    3.1.1. Creating a project in OpenShift Web Console ......................................................... 16
    3.1.2. Installing the Red Hat CodeReady Workspaces Operator ......................................................... 16
    3.1.3. Creating an instance of the Red Hat CodeReady Workspaces Operator ......................................................... 17
  3.2. INSTALLING CODEREADY WORKSPACES ON OPENSFIFT CONTAINER PLATFORM 3.11 ......................................................... 18
    3.2.1. Installing the crwcI CLI management tool ......................................................... 18
    3.2.2. Installing CodeReady Workspaces on OpenShift 3 using the Operator ......................................................... 19
  3.3. INSTALLING CODEREADY WORKSPACES IN A RESTRICTED ENVIRONMENT ......................................................... 21
    3.3.1. Installing CodeReady Workspaces in a restricted environment using OperatorHub ......................................................... 21
    3.3.2. Installing CodeReady Workspaces in a restricted environment using CLI management tool ......................................................... 22
      3.3.2.1. Preparing an private registry ......................................................... 22
      3.3.2.2. Preparing CodeReady Workspaces Custom Resource for restricted environment ......................................................... 29
      3.3.2.2.1. Downloading the default CheCluster Custom Resource ......................................................... 29
      3.3.2.2.2. Customizing the CheCluster Custom Resource for restricted environment ......................................................... 29
      3.3.2.3. Starting CodeReady Workspaces installation in a restricted environment using CodeReady Workspaces CLI management tool ......................................................... 30
      3.3.3. Preparing CodeReady Workspaces Custom Resource for installing behind a proxy ......................................................... 30

CHAPTER 4. CONFIGURING CODEREADY WORKSPACES ......................................................... 32
  4.1. ADVANCED CONFIGURATION OPTIONS FOR THE CODEREADY WORKSPACES SERVER COMPONENT ......................................................... 32
    4.1.1. Understanding CodeReady Workspaces server advanced configuration using the Operator ......................................................... 32
    4.1.2. CodeReady Workspaces server component system properties reference ......................................................... 33
  4.2. CONFIGURING PROJECT STRATEGIES ......................................................... 68
    4.2.1. One project per workspace strategy ......................................................... 69
    4.2.2. One project for all workspaces strategy ......................................................... 69
    4.2.3. One project per user strategy ......................................................... 69
    4.2.4. Allowing user-defined workspace projects ......................................................... 70
    4.2.5. Handling incompatible usernames or user IDs ......................................................... 70
    4.2.6. Pre-creating projects for users ......................................................... 70
  4.3. RUNNING MORE THAN ONE WORKSPACE AT A TIME ......................................................... 71
  4.4. CONFIGURING WORKSPACE EXPOSURE STRATEGIES ......................................................... 72
    4.4.1. Workspace exposure strategies ......................................................... 72
      4.4.1.1. Multi-host strategy ......................................................... 72
      4.4.1.2. Single-host strategy ......................................................... 73
        4.4.1.2.1. devfile endpoints: single-host ......................................................... 73
        4.4.1.2.2. devfile endpoints: multi-host ......................................................... 73
    4.4.2. Security considerations ......................................................... 74
      4.4.2.1. JSON web token (JWT) proxy ......................................................... 74
      4.4.2.2. Secured plug-ins and editors ......................................................... 74
      4.4.2.3. Secured container-image components ......................................................... 74
      4.4.2.4. Cross-site request forgery attacks ......................................................... 75
      4.4.2.5. Phishing attacks ......................................................... 75
4.5. CONFIGURING WORKSPACES NODESELECTOR
4.6. CONFIGURING RED HAT CODEREADY WORKSPACES SERVER HOSTNAME
4.7. CONFIGURING LABELS FOR OPENSIFT INGRESS
4.8. CONFIGURING LABELS FOR OPENSIFT ROUTE
4.9. DEPLOYING CODEREADY WORKSPACES WITH SUPPORT FOR GIT REPOSITORIES WITH SELF-SIGNED CERTIFICATES
4.10. INSTALLING CODEREADY WORKSPACES USING STORAGE CLASSES
4.11. CONFIGURING STORAGE TYPES
   4.11.1. Persistent storage
   4.11.2. Ephemeral storage
   4.11.3. Asynchronous storage
   4.11.4. Configuring storage type defaults for CodeReady Workspaces dashboard
   4.11.5. Idling asynchronous storage Pods
4.12. IMPORTING UNTRUSTED TLS CERTIFICATES TO CODEREADY WORKSPACES
   4.12.1. At CodeReady Workspaces installation time
   4.12.2. On already-running CodeReady Workspaces installations
   4.12.3. Verification at the CodeReady Workspaces installation level
   4.12.4. Verification at the workspace level
4.13. SWITCHING BETWEEN EXTERNAL AND INTERNAL WAYS IN INTER-COMPONENT COMMUNICATION

CHAPTER 5. UPGRADING CODEREADY WORKSPACES
5.1. UPGRADING CODEREADY WORKSPACES USING OPERATORHUB
5.2. UPGRADING CODEREADY WORKSPACES USING THE CLI MANAGEMENT TOOL
5.3. UPGRADING CODEREADY WORKSPACES USING THE CLI MANAGEMENT TOOL IN RESTRICTED ENVIRONMENT
   5.3.1. Understanding network connectivity in restricted environments
   5.3.2. Preparing a private registry
   5.3.3. Upgrading CodeReady Workspaces using the CLI management tool in restricted environment

CHAPTER 6. UNINSTALLING CODEREADY WORKSPACES
6.1. UNINSTALLING CODEREADY WORKSPACES AFTER OPERATORHUB INSTALLATION USING THE OPENSIFT WEB CONSOLE
6.2. UNINSTALLING CODEREADY WORKSPACES AFTER OPERATORHUB INSTALLATION USING OPENSIFT CLI
6.3. UNINSTALLING CODEREADY WORKSPACES AFTER CRWCTL INSTALLATION
MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.
CHAPTER 1. SUPPORTED PLATFORMS

This section describes the availability and the supported installation methods of CodeReady Workspaces 2.5 on OpenShift Container Platform.

The minimal OpenShift Container Platform version supporting Red Hat CodeReady Workspaces is OpenShift Container Platform 3.11.

Table 1.1. Supported deployment environments for CodeReady Workspaces 2.5 on OpenShift Container Platform

<table>
<thead>
<tr>
<th>Platform</th>
<th>Architecture</th>
<th>Deployment method</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenShift Container Platform 3.11</td>
<td>AMD64 and Intel 64 (x86_64)</td>
<td>crwctl</td>
</tr>
<tr>
<td>OpenShift Container Platform 4.5</td>
<td>AMD64 and Intel 64 (x86_64)</td>
<td>OperatorHub</td>
</tr>
<tr>
<td>OpenShift Container Platform 4.5</td>
<td>IBM Z (s390x)</td>
<td>OperatorHub</td>
</tr>
<tr>
<td>OpenShift Container Platform 4.5</td>
<td>IBM Power Systems (ppc64le)</td>
<td>OperatorHub</td>
</tr>
<tr>
<td>OpenShift Container Platform 4.6</td>
<td>AMD64 and Intel 64 (x86_64)</td>
<td>OperatorHub</td>
</tr>
<tr>
<td>OpenShift Container Platform 4.6</td>
<td>IBM Power Systems (ppc64le)</td>
<td>OperatorHub</td>
</tr>
</tbody>
</table>

NOTE

- On OpenShift Container Platform 4.5 and 4.6, when the OperatorHub installation method is not available, consider using crwctl as an unofficial backup installation method.

NOTE

Support for deploying CodeReady Workspaces on OpenShift Container Platform on IBM Power Systems (ppc64le) and IBM Z (s390x) is currently only available as a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process. For details about the level of support for Technology Preview features, see Technology Preview Features Support Scope.
CHAPTER 2. CONFIGURING THE CODEREADY WORKSPACES INSTALLATION

The following section describes configuration options to install Red Hat CodeReady Workspaces using the Operator.

2.1. UNDERSTANDING THE CHECLUSTER CUSTOM RESOURCE

A default deployment of CodeReady Workspaces consist in the application of a parametrized CheCluster Custom Resource by the Red Hat CodeReady Workspaces Operator.

CheCluster Custom Resource

- A YAML document describing the configuration of the overall CodeReady Workspaces installation.
- Contains sections to configure each component: auth, database, server, storage.

Role of the Red Hat CodeReady Workspaces Operator

- To translate the CheCluster Custom Resource into configuration (ConfigMap) usable by each component of the CodeReady Workspaces installation.

Role of the OpenShift platform

- To apply the configuration (ConfigMap) for each component.
- To create the necessary Pods.
- When OpenShift detects a change in the configuration of a component, it restarts the Pods accordingly.

Example 2.1. Configuring the main properties of the CodeReady Workspaces server component

1. The user applies a CheCluster Custom Resource containing some configuration related to the server.
2. The Operator generates a necessary ConfigMap, called che.
3. OpenShift detects change in the ConfigMap and triggers a restart of the CodeReady Workspaces Pod.

Additional resources

- Understanding Operators.
- Understanding Custom Resources.
- To learn how to modify the CheCluster Custom Resource, see the chosen installation procedure.

2.2. CHECLUSTER CUSTOM RESOURCE FIELDS REFERENCE
This section describes all fields available to customize the **CheCluster** Custom Resource.

- **Example 2.2**, "A minimal **CheCluster** Custom Resource example."

- **Table 2.3**, "**CheCluster** Custom Resource **auth** configuration settings related to authentication used by CodeReady Workspaces installation"

- **Table 2.2**, "**CheCluster** Custom Resource **database** configuration settings related to the database used by CodeReady Workspaces"

- **Table 2.1**, "**CheCluster** Custom Resource **server** settings, related to the CodeReady Workspaces server component."

- **Table 2.4**, "**CheCluster** Custom Resource **storage** configuration settings related to persistent storage used by CodeReady Workspaces"

- **Table 2.5**, "**CheCluster** Custom Resource **k8s** configuration settings specific to CodeReady Workspaces installations on OpenShift"

- **Table 2.6**, "**CheCluster** Custom Resource **status** defines the observed state of CodeReady Workspaces installation"

### Example 2.2. A minimal **CheCluster** Custom Resource example.

```yaml
apiVersion: org.eclipse.che/v1
kind: CheCluster
metadata:
  name: codeready-workspaces
spec:
  auth:
    externalIdentityProvider: false
  database:
    externalDb: false
  server:
    selfSignedCert: false
    gitSelfSignedCert: false
    tlsSupport: true
  storage:
    pvcStrategy: 'common'
    pvcClaimSize: '1Gi'
```

### Table 2.1. **CheCluster** Custom Resource **server** settings, related to the CodeReady Workspaces server component.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>airGapContainerRegistryHostName</td>
<td>omit</td>
<td>An optional host name or URL to an alternative container registry to pull images from. This value overrides the container registry host name defined in all default container images involved in a CodeReady Workspaces deployment. This is particularly useful to install CodeReady Workspaces in an airgapped environment.</td>
</tr>
<tr>
<td>Property</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>airGapContainerRegistryOrganization</td>
<td>omit</td>
<td>Optional repository name of an alternative container registry to pull images from. This value overrides the container registry organization defined in all the default container images involved in a CodeReady Workspaces deployment. This is particularly useful to install CodeReady Workspaces in an air-gapped environment.</td>
</tr>
<tr>
<td>cheDebug</td>
<td>false</td>
<td>Enables the debug mode for CodeReady Workspaces server.</td>
</tr>
<tr>
<td>cheFlavor</td>
<td>codeready-workspaces</td>
<td>Flavor of the installation.</td>
</tr>
<tr>
<td>cheHost</td>
<td>The Operator automatically sets the value.</td>
<td>A public host name of the installed CodeReady Workspaces server.</td>
</tr>
<tr>
<td>cheImagePullPolicy</td>
<td>Always for nightly or latest images, and IfNotPresent in other cases</td>
<td>Overrides the image pull policy used in CodeReady Workspaces deployment.</td>
</tr>
<tr>
<td>cheImageTag</td>
<td>omit</td>
<td>Overrides the tag of the container image used in CodeReady Workspaces deployment. Omit it or leave it empty to use the default image tag provided by the Operator.</td>
</tr>
<tr>
<td>cheImage</td>
<td>omit</td>
<td>Overrides the container image used in CodeReady Workspaces deployment. This does not include the container image tag. Omit it or leave it empty to use the default container image provided by the Operator.</td>
</tr>
<tr>
<td>cheLogLevel</td>
<td>INFO</td>
<td>Log level for the CodeReady Workspaces server: INFO or DEBUG.</td>
</tr>
<tr>
<td>cheWorkspaceClusterRole</td>
<td>omit</td>
<td>Custom cluster role bound to the user for the CodeReady Workspaces workspaces. Omit or leave empty to use the default roles.</td>
</tr>
<tr>
<td>customCheProperties</td>
<td>omit</td>
<td>Map of additional environment variables that will be applied in the generated codeready-workspaces ConfigMap to be used by the CodeReady Workspaces server, in addition to the values already generated from other fields of the CheCluster Custom Resource (CR). If customCheProperties contains a property that would be normally generated in codeready-workspaces ConfigMap from other CR fields, then the value defined in the customCheProperties will be used instead.</td>
</tr>
<tr>
<td>Property</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>devfileRegistryImage</td>
<td>omit</td>
<td>Overrides the container image used in the Devfile registry deployment. This includes the image tag. Omit it or leave it empty to use the default container image provided by the Operator.</td>
</tr>
<tr>
<td>devfileRegistryMemoryLimit</td>
<td>256Mi</td>
<td>Overrides the memory limit used in the Devfile registry deployment.</td>
</tr>
<tr>
<td>devfileRegistryMemoryRequest</td>
<td>16Mi</td>
<td>Overrides the memory request used in the Devfile registry deployment.</td>
</tr>
<tr>
<td>devfileRegistryPullPolicy</td>
<td>Always for nightly or latest images, and IfNotPresent in other cases</td>
<td>Overrides the image pull policy used in the Devfile registry deployment.</td>
</tr>
<tr>
<td>devfileRegistryUrl</td>
<td>The Operator automatically sets the value.</td>
<td>Public URL of the Devfile registry that serves sample, ready-to-use devfiles. Set it if you use an external devfile registry (see the externalDevfileRegistry field).</td>
</tr>
<tr>
<td>externalDevfileRegistry</td>
<td>false</td>
<td>Instructs the Operator to deploy a dedicated Devfile registry server. By default a dedicated devfile registry server is started. If externalDevfileRegistry set to true, the Operator does not start a dedicated registry server automatically and you need to set the devfileRegistryUrl field manually.</td>
</tr>
<tr>
<td>externalPluginRegistry</td>
<td>false</td>
<td>Instructs the Operator to deploy a dedicated Plugin registry server. By default, a dedicated plug-in registry server is started. If externalPluginRegistry set to true, the Operator does not deploy a dedicated server automatically and you need to set the pluginRegistryUrl field manually.</td>
</tr>
<tr>
<td>nonProxyHosts</td>
<td>omit</td>
<td>List of hosts that will not use the configured proxy. Use `</td>
</tr>
<tr>
<td>pluginRegistryImage</td>
<td>omit</td>
<td>Overrides the container image used in the Plugin registry deployment. This includes the image tag. Omit it or leave it empty to use the default container image provided by the Operator.</td>
</tr>
<tr>
<td>pluginRegistryMemoryLimit</td>
<td>256Mi</td>
<td>Overrides the memory limit used in the Plugin registry deployment.</td>
</tr>
</tbody>
</table>
### Table 2.2. CheCluster Custom Resource database configuration settings related to the database used by CodeReady Workspaces

