central2 (Warsaw, Poland)
6.10.3.7. Installing and configuring CLI tools for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must install and configure the CLI tools for GCP.

Prerequisites

- You created a project to host your cluster.
- You created a service account and granted it the required permissions.

Procedure

1. Install the following binaries in $PATH:
   - gcloud
   - gsutil

   See Install the latest Cloud SDK version in the GCP documentation.

2. Authenticate using the gcloud tool with your configured service account.
   See Authorizing with a service account in the GCP documentation.

6.10.4. Creating the installation files for GCP
To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `var` partition during the preparation phases of installation.

### 6.10.4.1. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- `/var/lib/containers`: Holds container-related content that can grow as more images and containers are added to a system.
- `/var/lib/etcd`: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- `/var`: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a `/var` directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because `/var` must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate `/var` partition by creating a machine config that is inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

**Prerequisites**

- If container storage is on the root partition, ensure that this root partition is mounted with the `pquota` option by including `rootflags=pquota` in the GRUB command line.

- If the container storage is on a partition that is mounted by `/etc/fstab`, ensure that the following mount option is included in the `/etc/fstab` file:

  ```
  /dev/sdb1 /var xfs defaults,pquota 0 0
  ```

- If the container storage is on a partition that is mounted by `systemd`, ensure that the `MachineConfig` object includes the following mount option as in this example:

  ```yaml
  spec:
    config:
      ignition:
        version: 3.2.0
  ```
Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```shell
   $ mkdir $HOME/clusterconfig
   ```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   ```shell
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ? SSH Public Key ...
   $ ls $HOME/clusterconfig/openshift/
   99_kubeadmin-password-secret.yaml
   99_openshift-cluster-api_master-machines-0.yaml
   99_openshift-cluster-api_master-machines-1.yaml
   99_openshift-cluster-api_master-machines-2.yaml
   ...
   ```

3. Create a `MachineConfig` object and add it to a file in the `openshift` directory. For example, name the file `98-var-partition.yaml`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This attaches storage to a separate `/var` directory.

```
apiVersion: machineconfiguration.openshift.io/v1
kind: MachineConfig
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
name: 98-var-partition
spec:
```
The storage device name of the disk that you want to partition.

When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

4. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:

```bash
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth  bootstrap.ign  master.ign  metadata.json  worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

6.10.4.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
Procedure

1. Create the `install-config.yaml` file.
   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory>
   
   For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
   
   IMPORTANT
   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.
   
   b. At the prompts, provide the configuration details for your cloud:
      i. Optional: Select an SSH key to use to access your cluster machines.
      
      ```
      NOTE
      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.
      ```
      
      ii. Select `gcp` as the platform to target.
      
      iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
      
      iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
      
      v. Select the region to deploy the cluster to.
      
      vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
      
      vii. Enter a descriptive name for your cluster.
      
      viii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.
      
   c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting `install-config.yaml` file to set `replicas` to `0` for the `compute` pool.
      ```
1. Set to 0.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

2. In the `install-config.yaml` file:

   ```yaml
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   ```

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.10.4.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

**Prerequisites**
You have an existing `install-config.yaml` file.

You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the `Proxy` object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The `Proxy` object's `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the `Proxy` object's `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

**Procedure**

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

   ```yaml
   apiVersion: v1
   baseDomain: my.domain.com
   proxy:
     httpProxy: http://<username>:<pswd>@<ip>:<port>  # 1
     httpsProxy: https://<username>:<pswd>@<ip>:<port>  # 2
     noProxy: example.com  # 3
     additionalTrustBundle: |
       -----BEGIN CERTIFICATE-----
       <MY_TRUSTED_CA_CERT>
       -----END CERTIFICATE-----
   ...
   ...
   ...
   ```

1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be `http`. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpProxy` value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then `httpProxy` is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an `httpsProxy` value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use * to bypass the proxy for all destinations.
If provided, the installation program generates a config map that is named `user-ca-bundle` in the `openshift-config` namespace that contains one or more additional CA certificates.

**NOTE**

The installation program does not support the proxy `readinessEndpoints` field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named `cluster` that uses the proxy settings in the provided `install-config.yaml` file. If no proxy settings are provided, a `cluster Proxy` object is still created, but it will have a nil `spec`.

**NOTE**

Only the `Proxy` object named `cluster` is supported, and no additional proxies can be created.

### 6.10.4.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program.
- You created the `install-config.yaml` installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>
   ```

   **Example output**

   ```
   # Example output
   ```
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: install_dir/manifests and install_dir/openshift

1. For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*_.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Optional: If you do not want the cluster to provision compute machines, remove the Kubernetes manifest files that define the worker machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*_.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.

   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.

   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
   name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone:
       id: mycluster-100419-private-zone
     publicZone:
       id: example.openshift.com
   status: {}
   ```

   Remove this section completely.

   If you do so, you must add ingress DNS records manually in a later step.
6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir=<installation_directory>
```

For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

```
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

Additional resources

- Optional: Adding the ingress DNS records

6.10.5. Exporting common variables

6.10.5.1. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Google Cloud Platform (GCP). The infrastructure name is also used to locate the appropriate GCP resources during an OpenShift Container Platform installation. The provided Deployment Manager templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the `jq` package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
Example output

```bash
openshift-vw9j6
```

1  The output of this command is your cluster name and a random string.

6.10.5.2. Exporting common variables for Deployment Manager templates

You must export a common set of variables that are used with the provided Deployment Manager templates used to assist in completing a user-provided infrastructure install on Google Cloud Platform (GCP).

**NOTE**

Specific Deployment Manager templates can also require additional exported variables, which are detailed in their related procedures.

**Prerequisites**

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Generate the Ignition config files for your cluster.
- Install the **jq** package.

**Procedure**

1. Export the following common variables to be used by the provided Deployment Manager templates:

   ```bash
   $ export BASE_DOMAIN='<base_domain>'
   $ export BASE_DOMAIN_ZONE_NAME='<base_domain_zone_name>'
   $ export NETWORK_CIDR='10.0.0.0/16'
   $ export MASTER_SUBNET_CIDR='10.0.0.0/17'
   $ export WORKER_SUBNET_CIDR='10.0.128.0/17'
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   $ export CLUSTER_NAME=`jq -r .clusterName <installation_directory>/metadata.json`
   $ export INFRA_ID=`jq -r .infraID <installation_directory>/metadata.json`
   $ export PROJECT_NAME=`jq -r .gcp.projectID <installation_directory>/metadata.json`
   $ export REGION=`jq -r .gcp.region <installation_directory>/metadata.json`
   ```

   1  For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

6.10.6. Creating a VPC in GCP

You must create a VPC in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements. One way to create the VPC is to modify the provided Deployment Manager template.
NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.

Procedure

1. Copy the template from the Deployment Manager template for the VPC section of this topic and save it as 01_vpc.py on your computer. This template describes the VPC that your cluster requires.

2. Create a 01_vpc.yaml resource definition file:

   ```
   $ cat <<EOF >01_vpc.yaml
   imports:
   - path: 01_vpc.py
   resources:
   - name: cluster-vpc
     type: 01_vpc.py
     properties:
       infra_id: '${INFRA_ID}'
       region: '${REGION}'
       master_subnet_cidr: '${MASTER_SUBNET_CIDR}'
       worker_subnet_cidr: '${WORKER_SUBNET_CIDR}'
   EOF
   ```

   - `infra_id` is the INFRA_ID infrastructure name from the extraction step.
   - `region` is the region to deploy the cluster into, for example us-central1.
   - `master_subnet_cidr` is the CIDR for the master subnet, for example 10.0.0.0/19.
   - `worker_subnet_cidr` is the CIDR for the worker subnet, for example 10.0.32.0/19.

3. Create the deployment by using the gcloud CLI:

   ```
   $ gcloud deployment-manager deployments create ${INFRA_ID}-vpc --config 01_vpc.yaml
   ```

6.10.6.1. Deployment Manager template for the VPC

You can use the following Deployment Manager template to deploy the VPC that you need for your OpenShift Container Platform cluster:

```
Example 6.1. 01_vpc.py Deployment Manager template
```
def GenerateConfig(context):
    resources = [
        {
            'name': context.properties['infra_id'] + '-network',
            'type': 'compute.v1.network',
            'properties': {
                'region': context.properties['region'],
                'autoCreateSubnetworks': False
            }
        }, {
            'name': context.properties['infra_id'] + '-master-subnet',
            'type': 'compute.v1.subnetwork',
            'properties': {
                'region': context.properties['region'],
                'network': '$(ref. ' + context.properties['infra_id'] + '-network.selfLink)',
                'ipCidrRange': context.properties['master_subnet_cidr']
            }
        }, {
            'name': context.properties['infra_id'] + '-worker-subnet',
            'type': 'compute.v1.subnetwork',
            'properties': {
                'region': context.properties['region'],
                'network': '$(ref. ' + context.properties['infra_id'] + '-network.selfLink)',
                'ipCidrRange': context.properties['worker_subnet_cidr']
            }
        }, {
            'name': context.properties['infra_id'] + '-router',
            'type': 'compute.v1.router',
            'properties': {
                'region': context.properties['region'],
                'network': '$(ref. ' + context.properties['infra_id'] + '-network.selfLink)',
                'nats': [
                    {
                        'name': context.properties['infra_id'] + '-nat-master',
                        'natIpAllocateOption': 'AUTO_ONLY',
                        'minPortsPerVm': 7168,
                        'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
                        'subnetworks': [
                            {
                                'name': '$(ref. ' + context.properties['infra_id'] + '-master-subnet.selfLink)',
                                'sourceIpRangesToNat': ['ALL_IP_RANGES']
                            }
                        ],
                        'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
                        'subnetworks': [
                            {
                                'name': '$(ref. ' + context.properties['infra_id'] + '-worker-subnet.selfLink)',
                                'sourceIpRangesToNat': ['ALL_IP_RANGES']
                            }
                        ]
                    }
                ]
            }
        }
    ]
    return {'resources': resources}
6.10.7. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in initramfs during boot to fetch their Ignition config files.

6.10.7.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as localhost or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

6.10.7.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

**IMPORTANT**

In connected OpenShift Container Platform environments, all nodes are required to have Internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.33. Ports used for all-machine to all-machine communications

<table>
<thead>

6.10.8. Creating load balancers in GCP

You must configure load balancers in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

**Procedure**

1. Copy the template from the Deployment Manager template for the internal load balancer section of this topic and save it as `02_lb_int.py` on your computer. This template describes the internal load balancing objects that your cluster requires.

2. For an external cluster, also copy the template from the Deployment Manager template for the external load balancer section of this topic and save it as `02_lb_ext.py` on your computer. This template describes the external load balancing objects that your cluster requires.
3. Export the variables that the deployment template uses:
   a. Export the cluster network location:

   ```
   $ export CLUSTER_NETWORK="$(gcloud compute networks describe ${INFRA_ID}-network --format json | jq -r .selfLink)
   ```

   b. Export the control plane subnet location:

   ```
   $ export CONTROL_SUBNET="$(gcloud compute networks subnets describe ${INFRA_ID}-master-subnet --region=${REGION} --format json | jq -r .selfLink)"
   ```

   c. Export the three zones that the cluster uses:

   ```
   $ export ZONE_0="$(gcloud compute regions describe ${REGION} --format=json | jq -r .zones[0] | cut -d "/" -f9)"
   $ export ZONE_1="$(gcloud compute regions describe ${REGION} --format=json | jq -r .zones[1] | cut -d "/" -f9)"
   $ export ZONE_2="$(gcloud compute regions describe ${REGION} --format=json | jq -r .zones[2] | cut -d "/" -f9)"
   ```

4. Create a `02_infra.yaml` resource definition file:

   ```
   $ cat <<EOF >02_infra.yaml
   imports:
   - path: 02_lb_ext.py
   - path: 02_lb_int.py
   resources:
   - name: cluster-lb-ext
     type: 02_lb_ext.py
     properties:
     infra_id: '${INFRA_ID}'
     region: '${REGION}'
   - name: cluster-lb-int
     type: 02_lb_int.py
     properties:
     cluster_network: '${CLUSTER_NETWORK}'
     control_subnet: '${CONTROL_SUBNET}'
     infra_id: '${INFRA_ID}'
     region: '${REGION}'
     zones:
     - '${ZONE_0}'
     - '${ZONE_1}'
     - '${ZONE_2}'
   EOF
   ```

   **Required only when deploying an external cluster.**

   **infra_id** is the INFRA_ID infrastructure name from the extraction step.

   **region** is the region to deploy the cluster into, for example `us-central1`. 

---

902
control_subnet is the URI to the control subnet.

zones are the zones to deploy the control plane instances into, like us-east1-b, us-east1-c, and us-east1-d.

5. Create the deployment by using the gcloud CLI:

   $ gcloud deployment-manager deployments create ${INFRA_ID}-infra --config 02_infra.yaml

6. Export the cluster IP address:

   $ export CLUSTER_IP=('gcloud compute addresses describe ${INFRA_ID}-cluster-ip --region=${REGION} --format json | jq -r .address')

7. For an external cluster, also export the cluster public IP address:

   $ export CLUSTER_PUBLIC_IP=('gcloud compute addresses describe ${INFRA_ID}-cluster-public-ip --region=${REGION} --format json | jq -r .address')

6.10.8.1. Deployment Manager template for the external load balancer

You can use the following Deployment Manager template to deploy the external load balancer that you need for your OpenShift Container Platform cluster:

Example 6.2. 02_lb_ext.py Deployment Manager template

```python
def GenerateConfig(context):

    resources = [{
      'name': context.properties['infra_id'] + '-cluster-public-ip',
      'type': 'compute.v1.address',
      'properties': {
        'region': context.properties['region']
      }
    }, {
      # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check
      # probe for kube-apiserver
      'name': context.properties['infra_id'] + '-api-http-health-check',
      'type': 'compute.v1.httpHealthCheck',
      'properties': {
        'port': 6080,
        'requestPath': '/readyz'
      }
    }, {
      'name': context.properties['infra_id'] + '-api-target-pool',
      'type': 'compute.v1.targetPool',
      'properties': {
        'region': context.properties['region'],
        'healthChecks': ['$ref.' + context.properties['infra_id'] + '-api-http-health-check.selfLink],
        'instances': []
      }
    }, {
      'name': context.properties['infra_id'] + '-api-forwarding-rule',
```
6.10.8.2. Deployment Manager template for the internal load balancer

You can use the following Deployment Manager template to deploy the internal load balancer that you need for your OpenShift Container Platform cluster:

Example 6.3. 02_lb_int.py Deployment Manager template

def GenerateConfig(context):
    backends = []
    for zone in context.properties['zones']:
        backends.append({'group': '$(ref. + context.properties['infra_id'] + '-master-' + zone + '-instance-group').selfLink'}
    )

    resources = [
        {'name': context.properties['infra_id'] + '-cluster-ip',
        'type': 'compute.v1.address',
        'properties': {
            'addressType': 'INTERNAL',
            'region': context.properties['region'],
            'subnetwork': context.properties['control_subnet']
        },

        {'name': context.properties['infra_id'] + '-api-internal-health-check',
        'type': 'compute.v1.healthCheck',
        'properties': {
            'httpsHealthCheck': {
                'port': 6443,
                'requestPath': '/readyz'
            },
            'type': "HTTPS"
        },

        {'name': context.properties['infra_id'] + '-api-internal-backend-service',
        'type': 'compute.v1.regionBackendService',
        'properties': {
            'backends': backends,
            'healthChecks': ['$ref.' + context.properties['infra_id'] + '-api-internal-health-check.specificLink']
        }},

        return {'resources': resources}
You will need this template in addition to the `02_lb_ext.py` template when you create an external cluster.

### 6.10.9. Creating a private DNS zone in GCP

You must configure a private DNS zone in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create this component is to modify the provided Deployment Manager template.
NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for the private DNS section of this topic and save it as 02_dns.py on your computer. This template describes the private DNS objects that your cluster requires.

2. Create a 02_dns.yaml resource definition file:

   ```
   $ cat <<EOF >02_dns.yaml
   imports:
   - path: 02_dns.py

   resources:
   - name: cluster-dns
     type: 02_dns.py
     properties:
       infra_id: '${INFRA_ID}'
       cluster_domain: '${CLUSTER_NAME}.${BASE_DOMAIN}'
       cluster_network: '${CLUSTER_NETWORK}'
   EOF
   ``

   - **infra_id** is the INFRA_ID infrastructure name from the extraction step.
   - **cluster_domain** is the domain for the cluster, for example openshift.example.com.
   - **cluster_network** is the selfLink URL to the cluster network.

3. Create the deployment by using the gcloud CLI:

   ```
   $ gcloud deployment-manager deployments create ${INFRA_ID}-dns --config 02_dns.yaml
   ``

4. The templates do not create DNS entries due to limitations of Deployment Manager, so you must create them manually:

   a. Add the internal DNS entries:

   ```
   $ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
   $ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
   $ gcloud dns record-sets transaction add ${CLUSTER_IP} --name
   ```
For an external cluster, also add the external DNS entries:

```bash
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api-int.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-private-zone
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone
```

6.10.9.1. Deployment Manager template for the private DNS

You can use the following Deployment Manager template to deploy the private DNS that you need for your OpenShift Container Platform cluster:

**Example 6.4. 02_dns.py Deployment Manager template**

```python
def GenerateConfig(context):
    resources = [{
        'name': context.properties['infra_id'] + '-private-zone',
        'type': 'dns.v1.managedZone',
        'properties': {
            'description': '',
            'dnsName': context.properties['cluster_domain'] + '.',
            'visibility': 'private',
            'privateVisibilityConfig': {
                'networks': [{
                    'networkUrl': context.properties['cluster_network']
                }]
            }
        }
    }]
    return {'resources': resources}
```

6.10.10. Creating firewall rules in GCP

You must create firewall rules in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.
NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for firewall rules section of this topic and save it as 03_firewall.py on your computer. This template describes the security groups that your cluster requires.

2. Create a 03_firewall.yaml resource definition file:

   ```
   $ cat <<EOF >03_firewall.yaml
   imports:
   - path: 03_firewall.py
   
   resources:
   - name: cluster-firewall
     type: 03_firewall.py
     properties:
       allowed_external_cidr: '0.0.0.0/0'  # 1
       infra_id: '${INFRA_ID}'  # 2
       cluster_network: '${CLUSTER_NETWORK}'  # 3
       network_cidr: '${NETWORK_CIDR}'  # 4
   EOF
   ```

1. `allowed_external_cidr` is the CIDR range that can access the cluster API and SSH to the bootstrap host. For an internal cluster, set this value to `${NETWORK_CIDR}`.
2. `infra_id` is the INFRA_ID infrastructure name from the extraction step.
3. `cluster_network` is the selfLink URL to the cluster network.
4. `network_cidr` is the CIDR of the VPC network, for example 10.0.0.0/16.

3. Create the deployment by using the gcloud CLI:

   ```
   $ gcloud deployment-manager deployments create ${INFRA_ID}-firewall --config 03_firewall.yaml
   ```

6.10.10.1. Deployment Manager template for firewall rules
You can use the following Deployment Manager template to deploy the firewall rules that you need for your OpenShift Container Platform cluster:

Example 6.5. 03_firewall.py Deployment Manager template

```python
def GenerateConfig(context):
    resources = [
        {
            'name': context.properties['infra_id'] + '-bootstrap-in-ssh',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [{
                    'IPProtocol': 'tcp',
                    'ports': ['22']
                }],
                'sourceRanges': [context.properties['allowed_external_cidr']],
                'targetTags': [context.properties['infra_id'] + '-bootstrap']
            }
        },
        {
            'name': context.properties['infra_id'] + '-api',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [{
                    'IPProtocol': 'tcp',
                    'ports': ['6443']
                }],
                'sourceRanges': [context.properties['allowed_external_cidr']],
                'targetTags': [context.properties['infra_id'] + '-master']
            }
        },
        {
            'name': context.properties['infra_id'] + '-health-checks',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [{
                    'IPProtocol': 'tcp',
                    'ports': ['6080', '6443', '22624']
                }],
                'sourceRanges': ['35.191.0.0/16', '130.211.0.0/22', '209.85.152.0/22', '209.85.204.0/22'],
                'targetTags': [context.properties['infra_id'] + '-master']
            }
        },
        {
            'name': context.properties['infra_id'] + '-etcd',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [{
                    'IPProtocol': 'tcp',
                    'ports': ['2379-2380']
                }],
                'sourceTags': [context.properties['infra_id'] + '-master'],
                'targetTags': [context.properties['infra_id'] + '-master']
            }
        }]
```

CHAPTER 6. INSTALLING ON GCP

909
'name': context.properties['infra_id'] + '-control-plane',
'type': 'compute.v1.firewall',
'properties': {
  'network': context.properties['cluster_network'],
  'allowed': [{
    'IPProtocol': 'tcp',
    'ports': ['10257']
  },{
    'IPProtocol': 'tcp',
    'ports': ['10259']
  },{
    'IPProtocol': 'tcp',
    'ports': ['22623']
  }],
  'sourceTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ],
  'targetTags': [context.properties['infra_id'] + '-master']
},

'name': context.properties['infra_id'] + '-internal-network',
'type': 'compute.v1.firewall',
'properties': {
  'network': context.properties['cluster_network'],
  'allowed': [{
    'IPProtocol': 'icmp'
  },{
    'IPProtocol': 'tcp',
    'ports': ['22']
  }],
  'sourceRanges': [context.properties['network_cidr']],
  'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ]
},

'name': context.properties['infra_id'] + '-internal-cluster',
'type': 'compute.v1.firewall',
'properties': {
  'network': context.properties['cluster_network'],
  'allowed': [{
    'IPProtocol': 'udp',
    'ports': ['4789', '6081']
  },{
    'IPProtocol': 'udp',
    'ports': ['500', '4500']
  },{
    'IPProtocol': 'esp',
  },{
    'IPProtocol': 'tcp',
    'ports': ['9000-9999']
  },{
    'IPProtocol': 'udp',
    'ports': ['9000-9999']
  }],
  'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
  ]
}
6.10.11. Creating IAM roles in GCP

You must create IAM roles in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for IAM roles section of this topic and save it as `03_iam.py` on your computer. This template describes the IAM roles that your cluster requires.

2. Create a `03_iam.yaml` resource definition file:

   ```
   $ cat <<EOF >03_iam.yaml
   ```
infra_id is the INFRA_ID infrastructure name from the extraction step.

3. Create the deployment by using the gcloud CLI:

   ```bash
   $ gcloud deployment-manager deployments create ${INFRA_ID}-iam --config 03_iam.yaml
   ```

4. Export the variable for the master service account:

   ```bash
   $ export MASTER_SERVICE_ACCOUNT=('gcloud iam service-accounts list --filter "email~^${INFRA_ID}-m@${PROJECT_NAME}." --format json | jq -r '.[0].email')
   ```

5. Export the variable for the worker service account:

   ```bash
   $ export WORKER_SERVICE_ACCOUNT=('gcloud iam service-accounts list --filter "email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email')
   ```

6. Export the variable for the subnet that hosts the compute machines:

   ```bash
   $ export COMPUTE_SUBNET=('gcloud compute networks subnets describe ${INFRA_ID}-worker-subnet --region=${REGION} --format json | jq .selfLink')
   ```

7. The templates do not create the policy bindings due to limitations of Deployment Manager, so you must create them manually:

   ```bash
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.instanceAdmin"
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkAdmin"
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.securityAdmin"
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/iam.serviceAccountUser"
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/storage.admin"
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/compute.viewer"
   $ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/storage.admin"
   ```

8. Create a service account key and store it locally for later use:

   ```bash
   $ gcloud iam service-accounts keys create service-account-key.json --iam-account=${MASTER_SERVICE_ACCOUNT}
   ```
6.10.11.1. Deployment Manager template for IAM roles

You can use the following Deployment Manager template to deploy the IAM roles that you need for your OpenShift Container Platform cluster:

Example 6.6. 03_iam.py Deployment Manager template

```python
def GenerateConfig(context):
    resources = [
        {'name': context.properties['infra_id'] + '-master-node-sa',
         'type': 'iam.v1.serviceAccount',
         'properties': {
             'accountId': context.properties['infra_id'] + '-m',
             'displayName': context.properties['infra_id'] + '-master-node'
         }},
        {'name': context.properties['infra_id'] + '-worker-node-sa',
         'type': 'iam.v1.serviceAccount',
         'properties': {
             'accountId': context.properties['infra_id'] + '-w',
             'displayName': context.properties['infra_id'] + '-worker-node'
         }}
    ]
    return {'resources': resources}
```

6.10.12. Creating the RHCOS cluster image for the GCP infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Google Cloud Platform (GCP) for your OpenShift Container Platform nodes.

