Red Hat Directory Server 12

Importing and exporting data

Procedures on how to populate and extract directory databases
Procedures on how to populate and extract directory databases
Abstract

You can import data into a Directory Server instance when the instance is offline or online. You can also extract data from a Directory Server database.

We appreciate your input on our documentation. Please let us know how we could make it better. To do so:

- For submitting feedback through Jira (account required):
  1. Log in to the Jira website.
  2. Click Create in the top navigation bar.
  3. Enter a descriptive title in the Summary field.
  4. Enter your suggestion for improvement in the Description field. Include links to the relevant parts of the documentation.
  5. Click Create at the bottom of the dialogue.

- For submitting feedback through Bugzilla (account required):
  1. Go to the Bugzilla website.
  2. As the Component, use Documentation.
  3. Fill in the Description field with your suggestion for improvement. Include a link to the relevant part(s) of documentation.
  4. Click Submit Bug.
CHAPTER 1. IMPORTING DATA TO DIRECTORY SERVER

Import data from an LDIF file to a Directory Server database using the command line or the web console.

IMPORTANT

To import data, you must store the LDIF file that you want to import in the /var/lib/dirsrv/slapd-instance_name/ldif/ directory.

1. IMPORTING DATA USING THE COMMAND LINE WHILE THE SERVER IS RUNNING

To import data while the Directory Server instance is running, use the `dsconf backend import` command.

WARNING

When you start an import operation, Directory Server first removes all existing data from the database and, subsequently, imports the data from the LDIF file. Therefore, if the import fails, the server returns no entries or a partial set of entries.

Prerequisites

- The LDIF file permissions allow the `dirsrv` user to read the file.
- The LDIF file to import contains the root suffix entry.
- The suffix and its database, to which you want to import data, exists in the directory.
- The Directory Server instance is running.
- The LDIF file to import uses UTF-8 character set encoding.

Procedure

1. Optional: By default, Directory Server sets the entry update sequence numbers (USNs) of all imported entries to 0. To set an alternative initial USN value, set the `nsslapd-entryusn-import-initval` parameter. For example, to set USN for all imported values to 12345, enter:

   ```bash
   # dsconf -D "cn=Directory Manager" ldap://server.example.com config replace nsslapd-entryusn-import-initval=12345
   ```

2. If you copied the file you want to import to /var/lib/dirsrv/slapd-instance_name/ldif/, reset the SELinux context on that file:

   ```bash
   # restorecon -Rv /var/lib/dirsrv/slapd-instance_name/ldif/example.ldif
   ```

3. Use the `dsconf backend import` command to import data from an LDIF file.
For example, to import the `/var/lib/dirsrv/slapd-instance_name/ldif/example.ldif` file into the `userRoot` database:

```
# dsconf -D "cn=Directory Manager" ldap://server.example.com backend import
userRoot /var/lib/dirsrv/slapd-instance_name/ldif/example.ldif
```

The import task has finished successfully.

4. Search the `/var/log/dirsrv/slapd-instance_name/errors` log for problems during the import.

Verification

- Search for entries under the imported suffix, for example `dc=example,dc=com`:

```
# ldapsearch -D "cn=Directory Manager" -W -H ldap://server.example.com -b "dc=example,dc=com" -s sub -x
```

Additional resources

- Storing suffixes in separate databases
- `nsslapd-entryusn-import-initval`

1.2. IMPORTING DATA USING THE COMMAND LINE WHILE THE SERVER IS OFFLINE

If the Directory Server instance is offline, use the `dsctl ldif2db` command to import data.

**WARNING**

When you start an import operation, Directory Server first removes all existing data from the database and, subsequently, imports the data from the LDIF file. Therefore, if the import fails, the server returns no entries or a partial set of entries.

Prerequisites

- The LDIF file permissions allow the `dirsrv` user to read the file.
- The LDIF file to import contains the root suffix entry.
- The suffix and its database, to which you want to import data, exists in the directory.
- The Directory Server instance is not running.
- The LDIF file to import uses UTF-8 character set encoding.

Procedure
1. Optional: By default, Directory Server sets the entry update sequence numbers (USNs) of all imported entries to 0. To set an alternative initial USN value, set the `nsslapd-entryusn-import-initval` parameter. For example, to set USN for all imported values to 12345, enter:

```
# dsconf -D "cn=Directory Manager" ldap://server.example.com config replace nsslapd-entryusn-import-initval=12345
```

2. If you copied the file you want to import to `/var/lib/dirsrv/slapd-instance_name/ldif/`, reset the SELinux context on that file:

```
# restorecon -Rv /var/lib/dirsrv/slapd-instance_name/ldif/example.ldif
```

3. Use the `dsctl ldif2db` command to import data from an LDIF file. For example, to import the `/var/lib/dirsrv/slapd-instance_name/ldif/example.ldif` file into the `userRoot` database:

```
# dsctl instance_name ldif2db userRoot /var/lib/dirsrv/slapd-instance_name/ldif/example.ldif
```

```
OK group dirsrv exists
OK user dirsrv exists
ldif2db successful
```

4. Search the `/var/log/dirsrv/slapd-instance_name/errors` log for problems during the import.

5. Optional: Start the instance:

```
# dsctl instance_name start
```

**Verification**

- Search for entries under the imported suffix, for example `dc=example,dc=com`:

```
# ldapsearch -D "cn=Directory Manager" -W -H ldap://server.example.com -b "dc=example,dc=com" -s sub -x
```

**Additional resources**

- Storing suffixes in separate databases
- `nsslapd-entryusn-import-initval`
- To display all additional settings that you can use to import data, see the output of the `dsctl ldif2db --help` command.

