Red Hat, Red Hat Enterprise Linux, the Shadowman logo, JBoss, OpenShift, Fedora, the Infinity logo, and RHCE are trademarks of Red Hat, Inc., registered in the United States and other countries.

Linux ® is the registered trademark of Linus Torvalds in the United States and other countries.

Java ® is a registered trademark of Oracle and/or its affiliates.

XFS ® is a trademark of Silicon Graphics International Corp. or its subsidiaries in the United States and/or other countries.

MySQL ® is a registered trademark of MySQL AB in the United States, the European Union and other countries.

Node.js ® is an official trademark of Joyent. Red Hat Software Collections is not formally related to or endorsed by the official Joyent Node.js open source or commercial project.

The OpenStack ® Word Mark and OpenStack logo are either registered trademarks/service marks or trademarks/service marks of the OpenStack Foundation, in the United States and other countries and are used with the OpenStack Foundation's permission. We are not affiliated with, endorsed or sponsored by the OpenStack Foundation, or the OpenStack community.

All other trademarks are the property of their respective owners.

Abstract

Red Hat Enterprise Linux minor releases are an aggregation of individual enhancement, security and bug fix errata. The Red Hat Enterprise Linux 6.1 Release Notes documents the major changes made to the Red Hat Enterprise Linux 6 operating system and its accompanying applications for this minor release. Detailed notes on all changes in this minor release are available in the Technical Notes.

Table of Contents

1. HARDWARE SUPPORT	2
2. KERNEL	3
3. DESKTOP	4
4. STORAGE	4
5. AUTHENTICATION AND INTEROPERABILITY	5
6. SECURITY	6
7. INSTALLATION	6
8. COMPILER AND TOOLS	7
9. CLUSTERING	8
10. VIRTUALIZATION	9
11. ENTITLEMENT	10
12. GENERAL UPDATES	11
A. REVISION HISTORY	12

1. HARDWARE SUPPORT

Naming convention for network interfaces

Traditionally, network interfaces in Linux are named *eth[X]*. However, in many cases, these names do not correspond to actual labels on the chassis. Modern server platforms with multiple network adapters can encounter non-deterministic and counterintuitive naming of these network interfaces.

Red Hat Enterprise Linux 6.1 introduces **biosdevname**, an optional convention for naming network interfaces. **biosdevname** assigns names to network interfaces based on their physical location. Note, however that **biosdevname** is disabled by default, except for a limited set of Dell systems.

Refer to the [Red Hat Knowledge Base](#) for further information on using **biosdevname**.

USB 3.0

The implementation of version 3.0 of the Universal Serial Bus (USB 3.0) specification is a fully supported feature in Red Hat Enterprise Linux 6.1. USB 3.0 support was previously considered a Technology Preview in previous releases.

CPU and Memory Hot-add

On Nehalem-EX, hot-adding of CPUs and memory is now fully supported in Red Hat Enterprise Linux 6.1. Note, however that the hardware must also support hot-adding. Damage may occur from an attempt to hot-add CPUs or memory on hardware without support for hot-adding.

Driver Updates

Red Hat Enterprise Linux 6.1 features a wide range of driver updates, including updates to the following device drivers:

- **ixgbe** driver for Intel 10 Gigabit PCI Express Network devices
- **mLx4** driver for Mellanox ConnectX HCA InfiniBand hardware, providing support for Mellanox Connect X2/X3 10GB devices
- **be2net** driver for ServerEngines BladeEngine2 10Gbps network devices
- **bnx2** driver for Broadcom NetXtreme II network devices, including support for Advanced Error Reporting (AER), and PPC support for 5709 devices
- **bnx2i** driver for Broadcom NetXtreme II iSCSI
- **bnx2x** driver for Broadcom Everest network devices
- **igbvf** and **ixgbevf** Virtual Function drivers
- **tg3** driver for Broadcom Tigon3 ethernet devices
- **bfa** driver for Brocade Fibre Channel to PCIe Host Bus Adapters
- **bna** driver for Brocade 10G PCIe ethernet Controllers
- **cxgb4** driver for Chelsio Terminator4 10G Unified Wire Network controllers