Procedure

1. Obtain the RHCOS image from the RHCOS image mirror page.

   **IMPORTANT**

   The RHCOS images might not change with every release of OpenShift Container Platform. You must download an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

   The file name contains the OpenShift Container Platform version number in the format **rhcos-<version>-<arch>-gcp.<arch>.tar.gz**.

2. Create the Google storage bucket:

   ```bash
   $ gsutil mb gs://<bucket_name>
   ```
3. Upload the RHCOS image to the Google storage bucket:

```bash
$ gsutil cp <downloaded_image_file_path>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz gs://<bucket_name>
```

4. Export the uploaded RHCOS image location as a variable:

```bash
$ export IMAGE_SOURCE=gs://<bucket_name>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz
```

5. Create the cluster image:

```bash
$ gcloud compute images create "${INFRA_ID}-rhcos-image" --source-uri="${IMAGE_SOURCE}"
```

### 6.10.13. Creating the bootstrap machine in GCP

You must create the bootstrap machine in Google Cloud Platform (GCP) to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Ensure pyOpenSSL is installed.

**Procedure**

1. Copy the template from the Deployment Manager template for the bootstrap machine section of this topic and save it as `04_bootstrap.py` on your computer. This template describes the bootstrap machine that your cluster requires.

2. Export the location of the Red Hat Enterprise Linux CoreOS (RHCOS) image that the installation program requires:

```bash
$ export CLUSTER_IMAGE=('gcloud compute images describe ${INFRA_ID}-rhcos-image --format json | jq -r .selfLink')
```
3. Create a bucket and upload the `bootstrap.ign` file:

```bash
$ gsutil mb gs://${INFRA_ID}-bootstrap-ignition
$ gsutil cp <installation_directory>/bootstrap.ign gs://${INFRA_ID}-bootstrap-ignition/
```

4. Create a signed URL for the bootstrap instance to use to access the Ignition config. Export the URL from the output as a variable:

```bash
$ export BOOTSTRAP_IGN=`gsutil signurl -d 1h service-account-key.json gs://${INFRA_ID}-bootstrap-ignition/bootstrap.ign | grep "^gs:" | awk '{print $5}'`
```

5. Create a `04_bootstrap.yaml` resource definition file:

```bash
$ cat <<EOF >04_bootstrap.yaml
imports:
- path: 04_bootstrap.py

resources:
- name: cluster-bootstrap
  type: 04_bootstrap.py
  properties:
    infra_id: '${INFRA_ID}'
    region: '${REGION}'
    zone: '${ZONE_0}'
    cluster_network: '${CLUSTER_NETWORK}'
    control_subnet: '${CONTROL_SUBNET}'
    image: '${CLUSTER_IMAGE}'
    machine_type: 'n1-standard-4'
    root_volume_size: '128'

    bootstrap_ign: '${BOOTSTRAP_IGN}'

EOF
```

1. `infra_id` is the `INFRA_ID` infrastructure name from the extraction step.
2. `region` is the region to deploy the cluster into, for example `us-central1`.
3. `zone` is the zone to deploy the bootstrap instance into, for example `us-central1-b`.
4. `cluster_network` is the `selfLink` URL to the cluster network.
5. `control_subnet` is the `selfLink` URL to the control subnet.
6. `image` is the `selfLink` URL to the RHCOS image.
7. `machine_type` is the machine type of the instance, for example `n1-standard-4`.
8. `root_volume_size` is the boot disk size for the bootstrap machine.
9. `bootstrap_ign` is the URL output when creating a signed URL.

6. Create the deployment by using the `gcloud` CLI:

```bash
```

---

CHAPTER 6. INSTALLING ON GCP

---

915
The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the bootstrap machine manually.

a. Add the bootstrap instance to the internal load balancer instance group:

```bash
$ gcloud compute instance-groups unmanaged add-instances \
${INFRA_ID}-bootstrap-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-bootstrap
```

b. Add the bootstrap instance group to the internal load balancer backend service:

```bash
$ gcloud compute backend-services add-backend \
${INFRA_ID}-api-internal-backend-service --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --instance-group-zone=${ZONE_0}
```

### 6.10.13.1. Deployment Manager template for the bootstrap machine

You can use the following Deployment Manager template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

```python
def GenerateConfig(context):
    resources = [
        {'name': context.properties['infra_id'] + '-bootstrap-public-ip',
         'type': 'compute.v1.address',
         'properties': {
             'region': context.properties['region']
         }},
        {'name': context.properties['infra_id'] + '-bootstrap',
         'type': 'compute.v1.instance',
         'properties': {
             'disks': [{
                 'autoDelete': True,
                 'boot': True,
                 'initializeParams': {
                     'diskSizeGb': context.properties['root_volume_size'],
                     'sourceImage': context.properties['image']
                 }
             }],
             'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' + context.properties['machine_type'],
             'metadata': {
                 'items': [{
                     'key': 'user-data',
                     'value': '{"ignition":{"config":{"replace":{"source":"' + context.properties['bootstrap_ign'] + '"}},”version”:”3.1.0”}}
                 }
             }
         }
    ]
```

Example 6.7. 04_bootstrap.py Deployment Manager template
6.10.14. Creating the control plane machines in GCP

You must create the control plane machines in Google Cloud Platform (GCP) for your cluster to use. One way to create these machines is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
Create and configure networking and load balancers in GCP.

Create control plane and compute roles.

Create the bootstrap machine.

Procedure

1. Copy the template from the Deployment Manager template for control plane machines section of this topic and save it as `05_control_plane.py` on your computer. This template describes the control plane machines that your cluster requires.

2. Export the following variable required by the resource definition:

   ```bash
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign`
   ```

3. Create a `05_control_plane.yaml` resource definition file:

   ```bash
   $ cat <<EOF >05_control_plane.yaml
   imports:
   - path: 05_control_plane.py
   
   resources:
   - name: cluster-control-plane
     type: 05_control_plane.py
     properties:
       infra_id: '${INFRA_ID}'
       zones:
       - '${ZONE_0}'
       - '${ZONE_1}'
       - '${ZONE_2}'
       control_subnet: '${CONTROL_SUBNET}'
       image: '${CLUSTER_IMAGE}'
       machine_type: 'n1-standard-4'
       root_volume_size: '128'
       service_account_email: '${MASTER_SERVICE_ACCOUNT}'
       ignition: '${MASTER_IGNITION}'
   EOF
   ```

   - **infra_id** is the `INFRA_ID` infrastructure name from the extraction step.
   - **zones** are the zones to deploy the control plane instances into, for example `us-central1-a`, `us-central1-b`, and `us-central1-c`.
   - **control_subnet** is the `selfLink` URL to the control subnet.
   - **image** is the `selfLink` URL to the RHCOS image.
   - **machine_type** is the machine type of the instance, for example `n1-standard-4`.
   - **service_account_email** is the email address for the master service account that you created.
7 **ignition** is the contents of the `master.ign` file.

4. Create the deployment by using the **gcloud** CLI:

```bash
$ gcloud deployment-manager deployments create ${INFRA_ID}-control-plane --config
05_control_plane.yaml
```

5. The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the control plane machines manually.

- Run the following commands to add the control plane machines to the appropriate instance groups:

```bash
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_0}-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-master-0
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_1}-instance-group --zone=${ZONE_1} --instances=${INFRA_ID}-master-1
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-
${ZONE_2}-instance-group --zone=${ZONE_2} --instances=${INFRA_ID}-master-2
```

- For an external cluster, you must also run the following commands to add the control plane machines to the target pools:

```bash
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_0}" --instances=${INFRA_ID}-master-0
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_1}" --instances=${INFRA_ID}-master-1
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-
zone="${ZONE_2}" --instances=${INFRA_ID}-master-2
```

### 6.10.14.1. Deployment Manager template for control plane machines

You can use the following Deployment Manager template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

**Example 6.8. 05_control_plane.py Deployment Manager template**

```python
def GenerateConfig(context):
    resources = [
        {'name': context.properties['infra_id'] + '-master-0',
         'type': 'compute.v1.instance',
         'properties': {
             'disks': [
                 {'autoDelete': True, 'boot': True, 'initializeParams': {
                     'diskSizeGb': context.properties['root_volume_size'],
                     'diskType': 'zones/' + context.properties['zones'][0] + '/diskTypes/pd-ssd',
                     'sourceImage': context.properties['image']
                 }},
             'machineType': 'zones/' + context.properties['zones'][0] + '/machineTypes/' +
```
context.properties['machine_type'],
'metadata': {
'items': [{
'key': 'user-data',
'value': context.properties['ignition']
}]
},
'networkInterfaces': [{
'subnetwork': context.properties['control_subnet']
}],
'serviceAccounts': [{
'email': context.properties['service_account_email'],
'scopes': ['https://www.googleapis.com/auth/cloud-platform']
}],
'tags': {
'items': [context.properties['infra_id'] + '-master',
],
'zone': context.properties['zones'][0]
},
{name': context.properties['infra_id'] + '-master-1',
'type': 'compute.v1.instance',
'properties': {
'disks': [{
'autoDelete': True,
'boot': True,
'initializeParams': {
'diskSizeGb': context.properties['root_volume_size'],
'diskType': 'zones/' + context.properties['zones'][1] + '/diskTypes/pd-ssd',
'sourceImage': context.properties['image']
}
}],
machineType': 'zones/' + context.properties['zones'][1] + '/' + context.properties['machine_type'],
'metadata': {
'items': [{
'key': 'user-data',
'value': context.properties['ignition']
}]
},
'networkInterfaces': [{
'subnetwork': context.properties['control_subnet']
}],
'serviceAccounts': [{
'email': context.properties['service_account_email'],
'scopes': ['https://www.googleapis.com/auth/cloud-platform']
}],
'tags': {
'items': [context.properties['infra_id'] + '-master',
],
'zone': context.properties['zones'][1]
}
6.10.15. Wait for bootstrap completion and remove bootstrap resources in GCP

After you create all of the required infrastructure in Google Cloud Platform (GCP), wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install wait-for bootstrap-complete --dir=<installation_directory> \
   --log-level info
   ```

   **For `<installation_directory>`**, specify the path to the directory that you stored the installation files in.

   **To view different installation details, specify warn, debug, or error instead of info.**

   If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

   ```
   $ gcloud compute backend-services remove-backend $INFRA_ID-api-internal-backend-service --region=$REGION --instance-group=$INFRA_ID-bootstrap-instance-group --instance-group-zone=$ZONE_0
   $ gsutil rm gs://$INFRA_ID-bootstrap-ignition/bootstrap.ign
   $ gsutil rb gs://$INFRA_ID-bootstrap-ignition
   $ gcloud deployment-manager deployments delete $INFRA_ID-bootstrap
   ```

**6.10.16. Creating additional worker machines in GCP**

You can create worker machines in Google Cloud Platform (GCP) for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Deployment Manager template. Additional instances can be launched by including additional resources of type **06_worker.py** in the file.

**NOTE**

If you do not use the provided Deployment Manager template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
Create and configure networking and load balancers in GCP.

Create control plane and compute roles.

Create the bootstrap machine.

Create the control plane machines.

### Procedure

1. Copy the template from the [Deployment Manager template for worker machines](#) section of this topic and save it as `06_worker.py` on your computer. This template describes the worker machines that your cluster requires.

2. Export the variables that the resource definition uses.

   a. Export the subnet that hosts the compute machines:

```
$ export COMPUTE_SUBNET=`(gcloud compute networks subnets describe ${INFRA_ID}-worker-subnet --region=${REGION} --format json | jq -r .selfLink)`
```

   b. Export the email address for your service account:

```
$ export WORKER_SERVICE_ACCOUNT=`(gcloud iam service-accounts list --filter "email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email')`
```

   c. Export the location of the compute machine Ignition config file:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign`
```

3. Create a `06_worker.yaml` resource definition file:

```
$ cat <<EOF >06_worker.yaml
imports:
  - path: 06_worker.py

resources:
  - name: 'worker-0'
    type: 06_worker.py
    properties:
      infra_id: '${INFRA_ID}'
      zone: '${ZONE_0}'
      compute_subnet: '${COMPUTE_SUBNET}'
      image: '${CLUSTER_IMAGE}'
      machine_type: 'n1-standard-4'
      root_volume_size: '128'
      service_account_email: '${WORKER_SERVICE_ACCOUNT}'
      ignition: '${WORKER_IGNITION}'

  - name: 'worker-1'
    type: 06_worker.py
    properties:
      infra_id: '${INFRA_ID}'
      zone: '${ZONE_1}'
```

4. Add any other variables as needed in the resource definition file.
name is the name of the worker machine, for example worker-0.

infra_id is the INFRA_ID infrastructure name from the extraction step.

zone is the zone to deploy the worker machine into, for example us-central1-a.

compute_subnet is the selfLink URL to the compute subnet.

image is the selfLink URL to the RHCOS image.

machine_type is the machine type of the instance, for example n1-standard-4.

service_account_email is the email address for the worker service account that you created.

ignition is the contents of the worker.ign file.

Optional: If you want to launch additional instances, include additional resources of type 06_worker.py in your 06_worker.yaml resource definition file.

Create the deployment by using the gcloud CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-worker --config
06_worker.yaml
```

6.10.16.1. Deployment Manager template for worker machines

You can use the following Deployment Manager template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

Example 6.9. 06_worker.py Deployment Manager template

def GenerateConfig(context):
    
    resources = [
        {'name': context.properties['infra_id'] + '-' + context.env['name'],
         'type': 'compute.v1.instance',
         'properties': {
            'disks': [{
                'autoDelete': True,
                'boot': True,
                'initializeParams': {
                    'diskSizeGb': context.properties['root_volume_size'],
                    'sourceImage': context.properties['image']
                }
            }]
        },
```
6.10.17. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your PATH.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Windows** from the drop-down menu and click **Download command-line tools**.

4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.

   To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **MacOS** from the drop-down menu and click **Download command-line tools**.

4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your **PATH**.

   To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the CLI, it is available using the **oc** command:

```
$ oc <command>
```
6.10.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster kubeconfig file. The kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   system:admin

6.10.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

   ```
   $ oc get nodes
   ```

   Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.21.0</td>
</tr>
</tbody>
</table>
The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the Pending or Approved status for each machine that you added to the cluster:

```bash
$ oc get csr
```

Example output

```
NAME        AGE     REQUESTOR                                                                 CONDITION
csr-8b2br   15m     system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
csr-8vnps   15m     system:serviceaccount:openshift-machine-config-operator:node-bootstrapper   Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in Pending status, approve the CSRs for your cluster machines:

NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. Once the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the machine-approver if the Kubelet requests a new certificate with identical parameters.
NOTE
For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the `oc exec`, `oc rsh`, and `oc logs` commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the `node-bootstrapper` service account in the `system:node` or `system:admin` groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

  $ oc adm certificate approve <csr_name>  ①

  ① `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

  $ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}" | xargs --no-run-if-empty oc adm certificate approve

NOTE
Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

  $ oc get csr

Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. If the remaining CSRs are not approved, and are in the Pending status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

  $ oc adm certificate approve <csr_name>  ①

  ① `<csr_name>` is the name of a CSR from the list of current CSRs.
To approve all pending CSRs, run the following command:

```bash
$ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}" | xargs oc adm certificate approve
```

After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```bash
$ oc get nodes
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>74m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>Ready</td>
<td>worker</td>
<td>11m</td>
<td>v1.21.0</td>
</tr>
</tbody>
</table>

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

**Additional information**

- For more information on CSRs, see [Certificate Signing Requests](#).

### 6.10.20. Optional: Adding the ingress DNS records

If you removed the DNS zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the ingress load balancer. You can create either a wildcard `*.apps.(baseDomain)`, or specific records. You can use A, CNAME, and other records per your requirements.

**Prerequisites**

- Configure a GCP account.
- Remove the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.
- Create the worker machines.
Procedure

1. Wait for the Ingress router to create a load balancer and populate the \textit{EXTERNAL-IP} field:

   
   ```
   $ oc -n openshift-ingress get service router-default
   
   Example output
   
   \begin{verbatim}
   NAME       TYPE           CLUSTER-IP      EXTERNAL-IP      PORT(S)                      AGE
   \end{verbatim}
   
2. Add the A record to your zones:

   \begin{itemize}
   \item To use A records:
     \begin{itemize}
     \item Export the variable for the router IP address:
       
       ```
       $ export ROUTER_IP=`oc -n openshift-ingress get service router-default --no-
       headers | awk '{print $4}'`
       
     \item Add the A record to the private zones:
       
       ```
       $ if [-f transaction.yaml ]; then rm transaction.yaml; fi
       $ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
       $ gcloud dns record-sets transaction add ${ROUTER_IP} --name
       \*.apps.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 300 --type A --zone
       ${INFRA_ID}-private-zone
       $ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone
       
       iii. For an external cluster, also add the A record to the public zones:
       
       ```
       $ if [-f transaction.yaml ]; then rm transaction.yaml; fi
       $ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
       $ gcloud dns record-sets transaction add ${ROUTER_IP} --name
       \*.apps.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 300 --type A --zone
       ${BASE_DOMAIN_ZONE_NAME}
       $ gcloud dns record-sets transaction execute --zone
       ${BASE_DOMAIN_ZONE_NAME}
       
       \item To add explicit domains instead of using a wildcard, create entries for each of the cluster’s current routes:
       
       ```
       $ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
       {"\n"}{{end}}{{end}} routes
       
   Example output
   
   oauth-openshift.apps.your.cluster.domain.example.com
   console-openshift-console.apps.your.cluster.domain.example.com
   downloads-openshift-console.apps.your.cluster.domain.example.com
   alertmanager-main-openshift-monitoring.apps.your.cluster.domain.example.com
   grafana-openshift-monitoring.apps.your.cluster.domain.example.com
   prometheus-k8s-openshift-monitoring.apps.your.cluster.domain.example.com
   ```
   \end{itemize}
   \end{itemize}
6.10.21. Completing a GCP installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Google Cloud Platform (GCP) user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned GCP infrastructure.
- Install the `oc` CLI and log in.

Procedure

1. Complete the cluster installation:

   ```bash
   $ ./openshift-install --dir=<installation_directory> wait-for install-complete
   ``

   **Example output**

   ```
   INFO Waiting up to 30m0s for the cluster to initialize...
   
   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
   ```

   **IMPORTANT**

   The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for `Recovering from expired control plane certificates` for more information.

2. Observe the running state of your cluster.
   
   a. Run the following command to view the current cluster version and status:

      ```bash
      $ oc get clusterversion
      ```

      **Example output**

      ```
      NAME      VERSION   AVAILABLE   PROGRESSING   SINCE   STATUS
      version             False       True          24m     Working towards 4.5.4: 99% complete
      ```

   b. Run the following command to view the Operators managed on the control plane by the Cluster Version Operator (CVO):
$ oc get clusteroperators

**Example output**

</tbody>
</table>

933
When the current cluster version is **AVAILABLE**, the installation is complete.

### 6.10.22. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
- Configure Global Access for an Ingress Controller on GCP.

### 6.11. INSTALLING A CLUSTER WITH SHARED VPC ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES

In OpenShift Container Platform version 4.8, you can install a cluster into a shared Virtual Private Cloud (VPC) on Google Cloud Platform (GCP) that uses infrastructure that you provide. In this context, a cluster installed into a shared VPC is a cluster that is configured to use a VPC from a project different from where the cluster is being deployed.

A shared VPC enables an organization to connect resources from multiple projects to a common VPC network. You can communicate within the organization securely and efficiently by using internal IPs from that network. For more information about shared VPC, see Shared VPC overview in the GCP documentation.

The steps for performing a user-provided infrastructure installation into a shared VPC are outlined here. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods.
The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 6.11.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- If you use a firewall and plan to use the Telemetry service, you configured the firewall to allow the sites that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

### 6.11.2. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The `kube-controller-manager` only approves the kubelet client CSRs. The `machine-approver` cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

### 6.11.3. Configuring the GCP project that hosts your cluster

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

#### 6.11.3.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

**Procedure**

- Create a project to host your OpenShift Container Platform cluster. See Creating and Managing Projects in the GCP documentation.
IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the api-int.<cluster_name>.<base_domain> URL; the Premium Tier is required for internal load balancing.

6.11.3.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See Enabling services in the GCP documentation.

Table 6.36. Required API services

<table>
<thead>
<tr>
<th>API service</th>
<th>Console service name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Deployment Manager V2 API</td>
<td>deploymentmanager.googleapis.com</td>

</tr>
</tbody>
</table>

6.11.3.3. GCP account limits
The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default Quotas do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

Table 6.37. GCP resources used in a default cluster

<table>
<thead>
<tr>

<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Target pools</td>
<td>Networking</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
</tbody>
</table>

**NOTE**

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- asia-east2
- asia-northeast2
- asia-south1
You can increase resource quotas from the GCP console, but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

6.11.3.4. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See Creating a service account in the GCP documentation.

2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the Owner role to it. See Granting roles to a service account for specific resources.

   NOTE
   
   While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See Creating service account keys in the GCP documentation.
   
   The service account key is required to create a cluster.

6.11.3.4.1. Required GCP permissions

When you attach the Owner role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you
deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

**Required roles for the installation program**
- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

**Required roles for creating network resources during installation**
- DNS Administrator

**Required roles for user-provisioned GCP infrastructure**
- Deployment Manager Editor
- Service Account Key Admin

**Optional roles**

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

**Table 6.38. GCP service account permissions**

<table>
<thead>
<tr>
<th>Account</th>
<th>Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Plane</td>
<td>roles/compute.instanceAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.networkAdmin</td>

<tr>
<td></td>
<td>roles/iam.serviceAccountUser</td>
</tr>
<tr>
<td>Compute</td>
<td>roles/compute.viewer</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
</tbody>
</table>

**6.11.3.5. Supported GCP regions**
You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)
- **asia-northeast3** (Seoul, South Korea)
- **asia-south1** (Mumbai, India)
- **asia-southeast1** (Jurong West, Singapore)
- **asia-southeast2** (Jakarta, Indonesia)
- **australia-southeast1** (Sydney, Australia)
- **europe-central2** (Warsaw, Poland)
- **europe-north1** (Hamina, Finland)
- **europe-west1** (St. Ghislain, Belgium)
- **europe-west2** (London, England, UK)
- **europe-west3** (Frankfurt, Germany)
- **europe-west4** (Eemshaven, Netherlands)
- **europe-west6** (Zürich, Switzerland)
- **northamerica-northeast1** (Montréal, Québec, Canada)
- **southamerica-east1** (São Paulo, Brazil)
- **us-central1** (Council Bluffs, Iowa, USA)
- **us-east1** (Moncks Corner, South Carolina, USA)
- **us-east4** (Ashburn, Northern Virginia, USA)
- **us-west1** (The Dalles, Oregon, USA)
- **us-west2** (Los Angeles, California, USA)
- **us-west3** (Salt Lake City, Utah, USA)
- **us-west4** (Las Vegas, Nevada, USA)

6.11.3.6. Installing and configuring CLI tools for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must install and configure the CLI tools for GCP.
Prerequisites

- You created a project to host your cluster.
- You created a service account and granted it the required permissions.

Procedure

1. Install the following binaries in $PATH:
   - `gcloud`
   - `gsutil`
   
   See Install the latest Cloud SDK version in the GCP documentation.

2. Authenticate using the `gcloud` tool with your configured service account.
   See Authorizing with a service account in the GCP documentation.

6.11.4. Configuring the GCP project that hosts your shared VPC network

If you use a shared Virtual Private Cloud (VPC) to host your OpenShift Container Platform cluster in Google Cloud Platform (GCP), you must configure the project that hosts it.

NOTE

If you already have a project that hosts the shared VPC network, review this section to ensure that the project meets all of the requirements to install an OpenShift Container Platform cluster.

Procedure

1. Create a project to host the shared VPC for your OpenShift Container Platform cluster. See Creating and Managing Projects in the GCP documentation.