## 1.3. Importing data using the Web Console while the server is running

Directory Server supports importing data using the web console.
Prerequisites

- The LDIF file permissions allow the `dirsrv` user to read the file.
- The LDIF file to import contains the root suffix entry.
- The suffix and its database, to which you want to import data, exists in the directory.
- The LDIF file is stored in the `/var/lib/dirsrv/slapd-instance_name/ldif/` directory and has the `dirsrv_var_lib_t` SELinux context set.
- The Directory Server instance is running.
- You are logged in to the instance in the web console.
- The LDIF file to import uses UTF-8 character set encoding.

Procedure

1. In the web console, open the **Database** menu.
2. Select the suffix entry.
3. Click **Suffix Tasks**, and select **Initialize Suffix**.
4. Click the **Import** button next to the LDIF file you want to import. If the LDIF file is stored in a directory different than `/var/lib/dirsrv/slapd-instance_name/ldif/`, enter the full path to the file and click the **Import** button.
5. Select **Yes, I am sure**, and click **Initialize Database** to confirm.
6. To check the log for problems during the import, open the **Monitoring → Logging → Errors Log** menu.

Verification

1. Search for entries under the imported suffix, for example `dc=example,dc=com`:

   ```bash
   # ldapsearch -D "cn=Directory Manager" -W -H ldap://server.example.com -b "dc=example,dc=com" -s sub -x
   ```

Additional resources

- Storing suffixes in separate databases
CHAPTER 2. EXPORTING DATA FROM DIRECTORY SERVER

Export data from the Directory Server database to an LDIF file using the command line or the web console.

NOTE
The export operations include only directory data. Export does not include the configuration information (cn=config), schema information (cn=schema), and monitoring information (cn=monitor).

Use the export feature to:

- Copy data to another Directory Server.
- Export data to another application.
- Repopulate databases after a change to the directory topology.
- Split the database.

2.1. EXPORTING DATA USING THE COMMAND LINE WHILE THE SERVER IS RUNNING

To export data while the Directory Server instance is running, use the `dsconf backend export` command.

Prerequisites

- The `dirsrv` user has write permissions in the destination directory.
- The Directory Server instance is running.

Procedure

1. Use the `dsconf backend export` command to export data to an LDIF file. For example, to export the `userRoot` database:

   ```
   # dsconf -D "cn=Directory Manager" ldap://server.example.com backend export userRoot
   The export task has finished successfully
   ```

   By default, `dsconf` stores the export in a file called `instance_name_database_name-time_stamp.ldif` in the `/var/lib/dirsrv/slapd-instance_name/export/` directory. Alternatively, add the `-l file_name` option to the command to specify a different location.

2. Search the `/var/log/dirsrv/slapd-instance_name/errors` log for problems during the export.

Additional resources

- To display all additional settings that you can use to export data, see the output of the `dsconf ldap://server.example.com backend export --help` command.
2.2. EXPORTING DATA USING THE COMMAND LINE WHILE THE SERVER IS OFFLINE

If the Directory Server instance is offline, use the `dsctl db2ldif` command to export data.

Prerequisites

- The `dirsrv` user has write permissions in the destination directory.
- The Directory Server instance is not running.

Procedure

1. Use the `dsctl db2ldif` command to export data to an LDIF file. For example, to export the `userRoot` database to the `/var/lib/dirsrv/slapd-instance_name/example.ldif` file:

   ```
   # dsctl instance_name db2ldif userRoot /var/lib/dirsrv/slapd-instance_name/example.ldif
   OK group dirsrv exists
   OK user dirsrv exists
   ldiffile: /var/lib/dirsrv/slapd-instance_name/example.ldif
   - force a minimal value 512000
   [18/Jul/2021:10:46:03.383101305 +0200] - INFO - ldbm_back_ldbm2ldif - export userRoot: Processed 160 entries (100%).
   [18/Jul/2021:10:46:03.391553963 +0200] - INFO - dblayer_pre_close - All database threads now stopped
   db2ldif successful
   ```

2. Search the `/var/log/dirsrv/slapd-instance_name/errors` log for problems during the export.

3. Optional: Start the instance:

   ```
   # dsctl instance_name start
   ```

Additional resources

- To display all additional settings that you can use to import data, see the output of the `dsctl db2ldif --help` command.
- Importing data using the command line while the server is offline
- Backing up Directory Server

2.3. EXPORTING DATA USING THE WEB CONSOLE WHILE THE SERVER IS RUNNING

Directory Server supports exporting data using the web console.
Prerequisites

- The `dirsrv` user has write permissions in the destination directory.
- The Directory Server instance is running.
- You are logged in to the instance in the web console.

