Abstract

This document describes how to learn about and install security updates, as well as displaying additional details about the updates.

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.
PROVIDING FEEDBACK ON RED HAT DOCUMENTATION

We appreciate your input on our documentation. Please let us know how we could make it better.

- For simple comments on specific passages:
  1. Make sure you are viewing the documentation in the Multi-page HTML format. In addition, ensure you see the Feedback button in the upper right corner of the document.
  2. Use your mouse cursor to highlight the part of text that you want to comment on.
  3. Click the Add Feedback pop-up that appears below the highlighted text.
  4. Follow the displayed instructions.

- For submitting feedback via Bugzilla, create a new ticket:
  1. Go to the Bugzilla website.
  2. As the Component, use Documentation.
  3. Fill in the Description field with your suggestion for improvement. Include a link to the relevant part(s) of documentation.
  4. Click Submit Bug.
CHAPTER 1. IDENTIFYING SECURITY UPDATES

Keeping enterprise systems secure from current and future threats requires regular security updates. Red Hat Product Security provides the guidance you need to confidently deploy and maintain enterprise solutions.

1.1. WHAT ARE SECURITY ADVISORIES?

Red Hat Security Advisories (RHSA) document the information about security flaws being fixed in Red Hat products and services.

Each RHSA includes the following information:

- Severity
- Type and status
- Affected products
- Summary of fixed issues
- Links to the tickets about the problem. Note that not all tickets are public.
- Common Vulnerabilities and Exposures (CVE) numbers and links with additional details, such as attack complexity.

Red Hat Customer Portal provides a list of Red Hat Security Advisories published by Red Hat. You can display details of a specific advisory by navigating to the advisory’s ID from the list of Red Hat Security Advisories.

Figure 1.1. List of security advisories

<table>
<thead>
<tr>
<th>Advisory</th>
<th>Synopsis</th>
<th>Severity</th>
<th>Products</th>
</tr>
</thead>
<tbody>
<tr>
<td>RHSA-20221491</td>
<td>Important java-l80-openjdk security update</td>
<td>Important</td>
<td>Red Hat CodeReady Linux Builder for ARM 64, Red Hat Enterprise Linux for x86_64, Red Hat Enterprise Linux for Power, little endian, Red Hat CodeReady Linux Builder for Power, little endian, Red Hat Enterprise Linux for ARM 64, Red Hat CodeReady Linux Builder for x86_64, Red Hat Enterprise Linux for IBM z Systems</td>
</tr>
<tr>
<td>RHSA-20221488</td>
<td>Important java-l80-openjdk security update</td>
<td>Important</td>
<td>Red Hat Enterprise Linux Server for Power LE - Update Services for SAP Solutions</td>
</tr>
</tbody>
</table>
Optionally, you can also filter the results by specific product, variant, version, and architecture. For example, to display only advisories for Red Hat Enterprise Linux 9, you can set the following filters:

- Product: Red Hat Enterprise Linux
- Variant: All Variants
- Version: 9
- Optionally, select a minor version.

- Red Hat Customer Portal

1.2. DISPLAYING SECURITY UPDATES THAT ARE NOT INSTALLED ON A HOST

You can list all available security updates for your system by using the `dnf` command.

Prerequisite

- A Red Hat subscription attached to the host.

Procedure

- List all available security updates which have not been installed on the host:

```
# dnf updateinfo list updates security
... RHSA-2019:0997 Important/Sec. platform-python-3.6.8-2.el8_0.x86_64 RHSA-2019:0997 Important/Sec. python3-libs-3.6.8-2.el8_0.x86_64 RHSA-2019:0990 Moderate/Sec. systemd-239-13.el8_0.3.x86_64 ...
```

1.3. DISPLAYING SECURITY UPDATES THAT ARE INSTALLED ON A HOST

You can list installed security updates for your system by using the `dnf` command.

Procedure

- List all security updates which are installed on the host:

```
# dnf updateinfo list security --installed
... RHSA-2019:1234 Important/Sec. libssh2-1.8.0-7.module+el8+2833+c7d6d092
```
If multiple updates of a single package are installed, `dnf` lists all advisories for the package. In the previous example, two security updates for the `python3-libs` package have been installed since the system installation.

### 1.4. DISPLAYING A SPECIFIC ADVISORY USING DNF

You can use the `dnf` utility to display a specific advisory information that is available for an update.

**Prerequisites**

- A Red Hat subscription attached to the host.
- You have a security advisory **Update ID**. See identifying the security advisory updates.
- The update provided by the advisory is not installed.

**Procedure**

- Display a specific advisory:

  ```bash
  # dnf updateinfo info <Update ID>
  ```

  Replace the **Update ID** with the required advisory. For example, `# dnf updateinfo info <RHSA-2019:0997>`.
CHAPTER 2. INSTALLING SECURITY UPDATES

2.1. INSTALLING ALL AVAILABLE SECURITY UPDATES

To keep the security of your system up to date, you can install all currently available security updates using the `dnf` utility.

Prerequisite
- A Red Hat subscription attached to the host.

Procedure
1. Install security updates using `dnf` utility:
   
   ```
   # dnf update --security
   ```

   NOTE
   The `--security` parameter is important. Without it, `dnf update` installs all updates, including bug fixes and enhancements.

2. Confirm and start the installation by pressing **y**:

   ...

   Transaction Summary
   Upgrade ... Packages
   Total download size: ... M

   Is this ok [y/d/N]: y

3. Optional: list processes that require a manual restart of the system after installing the updated packages:

   ```
   # dnf needs-restarting
   1107 : /usr/sbin/rsyslogd -n
   1199 : -bash
   ```

   NOTE
   This command lists only processes that require a restart, and not services. That is, you cannot restart processes listed using the `systemctl` utility. For example, the `bash` process in the output is terminated when the user that owns this process logs out.

2.2. INSTALLING A SECURITY UPDATE PROVIDED BY A SPECIFIC ADVISORY
In certain situations, you might want to install only specific updates. For example, if a specific service can be updated without scheduling a downtime, you can install security updates for only this service, and install the remaining security updates later.

Prerequisites

- A Red Hat subscription attached to the host.
- You have a security advisory Update ID. See identifying the security advisory updates.

Procedure

1. Install a specific advisory:

```
# dnf update --advisory=<Update ID>
```

Replace the Update ID with the required advisory. For example, `#dnf update --advisory=<RHSA-2019:0997>`

2. Confirm and start the installation by pressing y:

```
...                
Transaction Summary 
===========================================
Upgrade ... Packages 
Total download size: ... M 
Is this ok [y/d/N]: y
```

3. Optional: List the processes that require a manual restart of the system after installing the updated packages:

```
# dnf needs-restarting
1107 : /usr/sbin/rsyslogd -n
1199 : -bash
```

**NOTE**

This command lists only processes that require a restart, and not services. This means that you cannot restart all processes listed by using the systemctl utility. For example, the bash process in the output is terminated when the user that owns this process logs out.

2.3. ADDITIONAL RESOURCES

- See practices of securing workstations and servers in Security Hardening document.