2. Create a service account in the project that hosts your shared VPC. See Creating a service account in the GCP documentation.

3. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the Owner role to it. See Granting roles to a service account for specific resources.
While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

The service account for the project that hosts the shared VPC network requires the following roles:

- Compute Network User
- Compute Security Admin
- Deployment Manager Editor
- DNS Administrator
- Security Admin
- Network Management Admin

### 6.11.4.1. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the project that hosts the shared VPC that you install the cluster into. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

   **NOTE**

   If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](https://domains.google/).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](https://cloud.google.com/dns/docs/zones) in the GCP documentation.

   Use an appropriate root domain, such as `openshiftcorp.com`, or subdomain, such as `clusters.openshiftcorp.com`.

3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](https://cloud.google.com/dns/docs/authoritative-nameservers) in the GCP documentation.

   You typically have four name servers.

4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](https://domains.google/).

5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](https://cloud.google.com/dns/docs/migration) in the GCP documentation.
6. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain. This process might include a request to your company’s IT department or the division that controls the root domain and DNS services for your company.

### 6.11.4.2. Creating a VPC in GCP

You must create a VPC in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements. One way to create the VPC is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.

**Procedure**

1. Copy the template from the Deployment Manager template for the VPC section of this topic and save it as `01_vpc.py` on your computer. This template describes the VPC that your cluster requires.

2. Export the following variables required by the resource definition:

   a. Export the control plane CIDR:

      ```
      $ export MASTER_SUBNET_CIDR='10.0.0.0/17'
      ```

   b. Export the compute CIDR:

      ```
      $ export WORKER_SUBNET_CIDR='10.0.128.0/17'
      ```

   c. Export the region to deploy the VPC network and cluster to:

      ```
      $ export REGION='<region>'
      ```

3. Export the variable for the ID of the project that hosts the shared VPC:

   ```
   $ export HOST_PROJECT=<host_project>
   ```

4. Export the variable for the email of the service account that belongs to host project:

   ```
   $ export HOST_PROJECT_ACCOUNT=<host_service_account_email>
   ```

5. Create a `01_vpc.yaml` resource definition file:

   ```
   $ cat <<EOF >01_vpc.yaml
   imports:
   ```
infra_id is the prefix of the network name.

region is the region to deploy the cluster into, for example us-central1.

master_subnet_cidr is the CIDR for the master subnet, for example 10.0.0.0/19.

worker_subnet_cidr is the CIDR for the worker subnet, for example 10.0.32.0/19.

6. Create the deployment by using the gcloud CLI:

   $ gcloud deployment-manager deployments create <vpc_deployment_name> --config 01_vpc.yaml --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}

   For <vpc_deployment_name>, specify the name of the VPC to deploy.

7. Export the VPC variable that other components require:

   a. Export the name of the host project network:

      $ export HOST_PROJECT_NETWORK=<vpc_network>

   b. Export the name of the host project control plane subnet:

      $ export HOST_PROJECT_CONTROL_SUBNET=<control_plane_subnet>

   c. Export the name of the host project compute subnet:

      $ export HOST_PROJECT_COMPUTE_SUBNET=<compute_subnet>

8. Set up the shared VPC. See Setting up Shared VPC in the GCP documentation.

6.11.4.2.1. Deployment Manager template for the VPC

You can use the following Deployment Manager template to deploy the VPC that you need for your OpenShift Container Platform cluster:

   Example 6.10. 01_vpc.py Deployment Manager template

   ```
   def GenerateConfig(context):
   ```
resources = [
    {'name': context.properties['infra_id'] + '-network',
    'type': 'compute.v1.network',
    'properties': {
        'region': context.properties['region'],
        'autoCreateSubnetworks': False
    }
    },
    {'name': context.properties['infra_id'] + '-master-subnet',
    'type': 'compute.v1.subnetwork',
    'properties': {
        'region': context.properties['region'],
        'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
        'ipCidrRange': context.properties['master_subnet_cidr']
    }
    },
    {'name': context.properties['infra_id'] + '-worker-subnet',
    'type': 'compute.v1.subnetwork',
    'properties': {
        'region': context.properties['region'],
        'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
        'ipCidrRange': context.properties['worker_subnet_cidr']
    }
    },
    {'name': context.properties['infra_id'] + '-router',
    'type': 'compute.v1.router',
    'properties': {
        'region': context.properties['region'],
        'network': '${ref.' + context.properties['infra_id'] + '-network.selfLink}',
        'nats': [{
            'name': context.properties['infra_id'] + '-nat-master',
            'natIpAllocateOption': 'AUTO_ONLY',
            'minPortsPerVm': 7168,
            'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
            'subnetworks': [{
                'name': '${ref.' + context.properties['infra_id'] + '-master-subnet.selfLink}',
                'sourceIpRangesToNat': ['ALL_IP_RANGES']
            }]
        },
        {'name': context.properties['infra_id'] + '-nat-worker',
            'natIpAllocateOption': 'AUTO_ONLY',
            'minPortsPerVm': 512,
            'sourceSubnetworkIpRangesToNat': 'LIST_OF_SUBNETWORKS',
            'subnetworks': [{
                'name': '${ref.' + context.properties['infra_id'] + '-worker-subnet.selfLink}',
                'sourceIpRangesToNat': ['ALL_IP_RANGES']
            }]
        }]
    }
    ]
}

return {'resources': resources}
To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `var` partition during the preparation phases of installation.

6.11.5.1. Manually creating the installation configuration file

For user-provisioned installations of OpenShift Container Platform, you manually generate your installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```

   IMPORTANT

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   NOTE

   You must name this configuration file `install-config.yaml`.

   NOTE

   For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.
The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

6.11.5.2. Sample customized `install-config.yaml` file for GCP

You can customize the `install-config.yaml` file to specify more details about your OpenShift Container Platform cluster’s platform or modify the values of the required parameters.

```
apiVersion: v1
baseDomain: example.com
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
        - us-central1-a
        - us-central1-c
      replicas: 3
    compute:
      - hyperthreading: Enabled
      - name: worker
        platform:
          gcp:
            type: n2-standard-4
            zones:
              - us-central1-a
              - us-central1-c
            replicas: 0
      metadata:
        name: test-cluster
    networking:
      clusterNetwork:
        - cidr: 10.128.0.0/14
        hostPrefix: 23
      machineNetwork:
        - cidr: 10.0.0.0/16
      networkType: OpenShiftSDN
      serviceNetwork:
        - 172.30.0.0/16
      platform:
        gcp:
          region: us-central1
          projectID: openshift-production
          pullSecret: '{"auths": ...}''
```

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your `install-config.yaml` file by using the installation program and modify it.
Specify the public DNS on the host project.

If you do not provide these parameters and values, the installation program provides the default value.

The `controlPlane` section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the `compute` section must begin with a hyphen, `-`, and the first line of the `controlPlane` section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines’ cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

**IMPORTANT**

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as `n1-standard-8`, for your machines if you disable simultaneous multithreading.

Specify the main project where the VM instances reside.

Specify the region that your VPC network is in.

Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the `x86_64` architecture.

You can optionally provide the `sshKey` value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

How to publish the user-facing endpoints of your cluster. Set `publish` to **Internal** to deploy a private cluster, which cannot be accessed from the Internet. The default value is **External**. To use a shared VPC in a cluster that uses infrastructure that you provision, you must set `publish` to
The installation program will no longer be able to access the public DNS zone for the base domain in the host project.

6.11.5.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the Internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

Prerequisites

- You have an existing `install-config.yaml` file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the Proxy object’s `spec.noProxy` field to bypass the proxy if necessary.

**NOTE**

The Proxy object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the Proxy object `status.noProxy` field is also populated with the instance metadata endpoint (169.254.169.254).

- If your cluster is on AWS, you added the `ec2.<region>.amazonaws.com`, `elasticloadbalancing.<region>.amazonaws.com`, and `s3.<region>.amazonaws.com` endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```yaml
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...```

---
1. A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be http. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpProxy value.

2. A proxy URL to use for creating HTTPS connections outside the cluster. If this field is not specified, then httpProxy is used for both HTTP and HTTPS connections. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must not specify an httpsProxy value.

3. A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with . to match subdomains only. For example, .y.com matches x.y.com, but not y.com. Use * to bypass the proxy for all destinations.

4. If provided, the installation program generates a config map that is named user-ca-bundle in the openshift-config namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a trusted-ca-bundle config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the trustedCA field of the Proxy object. The additionalTrustBundle field is required unless the proxy’s identity certificate is signed by an authority from the RHCOS trust bundle. If you use an MITM transparent proxy network that does not require additional proxy configuration but requires additional CAs, you must provide the MITM CA certificate.

**NOTE**

The installation program does not support the proxy readinessEndpoints field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named cluster that uses the proxy settings in the provided install-config.yaml file. If no proxy settings are provided, a cluster Proxy object is still created, but it will have a nil spec.

**NOTE**

Only the Proxy object named cluster is supported, and no additional proxies can be created.

### 6.11.5.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.
IMPORTANT

The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending node-bootstrapper certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the install-config.yaml installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```
   $ ./openshift-install create manifests --dir=<installation_directory>
   ```

   For `<installation_directory>`, specify the installation directory that contains the install-config.yaml file you created.

   ```
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: install_dir/manifests and install_dir/openshift
   ```

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

   ```
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```

   Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the mastersSchedulable parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
b. Locate the mastersSchedulable parameter and ensure that it is set to false.

c. Save and exit the file.

5. Remove the privateZone sections from the <installation_directory>/manifests/cluster-dns-02-config.yml DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
     name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone:
       id: mycluster-100419-private-zone
     status: {}
   ```

   1. Remove this section completely.

6. Configure the cloud provider for your VPC.

   a. Open the <installation_directory>/manifests/cloud-provider-config.yaml file.

   b. Add the network-project-id parameter and set its value to the ID of project that hosts the shared VPC network.

   c. Add the network-name parameter and set its value to the name of the shared VPC network that hosts the OpenShift Container Platform cluster.

   d. Replace the value of the subnetwork-name parameter with the value of the shared VPC subnet that hosts your compute machines.

   The contents of the <installation_directory>/manifests/cloud-provider-config.yaml resemble the following example:

   ```yaml
   config: |
   [global]
   project-id = example-project
   regional = true
   multizone = true
   node-tags = opensh-ptzzx-master
   node-tags = opensh-ptzzx-worker
   node-instance-prefix = opensh-ptzzx
   external-instance-groups-prefix = opensh-ptzzx
   network-project-id = example-shared-vpc
   network-name = example-network
   subnetwork-name = example-worker-subnet
   ```

7. If you deploy a cluster that is not on a private network, open the <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml file and replace the value of the scope parameter with External. The contents of the file resemble the following example:

   ```yaml
   apiVersion: operator.openshift.io/v1
   ```
8. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir=<installation_directory>
```

For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

```
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

6.11.6. Exporting common variables

6.11.6.1. Extracting the infrastructure name

Additional resources

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Google Cloud Platform (GCP). The infrastructure name is also used to locate the appropriate GCP resources during an OpenShift Container Platform installation. The provided Deployment Manager templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
You installed the `jq` package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```bash
$ jq -r .infraID <installation_directory>/metadata.json
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6
```

The output of this command is your cluster name and a random string.

6.11.6.2. Exporting common variables for Deployment Manager templates

You must export a common set of variables that are used with the provided Deployment Manager templates used to assist in completing a user-provided infrastructure install on Google Cloud Platform (GCP).

**NOTE**

Specific Deployment Manager templates can also require additional exported variables, which are detailed in their related procedures.

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Generate the Ignition config files for your cluster.
- Install the `jq` package.

Procedure

1. Export the following common variables to be used by the provided Deployment Manager templates:

```bash
$ export BASE_DOMAIN='<base_domain>'
$ export BASE_DOMAIN_ZONE_NAME='<base_domain_zone_name>'
$ export NETWORK_CIDR='10.0.0.0/16'

$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
$ export CLUSTER_NAME=`jq -r .clusterName <installation_directory>/metadata.json`
$ export INFRA_ID=`jq -r .infraID <installation_directory>/metadata.json`
$ export PROJECT_NAME=`jq -r .gcp.projectID <installation_directory>/metadata.json`
```
Supply the values for the host project.

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

6.11.7. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in `initramfs` during boot to fetch their Ignition config files.

6.11.7.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as `localhost` or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

6.11.7.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

**IMPORTANT**

In connected OpenShift Container Platform environments, all nodes are required to have Internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.39. Ports used for all-machine to all-machine communications

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICMP</td>
<td>N/A</td>
<td>Network reachability tests</td>
</tr>
<tr>
<td>TCP</td>
<td>1936</td>
<td>Metrics</td>
</tr>
<tr>
<td>TCP</td>
<td>9000-9999</td>
<td>Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099.</td>
</tr>
<tr>
<td>TCP</td>
<td>10250-10259</td>
<td>The default ports that Kubernetes reserves</td>
</tr>
<tr>
<td>TCP</td>
<td>10256</td>
<td>openshift-sdn</td>
</tr>
</tbody>
</table>
### Table 6.40. Ports used for all-machine to control plane communications

<table>
<thead>
<tr>

</table>

### 6.11.8. Creating load balancers in GCP

You must configure load balancers in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

**Procedure**

1. Copy the template from the Deployment Manager template for the internal load balancer section of this topic and save it as `02_lb_int.py` on your computer. This template describes the internal load balancing objects that your cluster requires.
2. For an external cluster, also copy the template from the **Deployment Manager template for the external load balancer** section of this topic and save it as **02_lb_ext.py** on your computer. This template describes the external load balancing objects that your cluster requires.

3. Export the variables that the deployment template uses:

   a. Export the cluster network location:

      ```
      $ export CLUSTER_NETWORK=('gcloud compute networks describe
      $(HOST_PROJECT_NETWORK) --project=$(HOST_PROJECT) --account
      $(HOST_PROJECT_ACCOUNT) --format=json | jq -r .selfLink')
      ```

   b. Export the control plane subnet location:

      ```
      $ export CONTROL_SUBNET=('gcloud compute networks subnets describe
      $(HOST_PROJECT_CONTROL_SUBNET) --region=$(REGION) --project
      $(HOST_PROJECT) --account=$(HOST_PROJECT_ACCOUNT) --format=json | jq -r
      .selfLink')
      ```

   c. Export the three zones that the cluster uses:

      ```
      $ export ZONE_0=('gcloud compute regions describe $(REGION) --format=json | jq -r
      .zones[0] | cut -d "" -f9')
      $ export ZONE_1=('gcloud compute regions describe $(REGION) --format=json | jq -r
      .zones[1] | cut -d "" -f9')
      $ export ZONE_2=('gcloud compute regions describe $(REGION) --format=json | jq -r
      .zones[2] | cut -d "" -f9')
      ```

4. Create a **02_infra.yaml** resource definition file:

    ```
    $ cat <<EOF >02_infra.yaml
    imports:
    - path: 02_lb_ext.py
    - path: 02_lb_int.py
    resources:
    - name: cluster-lb-ext
      type: 02_lb_ext.py
      properties:
        infra_id: '${INFRA_ID}'
        region: '${REGION}'
    - name: cluster-lb-int
      type: 02_lb_int.py
      properties:
        cluster_network: '${CLUSTER_NETWORK}'
        control_subnet: '${CONTROL_SUBNET}'
        infra_id: '${INFRA_ID}'
        region: '${REGION}'
        zones:
        - '${ZONE_0}'
        - '${ZONE_1}'
        - '${ZONE_2}'
    EOF
    ```
Required only when deploying an external cluster.

`infra_id` is the INFRA_ID infrastructure name from the extraction step.

`region` is the region to deploy the cluster into, for example `us-central1`.

`control_subnet` is the URI to the control subnet.

`zones` are the zones to deploy the control plane instances into, like `us-east1-b, us-east1-c, and us-east1-d`.

5. Create the deployment by using the `gcloud` CLI:

   ```sh
   $ gcloud deployment-manager deployments create ${INFRA_ID}-infra --config 02_infra.yaml
   ```

6. Export the cluster IP address:

   ```sh
   $ export CLUSTER_IP=(`gcloud compute addresses describe ${INFRA_ID}-cluster-ip --region=${REGION} --format json | jq -r .address`)
   ```

7. For an external cluster, also export the cluster public IP address:

   ```sh
   $ export CLUSTER_PUBLIC_IP=(`gcloud compute addresses describe ${INFRA_ID}-cluster-public-ip --region=${REGION} --format json | jq -r .address`)
   ```

6.11.8.1. Deployment Manager template for the external load balancer

You can use the following Deployment Manager template to deploy the external load balancer that you need for your OpenShift Container Platform cluster:

**Example 6.11. 02_lb_ext.py Deployment Manager template**

```python
def GenerateConfig(context):
    resources = [
        {'name': context.properties['infra_id'] + '-cluster-public-ip',
         'type': 'compute.v1.address',
         'properties': {
             'region': context.properties['region']
         }
    ],
    # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check probe for kube-apiserver
    {'name': context.properties['infra_id'] + '-api-http-health-check',
     'type': 'compute.v1.httpHealthCheck',
     'properties': {
         'port': 6080,
         'requestPath': '/readyz'
     }
    ]
```
deployment manager template for the internal load balancer

You can use the following Deployment Manager template to deploy the internal load balancer that you need for your OpenShift Container Platform cluster:

Example 6.12. 02_lb_int.py Deployment Manager template

def GenerateConfig(context):
    backends = []
    for zone in context.properties['zones']:
        backends.append(
            {'group': '$(ref. + context.properties[infra_id] + '-master-' + zone + '-instance-group' + 
            '.selfLink')
        )
    resources = [[]
        {'name': context.properties[infra_id] + '-cluster-ip',
         'type': 'compute.v1.address',
         'properties': {
            'addressType': 'INTERNAL',
            'region': context.properties['region'],
            'subnetwork': context.properties['control_subnet']
        }
        ,
        # Refer to docs/dev/kube-apiserver-health-check.md on how to correctly setup health check probe for kube-apiserver
        {'name': context.properties[infra_id] + '-api-internal-health-check',
         'type': 'compute.v1.healthCheck',
         'properties': {
            'httpsHealthCheck': {
               'port': 6443,
               'requestPath': '/readyz'}
        }]}
You will need this template in addition to the `02_lb_ext.py` template when you create an external cluster.

6.11.9. Creating a private DNS zone in GCP
You must configure a private DNS zone in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create this component is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for the private DNS section of this topic and save it as 02_dns.py on your computer. This template describes the private DNS objects that your cluster requires.

2. Create a 02_dns.yaml resource definition file:

   ```
   $ cat <<EOF >02_dns.yaml
   imports:
   - path: 02_dns.py

   resources:
   - name: cluster-dns
     type: 02_dns.py
     properties:
       infra_id: '${INFRA_ID}'
       cluster_domain: '${CLUSTER_NAME}.${BASE_DOMAIN}'
       cluster_network: '${CLUSTER_NETWORK}'
   EOF
   ```

   1. `infra_id` is the INFRA_ID infrastructure name from the extraction step.
   2. `cluster_domain` is the domain for the cluster, for example openshift.example.com.
   3. `cluster_network` is the selfLink URL to the cluster network.

3. Create the deployment by using the gcloud CLI:

   ```
   $ gcloud deployment-manager deployments create ${INFRA_ID}-dns --config 02_dns.yaml --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
   ```

4. The templates do not create DNS entries due to limitations of Deployment Manager, so you must create them manually:
a. Add the internal DNS entries:

```bash
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-private-zone --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api-int.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${INFRA_ID}-private-zone --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
$ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}

$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns record-sets transaction add ${CLUSTER_PUBLIC_IP} --name api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns record-sets transaction execute --zone ${BASE_DOMAIN_ZONE_NAME}
```

b. For an external cluster, also add the external DNS entries:

```bash
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns record-sets transaction add ${CLUSTER_PUBLIC_IP} --name api.${CLUSTER_NAME}.${BASE_DOMAIN}. --ttl 60 --type A --zone ${BASE_DOMAIN_ZONE_NAME}
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} dns record-sets transaction execute --zone ${BASE_DOMAIN_ZONE_NAME}
```

6.11.9.1. Deployment Manager template for the private DNS

You can use the following Deployment Manager template to deploy the private DNS that you need for your OpenShift Container Platform cluster:

**Example 6.13. 02_dns.py Deployment Manager template**

```python
def GenerateConfig(context):

    resources = [
        {'name': context.properties['infra_id'] + '-private-zone',
         'type': 'dns.v1.managedZone',
         'properties': {
             'description': '',
             'dnsName': context.properties['cluster_domain'] + '.',
             'visibility': 'private',
             'privateVisibilityConfig': {
                 'networks': [{
                     'networkUrl': context.properties['cluster_network']
                 }]
             }
         }
    ]

    return {'resources': resources}
```
6.11.10. Creating firewall rules in GCP

You must create firewall rules in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for firewall rules section of this topic and save it as `03_firewall.py` on your computer. This template describes the security groups that your cluster requires.

2. Create a `03_firewall.yaml` resource definition file:

   ```
   $ cat <<EOF >03_firewall.yaml
   import:
     - path: 03_firewall.py
   
   resources:
     - name: cluster-firewall
       type: 03_firewall.py
       properties:
         allowed_external_cidr: '0.0.0.0/0'
         infra_id: '${INFRA_ID}'
         cluster_network: '${CLUSTER_NETWORK}'
         network_cidr: '${NETWORK_CIDR}'
   EOF
   ```

   - `allowed_external_cidr` is the CIDR range that can access the cluster API and SSH to the bootstrap host. For an internal cluster, set this value to `$(NETWORK_CIDR)`.
   - `infra_id` is the `INFRA_ID` infrastructure name from the extraction step.
   - `cluster_network` is the `selfLink` URL to the cluster network.
   - `network_cidr` is the CIDR of the VPC network, for example `10.0.0.0/16`.

3. Create the deployment by using the `gcloud` CLI:
You can use the following Deployment Manager template to deploy the firewall rules that you need for your OpenShift Container Platform cluster:

**Example 6.14. 03_firewall.py Deployment Manager template**

```python
def GenerateConfig(context):

    resources = [
        {
            'name': context.properties['infra_id'] + '-bootstrap-in-ssh',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [  
                    {'IPProtocol': 'tcp',
                    'ports': ['22']
                ],
                'sourceRanges': [context.properties['allowed_external_cidr']]  
            },
            'targetTags': [context.properties['infra_id'] + '-bootstrap']
        },
        {
            'name': context.properties['infra_id'] + '-api',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [  
                    {'IPProtocol': 'tcp',
                    'ports': ['6443']
                ],
                'sourceRanges': [context.properties['allowed_external_cidr']]  
            },
            'targetTags': [context.properties['infra_id'] + '-master']
        },
        {
            'name': context.properties['infra_id'] + '-health-checks',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [  
                    {'IPProtocol': 'tcp',
                    'ports': ['6080', '6443', '22624']
                ],
                'sourceRanges': ['35.191.0.0/16', '130.211.0.0/22', '209.85.152.0/22', '209.85.204.0/22'],
                'targetTags': [context.properties['infra_id'] + '-master']
            }
        },
        {
            'name': context.properties['infra_id'] + '-etcd',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [  
                    {'IPProtocol': 'tcp',
                    'ports': ['22']
                ],
                'sourceRanges': [context.properties['allowed_external_cidr']]  
            },
            'targetTags': [context.properties['infra_id'] + '-master']
        }
    ]
```

```bash
$ gcloud deployment-manager deployments create ${INFRA_ID}-firewall --config 03_firewall.yaml --project ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT}
```
"ports": [2379-2380]
},
"sourceTags": [context.properties[infra_id] + '-master'],
"targetTags": [context.properties[infra_id] + '-master']
}
}, {
"name": context.properties[infra_id] + '-control-plane',
"type": 'compute.v1.firewall',
"properties": {
  "network": context.properties[cluster_network],
  "properties": {
    "IPProtocol": 'tcp',
    "ports": [10257]
  },
  "IPProtocol": 'tcp',
  "ports": [10259]
  },
  "IPProtocol": 'tcp',
  "ports": [22623]
},
"sourceTags": [
  context.properties[infra_id] + '-master',
  context.properties[infra_id] + '-worker'
],
"targetTags": [context.properties[infra_id] + '-master']
}
}, {
"name": context.properties[infra_id] + '-internal-network',

"properties": {
  "network": context.properties[cluster_network],
  "allowed": [{
    "IPProtocol": 'udp',
    "ports": [4789, 6081]
  },
    "IPProtocol": 'udp',
    "ports": [500, 4500]
  },
  "IPProtocol": 'esp',

6.11.11. Creating IAM roles in GCP

You must create IAM roles in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure
1. Copy the template from the Deployment Manager template for IAM roles section of this topic and save it as **03_iam.py** on your computer. This template describes the IAM roles that your cluster requires.