<table>
<thead>
<tr>
<th>Property</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chePostgresDb</td>
<td>dbche</td>
<td>PostgreSQL database name that the CodeReady Workspaces server uses to connect to the database.</td>
</tr>
</tbody>
</table>
**Table 2.3. CheCluster Custom Resource auth configuration settings related to authentication used by CodeReady Workspaces installation**

<table>
<thead>
<tr>
<th>Property</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>externalIdentityProvider</td>
<td>false</td>
<td>By default, a dedicated Identity Provider server is deployed as part of the CodeReady Workspaces installation. But if <code>externalIdentityProvider</code> is <code>true</code>, then no dedicated identity provider will be deployed by the Operator and you might need to provide details about the external identity provider you want to use. See also all the other fields starting with: <code>identityProvider</code>.</td>
</tr>
<tr>
<td>identityProviderAdminUserName</td>
<td>admin</td>
<td>Overrides the name of the Identity Provider admin user.</td>
</tr>
<tr>
<td>Property</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>identityProviderClientid</td>
<td>omit</td>
<td>Name of an Identity provider (RH-SSO) <strong>client-id</strong> that must be used for CodeReady Workspaces. This is useful to override it ONLY if you use an external Identity Provider (see the <code>externalIdentityProvider</code> field). If omitted or left blank, it will be set to the value of the <code>flavor</code> field suffixed with <code>-public</code>.</td>
</tr>
<tr>
<td>identityProviderImagePullPolicy</td>
<td><strong>Always for nightly or latest images, and</strong> <strong>IfNotPresent</strong> <strong>in other cases</strong></td>
<td>Overrides the image pull policy used in the Identity Provider (RH-SSO) deployment.</td>
</tr>
<tr>
<td>identityProviderImage</td>
<td>omit</td>
<td>Overrides the container image used in the Identity Provider (RH-SSO) deployment. This includes the image tag. Omit it or leave it empty to use the default container image provided by the Operator.</td>
</tr>
<tr>
<td>identityProviderPassword</td>
<td>omit</td>
<td>Overrides the password of RH-SSO admin user. Override it only when using an external Identity Provider (see the <code>externalIdentityProvider</code> field). Omit or leave empty to set an auto-generated password.</td>
</tr>
<tr>
<td>identityProviderPostgresPassword</td>
<td>the Operator sets the value automatically</td>
<td>Password for The Identity Provider (RH-SSO) to connect to the database. This is useful to override it ONLY if you use an external Identity Provider (see the <code>externalIdentityProvider</code> field).</td>
</tr>
<tr>
<td>identityProviderRealm</td>
<td>omit</td>
<td>Name of an Identity provider (RH-SSO) realm. Override it only when using an external Identity Provider (see the <code>externalIdentityProvider</code> field). Omit or leave empty blank to set it to the value of the <code>flavor</code> field.</td>
</tr>
<tr>
<td>identityProviderURL</td>
<td>the Operator sets the value automatically</td>
<td>Instructs the Operator to deploy a dedicated Identity Provider (RH-SSO instance). Public URL of the Identity Provider server (RH-SSO server). Set it only when using an external Identity Provider (see the <code>externalIdentityProvider</code> field).</td>
</tr>
<tr>
<td>OAuthClientName</td>
<td>the Operator sets the value automatically</td>
<td>Name of the OpenShift <strong>OAuthClient</strong> resource used to setup identity federation on the OpenShift side. See also the <strong>OpenShiftOAuth</strong> field.</td>
</tr>
<tr>
<td>OAuthSecret</td>
<td>the Operator sets the value automatically</td>
<td>Name of the secret set in the OpenShift <strong>OAuthClient</strong> resource used to setup identity federation on the OpenShift side. See also the <strong>OAuthClientName</strong> field.</td>
</tr>
<tr>
<td>Property</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>openShiftOAuth</td>
<td>true on OpenShift</td>
<td>Enables the integration of the identity provider (RH-S SO / RHSSO) with OpenShift OAuth. This allows users to log in with their OpenShift login and have their workspaces created under personal OpenShift projects. The kubeadmin user is not supported, and logging through does not allow access to the CodeReady Workspaces Dashboard.</td>
</tr>
<tr>
<td>updateAdminPassword</td>
<td>false</td>
<td>Forc es the default admin CodeReady Workspaces user to update password on first login.</td>
</tr>
</tbody>
</table>

Table 2.4. CheCluster Custom Resourcestorage configuration settings related to persistent storage used by CodeReady Workspaces

<table>
<thead>
<tr>
<th>Property</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>postgresPVCStorageClassName</td>
<td>omit</td>
<td>Storage class for the Persistent Volume Claim dedicated to the PostgreSQL database. Omitted or leave empty to use a default storage class.</td>
</tr>
<tr>
<td>preCreateSubPaths</td>
<td>false</td>
<td>Instructs the CodeReady Workspaces server to launch a special Pod to pre-create a subpath in the Persistent Volumes. Enable it according to the configuration of your K8S cluster.</td>
</tr>
<tr>
<td>pvcClaimSize</td>
<td>1Gi</td>
<td>Size of the persistent volume claim for workspaces.</td>
</tr>
<tr>
<td>pvcJobsImage</td>
<td>omit</td>
<td>Overrides the container image used to create sub-paths in the Persistent Volumes. This includes the image tag. Omit it or leave it empty to use the default container image provided by the Operator. See also the preCreateSubPaths field.</td>
</tr>
<tr>
<td>pvcStrategy</td>
<td>common</td>
<td>Available options: <code>common</code> (all workspaces PVCs in one volume), per-workspace (one PVC per workspace for all declared volumes) and unique (one PVC per declared volume).</td>
</tr>
<tr>
<td>workspacePVCStorageClassName</td>
<td>omit</td>
<td>Storage class for the Persistent Volume Claims dedicated to the CodeReady Workspaces workspaces. Omit or leave empty to use a default storage class.</td>
</tr>
</tbody>
</table>

Table 2.5. CheCluster Custom Resourcek8s configuration settings specific to CodeReady Workspaces installations on OpenShift

<table>
<thead>
<tr>
<th>Property</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ingressClass</td>
<td>nginx</td>
<td>Ingress class that defines which controller manages ingresses.</td>
</tr>
</tbody>
</table>
**ingressDomain**

<table>
<thead>
<tr>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>omit</td>
<td>Global ingress domain for a K8S cluster. This field must be explicitly specified. This drives the <em>kubernetes.io/ingress.class</em> annotation on CodeReady Workspaces-related ingresses.</td>
</tr>
</tbody>
</table>

**ingressStrategy**

<table>
<thead>
<tr>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multi-host</td>
<td>Strategy for ingress creation. This can be multi-host (host is explicitly provided in ingress), single-host (host is provided, path-based rules) and default-host* (no host is provided, path-based rules).</td>
</tr>
</tbody>
</table>

**securityContext FsGroup,omitEmpty**

<table>
<thead>
<tr>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1724</td>
<td>FSGroup the CodeReady Workspaces Pod and Workspace Pods containers run in.</td>
</tr>
</tbody>
</table>

**securityContext RunAsUser**

<table>
<thead>
<tr>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1724</td>
<td>ID of the user the CodeReady Workspaces Pod and Workspace Pods containers run as.</td>
</tr>
</tbody>
</table>

**tlsSecretName**

<table>
<thead>
<tr>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>omit</td>
<td>Name of a secret that is used to set ingress TLS termination if TLS is enabled. See also the <em>tlsSupport</em> field.</td>
</tr>
</tbody>
</table>

**Table 2.6. CheCluster Custom Resource status defines the observed state of CodeReady Workspaces installation**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>cheClusterRunning</strong></td>
<td>Status of a CodeReady Workspaces installation. Can be Available, Unavailable, or Available, Rolling Update in Progress.</td>
</tr>
<tr>
<td><strong>cheURL</strong></td>
<td>Public URL to the CodeReady Workspaces server.</td>
</tr>
<tr>
<td><strong>cheVersion</strong></td>
<td>Currently installed CodeReady Workspaces version.</td>
</tr>
<tr>
<td><strong>dbProvisioned</strong></td>
<td>Indicates whether a PostgreSQL instance has been correctly provisioned.</td>
</tr>
<tr>
<td><strong>devfileRegistryURL</strong></td>
<td>Public URL to the Devfile registry.</td>
</tr>
<tr>
<td><strong>helpLink</strong></td>
<td>A URL to where to find help related to the current Operator status.</td>
</tr>
<tr>
<td><strong>keycloakProvisioned</strong></td>
<td>Indicates whether an Identity Provider instance (RH-SSO / RH SSO) has been provisioned with realm, client and user.</td>
</tr>
<tr>
<td><strong>keycloakURL</strong></td>
<td>Public URL to the Identity Provider server (RH-SSO / RH SSO).</td>

CHAPTER 3. INSTALLING CODEREADY WORKSPACES

This section contains instructions to install Red Hat CodeReady Workspaces. The installation method depends on the target platform and the environment restrictions.

3.1. INSTALLING CODEREADY WORKSPACES ON OPENSHIFT 4 USING OPERATORHUB

This section describes how to install CodeReady Workspaces using the CodeReady Workspaces Operator available in OpenShift 4 web console.

Operators are a method of packaging, deploying, and managing an OpenShift application which also provide the following:

- Repeatability of installation and upgrade.
- Constant health checks of every system component.
- Over-the-air (OTA) updates for OpenShift components and independent software vendor (ISV) content.
- A place to encapsulate knowledge from field engineers and spread it to all users.

Prerequisites

- An administrator account on a running instance of OpenShift 4.

3.1.1. Creating a project in OpenShift Web Console

A project allows to organize and manage different resources on the cluster in an isolated unit. Create a project first to host the Red Hat CodeReady Workspaces Operator.

Procedure

1. Open the OpenShift web console, in the left panel navigate to the Home → Projects section.

2. Click Create Project.

3. Specify the project details:
   - Name: workspaces
   - Display Name: Red Hat CodeReady Workspaces
   - Description: Red Hat CodeReady Workspaces

3.1.2. Installing the Red Hat CodeReady Workspaces Operator

Red Hat CodeReady Workspaces Operator provides all the resources for running CodeReady Workspaces, such as PostgreSQL, RH-SSO, image registries, and the CodeReady Workspaces server, and also configures all these services.

Prerequisites
• Access to the Web Console on the cluster.

Procedure

1. To install the Red Hat CodeReady Workspaces Operator, in the left panel, navigate to the Operators → OperatorHub section.

2. In the Filter by keyword field, type Red Hat CodeReady Workspaces and click the Red Hat CodeReady Workspaces tile.

3. In the Red Hat CodeReady Workspaces pop-up window, click the Install button.

4. On the Install Operator screen, specify the following options:
   • Installation mode: A specific project on the cluster
   • Installed Namespace: *Pick an existing project → workspaces

Verification steps

1. To verify the Red Hat CodeReady Workspaces Operator has installed correctly, in the left panel navigate to the Operators → Installed Operators section.

2. In the Installed Operators screen, click the Red Hat CodeReady Workspaces name and navigate to the Details tab.

3. In the ClusterServiceVersion Details section at the bottom of the page, wait for these messages:
   • Status: Succeeded
   • Status Reason: install strategy completed with no errors

4. Navigate to the Events tab and wait for this message: install strategy completed with no errors.

3.1.3. Creating an instance of the Red Hat CodeReady Workspaces Operator

Follow this procedure to install Red Hat CodeReady Workspaces with the default configuration. To modify the configuration, see Chapter 2, Configuring the CodeReady Workspaces installation.

Procedure

1. To create an instance of the Red Hat CodeReady Workspaces Operator, in the left panel, navigate to the Operators → Installed Operators section.

2. In the Installed Operators screen, click the Red Hat CodeReady Workspaces name.

3. In the Operator Details screen, in the Details tab, inside of the Provided APIs section, click the Create Instance link.

4. The Create CheCluster page contains the configuration of the overall CodeReady Workspaces instance to create. It is the CheCluster Custom Resource. Keep the default values.