- **be2iscsi** driver for ServerEngines BladeEngine 2 Open iSCSI devices
- **be2net** driver for ServerEngines BladeEngine2 10Gbps network devices
- **lpfc** driver for Emulex Fibre Channel HBAs
- **e1000** and **e1000e** drivers for Intel PRO/1000 network devices
- Intel Iron Pond ethernet driver
- Intel Kelsey Peak Wireless driver
- Intel SCU driver
- **megaraid_sas** driver for LSI MegaRAID SAS controllers
- **mpt2sas** driver for the SAS-2 family of adapters from LSI Logic

2. KERNEL

The kernel shipped in Red Hat Enterprise Linux 6.1 includes several hundred bug fixes for and enhancements to the Linux kernel. For details concerning every bug fixed in and every enhancement added to the kernel for this release, refer to the kernel chapter in the [Red Hat Enterprise Linux 6.1 Technical Notes](#).

Control Groups

Control groups are a feature of the Linux kernel introduced in Red Hat Enterprise Linux 6. Each control group is a set of tasks on a system that have been grouped together to better manage their interaction with system hardware. Control groups can be tracked to monitor the system resources that they use. Additionally, system administrators can use control group infrastructure to allow or to deny specific control groups access to system resources such as memory, CPUs (or groups of CPUs), networking, I/O, or the scheduler.

Red Hat Enterprise Linux 6.1 introduces many improvements and updates to control groups, including the ability to throttle block device Input/Output (I/O) to a particular device, either by bytes per second or I/O Per Second (IOPS).

Additionally, integration with libvirt and other userspace tools is provided by the new ability to create hierarchical block device control groups. The new block device control group tunable **group_idle**, provides better throughput with control groups while maintaining fairness.

Red Hat Enterprise Linux 6.1 also introduces the new **autogroup** feature, reducing latencies and allowing for more interactive tasks during CPU intensive workloads. This **cgsnapshot** tool, providing the ability to take a snapshot of the current control group configuration.

NOTE

Control Groups and other resource management features are discussed in detail in the Red Hat Enterprise Linux 6 [Resource Management Guide](#)

Networking updates

Red Hat Enterprise Linux 6.1 introduces support for Receive Packet Steering (RPS) and Receive Flow Steering (RFS). Receive Packet Steering allows incoming network packets to be processed in parallel over multiple CPU cores. Receive Flow Steering chooses the optimal CPU to process network data

intended for a specific application.

kdump

kdump is an advanced crash dumping mechanism. When enabled, the system is booted from the context of another kernel. This second kernel reserves a small amount of memory, and its only purpose is to capture the core dump image in case the system crashes.

Red Hat Enterprise Linux 6.1 introduces the kernel message dumper, which is called when a kernel panic occurs. The kernel message dumper provides easier crash analysis and allows 3rd party kernel message logging to alternative targets.

Performance updates and improvements

The kernel in Red Hat Enterprise Linux 6.1 provides the following notable performance improvements:

- Updates and improvements to Transparent Huge Pages (THP) support
- Updates to **perf_event**, adding the new **perf lock** feature to better analyze lock events.
- **kprobes** jump optimization, reducing overhead and enhancing SystemTap performance.
- Updates to **i7300_edac** and **i7core_edac**, providing support for monitoring of memory errors on motherboards using Intel 7300 chipset

3. DESKTOP

Graphics Hardware

Red Hat Enterprise Linux 6.1 provides a range of updates for graphics hardware. The driver for Intel Generation 6 Graphics on the Sandy Bridge processor is introduced in this release, providing fully accelerated 2D and 3D graphics on these devices. Additionally, this release introduces support for the Matrox MGA-G200ER graphics chipset.

Red Hat Enterprise Linux 6.1 introduces the **xorg-x11-drv-xgi** video driver to support the XGI Z9S AND Z11 chipsets. The SIS driver that provided support for older XGI hardware is no longer being updated to support new hardware.

Monitors that do not supply Extended Display Identification Data (EDID) to the operating system now have a default resolution of 1024 x 768 pixels.

Network Manager

NetworkManager is the desktop tool that is used to set up, configure and manage a wide range of network connection types. In Red Hat Enterprise Linux 6.1, NetworkManager has improved support for the configuration of Wi-Fi Protected Access (WPA) Enterprise and Internet Protocol version 6 (IPv6).

