Red Hat Ceph Storage 2

Installation Guide for Ubuntu

Installing Red Hat Ceph Storage on Ubuntu
Abstract

This document provides instructions on installing Red Hat Ceph Storage on Ubuntu 16.04 running on AMD64 and Intel 64 architectures.

CHAPTER 6. WHAT TO DO NEXT?  .................................................... 60.
CHAPTER 1. WHAT IS RED HAT CEPH STORAGE?

Red Hat Ceph Storage is a scalable, open, software-defined storage platform that combines the most stable version of the Ceph storage system with a Ceph management platform, deployment utilities, and support services.

Red Hat Ceph Storage is designed for cloud infrastructure and web-scale object storage. Red Hat Ceph Storage clusters consist of the following types of nodes:

**Red Hat Storage Ansible Administration node**

This type of node acts as the traditional Ceph Administration node did for previous versions of Red Hat Ceph Storage. This type of node provides the following functions:

- Centralized storage cluster management
  - Ansible administration
  - Ceph Client Command line interface
- The Ceph configuration files and keys
- Optionally, local repositories for installing Ceph on nodes that cannot access the Internet for security reasons

**NOTE**

In Red Hat Ceph Storage 1.3.x, the Ceph Administration node hosted the Calamari monitoring and administration server, and the `ceph-deploy` utility, which has been deprecated in Red Hat Ceph Storage 2. Use Ceph command-line utility or the Ansible automation application utility instead to install a Red Hat Ceph Storage cluster.

**Monitor nodes**

Each monitor node runs the monitor daemon (`ceph-mon`), which maintains a master copy of the cluster map. The cluster map includes the cluster topology. A client connecting to the Ceph cluster retrieves the current copy of the cluster map from the monitor which enables the client to read from and write data to the cluster.

Ceph can run with one monitor; however, to ensure high availability in a production cluster, Red Hat recommends to deploy at least three monitor nodes.

**OSD nodes**

Each Object Storage Device (OSD) node runs the Ceph OSD daemon (`ceph-osd`), which interacts with logical disks attached to the node. Ceph stores data on these OSD nodes.

Ceph can run with very few OSD nodes, which the default is three, but production clusters realize better performance beginning at modest scales, for example 50 OSDs in a storage cluster. Ideally, a Ceph cluster has multiple OSD nodes, allowing isolated failure domains by creating the CRUSH map.

**MDS nodes**

Each Metadata Server (MDS) node runs the MDS daemon (`ceph-mds`), which manages metadata related to files stored on the Ceph File System (CephFS). The MDS daemon also coordinates access to the shared cluster.

MDS and CephFS are Technology Preview features and as such they are not fully supported yet. For information on MDS installation and configuration, see the [Ceph File System Guide (Technology Preview)](http://example.com).
Object Gateway node

Ceph Object Gateway node runs the Ceph RADOS Gateway daemon (ceph-radosgw), and is an object storage interface built on top of librados to provide applications with a RESTful gateway to Ceph Storage Clusters. The Ceph RADOS Gateway supports two interfaces:

**S3**

Provides object storage functionality with an interface that is compatible with a large subset of the Amazon S3 RESTful API.

**Swift**

Provides object storage functionality with an interface that is compatible with a large subset of the OpenStack Swift API.

For details on the Ceph architecture, see the Architecture Guide.

For minimum recommended hardware, see the Hardware Guide.
CHAPTER 2. PREREQUISITES

Figure 2.1. Prerequisite Workflow

Before installing Red Hat Ceph Storage, review the following prerequisites first and prepare each Ceph Monitor, OSD, and client nodes accordingly.

Table 2.1. Prerequisites Checks

<table>
<thead>
<tr>
<th>Task</th>
<th>Required</th>
<th>Section</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verifying the operating system version</td>
<td>Yes</td>
<td>Section 2.1, “Operating System”</td>
<td>Verify the PID count</td>
</tr>
</tbody>
</table>
| Enabling Ceph software repositories     | Yes      | Section 2.2, “Enabling the Red Hat Ceph Storage Repositories” | Two installation methods:  
  - Content Delivery Network (CDN)  
  - Local Repository (ISO)          |
| Using a RAID controller                 | No       | Section 2.3, “Configuring RAID Controllers”  | For OSD nodes only.                                                           |
| Configuring network Interface           | Yes      | Section 2.4, “Configuring Network”           | Using a public network is required. Having a private network for cluster communication is optional, but recommended. |
| Configuring a firewall                  | No       | Section 2.5, “Configuring Firewall”          |                                                                               |
| Configuring the Network Time Protocol   | Yes      | Note                                         |                                                                               |
### 2.1. OPERATING SYSTEM

Red Hat Ceph Storage 2 and later requires Ubuntu 16.04 with a homogeneous version running on AMD64 and Intel 64 architectures for all Ceph nodes.

**IMPORTANT**

Red Hat does not support clusters with heterogeneous operating systems and versions.

Return to prerequisite checklist

#### 2.1.1. Adjusting the PID Count

Hosts with high numbers of OSDs, that being more than 12, may spawn a lot of threads, especially during recovery and re-balancing events. The kernel defaults to a relatively small maximum number of threads, typically 32768.

1. Check the current **`pid_max`** settings:

   ```
   # cat /proc/sys/kernel/pid_max
   ```

2. As **root**, consider setting **`kernel.pid_max`** to a higher number of threads. The theoretical maximum is 4,194,303 threads. For example, add the following to the `/etc/sysctl.conf` file to set it to the maximum value:

   ```
   kernel.pid_max = 4194303
   ```

3. As **root**, to load the changes without a rebooting:

   ```
   # sysctl -p
   ```

4. As **root**, verify the changes:

   ```
   # sysctl -a | grep kernel.pid_max
   ```

#### 2.2. ENABLING THE RED HAT CEPH STORAGE REPOSITORIES

Before you can install Red Hat Ceph Storage, you must choose an installation method. Red Hat Ceph Storage supports two installation methods:
Online Repositories
For Ceph Storage clusters with Ceph nodes that can connect directly to the Internet, you can use online repositories from the https://rhcs.download.redhat.com/ubuntu site. You will need your Customer Name and Customer Password received from https://rhcs.download.redhat.com to be able to use the repositories.

IMPORTANT
Contact your account manager to obtain credentials for https://rhcs.download.redhat.com.

Local Repository
For Ceph Storage clusters where security measures preclude nodes from accessing the Internet, install Red Hat Ceph Storage 2 from a single software build delivered as an ISO image, which will allow you to install local repositories.

2.2.1. Online Repositories

Online Installations for...

• Ansible Administration Node
  As root, enable the Red Hat Ceph Storage 2 Tools repository:

  $ sudo bash -c 'umask 0077; echo deb https://customername:customerpasswd@rhcs.download.redhat.com/2-updates/Tools $(lsb_release -sc) main | tee /etc/apt/sources.list.d/Tools.list'
  $ sudo bash -c 'wget -O - https://www.redhat.com/security/fd431d51.txt | apt-key add -'
  $ sudo apt-get update

• Monitor Nodes
  As root, enable the Red Hat Ceph Storage 2 Monitor repository:

  $ sudo bash -c 'umask 0077; echo deb https://customername:customerpasswd@rhcs.download.redhat.com/2-updates/MON $(lsb_release -sc) main | tee /etc/apt/sources.list.d/MON.list'
  $ sudo bash -c 'wget -O - https://www.redhat.com/security/fd431d51.txt | apt-key add -'
  $ sudo apt-get update

• OSD Nodes
  As root, enable the Red Hat Ceph Storage 2 OSD repository:

  $ sudo bash -c 'umask 0077; echo deb https://customername:customerpasswd@rhcs.download.redhat.com/2-updates/OSD $(lsb_release -sc) main | tee /etc/apt/sources.list.d/OSD.list'
  $ sudo bash -c 'wget -O - https://www.redhat.com/security/fd431d51.txt | apt-key add -'
  $ sudo apt-get update
• **RADOS Gateway and Client Nodes**
  As `root`, enable the Red Hat Ceph Storage 2 Tools repository:

  ```
  $ sudo bash -c 'umask 0077; echo deb https://customername:customerpasswd@rhcs.download.redhat.com/2-updates/Tools $(lsb_release -sc) main | tee /etc/apt/sources.list.d/Tools.list'
  $ sudo bash -c 'wget -O - https://www.redhat.com/security/fd431d51.txt | apt-key add -'
  $ sudo apt-get update
  ```

  [Return to prerequisite checklist](#)

### 2.2.2. Local Repository

#### ISO Installations

- **Download the Red Hat Ceph Storage ISO**
  1. Visit the [Red Hat Ceph Storage for Ubuntu](#) page on the Customer Portal to obtain the Red Hat Ceph Storage installation ISO image files.
  2. Copy the ISO image to the node.
  3. As `root`, mount the copied ISO image to the `/mnt/rhcs2/` directory:

     ```
     $ sudo mkdir -p /mnt/rhcs2
     $ sudo mount -o loop /<path_to_iso>/rhceph-2.0-ubuntu-x86_64.iso /mnt/rhcs2
     ```

  [NOTE](#) For ISO installations using Ansible to install Red Hat Ceph Storage 2, mounting the ISO and creating a local repository is not required.

- **Create a Local Repository**
  1. Copy the ISO image to the node.
  2. As `root`, mount the copied ISO image:

     ```
     $ sudo mkdir -p /mnt/<new_directory>
     $ sudo mount -o loop /<path_to_iso_file> /mnt/<new_directory>
     ```

  3. As `root`, add the ISO image as a software source:

     ```
     $ sudo apt-get install software-properties-common
     $ sudo add-apt-repository "deb file:/mnt/<new_directory> $(lsb_release -sc) main"
     ```
NOTE
If you are completely disconnected from the Internet, then you must use ISO images to receive any updates.

Return to prerequisite checklist

2.3. CONFIGURING RAID CONTROLLERS

If a RAID controller with 1-2 GB of cache is installed on a host, enabling write-back caches might result in increased small I/O write throughput. To prevent this problem, the cache must be non-volatile.

Modern RAID controllers usually have super capacitors that provide enough power to drain volatile memory to non-volatile NAND memory during a power loss event. It is important to understand how a particular controller and firmware behave after power is restored.

Some RAID controllers require manual intervention. Hard drives typically advertise to the operating system whether their disk caches should be enabled or disabled by default. However, certain RAID controllers or some firmware do not provide such information, so verify that disk level caches are disabled to avoid file system corruption.

Create a single RAID 0 volume with write-back for each OSD data drive with write-back cache enabled.

If Serial Attached SCSI (SAS) or SATA connected Solid-state Drive (SSD) disks are also present on the controller, investigate whether your controller and firmware support **passthrough** mode. **Passthrough** mode helps avoid caching logic, and generally results in much lower latency for fast media.

Return to prerequisite checklist

2.4. CONFIGURING NETWORK

All Ceph clusters require a public network. You must have a network interface card configured to a public network where Ceph clients can reach Ceph monitors and Ceph OSD nodes.

You might have a network interface card for a cluster network so that Ceph can conduct heart-beating, peering, replication, and recovery on a network separate from the public network.

**IMPORTANT**

Red Hat does not recommend using a single network interface card for both a public and private network.

For additional information on network configuration see the Network Configuration Reference chapter in the Configuration Guide for Red Hat Ceph Storage 2.

Return to prerequisite checklist

2.5. CONFIGURING FIREWALL

Red Hat Ceph Storage 2 uses the **iptables** service, which you must configure to suit your environment.
Monitor nodes use port 6789 for communication within the Ceph cluster. The monitor where the calamari-lite is running uses port 8002 for access to the Calamari REST-based API.