5. To create the codeready-workspaces cluster, click the Create button in the lower left corner of the window.

7. To navigate to the **codeready-workspaces** instance, click the link under **Red Hat CodeReady Workspaces URL**.

   **NOTE**
   
   The installation might take more than 5 minutes. The URL appears after the Red Hat CodeReady Workspaces installation finishes.

**Verification steps**

1. To verify that the Red Hat CodeReady Workspaces instance has installed correctly, navigate to the **CodeReady Workspaces Cluster** tab. The **CheClusters** screen displays the list of Red Hat CodeReady Workspaces instances and their status.

2. Click **codeready-workspaces CheCluster** in the table and navigate to the **Details** tab.

3. See the content of following fields:

   - **Message**: the field contains error messages, if any. The expected content is **None**.
   
   - **Red Hat CodeReady Workspaces URL**: displays the URL of the Red Hat CodeReady Workspaces instance, once the deployment is successful.

4. Navigate to the **Resources** tab. The screen displays the list of the resources assigned to the CodeReady Workspaces deployment.

5. To see more details about the state of a resource, click its name and inspect the content of the available tabs.

**Additional resources**

- It is possible to use the **crwctl** utility script for deploying CodeReady Workspaces on OpenShift Container Platform and OpenShift Dedicated versions 4.6. This method is unofficial and serves as a backup installation method for situations where the installation method using OperatorHub is not available. See the **Section 3.2.2, “Installing CodeReady Workspaces on OpenShift 3 using the Operator”** section.

### 3.2. INSTALLING CODEREADY WORKSPACES ON OPENSShift CONTAINER PLATFORM 3.11

**3.2.1. Installing the crwctl CLI management tool**

This section describes how to install crwctl, the CodeReady Workspaces CLI management tool.
Procedure

2. Download the CodeReady Workspaces CLI management tool archive for version 2.5.

3. Extract the archive to a folder, such as ${HOME}/crwctl or /opt/crwctl.

4. Run the crwctl executable from the extracted folder. In this example, ${HOME}/crwctl/bin/crwctl version.

5. Optionally, add the bin folder to your $PATH, for example, PATH=${PATH}:${HOME}/crwctl/bin to enable running crwctl without the full path specification.

Verification step

Running crwctl version displays the current version of the tool.

3.2.2. Installing CodeReady Workspaces on OpenShift 3 using the Operator

This section describes how to install CodeReady Workspaces on OpenShift 3 with the crwctl CLI management tool. The method of installation is using the Operator and enable TLS (HTTPS).

NOTE

Methods for updating from a previous CodeReady Workspaces installation and enabling multiple instances in the same OpenShift Container Platform 3.11 cluster are provided below the installation procedure.

Operators are a method of packaging, deploying, and managing a OpenShift application which also provide the following:

- Repeatability of installation and upgrade.
- Constant health checks of every system component.
- Over-the-air (OTA) updates for OpenShift components and independent software vendor (ISV) content.
- A place to encapsulate knowledge from field engineers and spread it to all users.

NOTE

This approach is only supported for use with OpenShift Container Platform and OpenShift Dedicated version 3.11, but also work for newer versions of OpenShift Container Platform and OpenShift Dedicated, and serves as a backup installation method for situations when the installation method using OperatorHub is not available.

Prerequisites

- Administrator rights on a running instance of OpenShift 3.11.
- An installation of the oc OpenShift 3.11 CLI management tool. See Installing the OpenShift 3.11 CLI.
An installation of the `crwctl` management tool. See Section 3.2.1, "Installing the crwctl CLI management tool".

To apply settings that the main crwctl command-line parameters cannot set, prepare a configuration file `operator-cr-patch.yaml` that will override the default values in the `CheCluster` Custom Resource used by the Operator. See Chapter 2, Configuring the CodeReady Workspaces installation.

<namespace> represents the project of the target installation.

**Procedure**

1. Log in to OpenShift. See Basic Setup and Login.
   
   ```
   $ oc login
   ```

2. Run the following command to verify that the version of the `oc` OpenShift CLI management tool is 3.11:
   
   ```
   $ oc version
   oc v3.11.0+0cbc58b
   ```

3. Run the following command to create the CodeReady Workspaces instance

   - In the user-defined <namespace>:
     
     ```
     $ crwctl server:deploy -n <namespace> -p openshift
     ```

   - In the default project called workspaces:
     
     ```
     $ crwctl server:deploy -p openshift
     ```

**Verification steps**

1. The output of the previous command ends with:

   ```
   Command server:deploy has completed successfully.
   ```

**Having multiple CodeReady Workspaces deployments**

- To have multiple CodeReady Workspaces deployments in parallel using different versions in the same OpenShift Container Platform 3.11 cluster, create a new service account for the new deployment. It is, however, strongly recommended that you update all your old CodeReady Workspaces deployments to the latest version instead, as this mix of versions may cause unexpected and unsupported results.

   ```
   $ oc patch clusterrolebinding codeready-operator \
   --type=json \
   -p '[["op":"add", "path":"/subjects/0", "value": {"kind":"ServiceAccount", "namespace": \
   
   
   "<workspaces>"", "name": "codeready-operator"} ]]'
3.3. INSTALLING CODEREADY WORKSPACES IN A RESTRICTED ENVIRONMENT

By default, Red Hat CodeReady Workspaces uses various external resources, mainly container images available in public registries.

To deploy CodeReady Workspaces in an environment where these external resources are not available (for example, on a cluster that is not exposed to the public Internet):

1. Identify the image registry used by the OpenShift cluster, and ensure you can push to it.
2. Push all the images needed for running CodeReady Workspaces to this registry.
3. Configure CodeReady Workspaces to use the images that have been pushed to the registry.
4. Proceed to the CodeReady Workspaces installation.

The procedure for installing CodeReady Workspaces in restricted environments is different based on the installation method you use:

- Installation using OperatorHub on OpenShift 4.3 and above
- Installation using the crwctl management tool on both OpenShift 3.11 or 4.x

Notes on network connectivity in restricted environments

Restricted network environments range from a private subnet in a cloud provider to a separate network owned by a company, disconnected from the public Internet. Regardless of the network configuration, CodeReady Workspaces works provided that the Routes that are created for CodeReady Workspaces components (codeready-workspaces-server, identity provider, devfile and plugin registries) are accessible from inside the OpenShift cluster.

Take into account the network topology of the environment to determine how best to accomplish this. For example, on a network owned by a company or an organization, the network administrators must ensure that traffic bound from the cluster can be routed to Route hostnames. In other cases, for example, on AWS, create a proxy configuration allowing the traffic to leave the node to reach an external-facing Load Balancer.

When the restricted network involves a proxy, follow the instructions provided in Section 3.3.3, “Preparing CodeReady Workspaces Custom Resource for installing behind a proxy”.

3.3.1. Installing CodeReady Workspaces in a restricted environment using OperatorHub

Prerequisites

- A running OpenShift cluster. See the OpenShift Container Platform 4.3 documentation for instructions on how to install an OpenShift cluster on a restricted network.

- Access to the mirror registry used to installed the OpenShift disconnected cluster in restricted network. See the Related OpenShift Container Platform 4.3 documentation about creating a mirror registry for installation in a restricted network.

On disconnected OpenShift 4 clusters running on restricted networks, an Operator can be successfully installed from OperatorHub only if it meets the additional requirements defined in Enabling your Operator for restricted network environments.
The CodeReady Workspaces operator meets these requirements and is therefore compatible with the official documentation about OLM on a restricted network.

Procedure
To install CodeReady Workspaces from OperatorHub:

1. Build a `redhat-operators` catalog image. See Building an Operator catalog image.
2. Configure OperatorHub to use this catalog image for operator installations. See Configuring OperatorHub for restricted networks.
3. Proceed to the CodeReady Workspaces installation as usual as described in Section 3.1, “Installing CodeReady Workspaces on OpenShift 4 using OperatorHub”.

3.3.2. Installing CodeReady Workspaces in a restricted environment using CLI management tool

NOTE
Use CodeReady Workspaces CLI management tool to install CodeReady Workspaces on restricted networks if installation through OperatorHub is not available. This method is supported for OpenShift Container Platform 3.11.

Prerequisites
- A running OpenShift cluster. See the OpenShift Container Platform 3.11 documentation for instructions on how to install an OpenShift cluster.

3.3.2.1. Preparing an private registry

Prerequisites
- The `oc` tool is available.
- The `skopeo` tool, version 0.1.40 or later, is available.
- The `podman` tool is available.
- An image registry accessible from the OpenShift cluster and supporting the format of the V2 image manifest, schema version 2. Ensure you can push to it from a location having, at least temporarily, access to the internet.

Table 3.1. Placeholders used in examples

| `<source-image>` | Full coordinates of the source image, including registry, organization, and digest. |
| `<target-registry>` | Host name and port of the target container-image registry. |
| `<target-organization>` | Organization in the target container-image registry |
| `<target-image>` | Image name and digest in the target container-image registry. |
| **<target-user>** | User name in the target container-image registry. |
| **<target-password>** | User password in the target container-image registry. |

Procedure

1. Log into the internal image registry:

   ```
   $ podman login --username <user> --password <password> <target-registry>
   ```

   **WARNING**

   If you meet an error, such as *x509: certificate signed by unknown authority*, when attempting to push to the internal registry, try one of these workarounds:

   - add the OpenShift cluster’s certificate to /etc/containers/certs.d/<target-registry>
   - add the registry as an insecure registry by adding the following lines to the Podman configuration file located at /etc/containers/registries.conf:
     ```
     [registries.insecure]
     registries = ['<target-registry>']
     ```

2. Copy images without changing their digest. Repeat this step for every image in the following table:

   ```
   $ skopeo copy --all docker://<source-image> docker://<target-registry>/<target-organization>/<target-image>
   ```
### Table 3.2. Understanding the usage of the container-images from the prefix or keyword they include in their name

</tr>
</tbody>
</table>
## Verification steps

- Verify the images have the same digests:

  ```bash
  $ skopeo inspect docker://<source-image>
  $ skopeo inspect docker://<target-registry>/<target-organization>/<target-image>
  ```

## Additional resources

- To find the sources of the images list, see the values of the `relatedImages` attribute in the CodeReady Workspaces Operator ClusterServiceVersion sources.

### 3.3.2.2. Preparing CodeReady Workspaces Custom Resource for restricted environment

When installing CodeReady Workspaces in a restricted environment using `crwctl` or OperatorHub, provide a CheCluster custom resource with additional information.

#### 3.3.2.2.1. Downloading the default CheCluster Custom Resource

**Procedure**

1. Download the default custom resource YAML file.
2. Name the downloaded custom resource `org_v1_che_cr.yaml`. Keep it for further modification and usage.

#### 3.3.2.2.2. Customizing the CheCluster Custom Resource for restricted environment

**Prerequisites**

- All required images available in an image registry that is visible to the OpenShift cluster where CodeReady Workspaces is to be deployed. This is described in Section 3.3.2.1, “Preparing an private registry”, where the placeholders used in the following examples are also defined.

**Procedure**

1. In the CheCluster Custom Resource, which is managed by the CodeReady Workspaces Operator, add the fields used to facilitate deploying an instance of CodeReady Workspaces in a restricted environment:

   ```yaml
   # [...]
   spec:
   server:
   ```
3.3.2.3. Starting CodeReady Workspaces installation in a restricted environment using CodeReady Workspaces CLI management tool

This section describes how to start the CodeReady Workspaces installation in a restricted environment using the CodeReady Workspaces CLI management tool.

Prerequisites

- CodeReady Workspaces CLI management tool is installed. See Section 3.2.1, "Installing the crwctl CLI management tool".
- The `oc` tool is installed.
- Access to an OpenShift instance.

Procedure

1. Log in to OpenShift Container Platform:

   ```bash
   $ oc login ${OPENSHIFT_API_URL} --username ${OPENSHIFT_USERNAME} \
   --password ${OPENSHIFT_PASSWORD}
   ```

2. Install CodeReady Workspaces with a customized Custom Resource to add fields related to the restricted environment:

   ```bash
   $ crwctl server:start \
   --che-operator-image=<target-registry>/<target-organization>/crw-2-rhel8-operator:2.5 \
   --che-operator-cr-yaml=org_v1_che_cr.yaml
   ```

   **NOTE**
   
   For slow systems or internet connections, add the `--k8spodwaittimeout=1800000` flag option to the `crwctl server:start` command to extend the Pod timeout period to 1800000 ms or longer.

3.3.3. Preparing CodeReady Workspaces Custom Resource for installing behind a proxy

This procedure describes how to provide necessary additional information to the `CheCluster` custom resource when installing CodeReady Workspaces behind a proxy.

Procedure

1. In the `CheCluster` Custom Resource, which is managed by the CodeReady Workspaces Operator, add the fields used to facilitate deploying an instance of CodeReady Workspaces in a restricted environment:

   ```yaml
   # [...]
   spec:
   ```
2. In addition to those basic settings, the proxy configuration usually requires adding the host of the external OpenShift cluster API URL in the list of the hosts to be accessed from CodeReady Workspaces without using the proxy.

To retrieve this cluster API host, run the following command against the OpenShift cluster:

```bash
$ oc whoami --show-server | sed 's#https://##' | sed 's#:.*$##'
```

The corresponding field of the `CheCluster` Custom Resource is `nonProxyHosts`. If a host already exists in this field, use `|` as a delimiter to add the cluster API host:

```
# [...]  
spec:  
  server:  
    nonProxyHosts: 'anotherExistingHost|<cluster api host>'  
# [...]  
```
CHAPTER 4. CONFIGURING CODEREADY WORKSPACES

The following chapter describes configuration methods and options for Red Hat CodeReady Workspaces, with some user stories as example.

- **Section 4.1, “Advanced configuration options for the CodeReady Workspaces server component”** describes advanced configuration methods to use when the previous method is not applicable.

The next sections describe some specific user stories.

- **Section 4.2, “Configuring project strategies”**
- **Section 4.3, “Running more than one workspace at a time”**
- **Section 4.5, “Configuring workspaces nodeSelector”**
- **Section 4.6, “Configuring Red Hat CodeReady Workspaces server hostname”**
- **Section 4.7, “Configuring labels for OpenShift Ingress”**
- **Section 4.8, “Configuring labels for OpenShift Route”**
- **Section 4.9, “Deploying CodeReady Workspaces with support for Git repositories with self-signed certificates”**
- **Section 4.10, “Installing CodeReady Workspaces using storage classes”**
- **Section 4.11, “Configuring storage types”**
- **Section 4.12, “Importing untrusted TLS certificates to CodeReady Workspaces”**
- **Section 4.13, “Switching between external and internal ways in inter-component communication”**
- **Section 4.14, “Setting up the RH-SSO codeready-workspaces-username-readonly theme for the Red Hat CodeReady Workspaces login page”**

4.1. ADVANCED CONFIGURATION OPTIONS FOR THE CODEREADY WORKSPACES SERVER COMPONENT

The following section describes advanced deployment and configuration methods for the CodeReady Workspaces server component.

4.1.1. Understanding CodeReady Workspaces server advanced configuration using the Operator

The following section describes the CodeReady Workspaces server component advanced configuration method for a deployment using the Operator.

Advanced configuration is necessary to:

- Add environment variables not automatically generated by the Operator from the standard CheCluster Custom Resource fields.
- Override the properties automatically generated by the Operator from the standard CheCluster Custom Resource fields.
The `customCheProperties` field, part of the `CheCluster` Custom Resource `server` settings, contains a map of additional environment variables to apply to the CodeReady Workspaces server component.

Example 4.1. Override the default memory limit for workspaces

- Add the `CHE_WORKSPACE_DEFAULT__MEMORY__LIMIT__MB` property to `customCheProperties`:

```yaml
apiVersion: org.eclipse.che/v1
kind: CheCluster
# [...]  
spec:
  server:
    # [...]  
    customCheProperties:
      CHE_WORKSPACE_DEFAULT__MEMORY__LIMIT__MB: "2048"
# [...]  
```

**NOTE**

Previous versions of the CodeReady Workspaces Operator had a configMap named `custom` to fulfill this role. If the CodeReady Workspaces Operator finds a configMap with the name `custom`, it adds the data it contains into the `customCheProperties` field, redeploys CodeReady Workspaces, and deletes the `custom` configMap.

Additional resources

- For the list of all parameters available in the `CheCluster` Custom Resource, see Chapter 2, *Configuring the CodeReady Workspaces installation*.

- For the list of all parameters available to configure `customCheProperties`, see Section 4.1.2, “CodeReady Workspaces server component system properties reference”.

### 4.1.2. CodeReady Workspaces server component system properties reference

The following document describes all possible configuration properties of the CodeReady Workspaces server component.

Table 4.1. Che server

<table>
<thead>
<tr>
<th>Environment Variable Name</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CHE_DATABASE</code></td>
<td><code>${che.home}/storage</code></td>
<td>Folder where CodeReady Workspaces stores internal data objects.</td>
</tr>
<tr>
<td><code>CHE_API</code></td>
<td><code>http://${CHE_HOST}:${CHE_PORT}/api</code></td>
<td>API service. Browsers initiate REST communications to CodeReady Workspaces server with this URL.</td>
</tr>
<tr>
<td>Environment Variable Name</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>----------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CHE_WEBSOCKET_ENDPOINT</td>
<td>ws://$(CHE_HOST):$(CHE_PORT)/api/websocket</td>
<td>CodeReady Workspaces websocket major endpoint. Provides basic communication endpoint for major websocket interactions and messaging.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_STORAGE</td>
<td>${che.home}/workspaces</td>
<td>Projects are synchronized from the CodeReady Workspaces server into the machine running each workspace. This is the directory in the workspace runtime where the projects are mounted.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_PROJECTS_STORAGE</td>
<td>/projects</td>
<td>Your projects are synchronized from the CodeReady Workspaces server into the machine running each workspace. This is the directory in the machine where your projects are placed.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_PROJECTS_STORAGE_DEFAULT_SIZE</td>
<td>1Gi</td>
<td>Used when OpenShift-type components in a devfile request project PVC creation (Applied in case of 'unique' and 'per workspace' PVC strategy. In case of the 'common' PVC strategy, it is rewritten with the value of the <code>che.infra.kubernetes.pvc.quantity</code> property.)</td>
</tr>
<tr>
<td>CHE_WORKSPACE_LOGS_ROOT_DIR</td>
<td>/workspace_logs</td>
<td>Defines the directory inside the machine where all the workspace logs are placed. Provide this value into the machine, for example, as an environment variable. This is to ensure that agent developers can use this directory to back up agent logs.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_HTTP_PROXY</td>
<td></td>
<td>Configures proxies used by runtimes powering workspaces.</td>
</tr>
<tr>
<td>Environment Variable Name</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CHE_WORKSPACE_HTTPS_PROXY</td>
<td></td>
<td>Configures proxies used by runtimes powering workspaces.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_NO_PROXY</td>
<td></td>
<td>Configures proxies used by runtimes powering workspaces.</td>
</tr>
<tr>
<td>CHE_TRUSTED_CA_BUNDLES_CONFIGMAP</td>
<td>NULL</td>
<td>When cluster-wide proxy is configured, che-operator creates a special configmap and allows the OpenShift Network Operator to inject the ca-bundle into it. In addition, it adds the CHE_TRUSTED_CA_BUNDLES_CONFIGMAP key with the name of this configmap in the CodeReady Workspaces server configmap (and corresponding environment variable). So, its presence can be used to detect if proxy mode is enabled or not. Do not set this property manually unless required for this purpose.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_AUTO_START</td>
<td>true</td>
<td>By default, when users access a workspace with its URL, the workspace automatically starts (if currently stopped). Set this to false to disable this behavior.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_POOL_TYPE</td>
<td>fixed</td>
<td>Workspace threads pool configuration. This pool is used for workspace-related operations that require asynchronous execution, for example, starting and stopping. Possible values are fixed and cached.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_POOL_EXACT_SIZE</td>
<td>30</td>
<td>This property is ignored when pool type is different from fixed. It configures the exact size of the pool. When set, the multiplier property is ignored. If this property is not set (0, &lt;0, NULL), then the pool size equals the number of cores. See also che.workspace.pool.cores_multiplier.</td>
</tr>
<tr>
<td>Environment Variable Name</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CHE_WORKSPACE_POOL_CORES__MULTIPLIER</td>
<td>2</td>
<td>This property is ignored when pool type is not set to <code>fixed</code>, <code>che.workspace.pool.exact_size</code> is set. When set, the pool size is <code>N_CORES * multiplier.</code></td>
</tr>
<tr>
<td>CHE_WORKSPACE_PROBE_POOL__SIZE</td>
<td>10</td>
<td>This property specifies how many threads to use for workspace server liveness probes.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_HTTP_PROXY__JAVA__OPTIONS</td>
<td>NULL</td>
<td>HTTP proxy setting for workspace JVM.</td>
</tr>
<tr>
<td>Environment Variable Name</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>CHE_WORKSPACE_DEFAULT_MEMORY_LIMIT MB</code></td>
<td>1024</td>
<td>RAM limit default for each machine that has no RAM settings in its environment. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td><code>CHE_WORKSPACE_DEFAULT_MEMORY_REQUEST MB</code></td>
<td>200</td>
<td>RAM request for each container that has no explicit RAM settings in its environment. This amount is allocated when the workspace container is created. This property may not be supported by all infrastructure implementations. Currently it is supported by OpenShift. A memory request exceeding the memory limit is ignored, and only the limit size is used. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td><code>CHE_WORKSPACE_DEFAULT_CPU_LIMIT CORES</code></td>
<td>-1</td>
<td>CPU limit for each container that has no CPU settings in its environment. Specify either in floating point cores number, for example, <strong>0.125</strong>, or using the OpenShift format, integer millicores, for example, <strong>125m</strong>. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td><code>CHE_WORKSPACE_DEFAULT_CPU_REQUEST CORES</code></td>
<td>-1</td>
<td>CPU request for each container that has no CPU settings in environment. A CPU request exceeding the CPU limit is ignored, and only limit number is used. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td><code>CHE_WORKSPACE_SIDEcar_DEFAULT_MEMORY_LIMIT MB</code></td>
<td>128</td>
<td>RAM limit and request for each sidecar that has no RAM settings in the CodeReady Workspaces plug-in configuration. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td><code>CHE_WORKSPACE_SIDEcar_DEFAULT_MEMORY_REQUEST MB</code></td>
<td>64</td>
<td>RAM limit and request for each sidecar that has no RAM settings in the CodeReady Workspaces plug-in configuration. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td>Environment Variable Name</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CHE_WORKSPACE_SIDECAR_DEFAULT_CPU_LIMIT_CORES</td>
<td>-1</td>
<td>CPU limit and request default for each sidecar that has no CPU settings in the CodeReady Workspaces plug-in configuration. Specify either in floating point cores number, for example, 0.125, or using the OpenShift format, integer millicores, for example, 125m. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_SIDECAR_DEFAULT_CPU_REQUEST_CORES</td>
<td>-1</td>
<td>CPU limit and request default for each sidecar that has no CPU settings in the CodeReady Workspaces plug-in configuration. Specify either in floating point cores number, for example, 0.125, or using the OpenShift format, integer millicores, for example, 125m. Value less or equal to 0 is interpreted as disabling the limit.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_SIDECAR_IMAGE_PULL_POLICY</td>
<td>Always</td>
<td>Defines image-pulling strategy for sidecars. Possible values are: Always, Never, IfNotPresent. For any other value, Always is assumed for images with the :latest tag, or IfNotPresent for all other cases.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_ACTIVITY_CHECK_SCHEDULER_PERIOD_S</td>
<td>60</td>
<td>Period of inactive workspaces suspend job execution.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_ACTIVITY_CLEANUP_SCHEDULER_PERIOD_S</td>
<td>3600</td>
<td>The period of the cleanup of the activity table. The activity table can contain invalid or stale data if some unforeseen errors happen, like a server crash at a peculiar point in time. The default is to run the cleanup job every hour.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_ACTIVITY_CLEANUP_SCHEDULER_INITIAL_DELAY_S</td>
<td>60</td>
<td>The delay after server startup to start the first activity clean up job.</td>
</tr>
<tr>
<td>Environment Variable Name</td>
<td>Default value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CHE_WORKSPACE_ACTIVITY_CHECK_SCHEDULER_DELAY_S</td>
<td>180</td>
<td>Delay before first workspace idleness check job started to avoid mass suspend if ws master was unavailable for period close to inactivity timeout.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_CLEANUP_TEMPORARY_INITIAL_DELAY_MIN</td>
<td>5</td>
<td>Period of stopped temporary workspaces cleanup job execution.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_CLEANUP_TEMPORARY_PERIOD_MIN</td>
<td>180</td>
<td>Period of stopped temporary workspaces cleanup job execution.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_SERVER_PING_SUCCESS_THRESHOLD</td>
<td>1</td>
<td>Number of sequential successful pings to server after which it is treated as available. Note: the property is common for all servers e.g. workspace agent, terminal, exec etc.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_SERVER_PING_INTERVAL_MILLISECONDS</td>
<td>3000</td>
<td>Interval, in milliseconds, between successive pings to workspace server.</td>
</tr>
<tr>
<td>CHE_WORKSPACE_SERVER_LIVENESS_PROBES</td>
<td></td>
<td>List of servers names which require liveness probes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>wsagent/http,exec-agent/http,terminal,thelia,jupyter,dirigible,cloud-shell,intellij</td>
</tr>
<tr>
<td>CHE_WORKSPACE_STARTUP_DEBUG_LOG_LIMIT_BYTES</td>
<td>10485760</td>
<td>Limit size of the logs collected from single container that can be observed by che-server when debugging workspace startup. default 10MB=10485760</td>
</tr>
<tr>
<td>CHE_WORKSPACE_STOP_ROLE_ENABLED</td>
<td>true</td>
<td>If true, ‘stop–workspace’ role with the edit privileges will be granted to the ‘che’ ServiceAccount if OpenShift OAuth is enabled. This configuration is mainly required for workspace idling when the OpenShift OAuth is enabled.</td>
</tr>
</tbody>
</table>

Table 4.2. Templates
<table>
<thead>

</tr>
</tbody>
</table>
Environment Variable Name | Default value | Description
--- | --- | ---
CHE-INFRA_KUBERNETES_INGRESS_ANNOTATIONS_JSON | NULL | Defines annotations for ingresses which are used for servers exposing. Value depends on the kind of ingress controller. OpenShift infrastructure ignores this property because it uses Routes instead of ingresses. Note that for a single-host deployment strategy to work, a controller supporting URL rewriting has to be used (so that URLs can point to different servers while the servers don’t need to support changing the app root). The che.infra.kubernetes.ingress.path.rewrite_transform property defines how the path of the ingress should be transformed to support the URL rewriting and this property defines the set of annotations on the ingress itself that instruct the chosen ingress controller to actually do the URL rewriting, potentially building on the path transformation (if required by the chosen ingress controller). For example for nginx ingress controller 0.22.0 and later the following value is recommended:

```
{"ingress.kubernetes.io/rewrite-target": 
’/\$1’,
‘ingress.kubernetes.io/ssl-redirect’: ‘false’,
‘ingress.kubernetes.io/proxy-connect-timeout’: ‘3600’,
‘ingress.kubernetes.io/proxy-read-timeout’: ‘3600’}
```

and the che.infra.kubernetes.ingress.path.rewrite_transform should be set to `%s(.*)` For nginx ingress controller older than 0.22.0, the rewrite-target should be set to merely `/` and the path transform to `%s` (see the the che.infra.kubernetes.ingress.path.rewrite_transform property).

Please consult the nginx ingress controller documentation for the explanation of how the ingress controller uses the regular
### Environment Variable Name | Default value | Description
--- | --- | ---
CHI-INFRA-KUBERNETES_INGRESS_PATH__TRANSFORM | NULL | Defines a 'recipe' on how to declare the path of the ingress that should expose a server. The '%s' represents the base public URL of the server and is guaranteed to end with a forward slash. This property must be a valid input to the String.format() method and contain exactly one reference to '%s'. Please see the description of the che.infra.kubernetes.ingress.annnotations_json property to see how these two properties interplay when specifying the ingress annotations and path. If not defined, this property defaults to '%s' (without the quotes) which means that the path is not transformed in any way for use with the ingress controller.

CHI-INFRA-KUBERNETES_INGRESS_LABELS | NULL | Additional labels to add into every Ingress created by CodeReady Workspaces server to allow clear identification.

CHI-INFRA-KUBERNETES_POD_SECURITY__CONTEXT_RUN__AS__USER | NULL | Defines security context for pods that will be created by OpenShift Infra This is ignored by OpenShift infra.

CHI-INFRA-KUBERNETES_POD_SECURITY__CONTEXT_FS__GROUP | NULL | Defines security context for pods that will be created by OpenShift Infra This is ignored by OpenShift infra.

CHI-INFRA-KUBERNETES_POD_TERMINATION__GRACE__PERIOD__SEC | 0 | Defines grace termination period for pods that will be created by OpenShift / OpenShift infrastructures Grace termination period of OpenShift / OpenShift workspace's pods defaults '0', which allows to terminate pods almost instantly and significantly decrease the time required for stopping a workspace. Note: if terminationGracePeriodSeconds have been explicitly set in OpenShift / OpenShift recipe it will not be overridden.

</tr>
</tbody>
</table>
CHE_WORKSPACE_STORAGE_AVAILABLE__TYPES

The configuration property that defines available values for storage types that clients like Dashboard should propose for users during workspace creation/update. Available values:
- 'persistent': Persistent Storage slow I/O but persistent.
- 'ephemeral': Ephemeral Storage allows for faster I/O but may have limited storage and is not persistent.
- 'async': Experimental feature: Asynchronous storage is combination of Ephemeral and Persistent storage. Allows for faster I/O and keep your changes, will backup on stop and restore on start workspace. Will work only if:
  - che.infra.kubernetes.pvc.strategy = 'common'
  - che.limits.user.workspaces.run.count = 1
  - che.infra.kubernetes.namespace.allow_user_defined = false
  - che.infra.kubernetes.namespace.default contains <username> in other cases remove 'async' from the list.

CHE_WORKSPACE_STORAGE_PREFERRED__TYPE

The configuration property that defines a default value for storage type that clients like Dashboard should propose for users during workspace creation/update. The 'async' value not recommended as default type since it's experimental.

CHE_SERVER_SECURE__EXPOSER

Configures in which way secure servers will be protected with authentication. Suitable values:
- 'default': jwtproxy is configured in a pass-through mode. So, servers should authenticate requests themselves.
- 'jwtproxy': jwtproxy will authenticate requests. So, servers will receive only authenticated ones.

<td>Keycloak admin password. Will be used for deleting user from Keycloak on removing user from CodeReady Workspaces database. Make sense only in case ${che.keycloak.cascade_user_remove_enabled} set to 'true'.</td>
</tr>
</tbody>
</table>

### 4.2. CONFIGURING PROJECT STRATEGIES

The OpenShift project strategies are configured using the **CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT** environment variable.
4.2.1. One project per workspace strategy

The strategy creates a new project for each new workspace.

To use the strategy, the `CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT` variable value must contain the `<workspaceID>` identifier. It can be used alone or combined with other identifiers or any string.

**Example 4.2. One project per workspace**

To assign project names composed of a `codeready-ws` prefix and workspace id, set:

```
CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT=codeready-ws-<workspaceID>
```

4.2.2. One project for all workspaces strategy

The strategy uses one predefined project for all workspaces.

To use the strategy, the `CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT` variable value must be the name of the desired project to use.

**Example 4.3. One project for all workspaces**

To have all workspaces created in `codeready-ws` project, set:

```
CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT=codeready-ws
```

4.2.3. One project per user strategy

The strategy isolates each user in their own project.
To use the strategy, the `CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT` variable value must contain one or more user identifiers. Currently supported identifiers are `<username>` and `<userid>`.

Example 4.4. One project per user

To assign project names composed of a `codeready-ws` prefix and individual usernames (`codeready-ws-user1`, `codeready-ws-user2`), set:

`CHE_INFRA_KUBERNETES_NAMESPACE_DEFAULT=codeready-ws-<username>`

4.2.4. Allowing user-defined workspace projects

CodeReady Workspaces server can be configured to honor the user selection of a project when a workspace is created. This feature is disabled by default. To allow user-defined workspace projects:

- For Operator deployments, set the following field in the CheCluster Custom Resource:

  `allowUserDefinedWorkspaceNamespaces`

4.2.5. Handling incompatible usernames or user IDs

CodeReady Workspaces server automatically checks usernames and IDs for compatibility with OpenShift objects naming convention before creating a project from a template. Incompatible username or IDs are reduced to the nearest valid name by replacing groups of unsuitable symbols with the `-` symbol. To avoid collisions, a random 6-symbol suffix is added and the result is stored in preferences for reuse.

4.2.6. Pre-creating projects for users

To pre-create projects for users, use project labels and annotations.

```
metadata:
  labels:
    app.kubernetes.io/component: workspace
    app.kubernetes.io/part-of: che.eclipse.org
  annotations:
    che.eclipse.org/username: <username>
```

To configure the labels, set the `CHE_INFRA_KUBERNETES_NAMESPACE_LABELS` to desired labels. To configure the annotations, set the `CHE_INFRA_KUBERNETES_NAMESPACE_ANNOTATIONS` to desired annotations. See the Section 4.1.2, “CodeReady Workspaces server component system properties reference” for more details.
IMPORTANT

On OpenShift with OAuth, target user must have **admin** role privileges in target namespace:

```yaml
apiVersion: rbac.authorization.k8s.io/v1
kind: RoleBinding
metadata:
  name: admin
  namespace: <namespace> 1
roleRef:
  apiGroup: rbac.authorization.k8s.io
  kind: ClusterRole
  name: admin
subjects:
  - apiGroup: rbac.authorization.k8s.io
    kind: User
    name: <username> 2
```

1. pre-created namespace
2. target user

On Kubernetes, **che** ServiceAccount must have a cluster-wide **list namespaces** privilege as well as an **admin** role in target namespace.

### 4.3. RUNNING MORE THAN ONE WORKSPACE AT A TIME

This procedure describes how to run more than one workspace simultaneously. This makes it possible for multiple workspace contexts per user to run in parallel.

**Prerequisites**

- The `oc` tool is available.
- An instance of CodeReady Workspaces running in OpenShift.

**NOTE**

The following commands use the default OpenShift project, **workspaces**, as a user's example for the `-n` option.

**Procedure**

1. Change the default limit of 1 to `-1` to allow an unlimited number of concurrent workspaces per user:

   ```bash
   $ oc patch checluster codeready-workspaces -n workspaces --type merge \   -p '{ "spec": { "server": {"customCheProperties": {"CHE_LIMITS_USER_WORKSPACES_RUN_COUNT": "-1" } } }'}
   ```

1. Set the **per-workspace** or **unique** PVC strategy. See **Configuring a CodeReady Workspaces workspace with a persistent volume strategy**.
NOTE

When using the common PVC strategy, configure the persistent volumes to use the ReadWriteMany access mode. That way, any of the user’s concurrent workspaces can read from and write to the common PVC.

4.4. CONFIGURING WORKSPACE EXPOSURE STRATEGIES

The following section describes how to configure workspace exposure strategies of a CodeReady Workspaces server and ensure that applications running inside are not vulnerable to outside attacks.

The workspace exposure strategy is configured per CodeReady Workspaces server, using the che.infra.kubernetes.server_strategy configuration property or the CHE_INFRA_KUBERNETES_SERVER__STRATEGY environment variable.

The supported values for che.infra.kubernetes.server_strategy are:

- multi-host

For enabling of the multi-host strategy:

1. Set the:
   - che.infra.kubernetes.ingress.domain configuration property
     or
   - CHE_INFRA_KUBERNETES_INGRESS_DOMAIN environment variable
     to match the domain name that will host workspace component subdomains.

4.4.1. Workspace exposure strategies

Specific components of workspaces need to be made accessible outside of the OpenShift cluster. This is typically the user interface of the workspace’s IDE, but it can also be the web UI of the application being developed. This enables developers to interact with the application during the development process.

The supported way of making workspace components available to the users is referred to as a strategy. This strategy defines whether new subdomains are created for the workspace components and what hosts these components are available on.

CodeReady Workspaces supports:

- multi-host strategy
- single-host strategy
  - with the gateway subtype

4.4.1.1. Multi-host strategy

With this strategy, each workspace component is assigned a new subdomain of the main domain configured for the CodeReady Workspaces server. On OpenShift, this is the only possible strategy, and manual configuration of the workspace exposure strategy is therefore always ignored.

This strategy is the easiest to understand from the perspective of component deployment because any paths present in the URL to the component are received as they are by the component.
On a CodeReady Workspaces server secured using the Transport Layer Security (TLS) protocol, creating new subdomains for each component of each workspace requires a wildcard certificate to be available for all such subdomains for the CodeReady Workspaces deployment to be practical.

4.4.1.2. Single-host strategy

Single-host strategy have two subtypes with different implementation methods. First subtype is named **native**. This strategy is available and default on Kubernetes, but not on OpenShift, since it uses ingress for servers exposing. The second subtype named **gateway**, works both on OpenShift, and uses a special pod with reverse-proxy running inside to route requests.

When any of those single-host types is used, all workspaces are deployed to sub-paths of the main CodeReady Workspaces server domain.

This is convenient for TLS-secured CodeReady Workspaces servers because it is sufficient to have a single certificate for the CodeReady Workspaces server, which will cover all the workspace component deployments as well.

There are two ways of exposing the endpoints specified in the devfile. These can be configured using the `CHE_INFRA_KUBERNETES_SINGLEHOST_WORKSPACE_DEVFILE__ENDPOINT__EXPOSURE` environment variable of the CodeReady Workspaces. This environment variable is only effective with the single-host server strategy and is applicable to all workspaces of all users.

4.4.1.2.1. devfile endpoints: single-host

**`CHE_INFRA_KUBERNETES_SINGLEHOST_WORKSPACE_DEVFILE__ENDPOINT__EXPOSURE`: 'single-host'**

This single-host configuration exposes the endpoints on subpaths, for example: `https://<che-host>/serverihzmuqqc/go-cli-server-8080`. This limits the exposed components and user applications. Any absolute URL generated on the server side that points back to the server does not work. This is because the server is hidden behind a path-rewriting reverse proxy that hides the unique URL path prefix from the component or user application.

For example, when the user accesses the hypothetical [https://codeready-<openshift_deployment_name>.-<domain_name>/component-prefix-djh3d/app/index.php] URL, the application sees the request coming to `https://internal-host/app/index.php`. If the application used the host in the URL that it generates in its UI, it would not work because the internal host is different from the externally visible host. However, if the application used an absolute path as the URL (for the example above, this would be `/app/index.php`), such URL would still not work. This is because on the outside, such URL does not point to the application, because it is missing the component-specific prefix.

Therefore, only applications that use relative URLs in their UI work with the single-host workspace exposure strategy.

4.4.1.2.2. devfile endpoints: multi-host

**`CHE_INFRA_KUBERNETES_SINGLEHOST_WORKSPACE_DEVFILE__ENDPOINT__EXPOSURE`: 'multi-host'**

This single-host configuration exposes the endpoints on subdomains, for example: `http://serverihzmuqqc-go-cli-server-8080.<che-host>`. These endpoints are exposed on an unsecured HTTP port. A dedicated Ingress or Route is used for such endpoints, even with `gateway` single-host setup.
This configuration limits the usability of previews shown directly in the editor page when CodeReady Workspaces is configured with TLS. Since https pages allow communication only with secured endpoints, users must open their application previews in another browser tab.

4.4.2. Security considerations

This section explains the security impact of using different CodeReady Workspaces workspace exposure strategies.

All the security-related considerations in this section are only applicable to CodeReady Workspaces in multiuser mode. The single user mode does not impose any security restrictions.

4.4.2.1. JSON web token (JWT) proxy

All CodeReady Workspaces plug-ins, editors, and components can require authentication of the user accessing them. This authentication is performed using a JSON web token (JWT) proxy that functions as a reverse proxy of the corresponding component, based on its configuration, and performs the authentication on behalf of the component.

The authentication uses a redirect to a special page on the CodeReady Workspaces server that propagates the workspace and user-specific authentication token (workspace access token) back to the originally requested page.

The JWT proxy accepts the workspace access token from the following places in the incoming requests, in the following order:

1. The token query parameter
2. The Authorization header in the bearer-token format
3. The access_token cookie

4.4.2.2. Secured plug-ins and editors

CodeReady Workspaces users do not need to secure workspace plug-ins and workspace editors (such as Che-Theia). This is because the JWT proxy authentication is transparent to the user and is governed by the plug-in or editor definition in their meta.yaml descriptors.

4.4.2.3. Secured container-image components

Container-image components can define custom endpoints for which the devfile author can require CodeReady Workspaces-provided authentication, if needed. This authentication is configured using two optional attributes of the endpoint:

- **secure** - A boolean attribute that instructs the CodeReady Workspaces server to put the JWT proxy in front of the endpoint. Such endpoints have to be provided with the workspace access token in one of the several ways explained in Section 4.4.2.1, “JSON web token (JWT) proxy”. The default value of the attribute is false.

- **cookiesAuthEnabled** - A boolean attribute that instructs the CodeReady Workspaces server to automatically redirect the unauthenticated requests for current user authentication as described in Section 4.4.2.1, “JSON web token (JWT) proxy”. Setting this attribute to true has security consequences because it makes Cross-site request forgery (CSRF) attacks possible. The default value of the attribute is false.
4.4.2.4. Cross-site request forgery attacks

Cookie-based authentication can make an application secured by a JWT proxy prone to Cross-site request forgery (CSRF) attacks. See the Cross-site request forgery Wikipedia page and other resources to ensure your application is not vulnerable.

4.4.2.5. Phishing attacks

An attacker who is able to create an Ingress or route inside the cluster with the workspace that shares the host with some services behind a JWT proxy, the attacker may be able to create a service and a specially forged Ingress object. When such a service or Ingress is accessed by a legitimate user that was previously authenticated with a workspace, it can lead to the attacker stealing the workspace access token from the cookies sent by the legitimate user’s browser to the forged URL. To eliminate this attack vector, configure OpenShift to disallow setting the host of an Ingress.

4.5. CONFIGURING WORKSPACES NODESELECTOR

This section describes how to configure nodeSelector for Pods of CodeReady Workspaces workspaces.

Procedure

CodeReady Workspaces uses the CHE_WORKSPACE.Pod.NodeSelector environment variable to configure nodeSelector. This variable may contain a set of comma-separated key=value pairs to form the nodeSelector rule, or NULL to disable it.