2. Create a **03_iam.yaml** resource definition file:

   ```
   $ cat <<EOF >03_iam.yaml
   imports:
   - path: 03_iam.py
   resources:
   - name: cluster-iam
     type: 03_iam.py
     properties:
       infra_id: '${INFRA_ID}'
   EOF
   ```

   **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.

3. Create the deployment by using the **gcloud** CLI:

   ```
   $ gcloud deployment-manager deployments create ${INFRA_ID}-iam --config 03_iam.yaml
   ```

4. Export the variable for the master service account:

   ```
   $ export MASTER_SERVICE_ACCOUNT=('gcloud iam service-accounts list --filter "email~^${INFRA_ID}-m@${PROJECT_NAME}." --format json | jq -r '.[0].email')
   ```

5. Export the variable for the worker service account:

   ```
   $ export WORKER_SERVICE_ACCOUNT=('gcloud iam service-accounts list --filter "email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email')
   ```

6. Assign the permissions that the installation program requires to the service accounts for the subnets that host the control plane and compute subnets:

   a. Grant the **networkViewer** role of the project that hosts your shared VPC to the master service account:

   ```
   $ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} projects add-iam-policy-binding ${HOST_PROJECT} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkViewer"
   ```

   b. Grant the **networkUser** role to the master service account for the control plane subnet:

   ```
   $ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT} compute networks subnets add-iam-policy-binding "$({HOST_PROJECT_CONTROL_SUBNET})" --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkUser" --region ${REGION}
   ```

   c. Grant the **networkUser** role to the worker service account for the control plane subnet:
d. Grant the **networkUser** role to the master service account for the compute subnet:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
  compute networks subnets add-iam-policy-binding
  "${HOST_PROJECT_CONTROL_SUBNET}" --member
  "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role
  "roles/compute.networkUser" --region ${REGION}
```

e. Grant the **networkUser** role to the worker service account for the compute subnet:

```
$ gcloud --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
  compute networks subnets add-iam-policy-binding
  "${HOST_PROJECT_COMPUTE_SUBNET}" --member
  "serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role
  "roles/compute.networkUser" --region ${REGION}
```

7. The templates do not create the policy bindings due to limitations of Deployment Manager, so you must create them manually:

```
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.instanceAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.securityAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/iam.serviceAccountUser"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/storage.admin"

$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/compute.viewer"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member
  "serviceAccount:${WORKER_SERVICE_ACCOUNT}" --role "roles/storage.admin"
```

8. Create a service account key and store it locally for later use:

```
$ gcloud iam service-accounts keys create service-account-key.json --iam-account=${MASTER_SERVICE_ACCOUNT}
```

### 6.11.11.1. Deployment Manager template for IAM roles

You can use the following Deployment Manager template to deploy the IAM roles that you need for your OpenShift Container Platform cluster:

```
Example 6.15. 03_iam.py Deployment Manager template
```
def GenerateConfig(context):

    resources = [
        {
            'name': context.properties['infra_id'] + '-master-node-sa',
            'type': 'iam.v1.serviceAccount',
            'properties': {
                'accountId': context.properties['infra_id'] + '-m',
                'displayName': context.properties['infra_id'] + '-master-node'
            }
        },
        {
            'name': context.properties['infra_id'] + '-worker-node-sa',
            'type': 'iam.v1.serviceAccount',
            'properties': {
                'accountId': context.properties['infra_id'] + '-w',
                'displayName': context.properties['infra_id'] + '-worker-node'
            }
        }
    ]

    return {'resources': resources}

6.11.12. Creating the RHCOS cluster image for the GCP infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Google Cloud Platform (GCP) for your OpenShift Container Platform nodes.

Procedure

1. Obtain the RHCOS image from the RHCOS image mirror page.

   IMPORTANT

   The RHCOS images might not change with every release of OpenShift Container Platform. You must download an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

   The file name contains the OpenShift Container Platform version number in the format `rhcos-<version>-<arch>-gcp.<arch>.tar.gz`.

2. Create the Google storage bucket:

   ```
   $ gsutil mb gs://<bucket_name>
   ```

3. Upload the RHCOS image to the Google storage bucket:

   ```
   $ gsutil cp <downloaded_image_file_path>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz gs://<bucket_name>
   ```

4. Export the uploaded RHCOS image location as a variable:
Create the cluster image:

5. Create the bootstrap machine in GCP

You must create the bootstrap machine in Google Cloud Platform (GCP) to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Ensure pyOpenSSL is installed.

Procedure

1. Copy the template from the Deployment Manager template for the bootstrap machine section of this topic and save it as 04_bootstrap.py on your computer. This template describes the bootstrap machine that your cluster requires.

2. Export the location of the Red Hat Enterprise Linux CoreOS (RHCOS) image that the installation program requires:

   $ export IMAGE_SOURCE=gs://<bucket_name>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz

   $ gcloud compute images create "${INFRA_ID}-rhcos-image" \
      --source-uri="${IMAGE_SOURCE}"

3. Create a bucket and upload the bootstrap.ign file:

   $ export IMAGE_SOURCE=gs://<bucket_name>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz

   $ export CLUSTER_IMAGE=(`gcloud compute images describe ${INFRA_ID}-rhcos-image --format json | jq -r .selfLink`)

   $ gsutil mb gs://${INFRA_ID}-bootstrap-ignition

   $ gsutil cp <installation_directory>/bootstrap.ign gs://${INFRA_ID}-bootstrap-ignition/
4. Create a signed URL for the bootstrap instance to use to access the Ignition config. Export the URL from the output as a variable:

   ```bash
   $ export BOOTSTRAP_IGN=`gsutil signurl -d 1h service-account-key.json gs://${INFRA_ID}-bootstrap-ignition/bootstrap.ign | grep "^gs:" | awk '{print $5}'`
   ```

5. Create a **04_bootstrap.yaml** resource definition file:

   ```
   $ cat <<EOF >04_bootstrap.yaml
   imports:
   - path: 04_bootstrap.py
   
   resources:
   - name: cluster-bootstrap
     type: 04_bootstrap.py
     properties:
       infra_id: '${INFRA_ID}'  
       region: '${REGION}'  
       zone: '${ZONE_0}'  
       cluster_network: '${CLUSTER_NETWORK}'  
       control_subnet: '${CONTROL_SUBNET}'  
       image: '${CLUSTER_IMAGE}'  
       machine_type: 'n1-standard-4'  
       root_volume_size: '128'
     bootstrap_ign: '${BOOTSTRAP_IGN}'
   EOF
   ```

   **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.

   **region** is the region to deploy the cluster into, for example **us-central1**.

   **zone** is the zone to deploy the bootstrap instance into, for example **us-central1-b**.

   **cluster_network** is the **selfLink** URL to the cluster network.

   **control_subnet** is the **selfLink** URL to the control subnet.

   **image** is the **selfLink** URL to the RHCOS image.

   **machine_type** is the machine type of the instance, for example **n1-standard-4**.

   **root_volume_size** is the boot disk size for the bootstrap machine.

   **bootstrap_ign** is the URL output when creating a signed URL.

6. Create the deployment by using the **gcloud** CLI:

   ```bash
   $ gcloud deployment-manager deployments create ${INFRA_ID}-bootstrap --config 04_bootstrap.yaml
   ```

7. Add the bootstrap instance to the internal load balancer instance group:
Add the bootstrap instance group to the internal load balancer backend service:

```bash
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-bootstrap-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-bootstrap
$ gcloud compute backend-services add-backend ${INFRA_ID}-api-internal-backend-service
   --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --instance-group-zone=${ZONE_0}
```

### 6.11.13.1. Deployment Manager template for the bootstrap machine

You can use the following Deployment Manager template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

**Example 6.16. 04_bootstrap.py Deployment Manager template**

```python
def GenerateConfig(context):

    resources = [{
        'name': context.properties['infra_id'] + '-bootstrap-public-ip',
        'type': 'compute.v1.address',
        'properties': {
            'region': context.properties['region']
        }
    }, {
        'name': context.properties['infra_id'] + '-bootstrap',
        'type': 'compute.v1.instance',
        'properties': {
            'autoDelete': True,
            'boot': True,
            'initializeParams': {
                'diskSizeGb': context.properties['root_volume_size'],
                'sourceImage': context.properties['image']
            }
        },
        'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' + context.properties['machine_type'],
        'metadata': {
            'items': [{
                'key': 'user-data',
                'value': '{"ignition":{"config":{"replace":{"source":"' + context.properties['bootstrap_ign'] + '"}},"version":"3.1.0"}}',
            }],
            'networkInterfaces': [{
                'subnetwork': context.properties['control_subnet'],
                'accessConfigs': [{
                    'natIP': '${ref.' + context.properties['infra_id'] + '-bootstrap-public-ip.address}'
                }]
            }],
            'tags': {
                'items': [
                    context.properties['infra_id'] + '-master',
                    context.properties['infra_id'] + '-bootstrap'
                ]
            }
        }
    }]
```
6.11.14. Creating the control plane machines in GCP

You must create the control plane machines in Google Cloud Platform (GCP) for your cluster to use. One way to create these machines is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.

**Procedure**

```json
return {
  'resources': resources
}
```
1. Copy the template from the Deployment Manager template for control plane machines section of this topic and save it as 05_control_plane.py on your computer. This template describes the control plane machines that your cluster requires.

2. Export the following variable required by the resource definition:

   ```
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign`
   ```

3. Create a 05_control_plane.yaml resource definition file:

   ```
   $ cat <<EOF >05_control_plane.yaml
   imports:
   - path: 05_control_plane.py
   
   resources:
   - name: cluster-control-plane
   type: 05_control_plane.py
   properties:
   infra_id: '${INFRA_ID}'
   zones:
   - '${ZONE_0}'
   - '${ZONE_1}'
   - '${ZONE_2}'
   control_subnet: '${CONTROL_SUBNET}'
   image: '${CLUSTER_IMAGE}'
   machine_type: 'n1-standard-4'
   root_volume_size: '128'
   service_account_email: '${MASTER_SERVICE_ACCOUNT}'
   ignition: '${MASTER_IGNITION}'
   
   EOF
   ```

   1. **infra_id** is the INFRA_ID infrastructure name from the extraction step.
   2. **zones** are the zones to deploy the control plane instances into, for example us-central1-a, us-central1-b, and us-central1-c.
   3. **control_subnet** is the selfLink URL to the control subnet.
   4. **image** is the selfLink URL to the RHCOS image.
   5. **machine_type** is the machine type of the instance, for example n1-standard-4.
   6. **service_account_email** is the email address for the master service account that you created.
   7. **ignition** is the contents of the master.ign file.

4. Create the deployment by using the gcloud CLI:

   ```
   $ gcloud deployment-manager deployments create ${INFRA_ID}-control-plane --config 05_control_plane.yaml
   ```
The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the control plane machines manually.

- Run the following commands to add the control plane machines to the appropriate instance groups:

  ```
  $ gcloud compute instance-groups unmanaged add-instances $(INFRA_ID)-master-$ZONE_0-instance-group --zone=$ZONE_0 --instances=$(INFRA_ID)-master-0
  $ gcloud compute instance-groups unmanaged add-instances $(INFRA_ID)-master-$ZONE_1-instance-group --zone=$ZONE_1 --instances=$(INFRA_ID)-master-1
  $ gcloud compute instance-groups unmanaged add-instances $(INFRA_ID)-master-$ZONE_2-instance-group --zone=$ZONE_2 --instances=$(INFRA_ID)-master-2
  ```

- For an external cluster, you must also run the following commands to add the control plane machines to the target pools:

  ```
  $ gcloud compute target-pools add-instances $(INFRA_ID)-api-target-pool --instances-zone="$ZONE_0" --instances=$(INFRA_ID)-master-0
  $ gcloud compute target-pools add-instances $(INFRA_ID)-api-target-pool --instances-zone="$ZONE_1" --instances=$(INFRA_ID)-master-1
  $ gcloud compute target-pools add-instances $(INFRA_ID)-api-target-pool --instances-zone="$ZONE_2" --instances=$(INFRA_ID)-master-2
  ```

### 6.11.14.1. Deployment Manager template for control plane machines

You can use the following Deployment Manager template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

#### Example 6.17. 05_control_plane.py Deployment Manager template

```python
def GenerateConfig(context):
    resources = [
        {'name': context.properties['infra_id'] + '-master-0',
         'type': 'compute.v1.instance',
         'properties': {
             'disks': [
                 {'autoDelete': True,
                  'boot': True,
                  'initializeParams': {
                      'diskSizeGb': context.properties['root_volume_size'],
                      'diskType': 'zones/' + context.properties['zones'][0] + '/diskTypes/pd-ssd',
                      'sourceImage': context.properties['image']
                  }
             ],
             'machineType': 'zones/' + context.properties['zones'][0] + '/machineTypes/' + context.properties['machine_type'],
             'metadata': {
                 'items': [{'
                     'key': 'user-data',
                     'value': context.properties['ignition']
                 }]
             },
             'networkInterfaces': [{'
                 'subnetwork': context.properties['control_subnet']
             }
```
{'serviceAccounts': [{'email': context.properties['service_account_email'],
  'scopes': ['https://www.googleapis.com/auth/cloud-platform']
}],
'tags': {
  'items': [
    context.properties['infra_id'] + '-master',
  ],
},
'zone': context.properties['zones'][0]}
},
{name: context.properties['infra_id'] + '-master-1',
'type': 'compute.v1.instance',
'properties': {
  'disks': [{
    'autoDelete': True,
    'boot': True,
    'initializeParams': {
      'diskSizeGb': context.properties['root_volume_size'],
      'diskType': 'zones/' + context.properties['zones'][1] + '/diskTypes/pd-ssd',
      'sourceImage': context.properties['image']
    }
  }],
  'machineType': 'zones/' + context.properties['zones'][1] + '/machineTypes/' + context.properties['machine_type'],
  'metadata': {
    'items': [{
      'key': 'user-data',
      'value': context.properties['ignition']
    }]
  },
  'networkInterfaces': [{
    'subnetwork': context.properties['control_subnet']
  }],
},
'serviceAccounts': [{'email': context.properties['service_account_email'],
  'scopes': ['https://www.googleapis.com/auth/cloud-platform']
}],
'tags': {
  'items': [
    context.properties['infra_id'] + '-master',
  ],
},
'zone': context.properties['zones'][1]}
},
{name: context.properties['infra_id'] + '-master-2',
'type': 'compute.v1.instance',
'properties': {
  'disks': [{
    'autoDelete': True,
    'boot': True,
    'initializeParams': {
      'diskSizeGb': context.properties['root_volume_size'],
    }
  }],
  'machineType': 'zones/' + context.properties['zones'][1] + '/machineTypes/' + context.properties['machine_type'],
  'metadata': {
    'items': [{
      'key': 'user-data',
      'value': context.properties['ignition']
    }]
  },
  'networkInterfaces': [{
    'subnetwork': context.properties['control_subnet']
  }],
},
'serviceAccounts': [{'email': context.properties['service_account_email'],
  'scopes': ['https://www.googleapis.com/auth/cloud-platform']
}],
'tags': {
  'items': [
    context.properties['infra_id'] + '-master',
  ],
},
'zone': context.properties['zones'][1]}
}
6.11.15. Wait for bootstrap completion and remove bootstrap resources in GCP

After you create all of the required infrastructure in Google Cloud Platform (GCP), wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**
1. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install wait-for bootstrap-complete --dir=<installation_directory> \ 
   --log-level info

1

For `<installation_directory>`, specify the path to the directory that you stored the
installation files in.

2

To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```
$ gcloud compute backend-services remove-backend ${INFRA_ID}-api-internal-backend-
   service --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --
   instance-group-zone=${ZONE_0}
$ gsutil rm gs://${INFRA_ID}-bootstrap-ignition/bootstrap.ign
$ gsutil rb gs://${INFRA_ID}-bootstrap-ignition
$ gcloud deployment-manager deployments delete ${INFRA_ID}-bootstrap
```

### 6.11.16. Creating additional worker machines in GCP

You can create worker machines in Google Cloud Platform (GCP) for your cluster to use by launching
individual instances discretely or by automated processes outside the cluster, such as auto scaling
groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in
OpenShift Container Platform.

In this example, you manually launch one instance by using the Deployment Manager template.
Additional instances can be launched by including additional resources of type `06_worker.py` in the file.

**NOTE**

If you do not use the provided Deployment Manager template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.
Procedure

1. Copy the template from the Deployment Manager template for worker machines section of this topic and save it as 06_worker.py on your computer. This template describes the worker machines that your cluster requires.

2. Export the variables that the resource definition uses.

   a. Export the subnet that hosts the compute machines:

   ```
   $ export COMPUTE_SUBNET=`gcloud compute networks subnets describe
   ${HOST_PROJECT_COMPUTE_SUBNET} --region=${REGION} --project
   ${HOST_PROJECT} --account ${HOST_PROJECT_ACCOUNT} --format json | jq -r
   .selfLink`
   ```

   b. Export the email address for your service account:

   ```
   $ export WORKER_SERVICE_ACCOUNT=`gcloud iam service-accounts list --filter
   "email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email')
   ```

   c. Export the location of the compute machine Ignition config file:

   ```
   $ export WORKER_IGNITION=`cat <installation_directory>/worker.ign`
   ```

3. Create a 06_worker.yaml resource definition file:

   ```
   $ cat <<EOF >06_worker.yaml
   imports:
   - path: 06_worker.py

   resources:
   - name: 'worker-0'
     type: 06_worker.py
     properties:
       infra_id: '${INFRA_ID}'
       zone: '${ZONE_0}'
       compute_subnet: '${COMPUTE_SUBNET}'
       image: '${CLUSTER_IMAGE}'
       machine_type: 'n1-standard-4'
       root_volume_size: '128'
       service_account_email: '${WORKER_SERVICE_ACCOUNT}'
       ignition: '${WORKER_IGNITION}'
   - name: 'worker-1'
     type: 06_worker.py
     properties:
       infra_id: '${INFRA_ID}'
       zone: '${ZONE_1}'
       compute_subnet: '${COMPUTE_SUBNET}'
       image: '${CLUSTER_IMAGE}'
       machine_type: 'n1-standard-4'
       root_volume_size: '128'
   ```
name is the name of the worker machine, for example `worker-0`.

infra_id is the INFRA_ID infrastructure name from the extraction step.

zone is the zone to deploy the worker machine into, for example `us-central1-a`.

compute_subnet is the selfLink URL to the compute subnet.

image is the selfLink URL to the RHCOS image.

machine_type is the machine type of the instance, for example `n1-standard-4`.

service_account_email is the email address for the worker service account that you created.

ignition is the contents of the `worker.ign` file.

4. Optional: If you want to launch additional instances, include additional resources of type `06_worker.py` in your `06_worker.yaml` resource definition file.

5. Create the deployment by using the `gcloud` CLI:

```
$ gcloud deployment-manager deployments create ${INFRA_ID}-worker --config 06_worker.yaml
```

### 6.11.16.1. Deployment Manager template for worker machines

You can use the following Deployment Manager template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

**Example 6.18. 06_worker.py Deployment Manager template**

```python
def GenerateConfig(context):

    resources = [
        {'name': context.properties['infra_id'] + '-' + context.env['name'],
         'type': 'compute.v1.instance',
         'properties': {
             'diskSizeGb': context.properties['root_volume_size'],
             'sourceImage': context.properties['image']
         },
         'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' + context.properties['machine_type'],
         'metadata': {
             'items': [
```
6.11.17. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (oc) to interact with OpenShift Container Platform from a command-line interface. You can install oc on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of oc, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of oc.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (oc) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the **Infrastructure Provider** page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the **Command line interface** section, select **Linux** from the drop-down menu and click **Download command-line tools**.

4. Unpack the archive:

   ```
   $ tar xvzf <file>
   ```

5. Place the oc binary in a directory that is on your **PATH**.

   To check your **PATH**, execute the following command:

   ```
   $ echo $PATH
   ```
After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (`oc`) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.
4. Unzip the archive with a ZIP program.
5. Move the `oc` binary to a directory that is on your PATH.
   
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:\> path
   ```

After you install the CLI, it is available using the `oc` command:

```
C:\> oc <command>
```

**Installing the OpenShift CLI on macOS**

You can install the OpenShift CLI (`oc`) binary on macOS by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.
2. Select your infrastructure provider, and, if applicable, your installation type.
3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.
4. Unpack and unzip the archive.
5. Move the `oc` binary to a directory on your PATH.
   
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

After you install the CLI, it is available using the `oc` command:

```
$ oc <command>
```

**6.11.18. Logging in to the cluster by using the CLI**

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The
kubeconfig file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the oc CLI.

Procedure

1. Export the kubeadmin credentials:

   ```
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig
   ```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   ```
   $ oc whoami
   ```

   Example output

   ```
   system:admin
   ```

6.11.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Prerequisites

- You added machines to your cluster.

Procedure

1. Confirm that the cluster recognizes the machines:

   ```
   $ oc get nodes
   ```

   Example output

   ```
   NAME      STATUS    ROLES    AGE     VERSION
   master-0  Ready     master   63m     v1.21.0
   master-1  Ready     master   63m     v1.21.0
   master-2  Ready     master   64m     v1.21.0
   worker-0  NotReady  worker   76s     v1.21.0
   worker-1  NotReady  worker   70s     v1.21.0
   ```
The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-8b2br</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-8vnps</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. Once the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the `oc exec`, `oc rsh`, and `oc logs` commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the `node-bootstrapper` service account in the `system:node` or `system:admin` groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:
To approve all pending CSRs, run the following command:

```bash
$ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

**NOTE**

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```bash
$ oc get csr
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```bash
$ oc adm certificate approve <csr_name> 1
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```bash
$ oc get nodes
```

**Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>73m</td>
<td>v1.21.0</td>
</tr>
</tbody>
</table>
NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the Ready status.

Additional information

- For more information on CSRs, see Certificate Signing Requests.

6.11.20. Adding the ingress DNS records

DNS zone configuration is removed when creating Kubernetes manifests and generating Ignition configs. You must manually create DNS records that point at the ingress load balancer. You can create either a wildcard *.apps.(baseDomain), or specific records. You can use A, CNAME, and other records per your requirements.

Prerequisites

- Configure a GCP account.
- Remove the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.
- Create the worker machines.