On each Ceph OSD node, the OSD daemon uses several ports in the range 6800-7300:

- One for communicating with clients and monitors over the public network
- One for sending data to other OSDs over a cluster network, if available; otherwise, over the public network
- One for exchanging heartbeat packets over a cluster network, if available; otherwise, over the public network

Ceph object gateway nodes use port 7480 by default. However, you can change the default port, for example to port 80. To use the SSL/TLS service, open port 443.

For more information about public and cluster network, see Network.

Configuring Access

1. As root, on all Ceph Monitor nodes, open port 6789 on the public network:

   ```
   $ sudo iptables -I INPUT 1 -i <iface> -p tcp -s <IP-address>/<prefix> --dport 6789 -j ACCEPT
   ```

2. If calamari-lite is running on the Ceph Monitor node, as root, open port 8002 on the public network:

   ```
   $ sudo iptables -I INPUT 1 -i <iface> -p tcp -s <IP-address>/<prefix> --dport 8002 -j ACCEPT
   ```

3. As root, on all OSD nodes, open ports 6800-7300:

   ```
   $ sudo iptables -I INPUT 1 -i <iface> -m multiport -p tcp -s <IP-address>/<prefix> --dports 6800:7300 -j ACCEPT
   ```

   Where <ip-address> is the network address of the OSD nodes.

4. As root, on all object gateway nodes, open the relevant port or ports on the public network.

   a. To open the default port 7480:

   ```
   $ sudo iptables -I INPUT 1 -i <iface> -p tcp -s <IP-address>/<prefix> --dport 7480 -j ACCEPT
   ```

   b. Optionally, as root, if you changed the default Ceph object gateway port, for example to port 80, open this port:

   ```
   $ sudo iptables -I INPUT 1 -i <iface> -p tcp -s <IP-address>/<prefix> --dport 80 -j ACCEPT
   ```

   c. Optionally, as root, to use SSL/TLS, open port 443:

   ```
   $ sudo iptables -I INPUT 1 -i <iface> -p tcp -s <IP-
5. As root, make the changes persistent on each node:
   
a. Install the `iptables-persistent` package:
   
   ```
   $ sudo apt-get install iptables-persistent
   ```
   
b. In the terminal UI that appears, select yes to save current IPv4 `iptables` rules to the
   `/etc/iptables/rules.v4` file and current IPv6 `iptables` rules to the
   `/etc/iptables/rules.v6` file.

   **NOTE**
   
   If you add a new `iptables` rule after installing `iptables-persistent`,
   add the new rule to the `rules` file:
   
   ```
   $ sudo iptables-save > /etc/iptables/rules.v4
   ```

2.6. CONFIGURING NETWORK TIME PROTOCOL

   **NOTE**
   
   If using Ansible to deploy a Red Hat Ceph Storage cluster, then the installation,
   configuration, and enabling NTP is done automatically during the deployment.

   You must configure the Network Time Protocol (NTP) on all Ceph Monitor and OSD nodes. Ensure that
   Ceph nodes are NTP peers. NTP helps preempt issues that arise from clock drift.

   1. As root, install the `ntp` package:
   
   ```
   $ sudo apt-get install ntp
   ```
   
   2. As root, start the NTP service and ensure it is running:
   
   ```
   $ sudo service ntp start
   $ sudo service ntp status
   ```
   
   3. Ensure that NTP is synchronizing Ceph monitor node clocks properly:
   
   ```
   $ ntpq -p
   ```

2.7. CREATING AN ANSIBLE USER WITH SUDO ACCESS

   Ansible must login to Ceph nodes as a user that has passwordless root privileges, because Ansible
   needs to install software and configuration files without prompting for passwords.
Red Hat recommends creating an Ansible user on all Ceph nodes in the cluster.

**IMPORTANT**

Do not use `ceph` as the user name. The `ceph` user name is reserved for the Ceph daemons.

A uniform user name across the cluster can improve ease of use, but avoid using obvious user names, because intruders typically use them to for brute force attacks. For example, `root`, `admin`, or `<productname>` are not advised.

The following procedure, substituting `<username>` for the user name you define, describes how to create an Ansible user with passwordless `root` privileges on a Ceph node.

1. Use the `ssh` command to log in to a Ceph node:

```
$ ssh <user_name>@<hostname>
```

Replace `<hostname>` with the host name of the Ceph node.

2. Create a new Ansible user and set a new password for this user:

```
$sudo adduser <username>
```

3. Ensure that the user you added has the `root` privileges:

```
$ sudo cat << EOF >/etc/sudoers.d/<username>
<username> ALL = (root) NOPASSWD:ALL
EOF
```

4. Ensure the correct file permissions:

```
$ sudo chmod 0440 /etc/sudoers.d/<username>
```

*Return to prerequisite checklist*

### 2.8. Enabling Password-Less SSH (Ansible Deployment Only)

Since Ansible will not prompt for a password, you must generate SSH keys on the administration node and distribute the public key to each Ceph node.

1. Generate the SSH keys, but do not use `sudo` or the `root` user. Instead, use the Ansible user you created in *Creating an Ansible User with Sudo Access*. Leave the passphrase empty:

```
$ ssh-keygen
```

Generating public/private key pair.
Enter file in which to save the key (/ceph-admin/.ssh/id_rsa): Enter passphrase (empty for no passphrase):
Enter same passphrase again: Your identification has been saved in /ceph-admin/.ssh/id_rsa. Your public key has been saved in /ceph-admin/.ssh/id_rsa.pub.
2. Copy the key to each Ceph Node, replacing `<username>` with the user name you created in *Creating an Ansible User with Sudo Access* and `<hostname>` with a host name of a Ceph node:

   $ ssh-copy-id <username>@<hostname>

3. Modify or create (using a utility such as vi) the `~/.ssh/config` file of the Ansible administration node so that Ansible can log in to Ceph nodes as the user you created without requiring you to specify the `-u <username>` option each time you execute the `ansible-playbook` command. Replace `<username>` with the name of the user you created and `<hostname>` with a host name of a Ceph node:

```
Host node1
  Hostname <hostname>
  User <username>

Host node2
  Hostname <hostname>
  User <username>

Host node3
  Hostname <hostname>
  User <username>
```

After editing the `~/.ssh/config` file on the Ansible administration node, ensure the permissions are correct:

```
$ chmod 600 ~/.ssh/config
```

*Return to prerequisite checklist*
CHAPTER 3. STORAGE CLUSTER INSTALLATION

Production Ceph storage clusters start with a minimum of three monitor hosts and three OSD nodes containing multiple OSDs.

You can install a Red Hat Ceph Storage cluster by using:

- Ansible automation application
- Command-line interface

3.1. INSTALLING RED HAT CEPH STORAGE USING ANSIBLE

Previously, Red Hat did not provide the ceph-ansible package for Ubuntu. In Red Hat Ceph Storage version 2 and later, you can use the Ansible automation application to deploy a Ceph cluster from an Ubuntu node. Execute the procedures in Figure 2.1, “Prerequisite Workflow” first.

To add more Monitors or OSDs to an existing storage cluster, see the Red Hat Ceph Storage Administration Guide for details:

- Adding a Monitor
- Adding an OSD

Before you start

- Install Python on all nodes:

```
# apt install python
```

3.1.1. Installing ceph-ansible

1. Install the `ceph-ansible` package:

```
$ sudo apt-get install ceph-ansible
```

2. As `root`, add the Ceph hosts to the `/etc/ansible/hosts` file. Remember to comment out example hosts. If the Ceph hosts have sequential naming, consider using a range:

```
a. Add Monitor nodes under the `[mons]` section:
```
```
b. Add OSD nodes under the [osds] section:

```
[osds]
<osd-host-name[1:10]>
```

Optionally, use the devices parameter to specify devices that the OSD nodes will use. Use a comma-separated list to list multiple devices.

```
[osds]
<ceph-host-name> devices="[ '<device_1>', '<device_2>' ]"
```

For example:

```
[osds]
ceph-osd-01 devices="[ '/dev/sdb', '/dev/sdc' ]"
ceph-osd-02 devices="[ '/dev/sdb', '/dev/sdc', '/dev/sdd' ]"
```

When specifying no devices, then set the osd_auto_discovery option to true in the osds.yml file. See Section 3.1.4, “Configuring Ceph OSD Settings” for more details.

Using the devices parameter is useful when OSDs use devices with different names or when one of the devices failed on one of the OSDs. See Section A.1, “Ansible Stops Installation Because It Detects Less Devices Than It Expected” for more details.

3. As the Ansible user, ensure that Ansible can reach the Ceph hosts:

```
$ ansible all -m ping
```

**NOTE**

See Section 2.7, “Creating an Ansible User with Sudo Access” for more details on creating an Ansible user.

### 3.1.2. Configuring Ceph Global Settings

1. Create a directory under the home directory so Ansible can write the keys:

```
# cd ~
# mkdir ceph-ansible-keys
```

2. As root, create a symbolic link to the Ansible group_vars directory in the /etc/ansible/ directory:

```
# ln -s /usr/share/ceph-ansible/group_vars /etc/ansible/group_vars
```

3. As root, create an all.yml file from the all.yml.sample file and open it for editing:
# cd /etc/ansible/group_vars
# cp all.yml.sample all.yml
# vim all.yml

4. Uncomment the `fetch_directory` setting under the `GENERAL` section. Then, point it to the directory you created in step 1:

```
fetch_directory: ~/ceph-ansible-keys
```

5. Uncomment the `ceph_repository_type` setting and set it to either `cdn` or `iso`:

```
ceph_repository_type: cdn
```

6. Select the installation method. There are two approaches:
   a. If Ceph hosts have connectivity to the Red Hat Content Delivery Network (CDN), uncomment and set the following:

```
ceph_origin: repository
ceph_repository: rhcs
ceph_repository_type: cdn
ceph_rhcs_version: 2
```

   b. If Ceph nodes cannot connect to the Red Hat Content Delivery Network (CDN), uncomment the `ceph_repository_type` setting and set it to `iso`. This approach is most frequently used in high security environments.

```
ceph_repository_type: iso
```

Then, uncomment the `ceph_rhcs_iso_path` setting and specify the path to the ISO image:

```
ceph_rhcs_iso_path: <path>
```

**Example**

```
ceph_rhcs_iso_path: /path/to/ISO_file.iso
```

7. For RCHS 2.5 and later versions, uncomment and set `ceph_rhcs_cdn_debian_repo` and `ceph_rhcs_cdn_debian_repo_version` so that Ansible can automatically enable and access Ubuntu online repositories:

```
ceph_rhcs_cdn_debian_repo: <repo-path>
ceph_rhcs_cdn_debian_repo_version: <repo-version>
```

**Example**

```
ceph_rhcs_cdn_debian_repo: https://<login>:@rhcs.download.redhat.com
ceph_rhcs_cdn_debian_repo_version: /2-release/
```
Where `<login>` is the RHN user login and `<pwd>` is the RHN user's password.

8. Set the `generate_fsid` setting to `false`:

```yaml
generate_fsid: false
```

**NOTE**

With `generate_fsid` set to `false`, then you must specify a value for the File System Identifier (FSID) manually. For example, using the command-line utility, `uuidgen`, you can generate a Universally Unique Identifier (UUID). Once you generate a UUID, then uncomment the `fsid` setting and specify the generated UUID:

```yaml
fsid: <generated_uuid>
```

With `generate_fsid` set to `true`, then the UUID will be automatically generated. This removes the need to specify the UUID in the `fsid` setting.

9. To enable authentication, uncomment the `cephx` setting under the Ceph Configuration section. Red Hat recommends running Ceph with authentication enabled:

```yaml
cephx: true
```

10. Uncomment the `monitor_interface` setting and specify the network interface:

```yaml
monitor_interface: 
```

**Example**

```yaml
monitor_interface: eth0
```

**NOTE**

The `monitor_interface` setting will use the IPv4 address. To use an IPv6 address, use the `monitor_address` setting instead.