```
CHE_WORKSPACE.Pod.NodeSelector=disktype=ssd,cpu=xlarge,[key=value]
```

**IMPORTANT**

nodeSelector must be configured during CodeReady Workspaces installation. This prevents existing workspaces from failing to run due to volumes affinity conflict caused by existing workspace PVC and Pod being scheduled in different zones.

To avoid Pods and PVCs to be scheduled in different zones on large, multi-zone clusters, create an additional StorageClass object (pay attention to the allowedTopologies field), which will coordinate the PVC creation process.

Pass the name of this newly created StorageClass to CodeReady Workspaces through the CHE_INFRA.KUBERNETES.PVC.STORAGE.CLASS.NAME environment variable. A default empty value of this variable instructs CodeReady Workspaces to use the cluster’s default StorageClass.

4.6. CONFIGURING RED HAT CODEREADY WORKSPACES SERVER HOSTNAME

This procedure describes how to configure Red Hat CodeReady Workspaces to use custom hostname.

Prerequisites

- The oc tool is available.
- The certificate and the private key files are generated.
IMPORTANT

To generate the pair of private key and certificate the same CA must be used as for other Red Hat CodeReady Workspaces hosts.

IMPORTANT

Ask a DNS provider to point the custom hostname to the cluster ingress.

Procedure

1. Pre-create a project for CodeReady Workspaces:

   $ oc create project workspaces

2. Create a tls secret:

   $ oc create secret tls ${secret} \
   --key ${key_file} \
   --cert ${cert_file} \
   -n workspaces

   1. The tls secret name
   2. A file with the private key
   3. A file with the certificate

3. Set the following values in the Custom Resource:

   spec:
   server:
   cheHost: <hostname>  
   cheHostTLSSecret: <secret>

   1. Custom Red Hat CodeReady Workspaces server hostname
   2. The tls secret name

4. If CodeReady Workspaces has been already deployed and CodeReady Workspaces reconfiguring to use a new CodeReady Workspaces hostname is required, log in using RH-SSO and select the codeready-public client in the CodeReady Workspaces realm and update Validate Redirect URIs and Web Origins fields with the value of the CodeReady Workspaces hostname.
### 4.7. CONFIGURING LABELS FOR OPENSHIFT INGRESS

This procedure describes how to configure labels for OpenShift Ingress to organize and categorize (scope and select) objects.

**Prerequisites**

- The `oc` tool is available.
- An instance of CodeReady Workspaces running in OpenShift.

**IMPORTANT**

Use comma to separate labels: `key1=value1,key2=value2`

**Procedure**

1. To configure labels for OpenShift Ingress update the Custom Resource with the following commands:

   ```bash
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p 
   ```

### 4.8. CONFIGURING LABELS FOR OPENSHIFT ROUTE

This procedure describes how to configure labels for OpenShift Route to organize and categorize (scope and select) objects.

**Prerequisites**
The oc tool is available.

An instance of CodeReady Workspaces running in OpenShift.

**IMPORTANT**

Use comma to separate labels: `key1=value1,key2=value2`

**Procedure**

1. To configure labels for OpenShift Route update the Custom Resource with the following commands:

   ```bash
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p '[["op": "replace", "path": "/spec/server/cheServerRoute/labels", "value": 
   "<labels for a codeready-workspaces server route>"}]'
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p '[["op": "replace", "path": "/spec/auth/identityProviderRoute/labels", "value": 
   "<labels for a RH-SSO route>"}]'
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p '[["op": "replace", "path": "/spec/server/pluginRegistryRoute/labels", "value": 
   "<labels for a plugin registry route>"}]'
   
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p '[["op": "replace", "path": "/spec/server/devfileRegistryRoute/labels", "value": 
   "<labels for a devfile registry route>"}]'
   ```

4.9. DEPLOYING CODEREADY WORKSPACES WITH SUPPORT FOR GIT REPOSITORIES WITH SELF-SIGNED CERTIFICATES

This procedure describes how to configure CodeReady Workspaces for deployment with support for Git operations on repositories that use self-signed certificates.

**Prerequisites**

- Git version 2 or later

**Procedure**

Configuring support for self-signed Git repositories.

1. Create a new configMap with details about the Git server:

   ```bash
   $ oc create configmap che-git-self-signed-cert --from-file=ca.crt --from-literal=githost=<host:port> -n {prod-namespace}
   ```

   In the command, substitute `<host:port>` for the host and port of the HTTPS connection on the Git server (optional).
NOTE

- When `githost` is not specified, the given certificate is used for all HTTPS repositories.
- The certificate file must be named `ca.crt`.
- Certificate files are typically stored as Base64 ASCII files, such as `.pem`, `.crt`, `.ca-bundle`. Also, they can be encoded as binary data, for example, `.cer`. All Secrets that hold certificate files should use the Base64 ASCII certificate rather than the binary data certificate.

2. Configure the workspace exposure strategy:
   Update the `gitSelfSignedCert` property. To do that, execute:
   
   ```bash
   $ oc patch checluster codeready-workspaces -n workspaces --type=json \\
   -p '[{"op": "replace", "path": "/spec/server/gitSelfSignedCert", "value": true}]'
   ```

3. Create and start a new workspace. Every container used by the workspace mounts a special volume that contains a file with the self-signed certificate. The repository's `.git/config` file contains information about the Git server host (its URL) and the path to the certificate in the `http` section (see Git documentation about `git-config`). For example:

   ```
   [http "https://10.33.177.118:3000"]
   sslCAInfo = /etc/che/git/cert/ca.crt
   ```

4.10. INSTALLING CODEREADY WORKSPACES USING STORAGE CLASSES

To configure CodeReady Workspaces to use a configured infrastructure storage, install CodeReady Workspaces using storage classes. This is especially useful when a user wants to bind a persistent volume provided by a non-default provisioner. To do so, a user binds this storage for the CodeReady Workspaces data saving and sets the parameters for that storage. These parameters can determine the following:

- A special host path
- A storage capacity
- A volume mod
- Mount options
- A file system
- An access mode
- A storage type
- And many others

CodeReady Workspaces has two components that require persistent volumes to store data:

- A PostgreSQL database.
A CodeReady Workspaces workspaces. CodeReady Workspaces workspaces store source code using volumes, for example `/projects` volume.

**NOTE**

CodeReady Workspaces workspaces source code is stored in the persistent volume only if a workspace is not ephemeral.

**Persistent volume claims facts:**

- CodeReady Workspaces does not create persistent volumes in the infrastructure.
- CodeReady Workspaces uses persistent volume claims (PVC) to mount persistent volumes.
- The CodeReady Workspaces server creates persistent volume claims.
  A user defines a storage class name in the CodeReady Workspaces configuration to use the storage classes feature in the CodeReady Workspaces PVC. With storage classes, a user configures infrastructure storage in a flexible way with additional storage parameters. It is also possible to bind a static provisioned persistent volumes to the CodeReady Workspaces PVC using the class name.

**Procedure**

Use CheCluster Custom Resource definition to define storage classes:

1. Define storage class names
   
   To do so, use one of the following methods:

   - **Use arguments for the `server:deploy` command**
     
     i. Provide the storage class name for the PostgreSQL PVC
        Use the `crwctl server:deploy` command with the `--postgres-pvc-storage-class-name` flag:

        ```
        $ crwctl server:deploy -m -p minikube -a operator --postgres-pvc-storage-class-name=postgress-storage
        ```

     ii. Provide the storage class name for the CodeReady Workspaces workspaces
        Use the `server:deploy` command with the `--workspace-pvc-storage-class-name` flag:

        ```
        $ crwctl server:deploy -m -p minikube -a operator --workspace-pvc-storage-class-name=workspace-storage
        ```

        For CodeReady Workspaces workspaces, the storage class name has different behavior depending on the workspace PVC strategy.

        **NOTE**

        `postgres-pvc-storage-class-name=postgress-storage` and `workspace-pvc-storage-class-name` work for the Operator installer and the Helm installer.

   - **Define storage class names using a Custom Resources YAML file:**
i. Create a YAML file with Custom Resources defined for the CodeReady Workspaces installation.

ii. Define fields: \texttt{spec\#storage\#postgresPVCStorageClassName} and \texttt{spec\#storage\#workspacePVCStorageClassName}.

```yaml
apiVersion: org.eclipse.che/v1
kind: CheCluster
metadata:
  name: codeready-workspaces
spec:
  # ...
  storage:
    # ...
    # keep blank unless you need to use a non default storage class for PostgreSQL PVC
    postgresPVCStorageClassName: 'postgres-storage'
    # ...
    # keep blank unless you need to use a non default storage class for workspace PVC(s)
    workspacePVCStorageClassName: 'workspace-storage'
    # ...
```

iii. Start the codeready-workspaces server with your Custom Resources:

```bash
$ crwctl server:deploy -m -p minikube -a operator --che-operator-cr-yaml=/path/to/custom/che/resource/org_v1_che_cr.yaml
```

2. Configure CodeReady Workspaces to store workspaces in one persistent volume and a PostgreSQL database in the second one:

a. Modify your Custom Resources YAML file:

- Set \texttt{pvcStrategy} as \texttt{common}.

- Configure CodeReady Workspaces to start workspaces in a single project.

- Define storage class names for \texttt{postgresPVCStorageClassName} and \texttt{workspacePVCStorageClassName}.

- Example of the YAML file:

```yaml
apiVersion: org.eclipse.che/v1
kind: CheCluster
metadata:
  name: codeready-workspaces
spec:
  server:
    # ...
    workspaceNamespaceDefault: 'che'
    # ...
  storage:
    # ...
    # Defaults to common
  pvcStrategy: 'common'
  # ...
```
b. Start the codeready-workspaces server with your Custom Resources:

```
$ crwctl server:deploy -m -p minikube -a operator --che-operator-cr-yaml=/path/to/custom/che/resource/org_v1_che_cr.yaml
```

3. Bind static provisioned volumes using class names:

a. Define the persistent volume for a PostgreSQL database:

```
# che-postgres-pv.yaml
apiVersion: v1
kind: PersistentVolume
metadata:
  name: postgres-pv-volume
labels:
  type: local
spec:
  storageClassName: postgres-storage
  capacity:
    storage: 1Gi
  accessModes:
    - ReadWriteOnce
  hostPath:
    path: "/data/che/postgres"
```

b. Define the persistent volume for a CodeReady Workspaces workspace:

```
# che-workspace-pv.yaml
apiVersion: v1
kind: PersistentVolume
metadata:
  name: workspace-pv-volume
labels:
  type: local
spec:
  storageClassName: workspace-storage
  capacity:
    storage: 10Gi
  accessModes:
    - ReadWriteOnce
  hostPath:
    path: "/data/che/workspace"
```

c. Bind the two persistent volumes:

```
$ oc apply -f che-workspace-pv.yaml -f che-postgres-pv.yaml
```
NOTE

You must provide valid file permissions for volumes. You can do it using storage class configuration or manually. To manually define permissions, define `storageClass#mountOptions uid` and `gid`. PostgreSQL volume requires `uid=26` and `gid=26`.

4.11. CONFIGURING STORAGE TYPES

Red Hat CodeReady Workspaces supports three types of storage with different capabilities:

- Persistent
- Ephemeral
- Asynchronous

4.11.1. Persistent storage

Persistent storage allows storing user changes directly in the mounted Persistent Volume. User changes are kept safe by the OpenShift infrastructure (storage backend) at the cost of slow I/O, especially with many small files. For example, Node.js projects tend to have many dependencies and the `node_modules/` directory is filled with thousands of small files.

NOTE

I/O speeds vary depending on the Storage Classes configured in the environment.

Persistent storage is the default mode for new workspaces. To make this setting visible in workspace configuration, add the following to the devfile:

```yaml
attributes:
persistVolumes: 'true'
```

4.11.2. Ephemeral storage

Ephemeral storage saves files to the `emptyDir` volume. This volume is initially empty. When a Pod is removed from a node, the data in the `emptyDir` volume is deleted forever. This means that all changes are lost on workspace stop or restart.

IMPORTANT

To save the changes, commit and push to the remote before stopping an ephemeral workspace.

Ephemeral mode provides faster I/O than persistent storage. To enable this storage type, add the following to workspace configuration:

```yaml
attributes:
persistVolumes: 'false'
```
Table 4.21. Comparison between I/O of ephemeral (emptyDir) and persistent modes on AWS EBS

<table>
<thead>
<tr>
<th>Command</th>
<th>Ephemeral</th>
<th>Persistent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clone Red Hat CodeReady Workspaces</td>
<td>0 m 19 s</td>
<td>1 m 26 s</td>
</tr>
<tr>
<td>Generate 1000 random files</td>
<td>1 m 12 s</td>
<td>44 m 53 s</td>
</tr>
</tbody>
</table>

### 4.11.3. Asynchronous storage

**NOTE**

Asynchronous storage is an experimental feature.

Asynchronous storage is a combination of persistent and ephemeral modes. The initial workspace container mounts the `emptyDir` volume. Then a backup is performed on workspace stop, and changes are restored on workspace start. Asynchronous storage provides fast I/O (similar to ephemeral mode), and workspace project changes are persisted.

Synchronization is performed by the `rsync` tool using the `SSH` protocol. When a workspace is configured with asynchronous storage, the `workspace-data-sync` plug-in is automatically added to the workspace configuration. The plug-in runs the `rsync` command on workspace start to restore changes. When a workspace is stopped, it sends changes to the permanent storage.

For relatively small projects, the restore procedure is fast, and project source files are immediately available after Che-Theia is initialized. In case `rsync` takes longer, the synchronization process is shown in the Che-Theia status-bar area. ([Extension in Che-Theia repository](#)).

### Asynchronous mode has the following limitations:

- Supports only the `common` PVC strategy
- Supports only the `per-user` project strategy
- Only one workspace can be running at a time

To configure asynchronous storage for a workspace, add the following to workspace configuration:

```yaml
attributes:
  asyncPersist: 'true'
  persistVolumes: 'false'
```
4.11.4. Configuring storage type defaults for CodeReady Workspaces dashboard

Use the following two `che.properties` to configure the default client values in CodeReady Workspaces dashboard:

**che.workspace.storage.available_types**
- Defines available values for storage types that clients like the dashboard propose for users during workspace creation or update. Available values: **persistent, ephemeral, and async**. Separate multiple values by commas. For example:

  ```
  che.workspace.storage.available_types=persistent,ephemeral,async
  ```

**che.workspace.storage.preferred_type**
- Defines the default value for storage type that clients like the dashboard propose for users during workspace creation or update. The **async** value is not recommended as the default type because it is experimental. For example:

  ```
  che.workspace.storage.preferred_type=persistent
  ```

The Storage Type drop-down menu is available on the **Create Custom Workspace** page of the user dashboard:
Create Custom Workspace

Get Started  Custom Workspace

Namespace  che
Workspace Name  will be auto-generated with the prefix 'wksp-custom-
Storage Type  Select a storage template

Devfile
Select a devfile from a template
Select a devfile template

```yaml
metadata:
  generateName: wksp-custom-
  apiVersion: 1.0.0
```

Create & Open

**Persistent Storage** is slow I/O but persistent.

**Ephemeral Storage** allows for faster I/O but may have limited storage and is not persistent.

Experimental feature

**Asynchronous Storage** is combination of Ephemeral and Persistent storages. It allows for faster I/O and keeps your changes, it does backup the workspace on stop and restores it on start.
4.11.5. Idling asynchronous storage Pods

CodeReady Workspaces can shut down the Asynchronous Storage Pod when not used for a configured period of time.

Use these configuration properties to adjust the behavior:

- `che.infra.kubernetes.async.storage.shutdown_timeout_min` Defines the idle time after which the asynchronous storage Pod is stopped following the stopping of the last active workspace. The default value is 120 minutes.

- `che.infra.kubernetes.async.storage.shutdown_check_period_min` Defines the frequency with which the asynchronous storage Pod is checked for idleness. The default value is 30 minutes.

4.12. IMPORTING UNTRUSTED TLS CERTIFICATES TO CODEREADY WORKSPACES

Internal communications between CodeReady Workspaces components are, by default, encrypted with TLS. Communications of CodeReady Workspaces components with external services such as proxies, source code repositories, identity providers may require TLS tool. Those communications require the use of SSL certificates signed by trusted Certificate Authorities.

When the certificates used by CodeReady Workspaces components or by an external service are signed by an untrusted CA it can be necessary to import the CA certificate in the CodeReady Workspaces installation, so that every CodeReady Workspaces component will consider them as signed by a trusted CA.

Typical cases that may require this addition are:

- when the underlying OpenShift cluster uses TLS certificates signed by a CA that is not trusted,
- when CodeReady Workspaces server or workspace components connect to external services such as RH-SSO or a Git server that use TLS certificates signed by an untrusted CA.

To store those certificates, CodeReady Workspaces uses a dedicated ConfigMap. Its default name is `ca-certs` but CodeReady Workspaces allows configuring its name.

**NOTE**

When the cluster contains cluster-wide trusted CA certificates added through the cluster-wide-proxy configuration, CodeReady Workspaces Operator detects them and automatically injects them into this ConfigMap:

- CodeReady Workspaces automatically labels the ConfigMap with the `config.openshift.io/inject-trusted-cabundle="true"` label.
- Based on this annotation, OpenShift automatically injects the cluster-wide trusted CA certificates inside the `ca-bundle.crt` key of ConfigMap

4.12.1. At CodeReady Workspaces installation time

**Prerequisites**

- The `oc` tool is available.
You are ready to create **CheCluster** custom resource.

**Procedure**

1. Save the certificates you need to import, to a local file system.

   **CAUTION**
   
   - Certificate files are typically stored as Base64 ASCII files, such as `.pem`, `.crt`, `.ca-bundle`. But, they can also be binary-encoded, for example, as `.cer` files. All Secrets that hold certificate files should use the Base64 ASCII certificate rather than the binary-encoded certificate.
   
   - CodeReady Workspaces already uses some reserved file names to automatically inject certificates into the ConfigMap, so you should avoid using the following reserved file names to save your certificates:
     - `ca-bundle.crt`
     - `ca.crt`

2. Create a new ConfigMap with the required TLS certificates:

   ```
   $ oc create configmap ca-certs --from-file=<certificate-file-path> -n=<crw-namespace-name>
   ```

   To apply more than one certificate, add another `--from-file=<certificate-file-path>` option to the above command.

3. During the installation process, when creating the **CheCluster** custom resource, take care of configuring the right name for the created ConfigMap.

   For a CodeReady Workspaces **Operator** deployment, ensure you add the `spec.server.ServerTrustStoreConfigMapName` field with the name of the ConfigMap, to the **CheCluster** Custom Resource you will create during the installation:

   ```
   spec:
   server:
    ...
   spec.server.ServerTrustStoreConfigMapName: ca-certs
   ```

**4.12.2. On already-running CodeReady Workspaces installations**

**Prerequisites**

- The **oc** tool is available.

- You should first gather the name of the ConfigMap used to import certificates:

  On instances of CodeReady Workspaces deployed with the CodeReady Workspaces **Operator**, retrieve the name of the ConfigMap by reading the `spec.server.ServerTrustStoreConfigMapName` **CheCluster** Custom Resource property:

  ```
  $ oc get checluster codeready-workspaces -n <crw-namespace-name> -o jsonpath={.spec.server.serverTrustStoreConfigMapName}
  ```
NOTE

If the existing installation did not define any name for the ConfigMap, just use `ca-certs`.

**Procedure**

1. Save the certificates you need to import, to a local file system.

**CAUTION**

- Certificate files are typically stored as Base64 ASCII files, such as `.pem`, `.crt`, `.ca-bundle`. But, they can also be binary-encoded, for example, as `.cer` files. All Secrets that hold certificate files should use the Base64 ASCII certificate rather than the binary-encoded certificate.

- CodeReady Workspaces already uses some reserved file names to automatically inject certificates into the ConfigMap, so you should avoid using the following reserved file names to save your certificates:
  - `ca-bundle.crt`
  - `ca.crt`

2. Add the required TLS certificates in the ConfigMap:

   ```bash
   $ oc create configmap <config-map-name> --from-file=<certificate-file-path> -n=<crw-namespace-name> -o yaml --dry-run | oc apply -f -
   
   To apply more than one certificate, add another `--from-file=<certificate-file-path>` option to the above command.
   
3. Configure the CodeReady Workspaces installation to use the ConfigMap:
   
   For a CodeReady Workspaces Operators deployment:
   
   1. Edit the `spec.server.ServerTrustStoreConfigMapName` Custom Resource property to match the name of the ConfigMap:

   ```bash
   $ oc patch checluster codeready-workspaces -n <crw-namespace-name> --type=json -p '{"op": "replace", "path": "/spec/server/serverTrustStoreConfigMapName", "value": "<config-map-name>"}"
   
   4. Restart the CodeReady Workspaces Operator, the CodeReady Workspaces server and RH-SSO to load the new certificates:

   ```bash
   $ oc rollout restart -n <crw-namespace-name> deployment/codeready-workspaces-operator
   $ oc rollout restart -n <crw-namespace-name> deployment/codeready-workspaces/keycloak
   $ oc rollout restart -n <crw-namespace-name> deployment/codeready-workspaces
   ```

**NOTE**

Restarting the CodeReady Workspaces components is not required anymore on CodeReady Workspaces 2.5.0 and higher.
4.12.3. Verification at the CodeReady Workspaces installation level

If you added the certificates without error, the CodeReady Workspaces server starts and obtains RHSSO configuration over https. Otherwise here is a list of things to verify:

- In case of a CodeReady Workspaces Operator deployment, the CheCluster attribute serverTrustStoreConfigMapName value matches the name of the ConfigMap. Get the value using the following command:

  ```bash
  $ oc get -o json checluster/codeready-workspaces -n <crw-namespace-name> | jq .spec.server.serverTrustStoreConfigMapName
  ```

- CodeReady Workspaces Pod Volumes list contains one Volume that uses the ConfigMap as data-source. To get the list of Volumes of the CodeReady Workspaces Pod:

  ```bash
  $ oc get pod -o json <codeready-workspaces-pod-name> -n <crw-namespace-name> | jq .spec.volumes
  ```

- CodeReady Workspaces mounts certificates in folder /public-certs/ of the CodeReady Workspaces server container. This command returns the list of files in that folder:

  ```bash
  $ oc exec -t <codeready-workspaces-pod-name> -n <crw-namespace-name> -- ls /public-certs/
  ```

- In the CodeReady Workspaces server logs there is a line for every certificate added to the Java truststore, including configured CodeReady Workspaces certificates.

  ```bash
  $ oc logs <codeready-workspaces-pod-name> -n <crw-namespace-name>
  (...)  
  Found a custom cert. Adding it to java trust store based on /usr/lib/jvm/java-1.8.0/jre/lib/security/cacerts
  (...)  
  ```

- CodeReady Workspaces server Java truststore contains the certificates. The certificates SHA1 fingerprints are among the list of the SHA1 of the certificates included in the truststore returned by the following command:

  ```bash
  $ oc exec -t <codeready-workspaces-pod-name> -n workspaces -- keytool -list -keystore /home/jboss/cacerts 
  Your keystore contains 141 entries
  (...)  
  ```

To get the SHA1 hash of a certificate on the local filesystem:

  ```bash
  $ openssl x509 -in <certificate-file-path> -fingerprint -noout
  ```

4.12.4. Verification at the workspace level

- Start a workspace, get the OpenShift namespace in which it has been created, and wait for it to be started
- Get the name of the workspace Pod with the following command:

```
$ oc get pods -o=jsonpath='{.items[0].metadata.name}' -n <workspace namespace> | grep '^workspace.*'
```

- Get the name of the theia IDE container in the workspace POD with the following command:

```
$ oc get -o json pod <workspace pod name> -n <workspace namespace> | \ 
jq -r '.spec.containers[] | select(.name | startswith("theia-ide")).name'
```

- Look for a `ca-certs` ConfigMap that should have been created inside the workspace namespace:

```
$ oc get cm ca-certs <workspace namespace>
```

- Check that the entries in the `ca-certs` config map contain all the additional entries you added in the certificate ConfigMap at the CodeReady Workspaces installation level, in addition to the the `ca-bundl.crt` entry which is a reserved one:

```
$ oc get cm ca-certs -n <workspace namespace> -o json | jq -r '.data | keys[]'
```

- Make sure that the `ca-certs` ConfigMap has been added as a volume in the workspace Pod:

```
$ oc get -o json pod <workspace pod name> -n <workspace namespace> | \ 
jq '.spec.volumes[] | select(.configMap.name == "ca-certs")'
```

- Confirm that the volume has been mounted into containers, especially in the Theia IDE container:

```
$ oc get -o json pod <workspace pod name> -n <workspace namespace> | \ 
jq '.spec.containers[] | select(.name == "<theia ide container name>").volumeMounts[] | \ 
select(.name == "che-self-signed-certs")'
```

- Inspect `/public-certs` folder on the Theia IDE container and check that its contents match the list of entries in the `ca-certs` ConfigMap:

```
$ oc exec <workspace pod name> -c <theia ide container name> -n <workspace namespace> -- ls /public-certs
```

```
cabundle.crt
manually-added-certificate.crt
```
4.13. SWITCHING BETWEEN EXTERNAL AND INTERNAL WAYS IN INTER-COMPONENT COMMUNICATION

The communication between Red Hat CodeReady Workspaces components uses the internal cluster host name. In following situations, instead, use external OpenShift Route in inter-component communication:

- The OpenShift instance is running multiple CodeReady Workspaces instance.
- The environment is restricting communication between namespaces.

**Prerequisites**

- The `oc` tool is available.
- An instance of CodeReady Workspaces running in `{platform-name}`.

**Procedure**

1. To use external OpenShift Route in inter-component communication:

   ```bash
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p \\
   
   
   
   
   
   
   ```

2. To use internal cluster host name in inter-component communication:

   ```bash
   $ oc patch checluster codeready-workspaces -n workspaces --type=json -p \\
   
   
   