Procedure

1. Wait for the Ingress router to create a load balancer and populate the EXTERNAL-IP field:

```
$ oc -n openshift-ingress get service router-default
```

Example output

```
NAME             TYPE           CLUSTER-IP      EXTERNAL-IP      PORT(S)                      AGE
```

2. Add the A record to your zones:
To use A records:

i. Export the variable for the router IP address:

```
$ export ROUTER_IP=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

ii. Add the A record to the private zones:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone $INFRA_ID-private-zone --project $HOST_PROJECT --account $HOST_PROJECT_ACCOUNT
$ gcloud dns record-sets transaction add $ROUTER_IP --name \*.apps.$(CLUSTER_NAME).$(BASE_DOMAIN). --ttl 300 --type A --zone $INFRA_ID-private-zone --project $HOST_PROJECT --account $HOST_PROJECT_ACCOUNT
$ gcloud dns record-sets transaction execute --zone $INFRA_ID-private-zone --project $HOST_PROJECT --account $HOST_PROJECT_ACCOUNT
```

iii. For an external cluster, also add the A record to the public zones:

```
$ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
$ gcloud dns record-sets transaction start --zone $BASE_DOMAIN_ZONE_NAME -project $HOST_PROJECT --account $HOST_PROJECT_ACCOUNT
$ gcloud dns record-sets transaction add $ROUTER_IP --name \*.apps.$(CLUSTER_NAME).$(BASE_DOMAIN). --ttl 300 --type A --zone $BASE_DOMAIN_ZONE_NAME --project $HOST_PROJECT --account $HOST_PROJECT_ACCOUNT
$ gcloud dns record-sets transaction execute --zone $BASE_DOMAIN_ZONE_NAME --project $HOST_PROJECT --account $HOST_PROJECT_ACCOUNT
```

To add explicit domains instead of using a wildcard, create entries for each of the cluster’s current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}{end}' routes
```

Example output

```
oauth-openshift.apps.your.cluster.domain.example.com
console-openshift-console.apps.your.cluster.domain.example.com
downloads-openshift-console.apps.your.cluster.domain.example.com
alertmanager-main-openshift-monitoring.apps.your.cluster.domain.example.com
grafana-openshift-monitoring.apps.your.cluster.domain.example.com
prometheus-k8s-openshift-monitoring.apps.your.cluster.domain.example.com
```

6.11.21. Adding ingress firewall rules

The cluster requires several firewall rules. If you do not use a shared VPC, these rules are created by the ingress controller via the GCP cloud provider. When you use a shared VPC, you can either create cluster-wide firewall rules for all services now or create each rule based on events, when the cluster
requests access. By creating each rule when the cluster requests access, you know exactly which firewall rules are required. By creating cluster-wide firewall rules, you can apply the same rule set across multiple clusters.

If you choose to create each rule based on events, you must create firewall rules after you provision the cluster and during the life of the cluster when the console notifies you that rules are missing. Events that are similar to the following event are displayed, and you must add the firewall rules that are required:

```bash
$ oc get events -n openshift-ingress --field-selector="reason=LoadBalancerManualChange"
```

**Example output**

```
Firewall change required by security admin: `gcloud compute firewall-rules create k8s-fw-a26e631036a3f46c8a28f8df67266d55 --network example-network --description "{"kubernetes.io/service-name":"openshift-ingress/router-default", "kubernetes.io/service-ip":"35.237.236.234\"}" --allow tcp:443,tcp:80 --source-ranges 0.0.0.0/0 --target-tags exampl-fqzq7-master,exampl-fqzq7-worker --project example-project`
```

If you encounter issues when creating these rule-based events, you can configure the cluster-wide firewall rules while your cluster is running.

### 6.11.21.1. Creating cluster-wide firewall rules for a shared VPC in GCP

You can create cluster-wide firewall rules to allow the access that the OpenShift Container Platform cluster requires.

**WARNING**

If you do not choose to create firewall rules based on cluster events, you must create cluster-wide firewall rules.

**Prerequisites**

- You exported the variables that the Deployment Manager templates require to deploy your cluster.
- You created the networking and load balancing components in GCP that your cluster requires.

**Procedure**

1. Add a single firewall rule to allow the Google Cloud Engine health checks to access all of the services. This rule enables the ingress load balancers to determine the health status of their instances.

```bash
$ gcloud compute firewall-rules create --allow='tcp:30000-32767,udp:30000-32767' --network="${CLUSTER_NETWORK}" --source-ranges='130.211.0.0/22,35.191.0.0/16,209.85.152.0/22,209.85.204.0/22' --target-tags="${INFRA_ID}-master,${INFRA_ID}-worker>${INFRA_ID}-ingress-hc --account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
```
2. Add a single firewall rule to allow access to all cluster services:
   
   - For an external cluster:
     
     ```bash
     $ gcloud compute firewall-rules create --allow='tcp:80,tcp:443' --
     network="${CLUSTER_NETWORK}" --source-ranges="0.0.0.0/0" --target-
     tags="${INFRA_ID}-master,${INFRA_ID}-worker" ${INFRA_ID}-ingress --
     account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
     ```
   
   - For a private cluster:
     
     ```bash
     $ gcloud compute firewall-rules create --allow='tcp:80,tcp:443' --
     network="${CLUSTER_NETWORK}" --source-ranges=${NETWORK_CIDR} --target-
     tags="${INFRA_ID}-master,${INFRA_ID}-worker" ${INFRA_ID}-ingress --
     account=${HOST_PROJECT_ACCOUNT} --project=${HOST_PROJECT}
     ```
   
   Because this rule only allows traffic on TCP ports 80 and 443, ensure that you add all the ports that your services use.

6.11.22. Completing a GCP installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Google Cloud Platform (GCP) user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned GCP infrastructure.
- Install the `oc` CLI and log in.

Procedure

1. Complete the cluster installation:

   ```bash
   $ ./openshift-install --dir=<installation_directory> wait-for install-complete
   ```

Example output

```
INFO Waiting up to 30m0s for the cluster to initialize...
```

1. For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
IMPORTANT

The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

2. Observe the running state of your cluster.

   a. Run the following command to view the current cluster version and status:

      ```
      $ oc get clusterversion
      
      Example output
      
      NAME   VERSION   AVAILABLE   PROGRESSING SINCE   STATUS
      version False   True        24m     Working towards 4.5.4: 99% complete
      ```

   b. Run the following command to view the Operators managed on the control plane by the Cluster Version Operator (CVO):

      ```
      $ oc get clusteroperators
      
      Example output
      
      NAME                                       VERSION   AVAILABLE   PROGRESSING   DEGRADED SINCE
      authentication                             4.5.4     True        False         False      7m56s
      cloud-credential                           4.5.4     True        False         False      31m
      cluster-autoscaler                         4.5.4     True        False         False      16m
      console                                    4.5.4     True        False         False      10m
      csi-snapshot-controller                    4.5.4     True        False         False      16m
      dns                                        4.5.4     True        False         False      22m
      etcd                                       4.5.4     False       False         False      25s
      image-registry                             4.5.4     True        False         False      16m
      ingress                                    4.5.4     True        False         False      16m
      insights                                   4.5.4     True        False         False      17m
      kube-apiserver                             4.5.4     True        False         False      19m
      kube-controller-manager                    4.5.4     True        False         False      20m
      kube-scheduler                             4.5.4     True        False         False      20m
      kube-storage-version-migrator              4.5.4     True        False         False      16m
      machine-api                                4.5.4     True        False         False      22m
      machine-config                             4.5.4     True        False         False      22m
      marketplace                                4.5.4     True        False         False      16m
      monitoring                                 4.5.4     True        False         False      10m
      network                                    4.5.4     True        False         False      23m
      node-tuning                                4.5.4     True        False         False      23m
      openshift-apiserver                        4.5.4     True        False         False      17m
      openshift-controller-manager               4.5.4     True        False         False      15m
      openshift-samples                          4.5.4     True        False         False      16m
c. Run the following command to view your cluster pods:

$ oc get pods --all-namespaces

Example output

<table>
<thead>
<tr>

</tbody>
</table>

When the current cluster version is **AVAILABLE**, the installation is complete.

### 6.11.23. Next steps

- Customize your cluster.
- If necessary, you can opt out of remote health reporting.
6.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.8, you can install a cluster on Google Cloud Platform (GCP) that uses infrastructure that you provide and an internal mirror of the installation release content.

**IMPORTANT**

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the GCP APIs.

The steps for performing a user-provided infrastructure install are outlined here. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods.

**IMPORTANT**

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several Deployment Manager templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

6.12.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- You created a registry on your mirror host and obtained the `imageContentSources` data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- If you use a firewall, you configured it to allow the sites that your cluster requires access to. While you might need to grant access to more sites, you must grant access to `*.googleapis.com` and `accounts.google.com`.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the `kube-system` namespace, you can manually create and maintain IAM credentials.

6.12.2. Configuring your GCP project

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.
6.12.2.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

Procedure

- Create a project to host your OpenShift Container Platform cluster. See Creating and Managing Projects in the GCP documentation.

IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the `api-int.<cluster_name>.<base_domain>` URL; the Premium Tier is required for internal load balancing.

6.12.2.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

Prerequisites

- You created a project to host your cluster.

Procedure

- Enable the following required API services in the project that hosts your cluster. See Enabling services in the GCP documentation.

Table 6.42. Required API services

<table>
<thead>
<tr>
<th>API service</th>
<th>Console service name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compute Engine API</td>
<td>compute.googleapis.com</td>
</tr>
<tr>
<td>Google Cloud APIs</td>
<td>cloudapis.googleapis.com</td>
</tr>
<tr>
<td>Cloud Resource Manager API</td>
<td>cloudresourcemanager.googleapis.com</td>
</tr>
<tr>
<td>Google DNS API</td>
<td>dns.googleapis.com</td>
</tr>
<tr>
<td>IAM Service Account Credentials API</td>
<td>iamcredentials.googleapis.com</td>
</tr>
<tr>
<td>Identity and Access Management (IAM) API</td>
<td>iam.googleapis.com</td>
</tr>
<tr>
<td>Service Management API</td>
<td>servicemanagement.googleapis.com</td>
</tr>
</tbody>
</table>
6.12.2.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

   **NOTE**

   If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](#).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](#) in the GCP documentation.
   Use an appropriate root domain, such as `openshiftcorp.com`, or subdomain, such as `clusters.openshiftcorp.com`.

3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](#) in the GCP documentation.
   You typically have four name servers.

4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](#).

5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](#) in the GCP documentation.

6. If you use a subdomain, follow your company’s procedures to add its delegation records to the parent domain. This process might include a request to your company’s IT department or the division that controls the root domain and DNS services for your company.

6.12.2.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default Quotas do not affect your ability to install a default OpenShift Container Platform cluster.
A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

### Table 6.43. GCP resources used in a default cluster

<table>
<thead>
<tr>
<th>Service</th>
<th>Component</th>
<th>Location</th>
<th>Total resources required</th>
<th>Resources removed after bootstrap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service account</td>
<td>IAM</td>
<td>Global</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>Firewall rules</td>
<td>Networking</td>
<td>Global</td>
<td>11</td>
<td>1</td>
</tr>
<tr>
<td>Forwarding rules</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Health checks</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Images</td>
<td>Compute</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Networks</td>
<td>Networking</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Routers</td>
<td>Networking</td>
<td>Global</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Routes</td>
<td>Networking</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Subnetworks</td>
<td>Compute</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Target pools</td>
<td>Networking</td>
<td>Global</td>
<td>2</td>
<td>0</td>
</tr>
</tbody>
</table>

**NOTE**

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- asia-east2
- asia-northeast2
- asia-south1
- australia-southeast1
- europe-north1
You can increase resource quotas from the GCP console, but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

6.12.2.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

Prerequisites

- You created a project to host your cluster.

Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See Creating a service account in the GCP documentation.

2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the Owner role to it. See Granting roles to a service account for specific resources.

   NOTE

   While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See Creating service account keys in the GCP documentation.

   The service account key is required to create a cluster.

6.12.2.5.1. Required GCP permissions

When you attach the Owner role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:
Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

Required roles for creating network resources during installation

- DNS Administrator

Required roles for user-provisioned GCP infrastructure

- Deployment Manager Editor
- Service Account Key Admin

Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

Table 6.44. GCP service account permissions

<table>
<thead>
<tr>
<th>Account</th>
<th>Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Plane</td>
<td>roles/compute.instanceAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.networkAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/compute.securityAdmin</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
<tr>
<td></td>
<td>roles/iam.serviceAccountUser</td>
</tr>
<tr>
<td>Compute</td>
<td>roles/compute.viewer</td>
</tr>
<tr>
<td></td>
<td>roles/storage.admin</td>
</tr>
</tbody>
</table>

6.12.2.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:
6.12.2.7. Installing and configuring CLI tools for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must install and configure the CLI tools for GCP.

Prerequisites
You created a project to host your cluster.

- You created a service account and granted it the required permissions.

**Procedure**

1. Install the following binaries in `PATH`:
   - `gcloud`
   - `gsutil`
   
   See [Install the latest Cloud SDK version](#) in the GCP documentation.

2. Authenticate using the `gcloud` tool with your configured service account.
   
   See [Authorizing with a service account](#) in the GCP documentation.

### 6.12.3. Creating the installation files for GCP

To install OpenShift Container Platform on Google Cloud Platform (GCP) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the `install-config.yaml` file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate `/var` partition during the preparation phases of installation.

#### 6.12.3.1. Optional: Creating a separate `/var` partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the `/var` partition or a subdirectory of `/var`. For example:

- `/var/lib/containers`: Holds container-related content that can grow as more images and containers are added to a system.
- `/var/lib/etcd`: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- `/var`: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a `/var` directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because `/var` must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate `/var` partition by creating a machine config that is inserted during the `openshift-install` preparation phases of an OpenShift Container Platform installation.

**IMPORTANT**

If you follow the steps to create a separate `/var` partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.
Prerequisites

- If container storage is on the root partition, ensure that this root partition is mounted with the `pquota` option by including `rootflags=pquota` in the GRUB command line.

- If the container storage is on a partition that is mounted by `/etc/fstab`, ensure that the following mount option is included in the `/etc/fstab` file:

```
/dev/sdb1 /var xfs defaults,pquota 0 0
```

- If the container storage is on a partition that is mounted by `systemd`, ensure that the `MachineConfig` object includes the following mount option as in this example:

```yaml
spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/sdb
          partitions:
            - label: var
              sizeMiB: 240000
              startMiB: 0
          filesystems:
            - device: /dev/disk/by-partlabel/var
              format: xfs
              path: /var
    systemd:
      units:
        - contents: |
          [Unit]
          Before=local-fs.target
          [Mount]
          Where=/var
          What=/dev/disk/by-partlabel/var
          Options=defaults,pquota
          [Install]
          WantedBy=local-fs.target
          enabled: true
          name: var.mount
```

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

   ```
   $ mkdir $HOME/clusterconfig
   ```

2. Run `openshift-install` to create a set of files in the `manifest` and `openshift` subdirectories. Answer the system questions as you are prompted:

   ```
   $ openshift-install create manifests --dir $HOME/clusterconfig
   ? SSH Public Key ... 
   $ ls $HOME/clusterconfig/openshift/
   99_kubeadmin-password-secret.yaml
   ```
3. Create a `MachineConfig` object and add it to a file in the `openshift` directory. For example, name the file `98-var-partition.yaml`, change the disk device name to the name of the storage device on the `worker` systems, and set the storage size as appropriate. This attaches storage to a separate `/var` directory.

```yaml
apiVersion: machineconfiguration.openshift.io/v1
kind: MachineConfig
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
name: 98-var-partition
spec:
  config:
    ignition:
      version: 3.2.0
    storage:
      disks:
        - device: /dev/<device_name> 1
          partitions:
            - sizeMiB: <partition_size>
              startMiB: <partition_start_offset> 2
              label: var
      filesystems:
        - path: /var
device: /dev/disk/by-partlabel/var
      format: xfs
systemd:
  units:
    - name: var.mount
      enabled: true
      contents: |
      [Unit]
      Before=local-fs.target
      [Mount]
      Where=/var
      What=/dev/disk/by-partlabel/var
      [Install]
      WantedBy=local-fs.target
```

1. The storage device name of the disk that you want to partition.

2. When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

4. Run `openshift-install` again to create Ignition configs from a set of files in the `manifest` and `openshift` subdirectories:
Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

6.12.3.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the `install-config.yaml` file.

   a. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install create install-config --dir=<installation_directory> ①
   ```

   ① For `<installation_directory>`, specify the directory name to store the files that the installation program creates.

   IMPORTANT

   Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

   b. At the prompts, provide the configuration details for your cloud:

      i. Optional: Select an SSH key to use to access your cluster machines.

      NOTE

      For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your `ssh-agent` process uses.

      ii. Select `gcp` as the platform to target.
iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.

iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.

v. Select the region to deploy the cluster to.

vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

vii. Enter a descriptive name for your cluster.

viii. Paste the pull secret that you obtained from the Pull Secret page on the Red Hat OpenShift Cluster Manager site.

2. Modify the `install-config.yaml` file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you have any intermediate CA certificates on the engine, verify that the certificates appear in the `ovirt-config.yaml` file and the `install-config.yaml` file. If they do not appear, add them as follows:

1. In the `~/.ovirt/ovirt-config.yaml` file:

   ```yaml
   [ovirt_ca_bundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   
   [additionalTrustBundle]: |
   -----BEGIN CERTIFICATE-----
   <MY_TRUSTED_CA>
   -----END CERTIFICATE-----
   -----BEGIN CERTIFICATE-----
   <INTERMEDIATE_CA>
   -----END CERTIFICATE-----
   
2. In the `install-config.yaml` file:

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the installation process. If you want to reuse the file, you must back it up now.

6.12.3.3. Creating the Kubernetes manifest and Ignition config files
Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.

- You created the `install-config.yaml` installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

   ```bash
   $ ./openshift-install create manifests --dir=<installation_directory>  
   ```

   **Example output**

   ```bash
   INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
   INFO Consuming Install Config from target directory
   INFO Manifests created in: install_dir/manifests and install_dir/openshift
   
   For `<installation_directory>`, specify the installation directory that contains the `install-config.yaml` file you created.
   ```

2. Remove the Kubernetes manifest files that define the control plane machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
   ```

   By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Optional: If you do not want the cluster to provision compute machines, remove the Kubernetes manifest files that define the worker machines:

   ```bash
   $ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
   ```
Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the `mastersSchedulable` parameter in the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` Kubernetes manifest file is set to `false`. This setting prevents pods from being scheduled on the control plane machines:

   a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
   
   b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
   
   c. Save and exit the file.

5. Optional: If you do not want the Ingress Operator to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

   ```yaml
   apiVersion: config.openshift.io/v1
   kind: DNS
   metadata:
     creationTimestamp: null
     name: cluster
   spec:
     baseDomain: example.openshift.com
     privateZone: 1
     id: mycluster-100419-private-zone
     publicZone: 2
     id: example.openshift.com
   status: {}
   ```

   1 2 Remove this section completely.

   If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

   ```bash
   $ ./openshift-install create ignition-configs --dir=<installation_directory> 1
   ```

   1 For `<installation_directory>`, specify the same installation directory.

   Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadm-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:
Additional resources

- Optional: Adding the ingress DNS records

### 6.12.4. Exporting common variables

#### 6.12.4.1. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Google Cloud Platform (GCP). The infrastructure name is also used to locate the appropriate GCP resources during an OpenShift Container Platform installation. The provided Deployment Manager templates contain references to this infrastructure name, so you must extract it.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

**Procedure**

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

  ```bash
  $ jq -r .infraID <installation_directory>/metadata.json
  
  1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.
  
  **Example output**
  
  openshift-vw9j6
  
  The output of this command is your cluster name and a random string.

#### 6.12.4.2. Exporting common variables for Deployment Manager templates

You must export a common set of variables that are used with the provided Deployment Manager templates used to assist in completing a user-provided infrastructure install on Google Cloud Platform (GCP).

**NOTE**

Specific Deployment Manager templates can also require additional exported variables, which are detailed in their related procedures.
Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

Generate the Ignition config files for your cluster.

Install the `jq` package.

Procedure

1. Export the following common variables to be used by the provided Deployment Manager templates:

```bash
$ export BASE_DOMAIN='<base_domain>'
$ export BASE_DOMAIN_ZONE_NAME='<base_domain_zone_name>'
$ export NETWORK_CIDR='10.0.0.0/16'
$ export MASTER_SUBNET_CIDR='10.0.0.0/17'
$ export WORKER_SUBNET_CIDR='10.0.128.0/17'
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig
$ export CLUSTER_NAME=`jq -r .clusterName <installation_directory>/metadata.json`
$ export INFRA_ID=`jq -r .infraID <installation_directory>/metadata.json`
$ export PROJECT_NAME=`jq -r .gcp.projectID <installation_directory>/metadata.json`
$ export REGION=`jq -r .gcp.region <installation_directory>/metadata.json`
```

For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

6.12.5. Creating a VPC in GCP

You must create a VPC in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements. One way to create the VPC is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.

Procedure

1. Copy the template from the Deployment Manager template for the VPC section of this topic and save it as `01_vpc.py` on your computer. This template describes the VPC that your cluster requires.

2. Create a `01_vpc.yaml` resource definition file:
$ cat <<EOF >01_vpc.yaml
imports:
- path: 01_vpc.py

resources:
- name: cluster-vpc
  type: 01_vpc.py
  properties:
    infra_id: '${INFRA_ID}'
    region: '${REGION}'
    master_subnet_cidr: '${MASTER_SUBNET_CIDR}'
    worker_subnet_cidr: '${WORKER_SUBNET_CIDR}'
EOF

1. `infra_id` is the INFRA_ID infrastructure name from the extraction step.
2. `region` is the region to deploy the cluster into, for example `us-central1`.
3. `master_subnet_cidr` is the CIDR for the master subnet, for example `10.0.0.0/19`.
4. `worker_subnet_cidr` is the CIDR for the worker subnet, for example `10.0.32.0/19`.

3. Create the deployment by using the `gcloud` CLI:

```bash
$ gcloud deployment-manager deployments create ${INFRA_ID}-vpc --config 01_vpc.yaml
```

6.12.5.1. Deployment Manager template for the VPC

You can use the following Deployment Manager template to deploy the VPC that you need for your OpenShift Container Platform cluster:

**Example 6.19. 01_vpc.py Deployment Manager template**

```python
def GenerateConfig(context):

    resources = [
        {
          'name': context.properties['infra_id'] + '-network',
          'type': 'compute.v1.network',
          'properties': {
            'region': context.properties['region'],
            'autoCreateSubnetworks': False
          }
        },
        {
          'name': context.properties['infra_id'] + '-master-subnet',
          'type': 'compute.v1.subnetwork',
          'properties': {
            'region': context.properties['region'],
            'network': '$(ref. + context.properties[infra_id] + -network.selfLink)',
            'ipCidrRange': context.properties['master_subnet_cidr']
          }
        },
        {
          'name': context.properties['infra_id'] + '-worker-subnet',
          'type': 'compute.v1.subnetwork',
```
6.12.6. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in `initramfs` during boot to fetch their Ignition config files.

6.12.6.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as `localhost` or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

6.12.6.2. Network connectivity requirements
You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

Table 6.45. Ports used for all-machine to all-machine communications

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICMP</td>
<td>N/A</td>
<td>Network reachability tests</td>
</tr>
<tr>
<td>TCP</td>
<td>1936</td>
<td>Metrics</td>
</tr>
<tr>
<td>9000-9999</td>
<td></td>
<td>Host level services, including the node exporter on ports 9100-9101 and the Cluster Version Operator on port 9099.</td>
</tr>
<tr>
<td>10250-10259</td>
<td></td>
<td>The default ports that Kubernetes reserves</td>
</tr>
<tr>
<td>10256</td>

</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>2379-2380</td>
<td>etcd server and peer ports</td>
</tr>
</tbody>
</table>

6.12.7. Creating load balancers in GCP

You must configure load balancers in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.
NOTE

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for the internal load balancer section of this topic and save it as 02_lb_int.py on your computer. This template describes the internal load balancing objects that your cluster requires.

2. For an external cluster, also copy the template from the Deployment Manager template for the external load balancer section of this topic and save it as 02_lb_ext.py on your computer. This template describes the external load balancing objects that your cluster requires.

3. Export the variables that the deployment template uses:
   a. Export the cluster network location:

   ```bash
   $ export CLUSTER_NETWORK=('gcloud compute networks describe ${INFRA_ID}-network --format json | jq -r .selfLink')
   ```

   b. Export the control plane subnet location:

   ```bash
   $ export CONTROL_SUBNET=('gcloud compute networks subnets describe
   ${INFRA_ID}-master-subnet --region=${REGION} --format json | jq -r .selfLink')
   ```

   c. Export the three zones that the cluster uses:

   ```bash
   $ export ZONE_0=('gcloud compute regions describe ${REGION} --format=json | jq -r .zones[0] | cut -d "" -f9')
   $ export ZONE_1=('gcloud compute regions describe ${REGION} --format=json | jq -r .zones[1] | cut -d "" -f9')
   $ export ZONE_2=('gcloud compute regions describe ${REGION} --format=json | jq -r .zones[2] | cut -d "" -f9')
   ```

4. Create a 02_infra.yaml resource definition file:

   ```bash
   $ cat <<EOF >02_infra.yaml
   imports:
   - path: 02_lb_ext.py
   - path: 02_lb_int.py
   EOF
   ```
Required only when deploying an external cluster.

1. `infra_id` is the `INFRA_ID` infrastructure name from the extraction step.
2. `region` is the region to deploy the cluster into, for example `us-central1`.
3. `control_subnet` is the URI to the control subnet.
4. `zones` are the zones to deploy the control plane instances into, like `us-east1-b`, `us-east1-c`, and `us-east1-d`.

5. Create the deployment by using the `gcloud` CLI:

   
   ```bash
   $ gcloud deployment-manager deployments create ${INFRA_ID}-infra --config 02_infra.yaml
   ```

6. Export the cluster IP address:

   ```bash
   $ export CLUSTER_IP=`gcloud compute addresses describe ${INFRA_ID}-cluster-ip --region=${REGION} --format json | jq -r .address`
   ```

7. For an external cluster, also export the cluster public IP address:

   ```bash
   $ export CLUSTER_PUBLIC_IP=`gcloud compute addresses describe ${INFRA_ID}-cluster-public-ip --region=${REGION} --format json | jq -r .address`
   ```

6.12.7.1. Deployment Manager template for the external load balancer

You can use the following Deployment Manager template to deploy the external load balancer that you need for your OpenShift Container Platform cluster:

Example 6.20. `02_lb_ext.py` Deployment Manager template

```python
def GenerateConfig(context):
```

resources:
  - name: cluster-lb-ext
    type: 02_lb_ext.py
    properties:
      infra_id: '$(INFRA_ID)'  
      region: '$(REGION)'  
  - name: cluster-lb-int
    type: 02_lb_int.py
    properties:
      cluster_network: '$(CLUSTER_NETWORK)'  
      control_subnet: '$(CONTROL_SUBNET)'  
      infra_id: '$(INFRA_ID)'  
      region: '$(REGION)'  
    zones:
      - '${ZONE_0}'
      - '${ZONE_1}'
      - '${ZONE_2}'
```
6.12.7.2. Deployment Manager template for the internal load balancer

You can use the following Deployment Manager template to deploy the internal load balancer that you need for your OpenShift Container Platform cluster:

**Example 6.21. 02_lb_int.py Deployment Manager template**

```python
resources = [{
    'name': context.properties['infra_id'] + '-cluster-public-ip',
    'type': 'compute.v1.address',
    'properties': {
        'region': context.properties['region']
    }
}, {
    'name': context.properties['infra_id'] + '-api-health-check',
    'type': 'compute.v1.httpHealthCheck',
    'properties': {
        'port': 6080,
        'requestPath': '/readyz'
    }
}, {
    'name': context.properties['infra_id'] + '-api-target-pool',
    'type': 'compute.v1.targetPool',
    'properties': {
        'region': context.properties['region'],
        'healthChecks': ['$ref.' + context.properties['infra_id'] + '-api-http-health-check.selfLink],
        'instances': []
    }
}, {
    'name': context.properties['infra_id'] + '-api-forwarding-rule',
    'type': 'compute.v1.forwardingRule',
    'properties': {
        'region': context.properties['region'],
        'IPAddress': '$ref.' + context.properties['infra_id'] + '-cluster-public-ip.selfLink',
        'target': '$ref.' + context.properties['infra_id'] + '-api-target-pool.selfLink',
        'portRange': '6443'
    }
}]

return {'resources': resources}
```

**CHAPTER 6. INSTALLING ON GCP**
for zone in context.properties['zones']:
    resources.append(
        {'name': context.properties['infra_id'] + '-master-' + zone + '-instance-group',
         'type': 'compute.v1.instanceGroup',
         'properties': {
            'namedPorts': [
                {'name': 'ignition',
                 'port': 22623},
                {'name': 'https',
                 'port': 6443}
            ]
        })
You will need this template in addition to the **02_lb_ext.py** template when you create an external cluster.