11. If not using IPv6, then skip this step. Uncomment and set the `ip_version` option:

```yaml
ip_version: ipv6
```

12. Set journal size:

```yaml
journal_size: <size_in_MB>
```

If not filled, the default journal size will be 5 GB. See Journal Settings for additional details.

13. Set the public network. Optionally, set the cluster network, too:

```yaml
public_network: <public_network>
cluster_network: <cluster_network>
```
See Section 2.4, “Configuring Network” and Network Configuration Reference for additional details.

14. If not using IPv6, then skip this step. Uncomment and set the `radosgw_civetweb_bind_ip` option:

```bash
radosgw_civetweb_bind_ip: "[{{ ansible_default_ipv6.address }}]"
```

IMPORTANT

Currently, there is a rendering bug when displaying content within double curly brackets on the Customer Portal. The Customer Portal team is working diligently to resolve this issue.

The HTML escape codes being displayed in the above step represent the left (`{`) and right (`}`) curly brackets respectively. For example, written in long hand, the `radosgw_civetweb_bind_ip` option would be the following:

```bash
radosgw_civetweb_bind_ip: "[<left_curly_bracket><left_curly_bracket> ansible_default_ipv6.address <right_curly_bracket><right_curly_bracket>]"
```

### 3.1.3. Configuring Monitor Settings

Ansible will create Ceph Monitors without any additional configuration steps. However, you may override default settings for authentication, and for use with OpenStack. By default, the Calamari API is disabled.

To configure monitors, perform the following:

1. Navigate to the `/etc/ansible/group_vars/` directory:

   ```bash
   # cd /etc/ansible/group_vars/
   ```

2. As root, create an `mons.yml` file from `mons.yml.sample` file and open it for editing:

   ```bash
   # cp mons.yml.sample mons.yml
   # vim mons.yml
   ```

3. To enable the Calamari API, uncomment the `calamari` setting and set it to `true`:

   ```bash
   calamari: true
   ```

4. To configure other settings, uncomment them and set appropriate values.

### 3.1.4. Configuring Ceph OSD Settings

To configure OSDs:

1. Navigate to the `/etc/ansible/group_vars/` directory:
# cd /etc/ansible/group_vars/

2. As **root**, create a new `osds.yml` file from the `osds.yml.sample` file and open it for editing:

   ```
   # cp osds.yml.sample osds.yml
   # vim osds.yml
   ```

3. Uncomment and set settings that are relevant for your use case. See Table 3.1, “What settings are needed for my use case?” for details.

4. Once you are done editing the file, save your changes and close the file.

### Table 3.1. What settings are needed for my use case?

<table>
<thead>
<tr>
<th>I want:</th>
<th>Relevant Options</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>to have the Ceph journal and OSD data co-located on the same device and to specify OSD disks on my own.</td>
<td><code>devices</code></td>
<td>The <strong>devices</strong> setting accepts a list of devices. Ensure that the specified devices correspond to the storage devices on the OSD nodes.</td>
</tr>
<tr>
<td></td>
<td><code>journal_collocation: true</code></td>
<td></td>

</tbody>
</table>
### I want:

<table>
<thead>
<tr>
<th>Relevant Options</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>devices</strong></td>
<td>The <code>devices</code> and <code>raw_journal_devices</code> settings except a list of devices. Ensure that the devices specified correspond to the storage devices on the OSD nodes. Note that all OSDs will be encrypted. For details, see the Encryption chapter in the Red Hat Ceph Storage 2 Architecture Guide.</td>
</tr>
<tr>
<td><strong>dmcrypt_dedicated_journal: true</strong></td>
<td></td>
</tr>
<tr>
<td><strong>raw_journal_devices</strong></td>
<td></td>
</tr>
</tbody>
</table>

| **devices**      | The `devices` setting accepts a list of devices. For details on BlueStore, see the OSD BlueStore (Technology Preview) chapter in the Administration Guide for Red Hat Ceph Storage. |
| **bluestore: true** | |

For additional settings, see the `osds.yml.sample` file located in `/usr/share/ceph-ansible/group_vars/`.

---

### WARNING

Some OSD options will conflict with each other. Avoid enabling these sets of options together:

- `journal_collocation` and `raw_multi_journal`
- `journal_collocation` and `osd_directory`
- `raw_multi_journal` and `osd_directory`

In addition, specifying one of these options is required.

---

#### 3.1.5. Overriding Ceph Default Settings

Unless otherwise specified in the Ansible configuration files, Ceph uses its default settings.

Because Ansible manages the Ceph configuration file, edit the `/etc/ansible/group_vars/all.yml` file to change the Ceph configuration. Use the `ceph_conf_overrides` setting to override the default Ceph configuration.
Ansible supports the same sections as the Ceph configuration file; `[global]`, `[mon]`, `[osd]`, `[mds]`, `[rgw]`, and so on. You can also override particular instances, such as a particular Ceph Object Gateway instance. For example:

```
# CONFIG OVERRIDE #

ceph_conf_overrides:
  client.rgw.rgw1:
    log_file: /var/log/ceph/ceph-rgw-rgw1.log
```

**NOTE**

Ansible does not include braces when referring to a particular section of the Ceph configuration file. Sections and settings names are terminated with a colon.

**IMPORTANT**

Do not set the cluster network with the `cluster_network` parameter in the `CONFIG OVERRIDE` section because this can cause two conflicting cluster networks being set in the Ceph configuration file.

To set the cluster network, use the `cluster_network` parameter in the `CEPH CONFIGURATION` section. For details, see Configuring Ceph Global Settings.

### 3.1.6. Deploying a Ceph Cluster

1. Navigate to the Ansible configuration directory:

   ```
   # cd /usr/share/ceph-ansible
   ```

2. As `root`, create a `site.yml` file from the `site.yml.sample` file:

   ```
   # cp site.yml.sample site.yml
   ```

3. As the Ansible user, run the Ansible playbook from within the directory where the playbook exists:

   ```
   $ ansible-playbook site.yml [-u <user_name>]
   ```

   Once the playbook runs, it creates a running Ceph cluster.

   **NOTE**

   During the deployment of a Red Hat Ceph Storage cluster with Ansible, the installation, configuration, and enabling NTP is done automatically on each node in the storage cluster.

4. As `root`, on the Ceph Monitor nodes, create a Calamari user:

   **Syntax**
3.2. INSTALLING RED HAT CEPH STORAGE BY USING THE COMMAND-LINE INTERFACE

All Ceph clusters require at least one monitor, and at least as many OSDs as copies of an object stored on the cluster. Red Hat recommends using three monitors for production environments and a minimum of three Object Storage Devices (OSD).

Bootstrapping the initial monitor is the first step in deploying a Ceph storage cluster. Ceph monitor deployment also sets important criteria for the entire cluster, such as:

- The number of replicas for pools
- The number of placement groups per OSD
- The heartbeat intervals
- Any authentication requirement

Most of these values are set by default, so it is useful to know about them when setting up the cluster for production.

Installing a Ceph storage cluster by using the command line interface involves these steps:

- Bootstrapping the initial Monitor node
- Adding an Object Storage Device (OSD) node

**IMPORTANT**

Red Hat does not support or test upgrading manually deployed clusters. Currently, the only supported way to upgrade to a minor version of Red Hat Ceph Storage 2 is to use the Ansible automation application as described in Important. Therefore, Red Hat recommends to use Ansible to deploy a new cluster with Red Hat Ceph Storage 2. See Section 3.1, “Installing Red Hat Ceph Storage using Ansible” for details.

You can use command-line utilities, such as `apt-get`, to upgrade manually deployed clusters, but Red Hat does not support or test this.

3.2.1. Monitor Bootstrapping

Bootstrapping a Monitor and by extension a Ceph storage cluster, requires the following data:

**Unique Identifier**

The File System Identifier (`fsid`) is a unique identifier for the cluster. The `fsid` was originally used when the Ceph storage cluster was principally used for the Ceph file system. Ceph now supports...
native interfaces, block devices, and object storage gateway interfaces too, so \textit{fsid} is a bit of a misnomer.

\textbf{Cluster Name}

Ceph clusters have a cluster name, which is a simple string without spaces. The default cluster name is \textit{ceph}, but you can specify a different cluster name. Overriding the default cluster name is especially useful when you work with multiple clusters.

When you run multiple clusters in a multi-site architecture, the cluster name for example, \textit{us-west}, \textit{us-east} identifies the cluster for the current command-line session.

\textbf{NOTE}

To identify the cluster name on the command-line interface, specify the Ceph configuration file with the cluster name, for example, \textit{ceph.conf}, \textit{us-west.conf}, \textit{us-east.conf}, and so on.

\textbf{Example:}

\begin{verbatim}
  # ceph --cluster us-west.conf ...
\end{verbatim}

\textbf{Monitor Name}

Each Monitor instance within a cluster has a unique name. In common practice, the Ceph Monitor name is the node name. Red Hat recommend one Ceph Monitor per node, and no co-locating the Ceph OSD daemons with the Ceph Monitor daemon. To retrieve the short node name, use the \texttt{hostname -s} command.

\textbf{Monitor Map}

Bootstrapping the initial Monitor requires you to generate a Monitor map. The Monitor map requires:

- The File System Identifier (\textit{fsid})
- The cluster name, or the default cluster name of \textit{ceph} is used
- At least one host name and its IP address.

\textbf{Monitor Keyring}

Monitors communicate with each other by using a secret key. You must generate a keyring with a Monitor secret key and provide it when bootstrapping the initial Monitor.

\textbf{Administrator Keyring}

To use the \texttt{ceph} command-line interface utilities, create the \texttt{client.admin} user and generate its keyring. Also, you must add the \texttt{client.admin} user to the Monitor keyring.

The foregoing requirements do not imply the creation of a Ceph configuration file. However, as a best practice, Red Hat recommends creating a Ceph configuration file and populating it with the \textit{fsid}, the \texttt{mon initial members} and the \texttt{mon host} settings at a minimum.

You can get and set all of the Monitor settings at runtime as well. However, the Ceph configuration file might contain only those settings which overrides the default values. When you add settings to a Ceph configuration file, these settings override the default settings. Maintaining those settings in a Ceph configuration file makes it easier to maintain the cluster.

To bootstrap the initial Monitor, perform the following steps:
1. Enable the Red Hat Ceph Storage 2 Monitor repository. For ISO-based installations, see the ISO installation section.

2. On your initial Monitor node, install the `ceph-mon` package as `root`:

   ```bash
   $ sudo apt-get install ceph-mon
   
   # echo "mon initial members = node1" >> /etc/ceph/ceph.conf
   ```

3. As `root`, create a Ceph configuration file in the `/etc/ceph/` directory. By default, Ceph uses `ceph.conf`, where `ceph` reflects the cluster name:

   **Syntax**

   ```
   # touch /etc/ceph/<cluster_name>.conf
   # echo "fsid = `uuidgen`" >> /etc/ceph/<cluster_name>.conf
   
   # echo "[global]" > /etc/ceph/ceph.conf
   # echo "fsid = `uuidgen`" >> /etc/ceph/ceph.conf
   ```

   **Example**

   ```
   # echo "[global]" > /etc/ceph/ceph.conf
   # echo "fsid = `uuidgen`" >> /etc/ceph/ceph.conf
   ```

4. As `root`, generate the unique identifier for your cluster and add the unique identifier to the `[global]` section of the Ceph configuration file:

   **Syntax**

   ```
   # echo "[global]" > /etc/ceph/<cluster_name>.conf
   # echo "fsid = `uuidgen`" >> /etc/ceph/<cluster_name>.conf
   ```

   **Example**

   ```
   # echo "[global]" > /etc/ceph/ceph.conf
   # echo "fsid = `uuidgen`" >> /etc/ceph/ceph.conf
   ```

5. View the current Ceph configuration file:

   ```bash
   $ cat /etc/ceph/ceph.conf
   [global]
   fsid = a7f64266-0894-4f1e-a635-d0aeaca0e993
   ```

6. As `root`, add the initial Monitor to the Ceph configuration file:

   **Syntax**

   ```
   # echo "mon initial members = <monitor_host_name>[, <monitor_host_name>]
   ```

   **Example**

   ```
   # echo "mon initial members = node1" >> /etc/ceph/ceph.conf
   ```

7. As `root`, add the IP address of the initial Monitor to the Ceph configuration file:

   **Syntax**
# echo "mon host = <ip-address>[,<ip-address>]" >> /etc/ceph/<cluster_name>.conf

Example

# echo "mon host = 192.168.0.120" >> /etc/ceph/ceph.conf

NOTE

To use IPv6 addresses, you must set the `ms bind ipv6` option to `true`. See the Red Hat Ceph Storage Configuration Guide for more details.

