Managing systems using the RHEL 9 web console

A guide to using the web console for managing systems in RHEL 9
Abstract

This document describes how to manage physical and virtual Linux-based systems using the RHEL 9 web console. The instructions assume that the server used for management is running in RHEL 9.

MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.
PROVIDING FEEDBACK ON RED HAT DOCUMENTATION

We appreciate your feedback on our documentation. Let us know how we can improve it.

Submitting comments on specific passages

1. View the documentation in the Multi-page HTML format and ensure that you see the Feedback button in the upper right corner after the page fully loads.

2. Use your cursor to highlight the part of the text that you want to comment on.

3. Click the Add Feedback button that appears near the highlighted text.

4. Add your feedback and click Submit.

Submitting feedback through Bugzilla (account required)

1. Log in to the Bugzilla website.

2. Select the correct version from the Version menu.

3. Enter a descriptive title in the Summary field.

4. Enter your suggestion for improvement in the Description field. Include links to the relevant parts of the documentation.

5. Click Submit Bug.
CHAPTER 1. GETTING STARTED USING THE RHEL WEB CONSOLE

Install the web console in Red Hat Enterprise Linux 9 and learn how to add remote hosts and monitor them in the RHEL 9 web console.

Prerequisites

- Installed Red Hat Enterprise Linux 9.
- Enabled networking.
- Registered system with appropriate subscription attached.

1.1. WHAT IS THE RHEL WEB CONSOLE

The RHEL web console is a Red Hat Enterprise Linux web-based interface designed for managing and monitoring your local system, as well as Linux servers located in your network environment.

The RHEL web console enables you to perform a wide range of administration tasks, including:

- Managing services
- Managing user accounts
- Managing and monitoring system services
- Configuring network interfaces and firewall
- Reviewing system logs
- Managing virtual machines
- Creating diagnostic reports
- Setting kernel dump configuration
- Configuring SELinux
- Updating software
- Managing system subscriptions

The RHEL web console uses the same system APIs as you would in a terminal, and actions performed in a terminal are immediately reflected in the RHEL web console.

You can monitor the logs of systems in the network environment, as well as their performance, displayed as graphs. In addition, you can change the settings directly in the web console or through the terminal.

1.2. INSTALLING AND ENABLING THE WEB CONSOLE

To access the RHEL 9 web console, first enable the `cockpit.socket` service.
Red Hat Enterprise Linux 9 includes the RHEL 9 web console installed by default in many installation variants. If this is not the case on your system, install the `cockpit` package before enabling the `cockpit.socket` service.

**Procedure**

1. If the web console is not installed by default on your installation variant, manually install the `cockpit` package:
   ```bash
   # dnf install cockpit
   ```

2. Enable and start the `cockpit.socket` service, which runs a web server:
   ```bash
   # systemctl enable --now cockpit.socket
   ```

3. If the web console was not installed by default on your installation variant and you are using a custom firewall profile, add the `cockpit` service to `firewalld` to open port 9090 in the firewall:
   ```bash
   # firewall-cmd --add-service=cockpit --permanent
   # firewall-cmd --reload
   ```

**Verification steps**

- To verify the previous installation and configuration, open the web console.

### 1.3. LOGGING IN TO THE WEB CONSOLE

Use the steps in this procedure for the first login to the RHEL web console using a system user name and password.

**Prerequisites**

- Use one of the following browsers for opening the web console:
  - Mozilla Firefox 52 and later
  - Google Chrome 57 and later
  - Microsoft Edge 16 and later

- System user account credentials
  The RHEL web console uses a specific PAM stack located at `/etc/pam.d/cockpit`. Authentication with PAM allows you to log in with the user name and password of any local account on the system.

**Procedure**

1. Open the web console in your web browser, and enter the following address:
   ```bash
   https://localhost:9090
   ```
NOTE

This logs you in on your local machine. If you want to log in to the web console of a remote system, see Section 1.4, “Connecting to the web console from a remote machine”

If you use a self-signed certificate, the browser issues a warning. Check the certificate and accept the security exception to proceed with the login.

The console loads a certificate from the /etc/cockpit/ws-certs.d directory and uses the last file with a .cert extension in alphabetical order. To avoid having to grant security exceptions, install a certificate signed by a certificate authority (CA).

2. In the login screen, enter your system user name and password.

3. Click Log In.

After successful authentication, the RHEL web console interface opens.