### 6.12.8. Creating a private DNS zone in GCP

You must configure a private DNS zone in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create this component is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

**Procedure**

1. Copy the template from the Deployment Manager template for the private DNS section of this topic and save it as **02_dns.py** on your computer. This template describes the private DNS objects that your cluster requires.

2. Create a **02_dns.yaml** resource definition file:

   ```
   $ cat <<EOF >02_dns.yaml
   imports:
   - path: 02_dns.py

   resources:
   - name: cluster-dns
     type: 02_dns.py
     properties:
       infra_id: '${INFRA_ID}'
       cluster_domain: '${CLUSTER_NAME}.${BASE_DOMAIN}'
       cluster_network: '${CLUSTER_NETWORK}'

   EOF
   ```
infra_id is the INFRA_ID infrastructure name from the extraction step.

cluster_domain is the domain for the cluster, for example openshift.example.com.

cluster_network is the selfLink URL to the cluster network.

3. Create the deployment by using the gcloud CLI:

   $ gcloud deployment-manager deployments create ${INFRA_ID}-dns --config 02_dns.yaml

4. The templates do not create DNS entries due to limitations of Deployment Manager, so you must create them manually:

   a. Add the internal DNS entries:

      $ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
      $ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
      $ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api.$(CLUSTER_NAME).$(BASE_DOMAIN). --ttl 60 --type A --zone ${INFRA_ID}-private-zone
      $ gcloud dns record-sets transaction add ${CLUSTER_IP} --name api-int.$(CLUSTER_NAME).$(BASE_DOMAIN). --ttl 60 --type A --zone ${INFRA_ID}-private-zone
      $ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone

   b. For an external cluster, also add the external DNS entries:

      $ if [ -f transaction.yaml ]; then rm transaction.yaml; fi
      $ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
      $ gcloud dns record-sets transaction add ${CLUSTER_PUBLIC_IP} --name api.$(CLUSTER_NAME).$(BASE_DOMAIN). --ttl 60 --type A --zone $(BASE_DOMAIN_ZONE_NAME)
      $ gcloud dns record-sets transaction execute --zone $(BASE_DOMAIN_ZONE_NAME)

6.12.8.1. Deployment Manager template for the private DNS

You can use the following Deployment Manager template to deploy the private DNS that you need for your OpenShift Container Platform cluster:

Example 6.22. 02_dns.py Deployment Manager template

```python
def GenerateConfig(context):

    resources = [
        {'name': context.properties['infra_id'] + '-private-zone',
         'type': 'dns.v1.managedZone',
         'properties': {
             'description': '',
             'dnsName': context.properties['cluster_domain'] + '.',
             'visibility': 'private',
             'privateVisibilityConfig': {
                 'networks': [{
                     'networkUrl': context.properties['cluster_network']
                 }]
             }
        }
    ]
```
6.12.9. Creating firewall rules in GCP

You must create firewall rules in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.

**Procedure**

1. Copy the template from the Deployment Manager template for firewall rules section of this topic and save it as `03_firewall.py` on your computer. This template describes the security groups that your cluster requires.

2. Create a `03_firewall.yaml` resource definition file:

```yaml
import:
- path: 03_firewall.py

resources:
- name: cluster-firewall
  type: 03_firewall.py
  properties:
    allowed_external_cidr: '0.0.0.0/0'
    infra_id: '${INFRA_ID}'
    cluster_network: '${CLUSTER_NETWORK}'
    network_cidr: '${NETWORK_CIDR}'
```

`allowed_external_cidr` is the CIDR range that can access the cluster API and SSH to the bootstrap host. For an internal cluster, set this value to `$NETWORK_CIDR`.

`infra_id` is the `INFRA_ID` infrastructure name from the extraction step.
3. **cluster_network** is the **selfLink** URL to the cluster network.

4. **network_cidr** is the CIDR of the VPC network, for example **10.0.0.0/16**.

3. Create the deployment by using the **gcloud** CLI:

   ```
   $ gcloud deployment-manager deployments create $(INFRA_ID)-firewall --config 03_firewall.yaml
   ```

### 6.12.9.1. Deployment Manager template for firewall rules

You can use the following Deployment Manager template to deploy the firewall rules that you need for your OpenShift Container Platform cluster:

**Example 6.23. 03_firewall.py Deployment Manager template**

```python

def GenerateConfig(context):
    resources = [
        {
            'name': context.properties['infra_id'] + '-bootstrap-in-ssh',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [
                    {
                        'IPProtocol': 'tcp',
                        'ports': ['22']
                    }
                ],
                'sourceRanges': [context.properties['allowed_external_cidr']]
            },
            'targetTags': [context.properties['infra_id'] + '-bootstrap']
        },
        {
            'name': context.properties['infra_id'] + '-api',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [
                    {
                        'IPProtocol': 'tcp',
                        'ports': ['6443']
                    }
                ],
                'sourceRanges': [context.properties['allowed_external_cidr']]
            },
            'targetTags': [context.properties['infra_id'] + '-master']
        },
        {
            'name': context.properties['infra_id'] + '-health-checks',
            'type': 'compute.v1.firewall',
            'properties': {
                'network': context.properties['cluster_network'],
                'allowed': [
                    {
                        'IPProtocol': 'tcp',
                        'ports': ['6080', '6443', '22624']
                    }
                ],
                'sourceRanges': ['35.191.0.0/16', '130.211.0.0/22', '209.85.152.0/22', '209.85.204.0/22']
            },
            'targetTags': [context.properties['infra_id'] + '-master']
        }
    ]
```

}, {
  'name': context.properties['infra_id'] + '-etcd',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [
      {'IPProtocol': 'tcp',
       'ports': ['2379-2380']}
    ],
    'sourceTags': [context.properties['infra_id'] + '-master'],
    'targetTags': [context.properties['infra_id'] + '-master']
  }
}, {
  'name': context.properties['infra_id'] + '-control-plane',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [
      {'IPProtocol': 'tcp',
       'ports': ['10257']},
      {'IPProtocol': 'tcp',
       'ports': ['10259']},
      {'IPProtocol': 'tcp',
       'ports': ['22623']}
    ],
    'sourceTags': [context.properties['infra_id'] + '-master', context.properties['infra_id'] + '-worker'],
    'targetTags': [context.properties['infra_id'] + '-master']
  }
}, {
  'name': context.properties['infra_id'] + '-internal-network',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [
      {'IPProtocol': 'icmp'}
    ],
    'sourceRanges': [context.properties['network_cidr']],
    'targetTags': [context.properties['infra_id'] + '-master', context.properties['infra_id'] + '-worker']
  }
}, {
  'name': context.properties['infra_id'] + '-internal-cluster',
  'type': 'compute.v1.firewall',
  'properties': {
    'network': context.properties['cluster_network'],
    'allowed': [{
      'IPProtocol': 'udp',
      'ports': ['53']},
      {'IPProtocol': 'UDP',
       'ports': ['53']}
    ]}
}
6.12.10. Creating IAM roles in GCP

You must create IAM roles in Google Cloud Platform (GCP) for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Deployment Manager template.

```

`IPProtocol': 'udp',
'ports': ['4789', '6081']
},
{ 'IPProtocol': 'udp',
'ports': ['500', '4500']
},
{ 'IPProtocol': 'esp',
},
{ 'IPProtocol': 'tcp',
'ports': ['9000-9999']
},
{ 'IPProtocol': 'udp',
'ports': ['9000-9999']
},
{ 'IPProtocol': 'tcp',
'ports': ['10250']
},
{ 'IPProtocol': 'tcp',
'ports': ['30000-32767']
},
{ 'IPProtocol': 'udp',
'ports': ['30000-32767']
}

'sourceTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
],
'targetTags': [
    context.properties['infra_id'] + '-master',
    context.properties['infra_id'] + '-worker'
]
```

return { 'resources': resources }

**NOTE**

If you do not use the provided Deployment Manager template to create your GCP infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
Create and configure a VPC and associated subnets in GCP.

Procedure

1. Copy the template from the Deployment Manager template for IAM roles section of this topic and save it as 03_iam.py on your computer. This template describes the IAM roles that your cluster requires.

2. Create a 03_iam.yaml resource definition file:

```bash
$ cat <<EOF >03_iam.yaml
imports:
- path: 03_iam.py
resources:
- name: cluster-iam
type: 03_iam.py
properties:
  infra_id: '${INFRA_ID}'
EOF
```

1. `infra_id` is the INFRA_ID infrastructure name from the extraction step.

3. Create the deployment by using the `gcloud` CLI:

```bash
$ gcloud deployment-manager deployments create ${INFRA_ID}-iam --config 03_iam.yaml
```

4. Export the variable for the master service account:

```bash
$ export MASTER_SERVICE_ACCOUNT=(`gcloud iam service-accounts list --filter "email~^${INFRA_ID}-m@$PROJECT_NAME." --format json | jq -r '.[0].email'`)
```

5. Export the variable for the worker service account:

```bash
$ export WORKER_SERVICE_ACCOUNT=(`gcloud iam service-accounts list --filter "email~^${INFRA_ID}-w@$PROJECT_NAME." --format json | jq -r '.[0].email'`)
```

6. Export the variable for the subnet that hosts the compute machines:

```bash
$ export COMPUTE_SUBNET=('gcloud compute networks subnets describe ${INFRA_ID}-worker-subnet --region=${REGION} --format json | jq -r .selfLink')
```

7. The templates do not create the policy bindings due to limitations of Deployment Manager, so you must create them manually:

```bash
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.instanceAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.networkAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/compute.securityAdmin"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/iam.serviceAccountUser"
$ gcloud projects add-iam-policy-binding ${PROJECT_NAME} --member "serviceAccount:${MASTER_SERVICE_ACCOUNT}" --role "roles/iam.serviceAccountUser"
```

CHAPTER 6. INSTALLING ON GCP

1021
Create a service account key and store it locally for later use:

```bash
$ gcloud iam service-accounts keys create service-account-key.json --iam-account=${MASTER_SERVICE_ACCOUNT}
```

8. Create a service account key and store it locally for later use:

```bash
$ gcloud iam service-accounts keys create service-account-key.json --iam-account=${MASTER_SERVICE_ACCOUNT}
```

### 6.12.10.1. Deployment Manager template for IAM roles

You can use the following Deployment Manager template to deploy the IAM roles that you need for your OpenShift Container Platform cluster:

**Example 6.24. 03_iam.py Deployment Manager template**

```python
def GenerateConfig(context):
    resources = [
        {
            'name': context.properties['infra_id'] + '-master-node-sa',
            'type': 'iam.v1.serviceAccount',
            'properties': {
                'accountId': context.properties['infra_id'] + '-m',
                'displayName': context.properties['infra_id'] + '-master-node'
            }
        },
        {
            'name': context.properties['infra_id'] + '-worker-node-sa',
            'type': 'iam.v1.serviceAccount',
            'properties': {
                'accountId': context.properties['infra_id'] + '-w',
                'displayName': context.properties['infra_id'] + '-worker-node'
            }
        }
    ]
    return {'resources': resources}
```

### 6.12.11. Creating the RHCOS cluster image for the GCP infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Google Cloud Platform (GCP) for your OpenShift Container Platform nodes.

**Procedure**

1. Obtain the RHCOS image from the RHCOS image mirror page.
IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must download an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

The file name contains the OpenShift Container Platform version number in the format `rhcos-<version>-<arch>-gcp.<arch>.tar.gz`.

2. Create the Google storage bucket:
   ```
   $ gsutil mb gs://<bucket_name>
   ```

3. Upload the RHCOS image to the Google storage bucket:
   ```
   $ gsutil cp <downloaded_image_file_path>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz gs://<bucket_name>
   ```

4. Export the uploaded RHCOS image location as a variable:
   ```
   $ export IMAGE_SOURCE="gs://<bucket_name>/rhcos-<version>-x86_64-gcp.x86_64.tar.gz"
   ```

5. Create the cluster image:
   ```
   $ gcloud compute images create "${INFRA_ID}-rhcos-image" --source-uri="${IMAGE_SOURCE}"
   ```

6.12.12. Creating the bootstrap machine in GCP

You must create the bootstrap machine in Google Cloud Platform (GCP) to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Deployment Manager template.

NOTE

If you do not use the provided Deployment Manager template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
• Create control plane and compute roles.

• Ensure pyOpenSSL is installed.

**Procedure**

1. Copy the template from the Deployment Manager template for the bootstrap machine section of this topic and save it as **04_bootstrap.py** on your computer. This template describes the bootstrap machine that your cluster requires.

2. Export the location of the Red Hat Enterprise Linux CoreOS (RHCOS) image that the installation program requires:

   ```
   $ export CLUSTER_IMAGE=`gcloud compute images describe ${INFRA_ID}-rhcos-image --format json | jq -r .selfLink`
   ```

3. Create a bucket and upload the **bootstrap.ign** file:

   ```
   $ gsutil mb gs://${INFRA_ID}-bootstrap-ignition
   $ gsutil cp <installation_directory>/bootstrap.ign gs://${INFRA_ID}-bootstrap-ignition/
   ```

4. Create a signed URL for the bootstrap instance to use to access the Ignition config. Export the URL from the output as a variable:

   ```
   $ export BOOTSTRAP_IGN=`gsutil signurl -d 1h service-account-key.json gs://${INFRA_ID}-bootstrap-ignition/bootstrap.ign | grep "^gs:" | awk '{print $5}'`
   ```

5. Create a **04_bootstrap.yaml** resource definition file:

   ```
   $ cat <<EOF >04_bootstrap.yaml
   imports:
   - path: 04_bootstrap.py

   resources:
   - name: cluster-bootstrap
     type: 04_bootstrap.py
     properties:
       infra_id: '${INFRA_ID}'
       region: '${REGION}'
       zone: '${ZONE_0}'
       cluster_network: '${CLUSTER_NETWORK}'
       control_subnet: '${CONTROL_SUBNET}'
       image: '${CLUSTER_IMAGE}'
       machine_type: 'n1-standard-4'
       root_volume_size: '128'
       bootstrap_ign: '${BOOTSTRAP_IGN}'
   EOF
   ```

   **infra_id** is the **INFRA_ID** infrastructure name from the extraction step.

   **region** is the region to deploy the cluster into, for example **us-central1**.
6. Create the deployment by using the `gcloud` CLI:

$ gcloud deployment-manager deployments create ${INFRA_ID}-bootstrap --config
04_bootstrap.yaml

7. The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the bootstrap machine manually.

a. Add the bootstrap instance to the internal load balancer instance group:

   $ gcloud compute instance-groups unmanaged add-instances
   ${INFRA_ID}-bootstrap-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}--bootstrap

b. Add the bootstrap instance group to the internal load balancer backend service:

   $ gcloud compute backend-services add-backend
   ${INFRA_ID}-api-internal-backend-service --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --instance-group-zone=${ZONE_0}

6.12.12.1. Deployment Manager template for the bootstrap machine

You can use the following Deployment Manager template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

**Example 6.25. 04_bootstrap.py Deployment Manager template**

```python
def GenerateConfig(context):
    resources = [{
       'name': context.properties['infra_id'] + '-bootstrap-public-ip',
       'type': 'compute.v1.address',
       'properties': {
          'region': context.properties['region']
       }
    }, {
       'name': context.properties['infra_id'] + '-bootstrap',
       'type': 'compute.v1.instance',
       'properties': {
          'disks': []
       }
    }]
```
6.12.13. Creating the control plane machines in GCP

You must create the control plane machines in Google Cloud Platform (GCP) for your cluster to use. One way to create these machines is to modify the provided Deployment Manager template.

```json
ereturn {
'autoDelete': True,
'boot': True,
'initializeParams': {
'diskSizeGb': context.properties['root_volume_size'],
'sourceImage': context.properties['image'],

'machineType': 'zones/' + context.properties['zone'] + '/machineTypes/' + context.properties['machine_type'],
'metadata': {
'items': [
'key': 'user-data',
'value': '{"ignition":{"config":{"replace":{"source":"' + context.properties['bootstrap_ign'] + '"}},"version":"3.1.0"}}',

'networkInterfaces': [
'subnetwork': context.properties['control_subnet'],
'accessConfigs': [
'natIP': '$(ref.' + context.properties['infra_id'] + '-bootstrap-public-ip.address)' + '"}},"version":"3.1.0"}],

'tags': {
'items': [
context.properties['infra_id'] + '-master',
context.properties['infra_id'] + '-bootstrap'
]
},
'zone': context.properties['zone']
}
},

'name': context.properties['infra_id'] + '-bootstrap-instance-group',
'type': 'compute.v1.instanceGroup',
'properties': {
'namedPorts': [
{name: 'ignition',
'port': 22623
},
{name: 'https',
'port': 6443
}
],
'network': context.properties['cluster_network'],
'zone': context.properties['zone']
}
}

return {'resources': resources}
```

OpenShift Container Platform 4.8 Installing

1026
NOTE

If you do not use the provided Deployment Manager template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.

Procedure

1. Copy the template from the Deployment Manager template for control plane machines section of this topic and save it as `05_control_plane.py` on your computer. This template describes the control plane machines that your cluster requires.

2. Export the following variable required by the resource definition:

   ```bash
   $ export MASTER_IGNITION=`cat <installation_directory>/master.ign`
   ```

3. Create a `05_control_plane.yaml` resource definition file:

   ```bash
   $ cat <<EOF >05_control_plane.yaml
   imports:
     - path: 05_control_plane.py
   resources:
     - name: cluster-control-plane
       type: 05_control_plane.py
       properties:
         infra_id: '${INFRA_ID}'
         zones:
         - '${ZONE_0}'
         - '${ZONE_1}'
         - '${ZONE_2}'
         control_subnet: '${CONTROL_SUBNET}'
         image: '${CLUSTER_IMAGE}'
         machine_type: 'n1-standard-4'
         root_volume_size: '128'
         service_account_email: '${MASTER_SERVICE_ACCOUNT}'
         ignition: '${MASTER_IGNITION}'
   EOF
   ```
infra_id is the INFRA_ID infrastructure name from the extraction step.

zones are the zones to deploy the control plane instances into, for example us-central1-a, us-central1-b, and us-central1-c.

control_subnet is the selfLink URL to the control subnet.

image is the selfLink URL to the RHCOS image.

machine_type is the machine type of the instance, for example n1-standard-4.

service_account_email is the email address for the master service account that you created.

ignition is the contents of the master.ign file.

4. Create the deployment by using the gcloud CLI:

```bash
$ gcloud deployment-manager deployments create ${INFRA_ID}-control-plane --config 05_control_plane.yaml
```

5. The templates do not manage load balancer membership due to limitations of Deployment Manager, so you must add the control plane machines manually.