Audio

Red Hat Enterprise Linux 6.1 provides updated Advanced Linux Sound Architecture - High Definition Audio (ALSA-HDA) drivers.

4. STORAGE

LVM Snapshots of Mirrors

The LVM snapshot feature provides the ability to create backup images of a logical volume at a particular instant without causing a service interruption. When a change is made to the original device (the origin) after a snapshot is taken, the snapshot feature makes a copy of the changed data area as it was prior to

the change so that it can reconstruct the state of the device. In Red Hat Enterprise Linux 6.1 the ability to take a snapshot of a mirrored logical volume is a fully supported feature.

LVM Stripe of Mirrors

It is now possible to combine RAID0 (striping) and RAID1 (mirroring) in a single logical volume in LVM. Creating a logical volume while simultaneously specifying the number of mirrors ('--mirrors X') and the number of stripes ('--stripes Y') results in a mirror devices whose constituent devices are striped.

5. AUTHENTICATION AND INTEROPERABILITY

System Security Services Daemon (SSSD)

The System Security Services Daemon (SSSD) implements a set of services for central management of identity and authentication. Centralizing identity and authentication services enables local caching of identities, allowing users to still identify in cases where the connection to the server is interrupted. SSSD supports many types of identity and authentication services, including: Red Hat Directory Server, OpenLDAP, 389, Kerberos and LDAP. SSSD in Red Hat Enterprise Linux 6.1 is updated to version 1.5, providing the following bug fixes and enhancements:

- Netgroups support
- Improved online/offline detection
- Improved LDAP access-control provider with support for shadow and authorizedService
- Improved caching and cleanup logic for different schemata
- Improved DNS based discovery
- Automatic Kerberos ticket renewal
- Enablement of the Kerberos FAST protocol
- Better handling of password expiration

NOTE

The [Deployment Guide](#) contains a section that describes how to install and configure SSSD.

IPA

Red Hat Enterprise Linux 6.1 features IPA as a Technology Preview. IPA is an integrated security information management solution which combines Red Hat Enterprise Linux, Red Hat Directory Server, MIT Kerberos, and NTP. It provides web browser and command-line interfaces, and its numerous administration tools allow an administrator to quickly install, set up, and administer one or more servers for centralized authentication and identity management.

NOTE

The [Enterprise Identity Management Guide](#) contains further information on the IPA Technology Preview.

Samba

Samba is an open source implementation of the Common Internet File System (CIFS) protocol. It allows the networking of Microsoft Windows, Linux, UNIX, and other operating systems together, enabling access to Windows-based file and printer shares. Samba in Red Hat Enterprise Linux 6.1 is updated to version 3.5.6.

Samba in Red Hat Enterprise Linux 6.1 allows users to use their own Kerberos credentials when accessing CIFS mount, rather than needing the same mount credentials for all access to the mount.

FreeRADIUS

FreeRADIUS is an Internet authentication daemon, which implements the RADIUS protocol, as defined in RFC 2865 (and others). It allows Network Access Servers (NAS boxes) to perform authentication for dial-up users. FreeRADIUS in Red Hat Enterprise Linux 6.1 is updated to version 2.1.10.

Kerberos

Kerberos is a networked authentication system which allows users and computers to authenticate to each other with the help of a trusted third party, the KDC. In Red Hat Enterprise Linux 6.1, Kerberos (supplied by the krb5 package) is updated to version 1.9.

6. SECURITY

OpenSCAP

OpenSCAP is a set of open source libraries that support the Security Content Automation Protocol (SCAP) standards from the National Institute of Standards and Technology (NIST). OpenSCAP supports the SCAP components:

- Common Vulnerabilities and Exposures (CVE)
- Common Platform Enumeration (CPE)
- Common Configuration Enumeration (CCE)
- Common Vulnerability Scoring System (CVSS)
- Open Vulnerability and Assessment Language (OVAL)
- Extensible Configuration Checklist Description Format (XCCDF)

Additionally, the openSCAP package includes an application to generate SCAP reports about system configuration. openSCAP is now a fully supported package in Red Hat Enterprise Linux 6.1.