8. As `root`, create the keyring for the cluster and generate the Monitor secret key:

Syntax

```
# ceph-authtool --create-keyring /tmp/<cluster_name>.mon.keyring --gen-key -n mon. --cap mon '<capabilities>'
```

Example

```
# ceph-authtool --create-keyring /tmp/ceph.mon.keyring --gen-key -n mon. --cap mon 'allow *'
creating /tmp/ceph.mon.keyring
```

9. As `root`, generate an administrator keyring, generate a `<cluster_name>.client.admin.keyring` user and add the user to the keyring:

Syntax

```
# ceph-authtool --create-keyring /etc/ceph/<cluster_name>.client.admin.keyring --gen-key -n client.admin --set-uid=0 --cap mon '<capabilities>' --cap osd '<capabilities>' --cap mds '<capabilities>'
```

Example

```
# ceph-authtool --create-keyring /etc/ceph/ceph.client.admin.keyring --gen-key -n client.admin --set-uid=0 --cap mon 'allow *' --cap osd 'allow *' --cap mds 'allow'
creating /etc/ceph/ceph.client.admin.keyring
```

10. As `root`, add the `<cluster_name>.client.admin.keyring` key to the `<cluster_name>.mon.keyring`:

Syntax

```
# ceph-authtool /tmp/<cluster_name>.mon.keyring --import-keyring /etc/ceph/<cluster_name>.client.admin.keyring
```

Example
11. Generate the Monitor map. Specify using the node name, IP address and the **fsid**, of the initial Monitor and save it as `/tmp/monmap`:

**Syntax**

```
$ monmaptool --create --add <monitor_host_name> <ip-address> --fsid <uuid> /tmp/monmap
```

**Example**

```
$ monmaptool --create --add node1 192.168.0.120 --fsid a7f64266-0894-4f1e-a635-d0aeaca0e993 /tmp/monmap
monmaptool: monmap file /tmp/monmap
monmaptool: set fsid to a7f64266-0894-4f1e-a635-d0aeaca0e993
monmaptool: writing epoch 0 to /tmp/monmap (1 monitors)
```

12. As root on the initial Monitor node, create a default data directory:

**Syntax**

```
# mkdir /var/lib/ceph/mon/<cluster_name>-<monitor_host_name>
```

**Example**

```
# mkdir /var/lib/ceph/mon/ceph-node1
```

13. As root, populate the initial Monitor daemon with the Monitor map and keyring:

**Syntax**

```
# ceph-mon [--cluster <cluster_name>] --mkfs -i <monitor_host_name> --monmap /tmp/monmap --keyring /tmp/<cluster_name>.mon.keyring
```

**Example**

```
# ceph-mon --mkfs -i node1 --monmap /tmp/monmap --keyring /tmp/ceph.mon.keyring
ceph-mon: set fsid to a7f64266-0894-4f1e-a635-d0aeaca0e993
ceph-mon: created monfs at /var/lib/ceph/mon/ceph-node1 for mon.node1
```

14. View the current Ceph configuration file:

```
# cat /etc/ceph/ceph.conf
[global]
fsid = a7f64266-0894-4f1e-a635-d0aeaca0e993
mon_initial_members = node1
```
mon_host = 192.168.0.120

For more details on the various Ceph configuration settings, see the Red Hat Ceph Storage Configuration Guide. The following example of a Ceph configuration file lists some of the most common configuration settings:

Example

```ini
[global]
fsid = <cluster-id>
mon initial members = <monitor_host_name>[, <monitor_host_name>]
mon host = <ip-address>[, <ip-address>]
public network = <network>[, <network>]
cluster network = <network>[, <network>]
auth cluster required = cephx
auth service required = cephx
auth client required = cephx
osd journal size = <n>
filestore xattr use omap = true
osd pool default size = <n>  # Write an object n times.
osd pool default min size = <n> # Allow writing n copy in a degraded state.
osd pool default pg num = <n>
osd pool default pgp num = <n>
osd crush chooseleaf type = <n>
```

15. As root, create the done file:

Syntax

```bash
# touch /var/lib/ceph/mon/<cluster_name>-<monitor_host_name>/done
```

Example

```bash
# touch /var/lib/ceph/mon/ceph-node1/done
```

16. As root, update the owner and group permissions on the newly created directory and files:

Syntax

```bash
# chown -R <owner>:<group> <path_to_directory>
```

Example

```bash
# chown -R ceph:ceph /var/lib/ceph/mon
# chown -R ceph:ceph /var/log/ceph
# chown -R ceph:ceph /var/run/ceph
# chown ceph:ceph /etc/ceph/ceph.client.admin.keyring
# chown ceph:ceph /etc/ceph/ceph.conf
# chown ceph:ceph /etc/ceph/rbdmap
```
NOTE

If the Ceph Monitor node is co-located with an OpenStack Controller node, then the Glance and Cinder keyring files must be owned by `glance` and `cinder` respectively. For example:

```
# ls -l /etc/ceph/
...
-rw-------. 1 glance glance 64 <date>
ceph.client.glance.keyring
-rw-------. 1 cinder cinder 64 <date>
ceph.client.cinder.keyring
...
```

17. For storage clusters with custom names, as `root`, add the following line:

**Syntax**
```
$ sudo echo "CLUSTER=<custom_cluster_name>" >> /etc/default/ceph
```

**Example**
```
$ sudo echo "CLUSTER=test123" >> /etc/default/ceph
```

18. As `root`, start and enable the `ceph-mon` process on the initial Monitor node:

**Syntax**
```
$ sudo systemctl enable ceph-mon.target
$ sudo systemctl enable ceph-mon@<monitor_host_name>
$ sudo systemctl start ceph-mon@<monitor_host_name>
```

**Example**
```
$ sudo systemctl enable ceph-mon.target
$ sudo systemctl enable ceph-mon@node1
$ sudo systemctl start ceph-mon@node1
```

19. Verify that Ceph created the default pools:

```
$ ceph osd lspools
 0 rbd,
```

20. Verify that the Monitor is running. The status output will look similar to the following example. The Monitor is up and running, but the cluster health will be in a `HEALTH_ERR` state. This error is indicating that placement groups are stuck and inactive. Once OSDs are added to the cluster and active, the placement group health errors will disappear.

**Example**
```
$ ceph -s
cluster a7f64266-0894-4f1e-a635-d0aeaca0e993
```
To add more Red Hat Ceph Storage Monitors to the storage cluster, see the Red Hat Ceph Storage Administration Guide

### 3.2.2. OSD Bootstrapping

Once you have your initial monitor running, you can start adding the Object Storage Devices (OSDs). Your cluster cannot reach an **active + clean** state until you have enough OSDs to handle the number of copies of an object.

The default number of copies for an object is three. You will need three OSD nodes at minimum. However, if you only want two copies of an object, therefore only adding two OSD nodes, then update the `osd pool default size` and `osd pool default min size` settings in the Ceph configuration file.

For more details, see the [OSD Configuration Reference](#) section in the Red Hat Ceph Storage Configuration Guide.

After bootstrapping the initial monitor, the cluster has a default CRUSH map. However, the CRUSH map does not have any Ceph OSD daemons mapped to a Ceph node.

To add an OSD to the cluster and updating the default CRUSH map, execute the following on each OSD node:

1. Enable the Red Hat Ceph Storage 2 [OSD repository](#). For ISO-based installations, see the ISO installation section.

2. As `root`, install the `ceph-osd` package on the Ceph OSD node:

   ```
   $ sudo apt-get install ceph-osd
   ```

3. Copy the Ceph configuration file and administration keyring file from the initial Monitor node to the OSD node:

   **Syntax**

   ```
   # scp <user_name>@<monitor_host_name>:<path_on_remote_system>:
   <path_to_local_file>
   ```

   **Example**

   ```
   # scp root@node1:/etc/ceph/ceph.conf /etc/ceph
   # scp root@node1:/etc/ceph/ceph.client.admin.keyring /etc/ceph
   ```

4. Generate the Universally Unique Identifier (UUID) for the OSD:
$ uuidgen
b367c360-b364-4b1d-8fc6-09408a9cda7a

5. As root, create the OSD instance:

**Syntax**

```
# ceph osd create <uuid> [osd_id]
```

**Example**

```
# ceph osd create b367c360-b364-4b1d-8fc6-09408a9cda7a 0
```

**NOTE**

This command outputs the OSD number identifier needed for subsequent steps.

6. As root, create the default directory for the new OSD:

**Syntax**

```
# mkdir /var/lib/ceph/osd/<cluster_name>-<osd_id>
```

**Example**

```
# mkdir /var/lib/ceph/osd/ceph-0
```

7. As root, prepare the drive for use as an OSD, and mount it to the directory you just created. Prepare a partition for the Ceph data and journal. The journal and the data partitions can be located on the same disk. This example is using a 15 GB disk:

**Syntax**

```
# parted <path_to_disk> mklabel gpt
# parted <path_to_disk> mkpart primary 1 10000
# mkfs -t <fstype> <path_to_partition>
# mount -o noatime <path_to_partition> /var/lib/ceph/osd/<cluster_name>-<osd_id>
# echo "<path_to_partition> /var/lib/ceph/osd/<cluster_name>-<osd_id> xfs defaults,noatime 1 2" >> /etc/fstab
```

**Example**

```
# parted /dev/sdb mklabel gpt
# parted /dev/sdb mkpart primary 1 10000
# parted /dev/sdb mkpart primary 10001 15000
# mkfs -t xfs /dev/sdb1
# mount -o noatime /dev/sdb1 /var/lib/ceph/osd/ceph-0
# echo "/dev/sdb1 /var/lib/ceph/osd/ceph-0 xfs defaults,noatime 1 2" >> /etc/fstab
```
8. As **root**, initialize the OSD data directory:

**Syntax**

```
# ceph-osd -i <osd_id> --mkfs --mkkey --osd-uuid <uuid>
```

**Example**

```
# ceph-osd -i 0 --mkfs --mkkey --osd-uuid b367c360-b364-4b1d-8fc6-09408a9cda7a
... auth: error reading file: /var/lib/ceph/osd/ceph-0/keyring: can't open /var/lib/ceph/osd/ceph-0/keyring: (2) No such file or directory
... created new key in keyring /var/lib/ceph/osd/ceph-0/keyring
```

**NOTE**

The directory must be empty before you run **ceph-osd** with the **--mkkey** option. If you have a custom cluster name, the **ceph-osd** utility requires the **--cluster** option.