   
   ```

The following procedure is relevant for all CodeReady Workspaces instances with the OpenShift OAuth service enabled.

When a user with pre-created namespaces logs in to Red Hat CodeReady Workspaces Dashboard for the first time, a page allowing the user to update account information is displayed. It is possible to change the username, but choosing a username that doesn’t match the OpenShift username, prevents the user’s workspaces from running. This is caused by CodeReady Workspaces attempts to use a non-existing namespace, the name of which is derived from a user OpenShift username, to create a workspace. To prevent this, modify the RH-SSO settings using the steps below.

**Prerequisites**

- An instance of CodeReady Workspaces running in OpenShift.
- A user is logged in to the RH-SSO service.

**Procedure**
After changing a username, set the **Login Theme** option to **readonly**.

1. In the main **Configure** menu on the left, select **Realm Settings**.

2. Navigate to the **Themes** tab.

3. In the **Login Theme** field, select the **codeready-workspaces-username-readonly** option and click the **Save** button to apply the changes.
CHAPTER 5. UPGRADING CODEREADY WORKSPACES

This chapter describes how to upgrade a CodeReady Workspaces instance from version 2.4 to CodeReady Workspaces 2.5.

The method used to install the CodeReady Workspaces instance determines the method to proceed with for the upgrade:

- Section 5.1, “Upgrading CodeReady Workspaces using OperatorHub”
- Section 5.2, “Upgrading CodeReady Workspaces using the CLI management tool”
- Section 5.3, “Upgrading CodeReady Workspaces using the CLI management tool in restricted environment”

5.1. UPGRADING CODEREADY WORKSPACES USING OPERATORHUB

This section describes how to upgrade from a previous minor version using the Operator from OperatorHub in the OpenShift web console.

Prerequisites

- An administrator account on an OpenShift instance.
- An instance of a previous minor version of CodeReady Workspaces, installed using the Operator from OperatorHub on the same instance of OpenShift.

Procedure

1. Open the OpenShift web console.
2. Navigate to the Operators → Installed Operators section.
3. Click Red Hat CodeReady Workspaces in the list of the installed Operators.
4. Navigate to the Subscription tab and enable the following options:
   - Channel: latest
   - Approval: Automatic

Verification steps

1. Navigate to the CodeReady Workspaces instance.
2. The 2.5 version number is visible at the bottom of the page.

5.2. UPGRADING CODEREADY WORKSPACES USING THE CLI MANAGEMENT TOOL

This section describes how to upgrade from previous minor version using the CLI management tool.

Prerequisites
5.3. UPGRADING CODEREADY WORKSPACES USING THE CLI MANAGEMENT TOOL IN RESTRICTED ENVIRONMENT

This section describes how to upgrade Red Hat CodeReady Workspaces using the CLI management tool in restricted environment. The upgrade path supports minor version update, from CodeReady Workspaces version 2.4 to version 2.5.

Prerequisites

- An administrative account on an instance of OpenShift.

- A running instance version 2.4 of Red Hat CodeReady Workspaces, installed using the CLI management tool on the same instance of OpenShift, with the crwctl --installer operator method, in the `<workspaces>` project. See Section 3.3, “Installing CodeReady Workspaces in a restricted environment”.

- The crwctl 2.5 management tool is available. See Section 3.2.1, “Installing the crwctl CLI management tool”.

5.3.1. Understanding network connectivity in restricted environments

### Procedure

1. In all running workspaces in the CodeReady Workspaces 2.4 instance, save and push changes back to the Git repositories.

2. Shut down all workspaces in the CodeReady Workspaces 2.4 instance.

3. Run the following command:

   ```
   $ crwctl server:update -n `<workspaces>`
   ```

   **NOTE**

   For slow systems or internet connections, add the `--k8spodwaittimeout=1800000` flag option to the `crwctl server:update` command to extend the Pod timeout period to 1800000 ms or longer.

### Verification steps

1. Navigate to the CodeReady Workspaces instance.

2. The 2.5 version number is visible at the bottom of the page.
CodeReady Workspaces requires that each OpenShift Route created for CodeReady Workspaces is accessible from inside the OpenShift cluster. These CodeReady Workspaces components have a OpenShift Route: `codeready-workspaces-server`, `keycloak`, `devfile-registry`, `plugin-registry`.

Consider the network topology of the environment to determine how best to accomplish this.

**Example 5.1. Network owned by a company or an organization, disconnected from the public Internet**

The network administrators must ensure that it is possible to route traffic bound from the cluster to OpenShift Route host names.

**Example 5.2. Private subnetwork in a cloud provider**

Create a proxy configuration allowing the traffic to leave the node to reach an external-facing Load Balancer.

### 5.3.2. Preparing an private registry

**Prerequisites**

- The `oc` tool is available.
- The `skopeo` tool, version 0.1.40 or later, is available.
- The `podman` tool is available.
- An image registry accessible from the OpenShift cluster and supporting the format of the V2 image manifest, schema version 2. Ensure you can push to it from a location having, at least temporarily, access to the internet.

#### Table 5.1. Placeholders used in examples

<table>
<thead>
<tr>
<th><code>&lt;source-image&gt;</code></th>
<th>Full coordinates of the source image, including registry, organization, and digest.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;target-registry&gt;</code></td>
<td>Host name and port of the target container-image registry.</td>
</tr>
<tr>
<td><code>&lt;target-organization&gt;</code></td>
<td>Organization in the target container-image registry</td>

<td>User name in the target container-image registry.</td>
</tr>
<tr>
<td><code>&lt;target-password&gt;</code></td>
<td>User password in the target container-image registry.</td>
</tr>
</tbody>
</table>

**Procedure**

1. Log into the internal image registry:
$ podman login --username <user> --password <password> <target-registry>

**WARNING**

If you meet an error, such as **x509: certificate signed by unknown authority**, when attempting to push to the internal registry, try one of these workarounds:

- add the OpenShift cluster’s certificate to
  `/etc/containers/certs.d/<target-registry>`

- add the registry as an insecure registry by adding the following lines to
  the Podman configuration file located at
  `/etc/containers/registries.conf`:

  ```
  [registries.insecure]
  registries = ['<target-registry>']
  ```

2. Copy images without changing their digest. Repeat this step for every image in the following table:

   $ skopeo copy --all docker://<source-image> docker://<target-registry>/<target-organization>/<target-image>

**NOTE**

Table 5.2. Understanding the usage of the container-images from the prefix or keyword they include in their name

</tr>
</tbody>
</table>

**Verification steps**

- Verify the images have the same digests:

  ```sh
  $ skopeo inspect docker://<source-image>
  $ skopeo inspect docker://<target-registry>/<target-organization>/<target-image>
  ```

**Additional resources**

- To find the sources of the images list, see the values of the `relatedImages` attribute in the CodeReady Workspaces Operator ClusterServiceVersion sources.

**5.3.3. Upgrading CodeReady Workspaces using the CLI management tool in restricted environment**
This section describes how to upgrade Red Hat CodeReady Workspaces using the CLI management tool in restricted environment.

**Prerequisites**

- An administrative account on an OpenShift instance.
- A running instance version 2.4 of Red Hat CodeReady Workspaces, installed using the CLI management tool on the same instance of OpenShift, with the `crwctl --installer operator` method, in the `<workspaces>` project. See Section 3.3, “Installing CodeReady Workspaces in a restricted environment”.
- Essential container images are available to the CodeReady Workspaces server running in the cluster. See Section 5.3.2, “Preparing an private registry”.
- The `crwctl` 2.5 management tool is available. See Section 3.2.1, “Installing the crwctl CLI management tool”.

**Procedure**

1. In all running workspaces in the CodeReady Workspaces 2.4 instance, save and push changes back to the Git repositories.

2. Stop all workspaces in the CodeReady Workspaces 2.4 instance.

3. Run the following command:

   ```bash
   $ crwctl server:update --che-operator-image=<image-registry>/<organization>/crw-2-rhel8-operator:2.5 -n workspaces
   ```

   - `<image-registry>`: A host name and a port of the container-image registry accessible in the restricted environment.
   - `<organization>`: An organization of the container-image registry. See: Section 5.3.2, “Preparing an private registry”.

**Verification steps**

1. Navigate to the CodeReady Workspaces instance.

2. The 2.5 version number is visible at the bottom of the page.

**NOTE**

For slow systems or internet connections, add the `--k8spodwaittimeout=1800000` flag option to the `crwctl server:update` command to extend the Pod timeout period to 1800000 ms or longer.
CHAPTER 6. UNINSTALLING CODEREADY WORKSPACES

This section describes uninstallation procedures for Red Hat CodeReady Workspaces. The uninstallation process leads to a complete removal of CodeReady Workspaces-related user data. The method previously used to install the CodeReady Workspaces instance determines the uninstallation method.

- For CodeReady Workspaces installed using OperatorHub, for the OpenShift Web Console method see Section 6.1, "Uninstalling CodeReady Workspaces after OperatorHub installation using the OpenShift web console".

- For CodeReady Workspaces installed using OperatorHub, for the CLI method see Section 6.2, "Uninstalling CodeReady Workspaces after OperatorHub installation using OpenShift CLI".

- For CodeReady Workspaces installed using crwctl, see Section 6.3, "Uninstalling CodeReady Workspaces after crwctl installation".

6.1. UNINSTALLING CODEREADY WORKSPACES AFTER OPERATORHUB INSTALLATION USING THE OPENSSHIFT WEB CONSOLE

This section describes how to uninstall CodeReady Workspaces from a cluster using the OpenShift Administrator Perspective main menu.

Prerequisites

- CodeReady Workspaces was installed on an OpenShift cluster using OperatorHub.

Procedure

1. Navigate to the OpenShift web console and select the Administrator Perspective.

2. In the Home > Projects section, navigate to the project containing the CodeReady Workspaces instance.

   NOTE
   
   The default project name is <workspaces>.

3. In the Operators > Installed Operators section, click Red Hat CodeReady Workspaces in the list of installed operators.

4. In the Red Hat CodeReady Workspaces Cluster tab, click the displayed Red Hat CodeReady Workspaces Cluster, and select the Delete cluster option in the Actions drop-down menu on the top right.

   NOTE
   
   The default Red Hat CodeReady Workspaces Cluster name is <red-hat-codeready-workspaces>.

5. In the Operators > Installed Operators section, click Red Hat CodeReady Workspaces in the list of installed operators and select the Uninstall Operator option in the Actions drop-down menu on the top right.
6. In the **Home > Projects** section, navigate to the project containing the CodeReady Workspaces instance, and select the **Delete Project** option in the **Actions** drop-down menu on the top right.

### 6.2. UNINSTALLING CODEREADY WORKSPACES AFTER OPERATORHUB INSTALLATION USING OPENSFiGHt CLI

This section provides instructions on how to uninstall a CodeReady Workspaces instance using `oc` commands.

**Prerequisites**

- CodeReady Workspaces was installed on an OpenShift cluster using OperatorHub.
- The `oc` tool is available.

**Procedure**

The following procedure provides command-line outputs as examples. Note that output in the user terminal may differ.

To uninstall a CodeReady Workspaces instance from a cluster:

1. Sign in to the cluster:
   
   ```
   $ oc login -u <username> -p <password> <cluster_URL>
   ```

2. Switch to the project where the CodeReady Workspaces instance is deployed:
   
   ```
   $ oc project <codeready-workspaces_project>
   ```

3. Obtain the CodeReady Workspaces cluster name. The following shows a cluster named **red-hat-codeready-workspaces**:
   
   ```
   $ oc get checluster
   NAME          AGE
   red-hat-codeready-workspaces   27m
   ```

4. Delete the CodeReady Workspaces cluster:
   
   ```
   $ oc delete checluster red-hat-codeready-workspaces
   checluster.org.eclipse.che "red-hat-codeready-workspaces" deleted
   ```

5. Obtain the name of the CodeReady Workspaces cluster service version (CSV) module. The following detects a CSV module named **red-hat-codeready-workspaces.v2.5**:
   
   ```
   $ oc get csv
   NAME              DISPLAY              VERSION               REPLACES                  PHASE
   red-hat-codeready-workspaces.v2.5  Red Hat CodeReady Workspaces  2.5  red-hat-codeready-workspaces.v2.4  Succeeded
   ```

6. Delete the CodeReady Workspaces CSV:
6.3. UNINSTALLING CODEREADY WORKSPACES AFTER CRWCTL INSTALLATION

This section describes how to uninstall an instance of Red Hat CodeReady Workspaces that was installed using the `crwctl` tool.

Prerequisites

- The `crwctl` tool is available.
- The `oc` tool is available.
- The `crwctl` tool installed the CodeReady Workspaces instance on OpenShift.

Procedure

1. Sign in to the OpenShift cluster:

   ```
   $ oc login -u <username> -p <password> <cluster_URL>
   ```

2. Export the name of the CodeReady Workspaces namespace you want to remove:

   ```
   $ export codereadyNamespace=<codeready-namespace-to-remove>
   ```

3. Export your user access token and Keycloak URLs:

   ```
   $ export KEYCLOAK_BASE_URL="http://$(KEYCLOAK_URL)/auth"
   $ export USER_ACCESS_TOKEN=$(curl -X POST $KEYCLOAK_BASE_URL/realms/codeready/protocol/openid-connect/token 
   -H "Content-Type: application/x-www-form-urlencoded" 
   -d "username=admin" 
   -d "password=admin" 
   -d "grant_type=password" 
   -d "client_id=codeready-public" | jq -r .access_token)
   ```

4. Stop the server using the UAT:

   ```
   $ crwctl/bin/crwctl server:stop -n ${codereadyNamespace} --access-token=$USER_ACCESS_TOKEN
   ```

5. Delete your project and your CodeReady Workspaces deployment:

   ```
   $ oc project ${codereadyNamespace}
   $ oc delete deployment codeready-operator
   $ oc delete checluster codeready-workspaces
$ oc delete project ${codereadyNamespace}

6. Verify that the removal was successful by listing the information about the project:

$ oc describe project ${codereadyNamespace}

7. Remove a specified **ClusterRoleBinding**:

$ oc delete clusterrolebinding codeready-operator