Smartcard support for SPICE

The Simple Protocol for Independent Computing Environments (SPICE) is a remote display protocol designed for virtual environments. SPICE users can view a virtualized desktop or server from the local system or any system with network access to the server. Red Hat Enterprise Linux 6.1 introduces support for smartcard passthrough via the SPICE protocol.

NOTE

The [Security Guide](#) assists users and administrators in learning the processes and practices of securing workstations and servers against local and remote intrusion, exploitation and malicious activity.

7. INSTALLATION

Installation and boot support is added in Red Hat Enterprise Linux 6.1 for the Emulex 10GbE PCI-E Gen2 and Chelsio T4 10GbE network adapters. Additionally, the GRUB bootloader is updated with support for booting volumes with a 4KB sector size on UEFI systems.

The installer in Red Hat Enterprise Linux 6.1 will detect unsupported hardware platforms and provide a notification to the user. The installation will continue, but the following message is displayed

```
This hardware (or a combination thereof) is not supported by Red Hat. For
more information on supported hardware, please refer to
http://www.redhat.com/hardware.
```

Improved support for iSCSI adapters

Red Hat Enterprise Linux 6.1 features improved support for iSCSI adapters at installation and boot time, including the ability to separate login credentials for iSCSI storage during installation and support for offload iSCSI adapters (e.g. the Emulex Tiger Shark adapter).

Red Hat Enterprise Linux 6 supports installation over iSCSI using auto-detection of BIOS iSCSI settings in iBFT. However, reconfiguration of the iBFT settings after installation was not possible. In Red Hat enterprise Linux 6.1, TCP/IP settings and iSCSI initiator configuration are dynamically configured from iBFT settings during boot time.

8. COMPILER AND TOOLS

SystemTap

SystemTap is a tracing and probing tool that allows users to study and monitor the activities of the operating system (particularly, the kernel) in fine detail. It provides information similar to the output of tools like netstat, ps, top, and iostat; however, SystemTap is designed to provide more filtering and analysis options for collected information.

SystemTap in Red Hat Enterprise Linux 6.1 is updated to version 1.4, providing:

- Alpha version of remote host scripting with `--remote USER@HOST`
- Optimization of near zero cost for dormant user probe points

Refer to the [SystemTap Release Notes](#) for more information.

GNU Project Debugger (GDB)

The GNU Project Debugger (normally referred to as GDB) debugs programs written in C, C++, and other languages by executing them in a controlled fashion, and then printing out their data. GDB in Red Hat Enterprise Linux 6.1 is updated to version 7.2, providing many bugfixes and enhancements, including enhancements to the python scripting features, and C++ debugging enhancements.

Performance Application Programming Interface (PAPI)

Red Hat Enterprise Linux 6.1 introduces the Performance Application Programming Interface (PAPI). PAPI is a specification of a cross-platform interfaces to hardware performance counters on modern microprocessors. These counters exist as a small set of registers that count events, which are occurrences of specific signals related to a processor's function. Monitoring these events has a variety of uses in application performance analysis and tuning.

OProfile

OProfile is a system-wide profiler for Linux systems. The profiling runs transparently in the background

and profile data can be collected at any time. In Red Hat Enterprise Linux 6.1, OProfile is updated to version 0.9.6-12, providing support for AMD family 12h/14h/15h processors and Intel Westmere specific events.

Valgrind

Valgrind is an instrumentation framework for building dynamic analysis tools that can be used to profile applications in detail. Valgrind tools are generally used to automatically detect many memory management and threading problems. The Valgrind suite also includes tools that allow you to build new profiling tools to suit your needs.

Red Hat Enterprise Linux 6.1 provides Valgrind version 3.6.0.

GNU Compiler Collection (GCC)

The GNU Compiler Collection (GCC) includes, among others, C, C++, and Java GNU compilers and related support libraries. Red Hat Enterprise Linux 6 features version 4.4 of GCC, which includes the following features and enhancements:

- IBM z196 new instruction support and optimizations
- IBM z10 prefetch instruction support and optimizations

libdfp

The libdfp library is updated in Red Hat Enterprise Linux 6.1. libdfp is a decimal floating point math library, and is available as an alternative to the glibc math functions on Power and s390x architectures, and is available in the supplementary channels.