9. As **root**, register the OSD authentication key. If your cluster name differs from **ceph**, insert your cluster name instead:

**Syntax**

```
# ceph auth add osd.<osd_id> osd 'allow *' mon 'allow profile osd' -i /var/lib/ceph/osd/<cluster_name>-<osd_id>/keyring
```

**Example**

```
# ceph auth add osd.0 osd 'allow *' mon 'allow profile osd' -i /var/lib/ceph/osd/ceph-0/keyring
added key for osd.0
```

10. As **root**, add the OSD node to the CRUSH map:

**Syntax**

```
# ceph [--cluster <cluster_name>] osd crush add-bucket <host_name> host
```

**Example**

```
# ceph osd crush add-bucket node2 host
```

11. As **root**, place the OSD node under the **default** CRUSH tree:

**Syntax**

```
12. As root, add the OSD disk to the CRUSH map

**Syntax**

```bash
# ceph [--cluster <cluster_name>] osd crush move <host_name>
```

**Example**

```bash
# ceph osd crush move node2 root=default
```

**NOTE**

You can also decompile the CRUSH map, and add the OSD to the device list. Add the OSD node as a bucket, then add the device as an item in the OSD node, assign the OSD a weight, recompile the CRUSH map and set the CRUSH map. For more details, see the Red Hat Ceph Storage Storage Strategies Guide for more details.

13. As root, update the owner and group permissions on the newly created directory and files:

**Syntax**

```bash
# chown -R <owner>:<group> <path_to_directory>
```

**Example**

```bash
# chown -R ceph:ceph /var/lib/ceph/osd
# chown -R ceph:ceph /var/log/ceph
# chown -R ceph:ceph /var/run/ceph
# chown -R ceph:ceph /etc/ceph
```

14. For storage clusters with custom names, as root, add the following line to the `/etc/default/ceph` file:

**Syntax**

```bash
$ sudo echo "CLUSTER=<custom_cluster_name>" >> /etc/default/ceph
```

**Example**

```bash
$ sudo echo "CLUSTER=test123" >> /etc/default/ceph
```
15. The OSD node is in your Ceph storage cluster configuration. However, the OSD daemon is *down* and *in*. The new OSD must be *up* before it can begin receiving data. As *root*, enable and start the OSD process:

**Syntax**

```bash
$ sudo systemctl enable ceph-osd.target
$ sudo systemctl enable ceph-osd@<osd_id>
$ sudo systemctl start ceph-osd@<osd_id>
```

**Example**

```bash
$ sudo systemctl enable ceph-osd.target
$ sudo systemctl enable ceph-osd@0
$ sudo systemctl start ceph-osd@0
```

Once you start the OSD daemon, it is *up* and *in*.

Now you have the monitors and some OSDs up and running. You can watch the placement groups peer by executing the following command:

```bash
$ ceph -w
```

To view the OSD tree, execute the following command:

```bash
$ ceph osd tree
```

**Example**

<table>
<thead>
<tr>
<th>ID</th>
<th>WEIGHT</th>
<th>TYPE</th>
<th>NAME</th>
<th>UP/DOWN</th>
<th>REWEIGHT</th>
<th>PRIMARY-AFFINITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>2</td>
<td>root</td>
<td>default</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>-2</td>
<td>2</td>
<td>host</td>
<td>node2</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td></td>
<td>osd.0</td>
<td>up</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>-3</td>
<td>1</td>
<td></td>
<td>host node3</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td></td>
<td>osd.1</td>
<td>up</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

To expand the storage capacity by adding new OSDs to the storage cluster, see the Red Hat Ceph Storage Administration Guide for more details.

### 3.2.3. Calamari Server Installation

The Calamari server provides a RESTful API for monitoring Ceph storage clusters.

To install *calamari-server*, perform the following steps on all Monitor nodes.

1. As *root*, enable the Red Hat Ceph Storage 2 Monitor repository

2. As *root*, install *calamari-server*:

   ```bash
   $ sudo apt-get install calamari-server
   ```
3. As root, initialize the **calamari-server**:

**Syntax**

```
$ sudo calamari-ctl clear --yes-i-am-sure
$ sudo calamari-ctl initialize --admin-username <uid> --admin-password <pwd> --admin-email <email>
```

**Example**

```
$ sudo calamari-ctl clear --yes-i-am-sure
$ sudo calamari-ctl initialize --admin-username admin --admin-password admin --admin-email cephadm@example.com
```

**IMPORTANT**

The `calamari-ctl clear --yes-i-am-sure` command is only necessary for removing the database of old Calamari server installations. Running this command on a new Calamari server results in an error.

**NOTE**

During initialization, the **calamari-server** will generate a self-signed certificate and a private key and place them in the `/etc/calamari/ssl/certs/` and `/etc/calamari/ssl/private` directories respectively. Use HTTPS when making requests. Otherwise, user names and passwords are transmitted in clear text.

The **calamari-ctl initialize** process generates a private key and a self-signed certificate, which means there is no need to purchase a certificate from a Certificate Authority (CA).

To verify access to the HTTPS API through a web browser, go to the following URL. Click through the untrusted certificate warnings, because the auto-generated certificate is self-signed:

```
https://<calamari_hostname>:8002/api/v2/cluster
```

To use a key and certificate from a CA:

1. Purchase a certificate from a CA. During the process, you will generate a private key and a certificate for CA. Or you can also use the self-signed certificate generated by Calamari.

2. Save the private key associated to the certificate to a path, preferably under `/etc/calamari/ssl/private/`.

3. Save the certificate to a path, preferably under `/etc/calamari/ssl/certs/`.

4. Open the `/etc/calamari/calamari.conf` file.

5. Under the `[calamari_web]` section, modify `ssl_cert` and `ssl_key` to point to the respective certificate and key path, for example:

```
[calamari_web]
...
```
ssl_cert = /etc/calamari/ssl/certs/calamari-lite-bundled.crt
ssl_key = /etc/calamari/ssl/private/calamari-lite.key

6. As root, re-initialize Calamari:

$ sudo calamari-ctl initialize
CHAPTER 4. CLIENT INSTALLATION

Red Hat Ceph Storage supports the following types of Ceph clients:

**Ceph CLI**

The Ceph command-line interface (CLI) enables administrators to execute Ceph administrative commands. See Section 4.2, “Ceph Command-line Interface Installation” for information on installing the Ceph CLI.

**Block Device**

The Ceph Block Device is a thin-provisioned, resizable block device. See Section 4.3, “Ceph Block Device Installation” for information on installing Ceph Block Devices.

**Object Gateway**

The Ceph Object Gateway provides its own user management and Swift- and S3-compliant APIs. See Section 4.4, “Ceph Object Gateway Installation” for information on installing Ceph Object Gateways.

In addition, the `ceph-ansible` utility provides the `ceph-client` role that copies the Ceph configuration file and the administration keyring to nodes. See Section 4.1, “Installing the ceph-client role” for details.

**IMPORTANT**

To use Ceph clients, you must have a Ceph cluster storage running, preferably in the active + clean state.

In addition, before installing the Ceph clients, ensure to perform the tasks listed in the Figure 2.1, “Prerequisite Workflow” section.

### 4.1. INSTALLING THE CEPH-CLIENT ROLE

The `ceph-client` role copies the Ceph configuration file and administration keyring to a node. In addition, you can use this role to create custom pools and clients.

To deploy the `ceph-client` role by using Ansible, see the Red Hat Ceph Storage 2 Installation Guide for Red Hat Enterprise Linux.

### 4.2. CEPH COMMAND-LINE INTERFACE INSTALLATION

The Ceph command-line interface (CLI) is provided by the `ceph-common` package and includes the following utilities:

- `ceph`
- `ceph-authtool`
- `ceph-dencoder`
- `rados`

To install the Ceph CLI:

1. On the client node, enable the Tools repository.
2. On the client node, install the `ceph-common` package:

```
$ sudo apt-get install ceph-common
```

3. From the initial monitor node, copy the Ceph configuration file, in this case `ceph.conf`, and the administration keyring to the client node:

**Syntax**

```
# scp /etc/ceph/<cluster_name>.conf <user_name>@<client_host_name>:/etc/ceph/
# scp /etc/ceph/<cluster_name>.client.admin.keyring <user_name>@<client_host_name>:/etc/ceph/
```

**Example**

```
# scp /etc/ceph/ceph.conf root@node1:/etc/ceph/
# scp /etc/ceph/ceph.client.admin.keyring root@node1:/etc/ceph/
```

Replace `<client_host_name>` with the host name of the client node.

### 4.3. CEPH BLOCK DEVICE INSTALLATION

The following procedure shows how to install and mount a thin-provisioned, resizable Ceph Block Device.

**IMPORTANT**

Ceph Block Devices must be deployed on separate nodes from the Ceph Monitor and OSD nodes. Running kernel clients and kernel server daemons on the same node can lead to kernel deadlocks.

**Before you start**

- Ensure to perform the tasks listed in the [Section 4.2, “Ceph Command-line Interface Installation”](#) section.

- If you use Ceph Block Devices as a back end for virtual machines (VMs) that use QEMU, increase the default file descriptor. See the [Ceph - VM hangs when transferring large amounts of data to RBD disk](#) Knowledgebase article for details.

**Installing Ceph Block Devices by Using the Command Line**

1. Create a Ceph Block Device user named `client.rbd` with full permissions to files on OSD nodes (`osd 'allow rwx'`) and output the result to a keyring file:

```
ceph auth get-or-create client.rbd mon 'allow r' osd 'allow rwx pool=<pool_name>' \
-o /etc/ceph/rbd.keyring
```

Replace `<pool_name>` with the name of the pool that you want to allow `client.rbd` to have access to, for example `rbd`. 

$ sudo ceph auth get-or-create \
client.rbd mon 'allow r' osd 'allow rwx pool=rbd' \
-o /etc/ceph/rbd.keyring

See the User Management section in the Red Hat Ceph Storage Administration Guide for more information about creating users.

2. Create a block device image:

    rbd create <image_name> --size <image_size> --pool <pool_name> \
    --name client.rbd --keyring /etc/ceph/rbd.keyring

Specify <image_name>, <image_size>, and <pool_name>, for example:

    $ rbd create image1 --size 4096 --pool rbd \
    --name client.rbd --keyring /etc/ceph/rbd.keyring
WARNING

The default Ceph configuration includes the following Ceph Block Device features:

- layering
- exclusive-lock
- object-map
- deep-flatten
- fast-diff

If you use the kernel RBD (krbd) client, you will not be able to map the block device image because the current kernel version included in Red Hat Enterprise Linux 7.3 does not support object-map, deep-flatten, and fast-diff.

To work around this problem, disable the unsupported features. Use one of the following options to do so:

- Disable the unsupported features dynamically:

  ```bash
  rbd feature disable <image_name> <feature_name>
  ```
  For example:
  ```bash
  # rbd feature disable image1 object-map deep-flatten fast-diff
  ```

- Use the --image-feature layering option with the rbd create command to enable only layering on newly created block device images.

- Disable the features be default in the Ceph configuration file:

  ```bash
  rbd_default_features = 1
  ```

This is a known issue, for details see the Release Notes Red Hat Ceph Storage 2.2.

All these features work for users that use the user-space RBD client to access the block device images.

3. Map the newly created image to the block device:

  ```bash
  rbd map <image_name> --pool <pool_name>\n  --name client.rbd --keyring /etc/ceph/rbd.keyring
  ```
For example:

```
$ sudo rbd map image1 --pool rbd --name client.rbd \
   --keyring /etc/ceph/rbd.keyring
```

4. Use the block device by creating a file system:

```
mkfs.ext4 -m5 /dev/rbd/<pool_name>/<image_name>
```

Specify the pool name and the image name, for example:

```
$ sudo mkfs.ext4 -m5 /dev/rbd/rbd/image1
```

This can take a few moments.

5. Mount the newly created file system:

```
mkdir <mount_directory>
mount /dev/rbd/<pool_name>/<image_name> <mount_directory>
```

For example:

```
$ sudo mkdir /mnt/ceph-block-device
$ sudo mount /dev/rbd/rbd/image1 /mnt/ceph-block-device
```

For additional details, see the Red Hat Ceph Storage Block Device Guide.

### 4.4. CEPH OBJECT GATEWAY INSTALLATION

The Ceph object gateway, also known as the RADOS gateway, is an object storage interface built on top of the **librados** API to provide applications with a RESTful gateway to Ceph storage clusters.

For more information about the Ceph object gateway, see the Object Gateway Guide for **Ubuntu**.

There are two ways to install the Ceph object gateway:

- Using the Ansible automation application, see Section 4.4.1, “Installing Ceph Object Gateway by using Ansible” for details
- Using the command-line interface, see Section 4.3.2, "Installing Ceph Object Gateway Manually" for details

#### 4.4.1. Installing Ceph Object Gateway by using Ansible

To deploy the Ceph Object Gateway using Ansible, see the Red Hat Ceph Storage 2 Installation Guide for **Red Hat Enterprise Linux**.

After installation for a multi-site cluster is complete, proceed to the Multi-site chapter in the Object Gateway Guide for Ubuntu for details on configuring a cluster for multi-site.

#### 4.4.2. Installing Ceph Object Gateway Manually

CHAPTER 4. CLIENT INSTALLATION
1. Enable the Red Hat Ceph Storage 2 Tools repository. For ISO-based installations, see the ISO installation section.

2. On the Object Gateway node, install the `radosgw` package:
   ```
   $ sudo apt-get install radosgw
   ```

3. On the initial Monitor node, do the following steps.
   a. Update the Ceph configuration file as follows:
      ```
      [client.rgw.<obj_gw_hostname>]
      host = <obj_gw_hostname>
      rgw frontends = "civetweb port=80"
      rgw dns name = <obj_gw_hostname>.example.com
      ```
      Where `<obj_gw_hostname>` is a short host name of the gateway node. To view the short host name, use the `hostname -s` command.
   b. Copy the updated configuration file to the new Object Gateway node and all other nodes in the Ceph storage cluster:
      ```
      Syntax
      $ sudo scp /etc/ceph/<cluster_name>.conf
      <user_name>@<target_host_name>:/etc/ceph
      Example
      $ sudo scp /etc/ceph/ceph.conf root@node1:/etc/ceph/
      ```
   c. Copy the `<cluster_name>.client.admin.keyring` file to the new Object Gateway node:
      ```
      Syntax
      $ sudo scp /etc/ceph/<cluster_name>.client.admin.keyring
      <user_name>@<target_host_name>:/etc/ceph
      Example
      $ sudo scp /etc/ceph/ceph.client.admin.keyring
      root@node1:/etc/ceph/
      ```

4. On the Object Gateway node, create the data directory:
   ```
   Syntax
   $ sudo mkdir -p /var/lib/ceph/radosgw/<cluster_name>-rgw.`hostname -s`
   Example
   ```
5. On the Object Gateway node, add a user and keyring to bootstrap the object gateway:

**Syntax**

```bash
$ sudo ceph auth get-or-create client.rgw.`hostname -s` osd 'allow rwx' mon 'allow rw' -o /var/lib/ceph/radosgw/<cluster_name>-rgw.`hostname -s`/keyring
```

**Example**

```bash
$ sudo ceph auth get-or-create client.rgw.`hostname -s` osd 'allow rwx' mon 'allow rw' -o /var/lib/ceph/radosgw/ceph-rgw.`hostname -s`/keyring
```

**IMPORTANT**

When you provide capabilities to the gateway key you must provide the read capability. However, providing the Monitor write capability is optional; if you provide it, the Ceph Object Gateway will be able to create pools automatically.

In such a case, ensure to specify a reasonable number of placement groups in a pool. Otherwise, the gateway uses the default number, which might not be suitable for your needs. See [Ceph Placement Groups (PGs) per Pool Calculator](#) for details.

6. On the Object Gateway node, create the done file:

**Syntax**

```bash
$ sudo touch /var/lib/ceph/radosgw/<cluster_name>-rgw.`hostname -s`/done
```

**Example**

```bash
$ sudo touch /var/lib/ceph/radosgw/ceph-rgw.`hostname -s`/done
```

7. On the Object Gateway node, change the owner and group permissions:

```bash
$ sudo chown -R ceph:ceph /var/lib/ceph/radosgw
$ sudo chown -R ceph:ceph /var/log/ceph
$ sudo chown -R ceph:ceph /var/run/ceph
$ sudo chown -R ceph:ceph /etc/ceph
```

8. For storage clusters with custom names, as root, add the following line:

**Syntax**

```bash
$ sudo echo "CLUSTER=<custom_cluster_name>" >> /etc/default/ceph
```
Example

$ sudo echo "CLUSTER=test123" >> /etc/default/ceph

9. On the Object Gateway node, open TCP port 80:

$ sudo iptables -I INPUT 1 -i <network_interface> -p tcp -s <ip_address>/<netmask> --dport 80 -j ACCEPT

10. On the Object Gateway node, start and enable the `ceph-radosgw` process:

Syntax

$ sudo systemctl enable ceph-radosgw.target
$ sudo systemctl enable ceph-radosgw@rgw.<rgw_hostname>
$ sudo systemctl start ceph-radosgw@rgw.<rgw_hostname>

Example

$ sudo systemctl enable ceph-radosgw.target
$ sudo systemctl enable ceph-radosgw@rgw.node1
$ sudo systemctl start ceph-radosgw@rgw.node1

Once installed, the Ceph Object Gateway automatically creates pools if the write capability is set on the Monitor. See the Pools chapter in the Storage Strategies Guide for information on creating pools manually.
CHAPTER 5. UPGRADING CEPH STORAGE CLUSTER

There are two main upgrading paths:

- from Red Hat Ceph Storage 1.3 to 2 (Important)
- between minor versions of Red Hat Ceph Storage 2 or between asynchronous updates (Important)

5.1. UPGRADING FROM RED HAT CEPH STORAGE 1.3 TO 2

IMPORTANT

Please contact Red Hat support prior to upgrading, if you have a large Ceph Object Gateway storage cluster with millions of objects present in buckets.

For more details refer to the Red Hat Ceph Storage 2.5 Release Notes, under the Slow OSD startup after upgrading to Red Hat Ceph Storage 2.5 heading.

You can upgrade the Ceph Storage Cluster in a rolling fashion and while the cluster is running. Upgrade each node in the cluster sequentially, only proceeding to the next node after the previous node is done.

Red Hat recommends upgrading the Ceph components in the following order:

- Monitor nodes
- OSD nodes
- Ceph Object Gateway nodes
- All other Ceph client nodes

Two methods are available to upgrade a Red Hat Ceph Storage 1.3.2 to 2.0:

- Using Red Hat’s Content Delivery Network (CDN)
- Using a Red Hat provided ISO image file

After upgrading the storage cluster you might have a health warning regarding the CRUSH map using legacy tunables. See the Red Hat Ceph Storage Strategies Guide for more information.

Example

```bash
$ ceph -s
cluster 848135d7-cdb9-4084-8df2-fb5e41ae60bd
  health HEALTH_WARN
    crush map has legacy tunables (require bobtail, min is firefly)
  monmap e1: 1 mons at {ceph1=192.168.0.121:6789/0}
    election epoch 2, quorum 0 ceph1
  osdmap e83: 2 osds: 2 up, 2 in
    pgmap v1864: 64 pgs, 1 pools, 38192 kB data, 17 objects
      10376 MB used, 10083 MB / 20460 MB avail
        64 active+clean
```
IMPORTANT

Red Hat recommends all Ceph clients to be running the same version as the Ceph storage cluster.

5.1.1. Upgrading a Ceph Monitor Node

Red Hat recommends a minimum of three Monitors for a production storage cluster. There must be an odd number of Monitors. While you are upgrading one Monitor, the storage cluster will still have quorum.

Upgrading Red Hat Ceph Storage from version 1.3.2 to version 2 running on Ubuntu 14.04 Trusty to Ubuntu 16.04 Xenial has two main tasks. The Red Hat Ceph Storage packages will be upgraded first, then the Ubuntu operating system will be upgraded next. These two main tasks will need to be done on each Monitor node in the storage cluster. Perform the following steps on each Monitor node in the storage cluster, sequentially upgrading one Monitor node at a time.

IMPORTANT

Red Hat does not support running Red Hat Ceph Storage 2 clusters on Ubuntu 14.04 Trusty in a production environment. This is only a transitional step to get to Red Hat Ceph Storage 2 on Ubuntu 16.04 Xenial, which is the supported platform. Red Hat recommends having a full system backup before proceeding with these upgrade procedures.

1. As root, disable any Red Hat Ceph Storage 1.3.x repositories:
   If the following lines exist in the /etc/apt/sources.list or in the /etc/apt/sources.list.d/ceph.list files, then comment out the online repositories for Red Hat Ceph Storage 1.3 by adding a # to the beginning of the line.

   ```
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Installer
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Calamari
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Tools
   ```

   Also, check for the following files in /etc/apt/sources.list.d/:

   ```
   Calamari.list
   ceph-mon.list
   ceph-osd.list
   Installer.list
   Tools.list
   ```

   NOTE

   Remove any reference to Red Hat Ceph Storage 1.3.x in the APT source file(s). If an ISO-based installation was performed for Red Hat Ceph Storage 1.3.x, then skip this first step.
2. Enable the Red Hat Ceph Storage 2 Monitor repository. For ISO-based installations, see the ISO installation section.

3. As root, stop the Monitor process:

   Syntax
   
   `$ sudo stop ceph-mon id=<monitor_host_name>`

   Example
   
   `$ sudo stop ceph-mon id=node1`

4. As root, update the ceph-mon package:

   ```
   $ sudo apt-get update
   $ sudo apt-get dist-upgrade
   $ sudo apt-get install ceph-mon
   ```

   a. Verify the latest Red Hat version is installed:

   ```
   $ dpkg -s ceph-base | grep Version
   Version: 10.2.2-19redhat1trusty
   ```

5. As root, update the owner and group permissions:

   Syntax
   
   `# chown -R <owner>:<group> <path_to_directory>`

   Example
   
   ```
   # chown -R ceph:ceph /var/lib/ceph/mon
   # chown -R ceph:ceph /var/log/ceph
   # chown -R ceph:ceph /var/run/ceph
   # chown ceph:ceph /etc/ceph/ceph.client.admin.keyring
   # chown ceph:ceph /etc/ceph/ceph.conf
   # chown ceph:ceph /etc/ceph/rbdmap
   ```

   **NOTE**

   If the Ceph Monitor node is co-located with an OpenStack Controller node, then the Glance and Cinder keyring files must be owned by **glance** and **cinder** respectively. For example:

   ```
   # ls -l /etc/ceph/
   ...
   -rw-------.  1 glance glance 64 <date>
   ceph.client.glance.keyring
   -rw-------.  1 cinder cinder 64 <date>
   ceph.client.cinder.keyring
   ```
6. Remove packages that are no longer needed:

   $ sudo apt-get purge ceph ceph-osd

   **NOTE**

   The `ceph` package is now a meta-package. Only the `ceph-mon` package is needed on the Monitor nodes, only the `ceph-osd` package is needed on the OSD nodes, and only the `ceph-radosgw` package is needed on the RADOS Gateway nodes.

7. As **root**, replay device events from the kernel:

   # udevadm trigger

   a. Configure **update-manager** for the Red Hat Ceph Storage packages:

      i. Create a new file

         $ sudo touch /etc/update-manager/release-upgrades.d/rhcs.cfg

      ii. Add the following lines to the new file

         [Sources]
         AllowThirdParty=yes

   b. Start the Ubuntu upgrade:

      $ sudo do-release-upgrade -d

   c. Follow the on screen instructions

   d. Verify the Ceph package versions:

      $ dpkg -s ceph-base | grep Version
      Version: 10.2.2-19redhat1xenial

   e. As **root**, enable the `ceph-mon` process:

      $ sudo systemctl enable ceph-mon.target
      $ sudo systemctl enable ceph-mon@<monitor_host_name>

   f. As **root**, reboot the Monitor node:

      # shutdown -r now

   g. Once the Monitor node is up, check the health of the Ceph storage cluster before moving to the next Monitor node:

      # ceph -s
To add more Red Hat Ceph Storage Monitors to the storage cluster, see the Red Hat Ceph Storage Administration Guide

5.1.2. Upgrading a Ceph OSD Node

Upgrading Red Hat Ceph Storage from version 1.3.2 to version 2 running on Ubuntu 14.04 Trusty to Ubuntu 16.04 Xenial has two main tasks. The Red Hat Ceph Storage packages will be upgraded first, then the Ubuntu operating system will be upgraded next. These two main tasks will need to be done on each OSD node in the storage cluster. Perform the following steps on each OSD node in the storage cluster, sequentially upgrading one OSD node at a time.

**IMPORTANT**

Red Hat does not support running Red Hat Ceph Storage 2 clusters on Ubuntu 14.04 Trusty in a production environment. This is only a transitional step to get to Red Hat Ceph Storage 2 on Ubuntu 16.04 Xenial, which is the supported platform. Red Hat recommends having a full system backup before proceeding with these upgrade procedures.

During the upgrade of an OSD node, some placement groups will become degraded, because the OSD might be down or restarting. You will need to tell the storage cluster not to mark an OSD out, because you do not want to trigger a recovery. The default behavior is to mark an OSD out of the CRUSH map after five minutes.

On a Monitor node, set `noout` and `norebalance` flags for the OSDs:

```bash
# ceph osd set noout
# ceph osd set norebalance
```

Perform the following steps on each OSD node in the storage cluster. Sequentially upgrading one OSD node at a time. If an ISO-based installation was performed for Red Hat Ceph Storage 1.3, then skip this first step.

1. As `root`, disable the Red Hat Ceph Storage 1.3 repositories:
   If the following lines exist in the `/etc/apt/sources.list` or in the `/etc/apt/sources.list.d/ceph.list` files, then comment out the online repositories for Red Hat Ceph Storage 1.3 by adding a `#` to the beginning of the line.

   ```bash
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Installer
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Calamari
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Tools
   ```

   Also, check for the following files in `/etc/apt/sources.list.d/`:

   ```bash
   Calamari.list
ceph-mon.list
ceph-osd.list
   ```
2. Enable the Red Hat Ceph Storage 2 **OSD repository**. For ISO-based installations, see the ISO installation section.

3. As **root**, stop any running OSD process:

   **Syntax**
   
   ```
   $ sudo stop ceph-osd id=<osd_id>
   ```

   **Example**
   
   ```
   $ sudo stop ceph-osd id=0
   ```

4. As **root**, update the **ceph-osd** package:

   ```
   $ sudo apt-get update
   $ sudo apt-get dist-upgrade
   $ sudo apt-get install ceph-osd
   ```

   a. Verify the latest Red Hat version is installed:

   ```
   $ dpkg -s ceph-base | grep Version
   Version: 10.2.2-19redhat1trusty
   ```

5. As **root**, update the owner and group permissions on the newly created directory and files:

   **Syntax**
   
   ```
   # chown -R <owner>:<group> <path_to_directory>
   ```

   **Example**
   
   ```
   # chown -R ceph:ceph /var/lib/ceph/osd
   # chown -R ceph:ceph /var/log/ceph
   # chown -R ceph:ceph /var/run/ceph
   # chown -R ceph:ceph /etc/ceph
   ```
Running the following `find` command might speed up the process of changing ownership by running the `chown` command in parallel on a Ceph storage cluster with a large number of disks:

```
# find /var/lib/ceph/osd -maxdepth 1 -mindepth 1 -print | 
xargs -P12 -n1 chown -R ceph:ceph
```

6. Remove packages that are no longer needed:

```
$ sudo apt-get purge ceph ceph-mon
```

NOTE

The `ceph` package is now a meta-package. Only the `ceph-mon` package is needed on the Monitor nodes, only the `ceph-osd` package is needed on the OSD nodes, and only the `ceph-radosgw` package is needed on the RADOS Gateway nodes.

7. As `root`, replay device events from the kernel:

```
# udevadm trigger
```

   a. Configure `update-manager` for the Red Hat Ceph Storage packages:

      i. Create a new file

      ```
      $ sudo touch /etc/update-manager/release-upgrades.d/rhcs.cfg
      ```

      ii. Add the following lines to the new file

      ```
      [Sources]
      AllowThirdParty=yes
      ```

   b. Start the Ubuntu upgrade:

      ```
      $ sudo do-release-upgrade -d
      ```

   c. Follow the on screen instructions

   d. Verify the Ceph package versions:

      ```
      $ dpkg -s ceph-base | grep Version
      Version: 10.2.2-19redhat1xenial
      ```

   e. As `root`, enable the `ceph-osd` process:

      ```
      $ sudo systemctl enable ceph-osd.target
      $ sudo systemctl enable ceph-osd@<osd_id>
      ```
f. As root, reboot the OSD node:

   # shutdown -r now

9. Move to the next OSD node.

   NOTE

   While the noout and norebalance flags are set, the storage cluster will have the HEALTH_WARN status:

   $ ceph health
   HEALTH_WARN noout, norebalance flag(s) set

Once you are done upgrading the Ceph storage cluster, unset the previously set OSD flags and verify the storage cluster status.

On a Monitor node, and after all OSD nodes have been upgraded, unset the noout and norebalance flags:

   # ceph osd unset noout
   # ceph osd unset norebalance

In addition, set the require_jewel_osds flag. This flag ensures that no more OSDs with Red Hat Ceph Storage 1.3 can be added to the storage cluster. If you do not set this flag, the storage status will be HEALTH_WARN.

   # ceph osd set require_jewel_osds

To expand the storage capacity by adding new OSDs to the storage cluster, see the Red Hat Ceph Storage Administration Guide for more details.

5.1.3. Upgrading the Ceph Object Gateway Nodes

This section describes steps to upgrade a Ceph Object Gateway node to a later version.

   IMPORTANT

   Red Hat does not support running Red Hat Ceph Storage 2 clusters on Ubuntu 14.04 in a production environment. Therefore, upgrading Red Hat Ceph Storage from 1.3 to 2 includes:

   - Upgrading the Red Hat Ceph Storage packages from 1.3 to 2
   - Upgrading the Ubuntu operation system from 14.04 to 16.04

   Perform these steps on each Ceph Object Gateway node in use, sequentially upgrading one node at time.

   Red Hat recommends to back up the system before proceeding with these upgrade procedures.
Before You Start

- Red Hat recommends putting a Ceph Object Gateway behind a load balancer, such as HAProxy. If you use a load balancer, remove the Ceph Object Gateway from the load balancer once no requests are being served.

- If you use a custom name for the region pool, specified in the `rgw_region_root_pool` parameter, add the `rgw_zonegroup_root_pool` parameter to the `[global]` section of the Ceph configuration file. Set the value of `rgw_zonegroup_root_pool` to be the same as `rgw_region_root_pool`, for example:

```bash
[global]
rgw_zonegroup_root_pool = .us.rgw.root
```

Procedure: Upgrading the Ceph Object Gateway Node

1. If you used online repositories to install Red Hat Ceph Storage, disable the 1.3 repositories.
   
   a. Comment out the following lines in the `/etc/apt/sources.list` and `/etc/apt/sources.list.d/ceph.list` files.

   ```bash
   # deb https://<customer_name>:
   <customer_password>@rhcs.download.redhat.com/ubuntu/1.3-
   updates/Installer
   # deb https://<customer_name>:
   <customer_password>@rhcs.download.redhat.com/ubuntu/1.3-
   updates/Calamari
   # deb https://<customer_name>:
   <customer_password>@rhcs.download.redhat.com/ubuntu/1.3-
   updates/Tools
   ```

   b. Remove the following files from the `/etc/apt/sources.list.d/` directory.

   ```bash
   # rm /etc/apt/sources.list.d/Calamari.list
   # rm /etc/apt/sources.list.d/ceph-mon.list
   # rm /etc/apt/sources.list.d/ceph-osd.list
   # rm /etc/apt/sources.list.d/Installer.list
   # rm /etc/apt/sources.list.d/Tools.list
   ```

2. Enable the Red Hat Ceph Storage 2 Tools repository. For ISO-based installations, see the ISO Installation section.

3. Stop the Ceph Object Gateway process (`ceph-radosgw`):

   ```bash
   $ sudo stop radosgw id=rgw.<hostname>
   ```

   Replace `<hostname>` with the name of Ceph Object Gateway host, for example `gateway-node`.

   ```bash
   $ sudo stop radosgw id=rgw.node
   ```

4. Update the `ceph-radosgw` package:
$ sudo apt-get update
$ sudo apt-get dist-upgrade
$ sudo apt-get install radosgw

5. Change the owner and group permissions on the newly created /var/lib/ceph/radosgw/ and /var/log/ceph/ directories and their content to ceph.

```
# chown -R ceph:ceph /var/lib/ceph/radosgw
# chown -R ceph:ceph /var/log/ceph
```

6. Remove packages that are no longer needed.

```
$ sudo apt-get purge ceph
```

**NOTE**

The ceph package is now a meta-package. Only the ceph-mon, ceph-osd, and ceph-radosgw packages are required on the Monitor, OSD, and Ceph Object Gateway nodes respectively.

7. Upgrade from Ubuntu 14.04 to 16.04.

   a. Configure the **update-manager** utility for the Red Hat Ceph Storage packages:
      
      i. Create a new rhcs.cfg file in the /etc/update-manager/release-upgrades.d/ directory.

      ```
      $ sudo touch /etc/update-manager/release-upgrades.d/rhcs.cfg
      ```

      ii. Add the following lines to the file.

      ```
      [Sources]
      AllowThirdParty=yes
      ```

   b. Start the upgrading process and follow the instructions on the screen.

   ```
   $ sudo do-release-upgrade -d
   ```

   c. Verify the Ceph package versions:

   ```
   $ dpkg -s ceph-base | grep Version
   Version: 10.2.2-19redhat1xenial
   ```

7. Upgrade from Ubuntu 14.04 to 16.04.

   a. Configure the **update-manager** utility for the Red Hat Ceph Storage packages:
      
      i. Create a new rhcs.cfg file in the /etc/update-manager/release-upgrades.d/ directory.

      ```
      $ sudo touch /etc/update-manager/release-upgrades.d/rhcs.cfg
      ```

      ii. Add the following lines to the file.

      ```
      [Sources]
      AllowThirdParty=yes
      ```

   b. Start the upgrading process and follow the instructions on the screen.

   ```
   $ sudo do-release-upgrade -d
   ```

   c. Verify the Ceph package versions:

   ```
   $ dpkg -s ceph-base | grep Version
   Version: 10.2.2-19redhat1xenial
   ```

8. Enable the **ceph-radosgw** process:

```
$ sudo systemctl enable ceph-radosgw.target
$ sudo systemctl enable ceph-radosgw@rgw.<hostname>
```

Replace `<hostname>` with the name of the Ceph Object Gateway host, for example **gateway-node**.
$ sudo systemctl enable ceph-radosgw.target
$ sudo systemctl enable ceph-radosgw@rgw.gateway-node

9. Reboot the Ceph Object Gateway node:

   # shutdown -r now

10. If you use a load balancer, add the Ceph Object Gateway node back to the load balancer.

11. Repeat these steps on a next Ceph Object Gateway node.

See Also

- The Ceph Object Gateway Guide for Ubuntu

5.1.4. Upgrading a Ceph Client Node

Ceph clients can be the RADOS Gateway, RADOS block devices, the Ceph command-line interface (CLI), Nova compute nodes, qemu-kvm, or any custom application using the Ceph client-side libraries. Red Hat recommends all Ceph clients to be running the same version as the Ceph storage cluster.

**IMPORTANT**

Red Hat recommends stopping all IO running against a Ceph client node while the packages are being upgraded. Not stopping all IO might cause unexpected errors to occur.

1. As **root**, disable any Red Hat Ceph Storage 1.3 repositories:
   - If the following lines exist in the `/etc/apt/sources.list` or in the `/etc/apt/sources.list.d/ceph.list` files, then comment out the online repositories for Red Hat Ceph Storage 1.3 by adding a `#` to the beginning of the line.

   ```
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Installer
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Calamari
   deb https://<customer_name>:@rhcs.download.redhat.com/ubuntu/1.3-updates/Tools
   ```

   Also, check for the following files in `/etc/apt/sources.list.d/`:

   ```
   Calamari.list
   ceph-mon.list
   ceph-osd.list
   Installer.list
   Tools.list
   ```
NOTE

Remove any reference to Red Hat Ceph Storage 1.3.x in the APT source file(s).

2. On the client node, enable the Tools repository.

3. On the client node, update the ceph-common package:

   $ sudo apt-get install ceph-common

Any application depending on the Ceph client-side libraries will have to be restarted after upgrading the Ceph client package.

NOTE

For Nova compute nodes with running qemu-kvm instances or if using a dedicated qemu-kvm client, then stopping and starting the qemu-kvm instance processes is required. A simple restart will not work here.

5.2. UPGRADING BETWEEN MINOR VERSIONS AND APPLYING ASYNCHRONOUS UPDATES

IMPORTANT

Please contact Red Hat support prior to upgrading, if you have a large Ceph Object Gateway storage cluster with millions of objects present in buckets.

For more details refer to the Red Hat Ceph Storage 2.5 Release Notes, under the Slow OSD startup after upgrading to Red Hat Ceph Storage 2.5 heading.

In Red Hat Ceph Storage version 2.5 and later, ceph-ansible is available on Ubuntu nodes and can be used to upgrade your cluster.

Use the Ansible rolling_update.yml playbook located in the infrastructure-playbooks directory from the administration node to upgrade between two minor versions of Red Hat Ceph Storage 2 or to apply asynchronous updates.

Currently, this is the only supported way to upgrade to a minor version. If you use a cluster that was not deployed by using Ansible, see Taking Over an Existing Cluster for details on configuring Ansible to use a cluster that was deployed without it.

NOTE

The administration node must use Red Hat Enterprise Linux because the ceph-ansible package is not supported on Ubuntu. See the Installing Red Hat Ceph Storage using Ansible chapter in the Red Hat Ceph Storage 2 Installation Guide for Red Hat Enterprise Linux.

Ansible upgrades the Ceph nodes in the following order:

- Monitor nodes
- OSD nodes
- MDS nodes
- Ceph Object Gateway nodes
- All other Ceph client nodes

**NOTE**
Upgrading encrypted OSD nodes is the same as upgrading OSD nodes that are not encrypted.

**Before you Start**

- On the Ansible Administration node, enable the Red Hat Ceph Storage 2 Tools repository:
  ```bash
  $ sudo bash -c 'umask 0077; echo deb https://customername:customerpasswd@rhcs.download.redhat.com/2-updates/Tools $(lsb_release -sc) main | tee /etc/apt/sources.list.d/Tools.list'
  $ sudo bash -c 'wget -O - https://www.redhat.com/security/fd431d51.txt | apt-key add -'
  $ sudo apt-get update
  ```

- On the Ansible Administration node, ensure the latest version of `ceph-ansible` is installed:
  ```bash
  $ sudo apt-get install ceph-ansible
  ```

- In the `rolling_update.yml` playbook, change the `health_osd_check_retries` and `health_osd_check_delay` values to 40 and 30 respectively. For each OSD node, Ansible will wait up to 20 minutes. Also, Ansible will check the cluster health every 30 seconds, waiting before continuing the upgrade process. Set the following values:

  ```yaml
  health_osd_check_retries: 40
  health_osd_check_delay: 30
  ```

- If the Ceph nodes are not connected to the Red Hat Content Delivery Network (CDN) and you used an ISO image to install Red Hat Ceph Storage, update the local repository with the latest version of Red Hat Ceph Storage. See Section 2.2, “Enabling the Red Hat Ceph Storage Repositories” for details.

- If the ansible node you are using has been changed from RHEL to Ubuntu, copy all the old variables in the `group_vars/all.yml` file to new Ansible node.

- If you upgrade from Red Hat Ceph Storage 2.1 to 2.2, review the Section 5.2.1, “Changes Between Ansible 2.1 and 2.2” section first. Ansible 2.2 uses slightly different file names and setting.

**Procedure: Updating the Ceph Storage Cluster by using Ansible**

1. On the Ansible administration node, edit the `/etc/ansible/hosts` file with custom `osd_scenarios` if your cluster has any.
2. On the Ansible administration node, navigate to the `/usr/share/ceph-ansible/` directory:

   ```bash
   # cd /usr/share/ceph-ansible
   ```

3. In the `group_vars/all.yml` file, uncomment the `upgrade_ceph_packages` option and set it to `True`:

   ```yaml
   upgrade_ceph_packages: True
   ```

4. In the `group_vars/all.yml` file, set `generate_fsid` to `false`.

5. Get the current cluster `fsid` by executing `ceph fsid`. Set the retrieved `fsid` in `group_vars/all.yml`.

6. If the cluster you want to upgrade contains any Ceph Object Gateway nodes, add the `radosgw_interface` parameter to the `group_vars/all.yml` file.

   ```yaml
   radosgw_interface: <interface>
   ```

   Replace:
   
   - `<interface>` with the interface that the Ceph Object Gateway nodes listen to

7. For RCHS 2.5 and later versions, uncomment and set `ceph_rhcs_cdn_debian_repo` and `ceph_rhcs_cdn_debian_repo_version` in the `group_vars/all.yml` file so that Ansible can automatically enable and access Ubuntu online repositories:

   ```yaml
   ceph_rhcs_cdn_debian_repo: <repo-path>
   ceph_rhcs_cdn_debian_repo_version: <repo-version>
   ```

   **Example**

   ```yaml
   ceph_rhcs_cdn_debian_repo: https://<login>:<pwd>@rhcs.download.redhat.com
   ceph_rhcs_cdn_debian_repo_version: /2-release/
   ```

   Where `<login>` is the RHN user login and `<pwd>` is the RHN user’s password.

8. Run the `rolling_update.yml` playbook:

   ```bash
   # cp infrastructure-playbooks/rolling_update.yml .
   $ ansible-playbook rolling_update.yml
   ```

   When upgrading from version 2.4 to 2.5, run the playbook using the following command:

   ```bash
   $ ansible-playbook rolling_update.yml -e jewel_minor_update=true
   ```

9. From the RBD mirroring daemon node, upgrade `rbd-mirror` manually:

   ```bash
   $ sudo apt-get install rbd-mirror
   ```

   Restart the daemon:
# systemctl restart ceph-rbd-mirror@<client-id>

**IMPORTANT**

The `rolling_update.yml` playbook includes the `serial` variable that adjusts the number of nodes to be updated simultaneously. Red Hat strongly recommends to use the default value (1), which ensures that hosts will be upgraded one by one.

### 5.2.1. Changes Between Ansible 2.1 and 2.2

Red Hat Ceph Storage 2.2 includes Ansible 2.2 that introduces the following changes:

- Files in the `group_vars` directory have the `.yml` extension. Before updating to 2.2, you must rename them. To do so:
  - Navigate to the Ansible directory:
  ```bash
  # cd usr/share/ceph-ansible
  ```
  - Change the names of the files in `group_vars`:
  ```bash
  # mv groups_vars/all groups_vars/all.yml
  # mv groups_vars/mons groups_vars/mons.yml
  # mv groups_vars/osds groups_vars/osds.yml
  # mv groups_vars/mdss groups_vars/mdss.yml
  # mv groups_vars/rgws groups_vars/rgws.yml
  ```

- Ansible 2.2 uses different variable names and handles this change automatically when updating to version 2.2. See Table 5.1, “Differences in Variable Names Between Ansible 2.1 and 2.2” table for details.

**Table 5.1. Differences in Variable Names Between Ansible 2.1 and 2.2**

<table>
<thead>
<tr>
<th>Ansible 2.1 variable name</th>
<th>Ansible 2.2 variable name</th>
</tr>

CHAPTER 6. WHAT TO DO NEXT?

This is only the beginning of what Red Hat Ceph Storage can do to help you meet the challenging storage demands of the modern data center. Here are links to more information on a variety of topics:

- Benchmarking performance and accessing performance counters, see the Red Hat Ceph Storage Administration Guide.

- Creating and managing snapshots, see the Red Hat Ceph Storage Block Device Guide.

- Expanding the Red Hat Ceph Storage cluster, see the Red Hat Ceph Storage Administration Guide.

- Mirroring RADOS Block Devices, see the Red Hat Ceph Storage Block Device Guide.

- Process management, enabling debug logging, and related topics, see the Red Hat Ceph Storage Administration Guide.

- Tunable parameters, see the Red Hat Ceph Storage Configuration Guide.

- Using Ceph as the back end storage for OpenStack, see the Red Hat OpenStack Platform Storage Guide.
A.1. ANSIBLE STOPS INSTALLATION BECAUSE IT DETECTS LESS DEVICES THAN IT EXPECTED

The Ansible automation application stops the installation process and returns the following error:

```
- name: fix partitions gpt header or labels of the osd disks (autodiscover disks)
  shell: "sgdisk --zap-all --clear --mbrtogpt -- '/dev/{{ item.0.item.key }}' || sgdisk --zap-all --clear --mbrtogpt -- '/dev/{{ item.0.item.key }}'"
  with_together:
  - {{ osd_partition_status_results.results }}
  - {{ ansible_devices }}
  changed_when: false
  when:
  - ansible_devices is defined
  - item.0.item.value.removable == "0"
  - item.0.item.value.partitions|count == 0
  - item.0.rc != 0
```

What this means:

When the `osd_auto_discovery` parameter is set to `true` in the `/etc/ansible/group_vars/osds.yml` file, Ansible automatically detects and configures all the available devices. During this process, Ansible expects that all OSDs use the same devices. The devices get their names in the same order in which Ansible detects them. If one of the devices fails on one of the OSDs, Ansible fails to detect the failed device and stops the whole installation process.

Example situation:

1. Three OSD nodes (`host1`, `host2`, `host3`) use the `/dev/sdb`, `/dev/sdc`, and `/dev/sdd` disks.
2. On `host2`, the `/dev/sdc` disk fails and is removed.
3. Upon the next reboot, Ansible fails to detect the removed `/dev/sdc` disk and expects that only two disks will be used for `host2`, `/dev/sdb` and `/dev/sdc` (formerly `/dev/sdd`).
4. Ansible stops the installation process and returns the above error message.

To fix the problem:

In the `/etc/ansible/hosts` file, specify the devices used by the OSD node with the failed disk (`host2` in the Example situation above):

```
[osds]
host1
host2 devices="[ '/dev/sdb', '/dev/sdc' ]"
host3
```

See [Installing Ceph Ansible](#) for details.