- Run the following commands to add the control plane machines to the appropriate instance groups:

```bash
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-$ZONE_0-instance-group --zone=${ZONE_0} --instances=${INFRA_ID}-master-0
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-$ZONE_1-instance-group --zone=${ZONE_1} --instances=${INFRA_ID}-master-1
$ gcloud compute instance-groups unmanaged add-instances ${INFRA_ID}-master-$ZONE_2-instance-group --zone=${ZONE_2} --instances=${INFRA_ID}-master-2
```

- For an external cluster, you must also run the following commands to add the control plane machines to the target pools:

```bash
$ gcloud compute target-pools add-instances ${INFRA_ID}-api-target-pool --instances-zone="${ZONE_0}" --instances=${INFRA_ID}-master-0
$ gcloud compute target-pools add-instances ${INFIRA_ID}-api-target-pool --instances-zone="${ZONE_1}" --instances=${INFIRA_ID}-master-1
$ gcloud compute target-pools add-instances ${INFIRA_ID}-api-target-pool --instances-zone="${ZONE_2}" --instances=${INFIRA_ID}-master-2
```

6.12.13.1. Deployment Manager template for control plane machines

You can use the following Deployment Manager template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

**Example 6.26. 05_control_plane.py Deployment Manager template**

```python
def GenerateConfig(context):
```

OpenShift Container Platform 4.8 Installing
resources = [
    {'name': context.properties['infra_id'] + '-master-0',
     'type': 'compute.v1.instance',
     'properties': {
         'disks': [{
             'autoDelete': True,
             'boot': True,
             'initializeParams': {
                 'diskSizeGb': context.properties['root_volume_size'],
                 'diskType': 'zones/' + context.properties['zones'][0] + '/diskTypes/pd-ssd',
                 'sourceImage': context.properties['image']
             }
         }],
         'machineType': 'zones/' + context.properties['zones'][0] + '/machineTypes/' + context.properties['machine_type'],
         'metadata': {
             'items': [{
                 'key': 'user-data',
                 'value': context.properties['ignition']
             }]
         },
         'networkInterfaces': [{
             'subnetwork': context.properties['control_subnet']
         }],
         'serviceAccounts': [{
             'email': context.properties['service_account_email'],
             'scopes': ['https://www.googleapis.com/auth/cloud-platform']
         }],
         'tags': {
             'items': [context.properties['infra_id'] + '-master',
             context.properties['infra_id'] + '-master-0']
         },
         'zone': context.properties['zones'][0]
     }
],
    {'name': context.properties['infra_id'] + '-master-1',
     'type': 'compute.v1.instance',
     'properties': {
         'disks': [{
             'autoDelete': True,
             'boot': True,
             'initializeParams': {
                 'diskSizeGb': context.properties['root_volume_size'],
                 'diskType': 'zones/' + context.properties['zones'][1] + '/diskTypes/pd-ssd',
                 'sourceImage': context.properties['image']
             }
         }],
         'machineType': 'zones/' + context.properties['zones'][1] + '/machineTypes/' + context.properties['machine_type'],
         'metadata': {
             'items': [{
                 'key': 'user-data',
                 'value': context.properties['ignition']
             }]
         }},
     ]}
6.12.14. Wait for bootstrap completion and remove bootstrap resources in GCP
After you create all of the required infrastructure in Google Cloud Platform (GCP), wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

**Prerequisites**

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Change to the directory that contains the installation program and run the following command:

   ```
   $ ./openshift-install wait-for bootstrap-complete --dir=<installation_directory> \ 1
   --log-level info 2
   
   1 For `<installation_directory>`, specify the path to the directory that you stored the
   installation files in.
   
   2 To view different installation details, specify warn, debug, or error instead of info.
   
   If the command exits without a FATAL warning, your production control plane has initialized.
   
   2. Delete the bootstrap resources:

   ```
   $ gcloud compute backend-services remove-backend ${INFRA_ID}-api-internal-backend-service --region=${REGION} --instance-group=${INFRA_ID}-bootstrap-instance-group --instance-group-zone=${ZONE_0}
   $ gsutil rm gs://${INFRA_ID}-bootstrap-ignition/bootstrap.ign
   $ gsutil rb gs://${INFRA_ID}-bootstrap-ignition
   $ gcloud deployment-manager deployments delete ${INFRA_ID}-bootstrap
   ```

**6.12.15. Creating additional worker machines in GCP**

You can create worker machines in Google Cloud Platform (GCP) for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Deployment Manager template. Additional instances can be launched by including additional resources of type `06_worker.py` in the file.
NOTE
If you do not use the provided Deployment Manager template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- Configure a GCP account.
- Generate the Ignition config files for your cluster.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

Procedure

1. Copy the template from the Deployment Manager template for worker machines section of this topic and save it as `06_worker.py` on your computer. This template describes the worker machines that your cluster requires.

2. Export the variables that the resource definition uses.
   
a. Export the subnet that hosts the compute machines:

   ```
   $ export COMPUTE_SUBNET=`gcloud compute networks subnets describe 
   ${INFRA_ID}-worker-subnet --region=${REGION} --format json | jq -r .selfLink`
   ```

   b. Export the email address for your service account:

   ```
   $ export WORKER_SERVICE_ACCOUNT=`gcloud iam service-accounts list --filter 
   "email~^${INFRA_ID}-w@${PROJECT_NAME}." --format json | jq -r '.[0].email'`
   ```

   c. Export the location of the compute machine Ignition config file:

   ```
   $ export WORKER_IGNITION=`cat <installation_directory>/worker.ign`
   ```

3. Create a `06_worker.yaml` resource definition file:

   ```
   $ cat <<EOF >06_worker.yaml
   imports:
   - path: 06_worker.py

   resources:
   - name: 'worker-0'
     type: 06_worker.py
     properties:
   ```
**name** is the name of the worker machine, for example *worker-0*.

**infra_id** is the INFRA_ID infrastructure name from the extraction step.

**zone** is the zone to deploy the worker machine into, for example *us-central1-a*.

**compute_subnet** is the selfLink URL to the compute subnet.

**image** is the selfLink URL to the RHCOS image.

**machine_type** is the machine type of the instance, for example *n1-standard-4*.

**service_account_email** is the email address for the worker service account that you created.

**ignition** is the contents of the *worker.ign* file.

4. Optional: If you want to launch additional instances, include additional resources of type *06_worker.py* in your *06_worker.yaml* resource definition file.

5. Create the deployment by using the *gcloud* CLI:

   ```bash
   gcloud deployment-manager deployments create '${INFRA_ID}-worker' --config 06_worker.yaml
   ```

### 6.12.15.1. Deployment Manager template for worker machines

You can use the following Deployment Manager template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

```yaml
- name: 'worker-1'
  type: 06_worker.py
  properties:
    infra_id: '${INFRA_ID}'
    zone: '${ZONE_1}'
    compute_subnet: '${COMPUTE_SUBNET}'
    image: '${CLUSTER_IMAGE}'
    machine_type: 'n1-standard-4'
    root_volume_size: '128'
    service_account_email: '${WORKER_SERVICE_ACCOUNT}'
    ignition: '${WORKER_IGNITION}'
EOF
```
6.12.16. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster `kubeconfig` file. The `kubeconfig` file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the `oc` CLI.
Procedure

1. Export the kubeadmin credentials:

   
   $ export KUBECONFIG=<installation_directory>/auth/kubeconfig

   For <installation_directory>, specify the path to the directory that you stored the installation files in.

2. Verify you can run oc commands successfully using the exported configuration:

   $ oc whoami

   **Example output**

   system:admin

6.12.17. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding disableAllDefaultSources: true to the OperatorHub object:

   
   $ oc patch OperatorHub cluster --type json
   
   -p '(["op": "add", "path": "/spec/disableAllDefaultSources", "value": true})'

**TIP**

Alternatively, you can use the web console to manage catalog sources. From the Administration → Cluster Settings → Global Configuration → OperatorHub page, click the Sources tab, where you can create, delete, disable, and enable individual sources.

6.12.18. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

**Prerequisites**

- You added machines to your cluster.

**Procedure**

1. Confirm that the cluster recognizes the machines:

   $ oc get nodes
Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>ROLES</th>
<th>AGE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>master-0</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-1</td>
<td>Ready</td>
<td>master</td>
<td>63m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>master-2</td>
<td>Ready</td>
<td>master</td>
<td>64m</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>worker-0</td>
<td>NotReady</td>
<td>worker</td>
<td>76s</td>
<td>v1.21.0</td>
</tr>
<tr>
<td>worker-1</td>
<td>NotReady</td>
<td>worker</td>
<td>70s</td>
<td>v1.21.0</td>
</tr>
</tbody>
</table>

The output lists all of the machines that you created.

NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

$ oc get csr

Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-8b2br</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-8vnps</td>
<td>15m</td>
<td>system:serviceaccount:openshift-machine-config-operator:node-bootstrapper</td>
<td>Pending</td>
</tr>
</tbody>
</table>

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. Once the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.
NOTE

For clusters running on platforms that are not machine API enabled, such as bare
metal and other user-provisioned infrastructure, you must implement a method
of automatically approving the kubelet serving certificate requests (CSRs). If a
request is not approved, then the `oc exec`, `oc rsh`, and `oc logs` commands
cannot succeed, because a serving certificate is required when the API server
connects to the kubelet. Any operation that contacts the Kubelet endpoint
requires this certificate approval to be in place. The method must watch for new
CSRs, confirm that the CSR was submitted by the `node-bootstrapper` service
account in the `system:node` or `system:admin` groups, and confirm the identity
of the node.

- To approve them individually, run the following command for each valid CSR:
  
  ```
  $ oc adm certificate approve <csr_name>  
  ```

  `<csr_name>` is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:
  
  ```
  $ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve  
  ```

NOTE

Some Operators might not become available until some CSRs are approved.

4. Now that your client requests are approved, you must review the server requests for each
machine that you added to the cluster:

```
$ oc get csr  
```

Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>REQUESTOR</th>
<th>CONDITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>csr-bfd72</td>
<td>5m26s</td>
<td>system:node:ip-10-0-50-126.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
<tr>
<td>csr-c57lv</td>
<td>5m26s</td>
<td>system:node:ip-10-0-95-157.us-east-2.compute.internal</td>
<td>Pending</td>
</tr>
</tbody>
</table>

5. If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for
your cluster machines:

- To approve them individually, run the following command for each valid CSR:
  
  ```
  $ oc adm certificate approve <csr_name>  
  ```

  `<csr_name>` is the name of a CSR from the list of current CSRs.
To approve all pending CSRs, run the following command:

```bash
$ oc get csr -o go-template="{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}" | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the `Ready` status. Verify this by running the following command:

```bash
$ oc get nodes
```

**Example output**

```
NAME      STATUS    ROLES   AGE  VERSION
master-0  Ready     master  73m  v1.21.0
master-1  Ready     master  73m  v1.21.0
master-2  Ready     master  74m  v1.21.0
worker-0  Ready     worker  11m  v1.21.0
worker-1  Ready     worker  11m  v1.21.0
```

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the `Ready` status.

**Additional information**

- For more information on CSRs, see [Certificate Signing Requests](#).

### 6.12.19. Optional: Adding the ingress DNS records

If you removed the DNS zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the ingress load balancer. You can create either a wildcard `*.apps.{baseDomain}.` or specific records. You can use A, CNAME, and other records per your requirements.

**Prerequisites**

- Configure a GCP account.
- Remove the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs.
- Create and configure a VPC and associated subnets in GCP.
- Create and configure networking and load balancers in GCP.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.
- Create the worker machines.
Procedure

1. Wait for the Ingress router to create a load balancer and populate the `EXTERNAL-IP` field:

   ```bash
   $ oc -n openshift-ingress get service router-default
   
   Example output
   
<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
<th>AGE</th>
</tr>
</thead>
</table>
   
   2. Add the A record to your zones:
   
   • To use A records:
      
      i. Export the variable for the router IP address:

         ```bash
         $ export ROUTER_IP=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
         
      ii. Add the A record to the private zones:

         ```bash
         $ if [-f transaction.yaml ]; then rm transaction.yaml; fi
         $ gcloud dns record-sets transaction start --zone ${INFRA_ID}-private-zone
         $ gcloud dns record-sets transaction add ${ROUTER_IP} --name
         \*.apps.$(CLUSTER_NAME).${BASE_DOMAIN}. --ttl 300 --type A --zone
         ${INFRA_ID}-private-zone
         $ gcloud dns record-sets transaction execute --zone ${INFRA_ID}-private-zone
         
         iii. For an external cluster, also add the A record to the public zones:

         ```bash
         $ if [-f transaction.yaml ]; then rm transaction.yaml; fi
         $ gcloud dns record-sets transaction start --zone ${BASE_DOMAIN_ZONE_NAME}
         $ gcloud dns record-sets transaction add ${ROUTER_IP} --name
         \*.apps.$(CLUSTER_NAME).${BASE_DOMAIN}. --ttl 300 --type A --zone
         ${BASE_DOMAIN_ZONE_NAME}
         $ gcloud dns record-sets transaction execute --zone
         ${BASE_DOMAIN_ZONE_NAME}
         
   • To add explicit domains instead of using a wildcard, create entries for each of the cluster’s current routes:

      ```bash
      $ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
      "\n"{end}{end}' routes
      
      Example output
      
      oauth-openshift.apps.your.cluster.domain.example.com
      console-openshift-console.apps.your.cluster.domain.example.com
      downloads-openshift-console.apps.your.cluster.domain.example.com
      alertmanager-main-openshift-monitoring.apps.your.cluster.domain.example.com
      grafana-openshift-monitoring.apps.your.cluster.domain.example.com
      prometheus-k8s-openshift-monitoring.apps.your.cluster.domain.example.com
      ```
6.12.20. Completing a GCP installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Google Cloud Platform (GCP) user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned GCP infrastructure.
- Install the oc CLI and log in.

Procedure

1. Complete the cluster installation:

```
$ ./openshift-install --dir=<installation_directory> wait-for install-complete
```

   Example output

```
INFO Waiting up to 30m0s for the cluster to initialize...
```

   For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   **IMPORTANT**

   The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending `node-bootstrapper` certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for Recovering from expired control plane certificates for more information.

2. Observe the running state of your cluster.

   a. Run the following command to view the current cluster version and status:

   ```
   $ oc get clusterversion
   ```

   Example output

   ```
   NAME      VERSION   AVAILABLE   PROGRESSING   SINCE   STATUS
   version             False       True          24m     Working towards 4.5.4: 99% complete
   OpenShift Container Platform 4.8 Installing
   ```

   b. Run the following command to view the Operators managed on the control plane by the Cluster Version Operator (CVO):
Run the following command to view your cluster pods:

```sh
$ oc get clusteroperators
```

**Example output**

<table>

</table>
When the current cluster version is **AVAILABLE**, the installation is complete.

### 6.12.21. Next steps

- Customize your cluster.
- Configure image streams for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to use **Operator Lifecycle Manager (OLM)** on restricted networks.
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by configuring additional trust stores.
- If necessary, you can opt out of remote health reporting.

### 6.13. UNINSTALLING A CLUSTER ON GCP

You can remove a cluster that you deployed to Google Cloud Platform (GCP).

#### 6.13.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

**NOTE**

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access. For example, some Google Cloud resources require **IAM permissions** in shared VPC host projects, or there might be unused health checks that must be deleted.

**Prerequisites**

- Have a copy of the installation program that you used to deploy the cluster.
• Have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

   ```bash
   $ ./openshift-install destroy cluster \
   --dir=<installation_directory> --log-level=info
   ```

   1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

   2 To view different details, specify `warn`, `debug`, or `error` instead of `info`.

   NOTE

   You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the `metadata.json` file in this directory to delete the cluster.

2. Optional: Delete the `<installation_directory>` directory and the OpenShift Container Platform installation program.
CHAPTER 7. INSTALLING ON BARE METAL

7.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION

7.1.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You have read the documentation on selecting a cluster installation method and preparing it for users.

7.1.2. Choosing a method to install OpenShift Container Platform on bare metal

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See Installation process for more information about installer-provisioned and user-provisioned installation processes.

7.1.2.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on bare metal infrastructure that is provisioned by the OpenShift Container Platform installation program, by using the following method:

- **Installing an installer-provisioned cluster on bare metal** You can install OpenShift Container Platform on bare metal by using installer provisioning.

7.1.2.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on bare metal infrastructure that you provision, by using one of the following methods:

- **Installing a user-provisioned cluster on bare metal** You can install OpenShift Container Platform on bare metal infrastructure that you provision. For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.
- **Installing a user-provisioned bare metal cluster with network customizations** You can install a bare metal cluster on user-provisioned infrastructure with network-customizations. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. Most of the network customizations must be applied at the installation stage.
- **Installing a user-provisioned bare metal cluster on a restricted network** You can install a user-provisioned bare metal cluster on a restricted or disconnected network by using a mirror registry. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content.

7.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL
In OpenShift Container Platform 4.8, you can install a cluster on bare metal infrastructure that you provision.

**IMPORTANT**

While you might be able to follow this procedure to deploy a cluster on virtualized or cloud environments, you must be aware of additional considerations for non-bare metal platforms. Review the information in the guidelines for deploying OpenShift Container Platform on non-tested platforms before you attempt to install an OpenShift Container Platform cluster in such an environment.

### 7.2.1. Prerequisites

- You reviewed details about the OpenShift Container Platform installation and update processes.
- You read the documentation on selecting a cluster installation method and preparing it for users.
- If you use a firewall, you configured it to allow the sites that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

### 7.2.2. Internet and Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.8, you require access to the Internet to install your cluster. The Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, also requires Internet access. If your cluster is connected to the Internet, Telemetry runs automatically, and your cluster is registered to the Red Hat OpenShift Cluster Manager (OCM).

Once you confirm that your Red Hat OpenShift Cluster Manager inventory is correct, either maintained automatically by Telemetry or manually using OCM, use subscription watch to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

You must have Internet access to:

- Access the Red Hat OpenShift Cluster Manager page to download the installation program and perform subscription management. If the cluster has Internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access Quay.io to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct Internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the content that is required and use it to populate a mirror registry with the packages that you need to install a cluster and generate the installation program. With some installation types, the environment that you install your cluster in will not require Internet access. Before you update the cluster, you update the content of the mirror registry.
Additional resources

- See Installing a user-provisioned bare metal cluster on a restricted network for more information about performing a restricted network installation on bare metal infrastructure that you provision.

7.2.3. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

7.2.3.1. Required machines

The smallest OpenShift Container Platform clusters require the following hosts:

Table 7.1. Default monitoring stack components

<table>
<thead>
<tr>
<th>Hosts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>One temporary bootstrap machine</td>
<td>The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.</td>
</tr>
<tr>
<td>Three control plane machines</td>
<td>The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.</td>
</tr>
<tr>
<td>At least two compute machines, which are also known as worker machines.</td>
<td>The workloads requested by OpenShift Container Platform users run on the compute machines.</td>
</tr>
</tbody>
</table>

**NOTE**

As an exception, you can run zero compute machines in a bare metal cluster that consists of three control plane machines only. This provides smaller, more resource efficient clusters for cluster administrators and developers to use for testing, development, and production. Running one compute machine is not supported.

**IMPORTANT**

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system.
IMPORTANT

If the platform: none field is defined in the install-config.yaml file, virtual machines (VMs) configured to use virtual hardware version 14 or greater might result in a failed installation. It is recommended to configure VMs with virtual hardware version 13. For more information, see BZ#1935539.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See Red Hat Enterprise Linux technology capabilities and limits.

7.2.3.2. Minimum resource requirements

Each cluster machine must meet the following minimum requirements:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>120 GB</td>
</tr>
<tr>
<td>Control plane</td>
<td>RHCOS</td>
<td>4</td>
<td>16 GB</td>
<td>120 GB</td>
</tr>
<tr>
<td>Compute</td>
<td>RHCOS or RHEL 7.9 [2]</td>
<td>2</td>
<td>8 GB</td>
<td>120 GB</td>
</tr>
</tbody>
</table>

1. 1 vCPU is equivalent to 1 physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. As with all user-provisioned installations, if you choose to use RHEL 7 compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

7.2.3.3. Managing certificate signing requests

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The kube-controller-manager only approves the kubelet client CSRs. The machine-approver cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

Additional resources

- See Configuring a three-node cluster for details about deploying three-node clusters in bare metal environments.
- See Approving the certificate signing requests for your machines for more information about approving cluster certificate signing requests after installation.

7.2.3.4. Networking requirements for user-provisioned infrastructure
All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in *initramfs* during boot to fetch their Ignition config files.

### 7.2.3.4.1. Setting the cluster node hostnames through DHCP

On Red Hat Enterprise Linux CoreOS (RHCOS) machines, the hostname is set through NetworkManager. By default, the machines obtain their hostname through DHCP. If the hostname is not provided by DHCP, it is obtained through a reverse DNS lookup. Reverse DNS lookup occurs after the network has been initialized on a node and can take time to resolve. Other system services can start prior to this and detect the hostname as *localhost* or similar. You can avoid this by using DHCP to provide the hostname for each cluster node.

Additionally, setting the hostnames through DHCP can bypass any manual DNS record name configuration errors in environments that have a DNS split-horizon implementation.

### 7.2.3.4.2. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

**IMPORTANT**

In connected OpenShift Container Platform environments, all nodes are required to have Internet access to pull images for platform containers and provide telemetry data to Red Hat.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>

</tr>
</tbody>
</table>

### Additional resources

- Configuring chrony time service

### 7.2.3.5. User-provisioned DNS requirements

In OpenShift Container Platform deployments, DNS name resolution is required for the following components:

- The Kubernetes API
- The OpenShift Container Platform application wildcard
- The bootstrap, control plane, and compute machines

Reverse DNS resolution is also required for the Kubernetes API, the bootstrap machine, the control plane machines, and the compute machines.

DNS A/AAAA or CNAME records are used for name resolution and PTR records are used for reverse name resolution. The reverse records are important because Red Hat Enterprise Linux CoreOS (RHCOS) uses the reverse records to set the hostnames for all the nodes, unless the hostnames are provided by DHCP. Additionally, the reverse records are used to generate the certificate signing requests (CSR) that OpenShift Container Platform needs to operate.

**NOTE**

It is recommended to use a DHCP server to provide the hostnames to each cluster node. See the *DHCP recommendations for user-provisioned infrastructure* section for more information.

The following DNS records are required for a user-provisioned OpenShift Container Platform cluster and they must be in place before installation. In each record, `<cluster_name>` is the cluster name and `<base_domain>` is the base domain that you specify in the `install-config.yaml` file. A complete DNS record takes the form: `<component>.<cluster_name>.<base_domain>.`
# Table 7.5. Required DNS records

<table>
<thead>
<tr>
<th>Component</th>
<th>Record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kubernetes API</td>
<td>api.&lt;cluster_name&gt;.&lt;base_domain&gt;.</td>
<td>A DNS A/AAAA or CNAME record, and a DNS PTR record, to identify the API load balancer. These records must be resolvable by both clients external to the cluster and from all the nodes within the cluster.</td>
</tr>
<tr>
<td></td>
<td>api-int.&lt;cluster_name&gt;.&lt;base_domain&gt;.</td>
<td>A DNS A/AAAA or CNAME record, and a DNS PTR record, to internally identify the API load balancer. These records must be resolvable from all the nodes within the cluster.</td>
</tr>
<tr>
<td>Routes</td>
<td>*.apps.&lt;cluster_name&gt;.&lt;base_domain&gt;.</td>
<td>A wildcard DNS A/AAAA or CNAME record that refers to the application ingress load balancer. The application ingress load balancer targets the machines that run the Ingress Controller pods. The Ingress Controller pods run on the compute machines by default. These records must be resolvable by both clients external to the cluster and from all the nodes within the cluster. For example, console-openshift-console.apps.&lt;cluster_name&gt;.&lt;base_domain&gt; is used as a wildcard route to the OpenShift Container Platform console.</td>
</tr>
<tr>
<td>Bootstrap machine</td>
<td>bootstrap.&lt;cluster_name&gt;.&lt;base_domain&gt;.</td>
<td>A DNS A/AAAA or CNAME record, and a DNS PTR record, to identify the bootstrap machine. These records must be resolvable by the nodes within the cluster.</td>
</tr>
<tr>
<td>Control plane machines</td>
<td>&lt;master&gt;&lt;n&gt;.&lt;cluster_name&gt;.&lt;base_domain&gt;.</td>
<td>DNS A/AAAA or CNAME records and DNS PTR records to identify each machine for the control plane nodes (also known as the master nodes). These records must be resolvable by the nodes within the cluster.</td>
</tr>
<tr>
<td>Compute machines</td>
<td>&lt;worker&gt;&lt;n&gt;.&lt;cluster_name&gt;.&lt;base_domain&gt;.</td>
<td>DNS A/AAAA or CNAME records and DNS PTR records to identify each machine for the worker nodes. These records must be resolvable by the nodes within the cluster.</td>
</tr>
</tbody>
</table>

**IMPORTANT**

The API server must be able to resolve the worker nodes by the hostnames that are recorded in Kubernetes. If the API server cannot resolve the node names, then proxied API calls can fail, and you cannot retrieve logs from pods.
NOTE

In OpenShift Container Platform 4.4 and later, you do not need to specify etcd host and SRV records in your DNS configuration.

TIP

You can use the `dig` command to verify name and reverse name resolution. See the section on Validating DNS resolution for user-provisioned infrastructure for detailed validation steps.

7.2.3.5.1. Example DNS configuration for user-provisioned clusters

This section provides A and PTR record configuration samples that meet the DNS requirements for deploying OpenShift Container Platform on user-provisioned infrastructure. The samples are not meant to provide advice for choosing one DNS solution over another.

In the examples, the cluster name is `ocp4` and the base domain is `example.com`.

Example DNS A record configuration for a user-provisioned cluster

The following example is a BIND zone file that shows sample A records for name resolution in a user-provisioned cluster.