Eclipse

Eclipse is a powerful development environment that provides tools for each phase of the development process. It is integrated into a single, fully configurable user interface for ease of use, featuring a pluggable architecture which allows for extension in a variety of ways.

An updated version of the Eclipse development environment is available in Red Hat Enterprise Linux 6.1, providing the following updates and enhancements:

- All the major plugins are refreshed, including Valgrind and OProfile integration and the tools for working with C and C++
- The Mylyn task-focused framework is updated
- Enhanced resource filtering for workspace contents
- performance enhancements when working with C, C++ and Java code bases

IcedTea

New IcedTea Web Open Source Web Browser Plugin and Webstart implementation for OpenJDK.

- Allows browsers such as Firefox to load Java applets embedded in a web page
- Provides framework to launch JNLP (Java Network Launching Protocol) files

9. CLUSTERING

Clusters are multiple computers (nodes) working in concert to increase reliability, scalability, and availability to critical production services. High Availability using Red Hat Enterprise Linux 6 can be

deployed in a variety of configurations to suit varying needs for performance, high-availability, load balancing, and file sharing.

The following major updates to clustering are available in Red Hat Enterprise Linux 6.1

- Rgmanager now supports the concept of critical and non-critical resources
- System Administrators can now configure and run a cluster using command line tools. This feature provides an alternative to manually editing the cluster.conf configuration file or using the graphical configuration tool, Luci.
- Red Hat Enterprise Linux High Availability on Red Hat Enterprise Linux KVM hosts is fully supported
- Comprehensive SNMP Trap support from central cluster daemons and sub-parts
- Additional watchdog integration allows a node to reboot itself when it loses quorum

The development library packages provided in the High Availability, Load Balancer, and Resilient Storage Add-On channels are not considered supported nor are their ABIs or APIs guaranteed to be consistent.

NOTE

The [Cluster Administration](#) document describes the configuration and management of Red Hat cluster systems for Red Hat Enterprise Linux 6.

10. VIRTUALIZATION

vhost

The new host kernel networking backend, **vhost**, is a fully supported feature in Red Hat Enterprise Linux 6.1. **vhost** provides superior throughput and latency over the userspace implementation.

qcow2

The qcow2 image format now supports caching of metadata. Additionally, support is added for live snapshots using external qcow2 images.

Block I/O latency improvements

ioeventfd is now available, providing faster notification of block I/O.

Kernel SamePage Merging (KSM)

The KVM hypervisor in Red Hat Enterprise Linux 6 features Kernel SamePage Merging (KSM), allowing KVM guests to share identical memory pages. Page sharing reduces memory duplication, allowing a host with similar guest operating systems to run more efficiently.

KSM in Red Hat Enterprise Linux 6.1 is Transparent HugePage aware. KSM has the ability to scan subpages inside hugepages and split them when merging is possible.

Additionally, KSM enablement can now be controlled on a per-VM basis.

PCI device assignment improvements

PCI configuration space access is improved, enabling a broader set of PCI devices to be device-assigned to guest VMs.

KVMClock Improvements

In Red Hat Enterprise Linux 6.1, the Time Stamp Counter (TSC) synchronization can now be automatically detected on guest bootup or when a host CPU is hot-plugged. Additionally, the TSC synchronization frequency is adjusted after a live migration.

QEMU monitor

Additionally, the new `drive_del` command allows libvirt to safely remove a block device from a guest.

General Updates and Improvements

- The maximum display resolution on qemu-kvm is now 2560x1600 pixels
- Red Hat Enterprise Linux 6.1 includes the ability to expose an emulated Intel HDA sound card to all guests. This update enables native sound support for many guests including the 64-bit version of Windows 7
- QEMU char device flow control is enabled
- Message Signaled Interrupts (MSI) implemented for the win-virtio-blk driver
- A new standard interface for selecting/prioritizing the boot devices of the guest
- Stability improvements for live migration
- QEMU userspace static tracing
- Virtual disk online dynamic resize feature
- Forbid pci hot unplug of critical devices such as gpu, pci bus controller, isa bus controller

11. ENTITLEMENT

Red Hat Subscription Manager and the Subscription Service

Effective software and infrastructure management requires a mechanism to handle the software inventory — both the type of products and the number of systems that the software is installed on. In parallel with Red Hat Enterprise Linux 6.1, Red Hat is introducing a new subscription service which provides oversight for the software subscriptions for an organization and a more effective content delivery system.