Procedure

1. Open the Database menu.
2. Select the suffix entry.
3. Click Suffix Tasks, and select Export Suffix.
4. Enter the name of the LDIF file in which you want to store the export. Directory Server will store the file in the `/var/lib/dirsrv/slapd-instance_name/ldif/` directory using the specified file name.
5. Click Export Database.
6. To check the log for problems during the export, open the Monitoring → Logging → Errors Log menu.

Additional resources

- Importing data using the web console while the server is running
- Backing up Directory Server

2.4. ADDITIONAL RESOURCES

CHAPTER 3. ENABLING MEMBERS OF A GROUP TO EXPORT DATA AND PERFORMING THE EXPORT AS ONE OF THE GROUP MEMBERS

You can configure that members of a group have permissions to export data. This increases the security because you no longer need to set the credentials of cn=Directory Manager in your scripts. Additionally, you can easily grant and revoke the export permissions by modifying the group.

3.1. ENABLING A GROUP TO EXPORT DATA

Use this procedure to add the cn=export_users,ou=groups,dc=example,dc=com group and enable members of this group to create export tasks.

Procedure

1. Create the cn=export_users,ou=groups,dc=example,dc=com group:

   # dsidxm -D "cn=Directory manager" ldap://server.example.com -b "dc=example,dc=com" group create --cn export_users

2. Add an access control instruction (ACI) that allows members of the cn=export_users,ou=groups,dc=example,dc=com group to create export tasks:

   # ldapadd -D "cn=Directory Manager" -W -H ldap://server.example.com
   dn: cn=config
   changetype: modify
   add: aci
   aci: (target = "ldap:///cn=export,cn=tasks,cn=config")
       (targetattr="*") (version 3.0 ; acl "permission: Allow export_users group to export data" ; allow (add, read, search) groupdn = "ldap:///cn=export_users,ou=groups,dc=example,dc=com" ;)
   -
   add: aci
   aci: (target = "ldap:///cn=config")
   (targetattr = "objectclass || cn || nsslapd-suffix || nsslapd-ldifdir")
   (version 3.0 ; acl "permission: Allow export_users group to access ldifdir attribute" ; allow (read,search) groupdn = "ldap:///cn=export_users,ou=groups,dc=example,dc=com" ;)

3. Create a user:

   a. Create a user account:

      # dsidxm -D "cn=Directory manager" ldap://server.example.com -b "dc=example,dc=com" user create --uid="example" --cn="example" --uidNumber="1000" --gidNumber="1000" --homeDirectory="/home/example/" --displayName="Example User"

   b. Set a password on the user account:
4. Add the `uid=example,ou=People,dc=example,dc=com` user to the `cn=export_users,ou=groups,dc=example,dc=com` group:

```
# dsidm -D "cn=Directory manager" ldap://server.example.com -b "dc=example,dc=com" group add_member export_users uid=example,ou=People,dc=example,dc=com
```

Verification

- Display the ACIs set on the `cn=config` entry:

```
# ldapsearch -o ldif-wrap=no -LLLx -D "cn=directory manager" -W -H ldap://server.example.com -b cn=config aci= " aci -s base
dn: cn=config
aci: (target = "ldap:///cn=export,cn=tasks,cn=config")(targetattr="*")(version 3.0 ; acl "permission: Allow export_users group to export data" ; allow (add, read, search) groupdn = "ldap:///cn=export_users,ou=groups,dc=example,dc=com");
aci: (target = "ldap:///cn=config")(targetattr = "objectclass || cn || nsslapd-suffix || nsslapd-ldifdir")(version 3.0 ; acl "permission: Allow export_users group to access ldifdir attribute" ; allow (read,search) groupdn = "ldap:///cn=export_users,ou=groups,dc=example,dc=com");
...```

3.2. PERFORMING AN EXPORT AS A REGULAR USER

You can perform exports as a regular user instead of `cn=Directory Manager`.

Prerequisites

- You enabled members of the `cn=export_users,ou=groups,dc=example,dc=com` group to export data.
- The user you use to perform the export is a member of the `cn=export_users,ou=groups,dc=example,dc=com` group.

Procedure

- Create a export task using one of the following methods:
  - Using the `dsconf backend export` command:

```
# dsconf -D "uid=example,ou=People,dc=example,dc=com" ldap://server.example.com backend export userRoot
```
  - By manually creating the task:

```
# ldapadd -D "uid=example,ou=People,dc=example,dc=com" -W -H ldap://server.example.com

dn: cn=userRoot-2021_07_23_12:55_00,cn=export,cn=tasks,cn=config
```
Verification

- Verify that the backup was created:

```
# ls -l /var/lib/dirsrv/slapd-instance_name/ldif/*.ldif
total 0
-rw-------. 1 dirsrv dirsrv 10306 Jul 23 12:55 None-userroot-2021_07_23_12_55_00.ldif
...`
```

Additional resources

- Enabling a group to export data