```bash
$TTL 1W
@ IN SOA ns1.example.com. root ( 2019070700 ; serial 3H ; refresh (3 hours) 30M ; retry (30 minutes) 2W ; expiry (2 weeks) 1W ) ; minimum (1 week)
IN NS ns1.example.com.
IN MX 10 smtp.example.com.
;
ns1.example.com. IN A 192.168.1.5
smtp.example.com. IN A 192.168.1.5
;
helper.example.com. IN A 192.168.1.5
helper.ocp4.example.com. IN A 192.168.1.5
;
api.ocp4.example.com. IN A 192.168.1.5 1
api-int.ocp4.example.com. IN A 192.168.1.5 2
;
*.apps.ocp4.example.com. IN A 192.168.1.5 3
;
bootstrap.ocp4.example.com. IN A 192.168.1.96 4
;
master0.ocp4.example.com. IN A 192.168.1.97 5
master1.ocp4.example.com. IN A 192.168.1.98 6
master2.ocp4.example.com. IN A 192.168.1.99 7
;
worker0.ocp4.example.com. IN A 192.168.1.11 8
```
Provides name resolution for the Kubernetes API. The record refers to the IP address of the API load balancer.

Provides name resolution for the Kubernetes API. The record refers to the IP address of the API load balancer and is used for internal cluster communications.

Provides name resolution for the wildcard routes. The record refers to the IP address of the application ingress load balancer. The application ingress load balancer targets the machines that run the Ingress Controller pods. The Ingress Controller pods run on the compute machines by default.

NOTE
In the example, the same load balancer is used for the Kubernetes API and application ingress traffic. In production scenarios, you can deploy the API and application ingress load balancers separately so that you can scale the load balancer infrastructure for each in isolation.

Provides name resolution for the bootstrap machine.

Provides name resolution for the control plane machines.

Provides name resolution for the compute machines.

Example DNS PTR record configuration for a user-provisioned cluster

The following example BIND zone file shows sample PTR records for reverse name resolution in a user-provisioned cluster.

Example 7.2. Sample DNS zone database for reverse records

```
$TTL 1W
@ IN SOA ns1.example.com. root (2019070700 ; serial 3H ; refresh (3 hours) 30M ; retry (30 minutes) 2W ; expiry (2 weeks) 1W ) ; minimum (1 week)
IN NS ns1.example.com.
;
5.1.168.192.in-addr.arpa. IN PTR api.ocp4.example.com. 1
5.1.168.192.in-addr.arpa. IN PTR api-int.ocp4.example.com. 2
;
96.1.168.192.in-addr.arpa. IN PTR bootstrap.ocp4.example.com. 3
;
97.1.168.192.in-addr.arpa. IN PTR master0.ocp4.example.com. 4
98.1.168.192.in-addr.arpa. IN PTR master1.ocp4.example.com. 5
99.1.168.192.in-addr.arpa. IN PTR master2.ocp4.example.com. 6
```
Provides reverse DNS resolution for the Kubernetes API. The PTR record refers to the record name of the API load balancer.

Provides reverse DNS resolution for the Kubernetes API. The PTR record refers to the record name of the API load balancer and is used for internal cluster communications.

Provides reverse DNS resolution for the bootstrap machine.

Provides reverse DNS resolution for the control plane machines.

Provides reverse DNS resolution for the compute machines.

NOTE
A PTR record is not required for the OpenShift Container Platform application wildcard.

Additional resources
- Validating DNS resolution for user-provisioned infrastructure

7.2.3.6. Load balancing requirements for user-provisioned infrastructure

Before you install OpenShift Container Platform, you must provision the API and application ingress load balancing infrastructure. In production scenarios, you can deploy the API and application ingress load balancers separately so that you can scale the load balancer infrastructure for each in isolation.

The load balancing infrastructure must meet the following requirements:

1. **API load balancer**: Provides a common endpoint for users, both human and machine, to interact with and configure the platform. Configure the following conditions:
   - Layer 4 load balancing only. This can be referred to as Raw TCP, SSL Passthrough, or SSL Bridge mode. If you use SSL Bridge mode, you must enable Server Name Indication (SNI) for the API routes.
   - A stateless load balancing algorithm. The options vary based on the load balancer implementation.

   NOTE
   Session persistence is not required for the API load balancer to function properly.

Configure the following ports on both the front and back of the load balancers:

Table 7.6. API load balancer
<table>
<thead>
<tr>
<th>Port</th>
<th>Back-end machines (pool members)</th>
<th>Internal</th>
<th>External</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6443</td>
<td>Bootstrap and control plane. You remove the bootstrap machine from the load balancer after the bootstrap machine initializes the cluster control plane. You must configure the <code>/readyz</code> endpoint for the API server health check probe.</td>
<td>X</td>
<td>X</td>
<td>Kubernetes API server</td>
</tr>
<tr>
<td>22623</td>
<td>Bootstrap and control plane. You remove the bootstrap machine from the load balancer after the bootstrap machine initializes the cluster control plane.</td>
<td>X</td>
<td></td>
<td>Machine config server</td>
</tr>
</tbody>
</table>

**NOTE**

The load balancer must be configured to take a maximum of 30 seconds from the time the API server turns off the `/readyz` endpoint to the removal of the API server instance from the pool. Within the time frame after `/readyz` returns an error or becomes healthy, the endpoint must have been removed or added. Probing every 5 or 10 seconds, with two successful requests to become healthy and three to become unhealthy, are well–tested values.

2. **Application ingress load balancer**: Provides an ingress point for application traffic flowing in from outside the cluster. Configure the following conditions:

   - Layer 4 load balancing only. This can be referred to as Raw TCP, SSL Passthrough, or SSL Bridge mode. If you use SSL Bridge mode, you must enable Server Name Indication (SNI) for the ingress routes.
   - A connection-based or session-based persistence is recommended, based on the options available and types of applications that will be hosted on the platform.

**TIP**

If the true IP address of the client can be seen by the application ingress load balancer, enabling source IP-based session persistence can improve performance for applications that use end-to-end TLS encryption.

Configure the following ports on both the front and back of the load balancers:

**Table 7.7. Application ingress load balancer**

<table>
<thead>
<tr>
<th>Port</th>
<th>Back-end machines (pool members)</th>
<th>Internal</th>
<th>External</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>443</td>
<td>The machines that run the Ingress Controller pods, compute, or worker, by default.</td>
<td>X</td>
<td>X</td>
<td>HTTPS traffic</td>
</tr>
</tbody>
</table>
The machines that run the Ingress Controller pods, compute, or worker, by default.

<table>
<thead>
<tr>
<th>Port</th>
<th>Back-end machines (pool members)</th>
<th>Internal</th>
<th>External</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>The machines that run the Ingress Controller pods, compute, or worker, by default.</td>
<td>X</td>
<td>X</td>
<td>HTTP traffic</td>
</tr>
</tbody>
</table>

**NOTE**

If you are deploying a three-node cluster with zero compute nodes, the Ingress Controller pods run on the control plane nodes. In three-node cluster deployments, you must configure your application ingress load balancer to route HTTP and HTTPS traffic to the control plane nodes.

**NOTE**

A working configuration for the Ingress router is required for an OpenShift Container Platform cluster. You must configure the Ingress router after the control plane initializes.

### 7.2.3.6.1. Example load balancer configuration for user-provisioned clusters

This section provides an example API and application ingress load balancer configuration that meets the load balancing requirements for user-provisioned clusters. The sample is an `/etc/haproxy/haproxy.cfg` configuration for an HAProxy load balancer. The example is not meant to provide advice for choosing one load balancing solution over another.

**NOTE**

In the example, the same load balancer is used for the Kubernetes API and application ingress traffic. In production scenarios you can deploy the API and application ingress load balancers separately so that you can scale the load balancer infrastructure for each in isolation.

### Example 7.3. Sample API and application ingress load balancer configuration

```bash
global
log 127.0.0.1 local2
pidfile /var/run/haproxy.pid
maxconn 4000
daemon
defaults
mode http
log global
option dontlognull
option http-server-close
option redispatch
retries 3
timeout http-request 10s
timeout queue 1m
timeout connect 10s
timeout client 1m
timeout server 1m
```
timeout http-keep-alive 10s
timeout check 10s
maxconn 3000
frontend stats
bind *:1936
mode http
log global
maxconn 10
stats enable
stats hide-version
stats refresh 30s
stats show-node
stats show-desc Stats for ocp4 cluster
stats auth admin:ocp4
stats uri /stats
listen api-server-6443
bind *:6443
mode tcp
server bootstrap bootstrap.ocp4.example.com:6443 check inter 1s backup
server master0 master0.ocp4.example.com:6443 check inter 1s
server master1 master1.ocp4.example.com:6443 check inter 1s
server master2 master2.ocp4.example.com:6443 check inter 1s
listen machine-config-server-22623
bind *:22623
mode tcp
server bootstrap bootstrap.ocp4.example.com:22623 check inter 1s backup
server master0 master0.ocp4.example.com:22623 check inter 1s
server master1 master1.ocp4.example.com:22623 check inter 1s
server master2 master2.ocp4.example.com:22623 check inter 1s
listen ingress-router-443
bind *:443
mode tcp
balance source
server worker0 worker0.ocp4.example.com:443 check inter 1s
server worker1 worker1.ocp4.example.com:443 check inter 1s
listen ingress-router-80
bind *:80
mode tcp
balance source
server worker0 worker0.ocp4.example.com:80 check inter 1s
server worker1 worker1.ocp4.example.com:80 check inter 1s

1 In the example, the cluster name is ocp4.
2 Port 6443 handles the Kubernetes API traffic and points to the control plane machines.
3 The bootstrap entries must be in place before the OpenShift Container Platform cluster installation and they must be removed after the bootstrap process is complete.
4 Port 22623 handles the machine config server traffic and points to the control plane machines.
5
6 Port 443 handles the HTTPS traffic and points to the machines that run the Ingress Controller pods. The Ingress Controller pods run on the compute machines by default.
7 Port 80 handles the HTTP traffic and points to the machines that run the Ingress Controller.
NOTE

If you are deploying a three-node cluster with zero compute nodes, the Ingress Controller pods run on the control plane nodes. In three-node cluster deployments, you must configure your application ingress load balancer to route HTTP and HTTPS traffic to the control plane nodes.

TIP

If you are using HAProxy as a load balancer, you can check that the `haproxy` process is listening on ports 6443, 22623, 443, and 80 by running `netstat -nltupe` on the HAProxy node.

NOTE

If you are using HAProxy as a load balancer and SELinux is set to `enforcing`, you must ensure that the HAProxy service can bind to the configured TCP port by running `setsebool -P haproxy_connect_any=1`.

7.2.4. Preparing the user-provisioned infrastructure

Before you install OpenShift Container Platform on user-provisioned infrastructure, you must prepare the underlying infrastructure.

This section provides details about the high-level steps required to set up your cluster infrastructure in preparation for an OpenShift Container Platform installation. This includes configuring IP networking and network connectivity for your cluster nodes, enabling the required ports through your firewall, and setting up the required DNS and load balancing infrastructure.

After preparation, your cluster infrastructure must meet the requirements outlined in the Requirements for a cluster with user-provisioned infrastructure section.

Prerequisites

- You have reviewed the OpenShift Container Platform 4.x Tested Integrations page.
- You have reviewed the infrastructure requirements detailed in the Requirements for a cluster with user-provisioned infrastructure section.

Procedure

1. If you are using DHCP to provide the IP networking configuration to your cluster nodes, configure your DHCP service.
   a. Add persistent IP addresses for the nodes to your DHCP server configuration. In your configuration, match the MAC address of the relevant network interface to the intended IP address for each node.
   b. When you use DHCP to configure IP addressing for the cluster machines, the machines also obtain the DNS server information through DHCP. Define the persistent DNS server address that is used by the cluster nodes through your DHCP server configuration.
NOTE
If you are not using a DHCP service, you must provide the IP networking configuration and the address of the DNS server to the nodes at RHCOS install time. These can be passed as boot arguments if you are installing from an ISO image. See the *Creating Red Hat Enterprise Linux CoreOS (RHCOS) machines* section for more information about static IP provisioning and advanced networking options.

c. Define the hostnames of your cluster nodes in your DHCP server configuration. See the *Setting the cluster node hostnames through DHCP* section for details about hostname considerations.

NOTE
If you are not using a DHCP service, the cluster nodes obtain their hostname through a reverse DNS lookup.

2. Ensure that your network infrastructure provides the required network connectivity between the cluster components. See the *Networking requirements for user-provisioned infrastructure* section for details about the requirements.

3. Configure your firewall to enable the ports required for the OpenShift Container Platform cluster components to communicate. See *Networking requirements for user-provisioned infrastructure* section for details about the ports that are required.

4. Setup the required DNS infrastructure for your cluster.
   a. Configure DNS name resolution for the Kubernetes API, the application wildcard, the bootstrap machine, the control plane machines, and the compute machines.
   b. Configure reverse DNS resolution for the Kubernetes API, the bootstrap machine, the control plane machines, and the compute machines.
      See the *User-provisioned DNS requirements* section for more information about the OpenShift Container Platform DNS requirements.

5. Validate your DNS configuration.
   a. From your installation node, run DNS lookups against the record names of the Kubernetes API, the wildcard routes, and the cluster nodes. Validate that the IP addresses in the responses correspond to the correct components.
   b. From your installation node, run reverse DNS lookups against the IP addresses of the load balancer and the cluster nodes. Validate that the record names in the responses correspond to the correct components.
      See the *Validating DNS resolution for user-provisioned infrastructure* section for detailed DNS validation steps.

6. Provision the required API and application ingress load balancing infrastructure. See the *Load balancing requirements for user-provisioned infrastructure* section for more information about the requirements.
NOTE

Some load balancing solutions require the DNS name resolution for the cluster nodes to be in place before the load balancing is initialized.

Additional resources

- Requirements for a cluster with user-provisioned infrastructure
- Installing RHCOS and starting the OpenShift Container Platform bootstrap process
- Setting the cluster node hostnames through DHCP
- Advanced RHCOS installation configuration
- Networking requirements for user-provisioned infrastructure
- User-provisioned DNS requirements
- Validating DNS resolution for user-provisioned infrastructure
- Load balancing requirements for user-provisioned infrastructure

7.2.5. Validating DNS resolution for user-provisioned infrastructure

You can validate your DNS configuration before installing OpenShift Container Platform on user-provisioned infrastructure.

IMPORTANT

The validation steps detailed in this section must succeed before you install your cluster.

Prerequisites

- You have configured the required DNS records for your user-provisioned infrastructure.

Procedure

1. From your installation node, run DNS lookups against the record names of the Kubernetes API, the wildcard routes, and the cluster nodes. Validate that the IP addresses contained in the responses correspond to the correct components.

   a. Perform a lookup against the Kubernetes API record name. Check that the result points to the IP address of the API load balancer:

   ```
   $ dig +noall +answer @<nameserver_ip> api.<cluster_name>.<base_domain>
   ```

   Replace `<nameserver_ip>` with the IP address of the nameserver, `<cluster_name>` with your cluster name, and `<base_domain>` with your base domain name.

   Example output

   ```
   api.ocp4.example.com. 0 IN A 192.168.1.5
   ```
b. Perform a lookup against the Kubernetes internal API record name. Check that the result points to the IP address of the API load balancer:

```
$ dig +noall +answer @<nameserver_ip> api-int.<cluster_name>.<base_domain>
```

**Example output**

```text
api-int.ocp4.example.com. 0 IN A 192.168.1.5
```

c. Test an example `*.apps.<cluster_name>.<base_domain>` DNS wildcard lookup. All of the application wildcard lookups must resolve to the IP address of the application ingress load balancer:

```
$ dig +noall +answer @<nameserver_ip> random.apps.<cluster_name>.<base_domain>
```

**Example output**

```text
random.apps.ocp4.example.com. 0 IN A 192.168.1.5
```

**NOTE**

In the example outputs, the same load balancer is used for the Kubernetes API and application ingress traffic. In production scenarios, you can deploy the API and application ingress load balancers separately so that you can scale the load balancer infrastructure for each in isolation.

You can replace `random` with another wildcard value. For example, you can query the route to the OpenShift Container Platform console:

```
$ dig +noall +answer @<nameserver_ip> console-openshift-console.apps.<cluster_name>.<base_domain>
```

**Example output**

```text
console-openshift-console.apps.ocp4.example.com. 0 IN A 192.168.1.5
```

d. Run a lookup against the bootstrap DNS record name. Check that the result points to the IP address of the bootstrap node:

```
$ dig +noall +answer @<nameserver_ip> bootstrap.<cluster_name>.<base_domain>
```

**Example output**

```text
bootstrap.ocp4.example.com. 0 IN A 192.168.1.96
```

e. Use this method to perform lookups against the DNS record names for the control plane and compute nodes. Check that the results correspond to the IP addresses of each node.

2. From your installation node, run reverse DNS lookups against the IP addresses of the load balancer and the cluster nodes. Validate that the record names contained in the responses correspond to the correct components.
a. Perform a reverse lookup against the IP address of the API load balancer. Check that the response includes the record names for the Kubernetes API and the Kubernetes internal API:

```
$ dig +noall +answer @<nameserver_ip> -x 192.168.1.5
```

**Example output**

```
5.1.168.192.in-addr.arpa. 0 IN PTR api-int.ocp4.example.com. 1
5.1.168.192.in-addr.arpa. 0 IN PTR api.ocp4.example.com. 2
```

1. Provides the record name for the Kubernetes internal API.
2. Provides the record name for the Kubernetes API.

**NOTE**

A PTR record is not required for the OpenShift Container Platform application wildcard. No validation step is needed for reverse DNS resolution against the IP address of the application ingress load balancer.

b. Perform a reverse lookup against the IP address of the bootstrap node. Check that the result points to the DNS record name of the bootstrap node:

```
$ dig +noall +answer @<nameserver_ip> -x 192.168.1.96
```

**Example output**

```
96.1.168.192.in-addr.arpa. 0 IN PTR bootstrap.ocp4.example.com.
```

c. Use this method to perform reverse lookups against the IP addresses for the control plane and compute nodes. Check that the results correspond to the DNS record names of each node.

**Additional resources**

- User-provisioned DNS requirements
- Load balancing requirements for user-provisioned infrastructure

### 7.2.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.
If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as AWS key pairs.

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

   ```
   $ ssh-keygen -t ed25519 -N "" -f <path>/<file_name>
   ```

   Specify the path and file name, such as `~/.ssh/id_rsa`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

   **NOTE**

   If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

   ```
   $ cat <path>/<file_name>.pub
   ```

   For example, run the following to view the `~/.ssh/id_rsa.pub` public key:

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

   **NOTE**

   On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

   a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

      ```
      ```
If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

1. Add your SSH private key to the `ssh-agent`:

   ```
   $ ssh-add <path>/<file_name>
   ```

   Example output
   
   Agent pid 31874

   Specify the path and file name for your SSH private key, such as `~/.ssh/id_rsa`

   Example output
   
   Identity added: /home/<you>/<path>/<file_name> (<computer_name>)

2. Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

   ```
   $ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
   ```

3. Verify that the credentials were applied.

   ```
   $ gcloud auth list
   ```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

Additional resources

- [Verifying node health](#)

7.2.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

Procedure

1. Access the [Infrastructre Provider](#) page on the Red Hat OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar xvf openshift-install-linux.tar.gz
```

5. From the Pull Secret page on the Red Hat OpenShift Cluster Manager site, download your installation pull secret. This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 7.2.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.8. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Linux from the drop-down menu and click Download command-line tools.

4. Unpack the archive:
Installing the OpenShift CLI on Windows
You can install the OpenShift CLI (oc) binary on Windows by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select Windows from the drop-down menu and click Download command-line tools.

4. Unzip the archive with a ZIP program.

5. Move the oc binary to a directory that is on your PATH.
   To check your PATH, open the command prompt and execute the following command:

   ```
   C:> path
   ```

   After you install the CLI, it is available using the oc command:

   ```
   C:> oc <command>
   ```

Installing the OpenShift CLI on macOS
You can install the OpenShift CLI (oc) binary on macOS by using the following procedure.

Procedure

1. Navigate to the Infrastructure Provider page on the Red Hat OpenShift Cluster Manager site.

2. Select your infrastructure provider, and, if applicable, your installation type.

3. In the Command line interface section, select MacOS from the drop-down menu and click Download command-line tools.

4. Unpack and unzip the archive.

5. Move the oc binary to a directory on your PATH.
   To check your PATH, open a terminal and execute the following command:

   ```
   $ echo $PATH
   ```

   After you install the CLI, it is available using the oc command:

   ```
   $ oc <command>
   ```
After you install the CLI, it is available using the `oc` command:

```bash
$ oc <command>
```

### 7.2.9. Manually creating the installation configuration file

For user-provisioned installations of OpenShift Container Platform, you manually generate your installation configuration file.

**Prerequisites**

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Create an installation directory to store your required installation assets in:

   ```bash
   $ mkdir <installation_directory>
   ```

   **IMPORTANT**

   You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample `install-config.yaml` file template that is provided and save it in the `<installation_directory>`.

   **NOTE**

   You must name this configuration file `install-config.yaml`.

   **NOTE**

   For some platform types, you can alternatively run `./openshift-install create install-config --dir=<installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

   **IMPORTANT**

   The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.
7.2.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide a customized `install-config.yaml` installation configuration file that describes the details for your environment.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

7.2.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 7.8. Required parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiVersion</td>
<td>The API version for the <code>install-config.yaml</code> content. The current version is v1. The installer may also support older API versions.</td>
<td>String</td>
</tr>
<tr>
<td>baseDomain</td>
<td>The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <code>baseDomain</code> and <code>metadata.name</code> parameter values that uses the <code>&lt;metadata.name&gt;.-&lt;baseDomain&gt;</code> format.</td>
<td>A fully-qualified domain or subdomain name, such as example.com.</td>
</tr>
<tr>
<td>metadata</td>
<td>Kubernetes resource <code>ObjectMeta</code>, from which only the <code>name</code> parameter is consumed.</td>
<td>Object</td>
</tr>
<tr>
<td>metadata.name</td>
<td>The name of the cluster. DNS records for the cluster are all subdomains of <code>${.metadata.name}}.${.baseDomain}</code>.</td>
<td>String of lowercase letters, hyphens (-), and periods (.), such as dev.</td>
</tr>
</tbody>
</table>
platform

The configuration for the specific platform upon which to perform the installation: **aws, baremetal, azure, openstack, ovirt, vsphere.**
For additional information about platform.<platform> parameters, consult the table for your specific platform that follows.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform</td>
<td>The configuration for the specific platform upon which to perform the installation: <strong>aws, baremetal, azure, openstack, ovirt, vsphere.</strong> For additional information about platform.&lt;platform&gt; parameters, consult the table for your specific platform that follows.</td>
<td>Object</td>
</tr>
<tr>
<td>pullSecret</td>
<td>Get a pull secret from <a href="https://cloud.redhat.com/openshift/install/pull-secret">https://cloud.redhat.com/openshift/install/pull-secret</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.</td>
<td><code>{ &quot;auths&quot;: { &quot;cloud.openshift.com&quot;: { &quot;auth&quot;: &quot;b3Blb=&quot;, &quot;email&quot;: &quot;you@example.com&quot; }, &quot;quay.io&quot;: { &quot;auth&quot;: &quot;b3Blb=&quot;, &quot;email&quot;: &quot;you@example.com&quot; } } }</code></td>
</tr>
</tbody>
</table>

### 7.2.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

If you use the OVN-Kubernetes cluster network provider, both IPv4 and IPv6 address families are supported.

If you use the OpenShift SDN cluster network provider, only the IPv4 address family is supported.

If you configure your cluster to use both IP address families, you must specify IPv4 and IPv6 addresses in the same order for all network configuration parameters. For example, in the following configuration IPv4 addresses are listed before IPv6 addresses.

```
 networking:
 clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  - cidr: fd00:10:128::/56
    hostPrefix: 64
 serviceNetwork:
  - 172.30.0.0/16
  - fd00:172:16::/112
```

Table 7.9. Network parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>networking</td>
<td>The configuration for the cluster network.</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>You cannot modify parameters specified by the <code>networking</code> object after installation.</td>
<td></td>
</tr>
<tr>
<td>networking.network.Type</td>
<td>The cluster network provider Container Network Interface (CNI) plug-in to install.</td>
<td>Either OpenShiftSDN or OVNKubernetes. The default value is OpenShiftSDN.</td>
</tr>
<tr>
<td>networking.clusterNetwork</td>
<td>The IP address blocks for pods. The default value is 10.128.0.0/14 with a host prefix of /23. If you specify multiple IP address blocks, the blocks must not overlap.</td>
<td>An array of objects. For example:</td>
</tr>
<tr>
<td></td>
<td><strong>networking:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>clusterNetwork:</td>
<td></td>