On local systems, the new Red Hat Subscription Manager offers both GUI and command-line tools to manage the local system and its allocated subscriptions. A better method to handle subscriptions will help our customers allocate their subscriptions more effectively and will make installing and updating Red Hat products much simpler.

In Red Hat Enterprise Linux 6.0 and 5.6 and older, subscriptions were based on *access to channels* and were assigned to an organization as a whole. Starting in Red Hat Enterprise Linux 6.1, subscriptions are based on *installed products* and are assigned to systems individually. This provides clear and delineated control over the products used by and subscribed to by a specific system.

As part of the new subscription structure, the Customer Portal provides two paths to manage subscriptions: Certificate-based Red Hat Network, which uses the new subscription service, and RHN Classic, which uses the traditional channels. Systems must be managed either by the new Certificate-based Red Hat Network or by RHN Classic, but not both.

If a system was previously managed by RHN Classic, there is no direct, supported migration path from RHN Classic to Certificate-based Red Hat Network.

NOTE

The [Red Hat Enterprise Linux 6 Subscription Management Guide](#) contains further information on managing subscriptions.

The [Red Hat Enterprise Linux 6 Installation Guide](#) contains further information on the registration and subscription process during firstboot and kickstart.

12. GENERAL UPDATES

Multilib Python Packages Removed

In Red Hat Enterprise Linux 6.1, multilib Python packages and packages dependent on them have been removed. This was because installing Python packages for multiple architectures on one system can cause various problems. For more information, refer to <https://access.redhat.com/knowledge/solutions/68140>.

Automated Bug Reporting Tool

Red Hat Enterprise Linux 6 introduced the new Automated Bug Reporting Tool (ABRT). ABRT logs details of software crashes on a local system, and provides interfaces (both graphical and command line based) to report issues to Red Hat support. In Red Hat Enterprise Linux 6.1, ABRT is updated to version 1.1.16. This update provides an enhanced graphical user interface (GUI) in addition to a range of other bugfixes and enhancements.

openCryptoki

openCryptoki contains version 2.11 of the PKCS#11 API, implemented for IBM Cryptocards. openCryptoki is updated in Red Hat Enterprise Linux 6.1, providing many bugfixes and enhancements, including better overall performance.

OpenLDAP

OpenLDAP is an open source suite of Lightweight Directory Access Protocol (LDAP) applications and development tools. OpenLDAP in Red Hat Enterprise Linux 6.1 is updated to version 2.4.23. This updated version of OpenLDAP utilizes Network Security Services (NSS) cryptographic libraries, replacing OpenSSL.

TigerVNC

TigerVNC provides client and server software for Virtual Network Computing (VNC). VNC is a remote display system, allowing a user to view a computing desktop environment over a network connection. TigerVNC is updated to version 1.1.0, providing many bugfixes enhanced encryption support.

tuned

tuned is a system tuning daemon that monitors system components and dynamically tunes system settings. Utilizing ktune (the static mechanism for system tuning), tuned can monitor and tune devices (e.g. hard disk drives and ethernet devices). In Red Hat Enterprise Linux 6.1, the tuned tuning profiles now include support for the s390x architectures.

A. REVISION HISTORY

Revision 1-1 Rebuild with sort_order	2015-02-25	Laura Bailey
Revision 0-40.2.400 Rebuild with publican 4.0.0	2013-10-31	Rüdiger Landmann
Revision 0-40.2 Added a note about removal of multilib Python packages.	Thu Dec 13 2012	Martin Prpič
Revision 0-39 Copyedit in the Installation section	Fri May 20 2011	Ryan Lerch
Revision 1-0 Initial Version of the Red Hat Enterprise Linux 6.1 Release Notes	Tue Mar 22 2011	Ryan Lerch