NOTE

To switch between limited and administrative access, click Administrative access or Limited access in the top panel of the web console page. You must provide your user password to gain administrative access.

1.4. CONNECTING TO THE WEB CONSOLE FROM A REMOTE MACHINE

It is possible to connect to your web console interface from any client operating system and also from mobile phones or tablets.

Prerequisites

- Device with a supported internet browser, such as:
  - Mozilla Firefox 52 and later
  - Google Chrome 57 and later
  - Microsoft Edge 16 and later
- RHEL 9 server you want to access with an installed and accessible web console.

Procedure

1. Open your web browser.

2. Type the remote server’s address in one of the following formats:
   a. With the server’s host name: https://server.hostname.example.com:port_number.
      For example:

      https://example.com:9090

   b. With the server’s IP address: https://server.IP_address:port_number
      For example:
3. After the login interface opens, log in with your RHEL machine credentials.

1.5. LOGGING IN TO THE WEB CONSOLE USING A ONE-TIME PASSWORD

If your system is part of an Identity Management (IdM) domain with enabled one-time password (OTP) configuration, you can use an OTP to log in to the RHEL web console.

**IMPORTANT**

It is possible to log in using a one-time password only if your system is part of an Identity Management (IdM) domain with enabled OTP configuration.

**Prerequisites**

- The RHEL web console has been installed.
- An Identity Management server with enabled OTP configuration.
- A configured hardware or software device generating OTP tokens.

**Procedure**

1. Open the RHEL web console in your browser:
   - Locally: `https://localhost:PORT_NUMBER`
   - Remotely with the server hostname: `https://example.com:PORT_NUMBER`
   - Remotely with the server IP address: `https://EXAMPLE.SERVER.IP.ADDR:PORT_NUMBER`

   If you use a self-signed certificate, the browser issues a warning. Check the certificate and accept the security exception to proceed with the login.

   The console loads a certificate from the `/etc/cockpit/ws-certs.d` directory and uses the last file with a `.cert` extension in alphabetical order. To avoid having to grant security exceptions, install a certificate signed by a certificate authority (CA).

2. The Login window opens. In the Login window, enter your system user name and password.

3. Generate a one–time password on your device.

4. Enter the one-time password into a new field that appears in the web console interface after you confirm your password.

5. Click Log in.

6. Successful login takes you to the Overview page of the web console interface.

1.6. REBOOTING THE SYSTEM USING THE WEB CONSOLE

You can use the web console to restart a RHEL system that the web console is attached to.
Prerequisites

- The web console is installed and accessible. For details, see Installing the web console.

Procedure

1. Log into the RHEL web console. For details, see Logging in to the web console.
2. In the Overview page, click the Reboot button.
3. If any users are logged in to the system, write a reason for the restart in the Reboot dialog box.
4. Optional: In the Delay drop down list, select a time interval for the reboot delay.
5. Click Reboot.

1.7. SHUTTING DOWN THE SYSTEM USING THE WEB CONSOLE

You can use the web console to shut down a RHEL system that the web console is attached to.

Prerequisites

- The web console is installed and accessible.

Procedure

1. Log into the RHEL web console.
2. Click Overview.
3. In the Restart drop down list, select Shut Down.
4. If any users are logged in to the system, write a reason for the shutdown in the Shut Down dialog box.
5. Optional: In the Delay drop down list, select a time interval.
6. Click Shut Down.

1.8. CONFIGURING TIME SETTINGS USING THE WEB CONSOLE

You can set a time zone and synchronize the system time with a Network Time Protocol (NTP) server.

Prerequisites

- The web console is installed and accessible.

Procedure

1. Log in to the RHEL web console.
2. Click the current system time in Overview.
3. Click System time.
4. In the **Change System Time** dialog box, change the time zone if necessary.

5. In the **Set Time** drop down menu, select one of the following:

   **Manually**
   
   Use this option if you need to set the time manually, without an NTP server.

   **Automatically using NTP server**
   
   This is a default option, which synchronizes time automatically with the preset NTP servers.

   **Automatically using specific NTP servers**
   
   Use this option only if you need to synchronize the system with a specific NTP server. Specify the DNS name or the IP address of the server.

6. Click **Change**.

   - Check the system time displayed in the **System** tab.

### 1.9. DISABLING SMT TO PREVENT CPU SECURITY ISSUES USING THE WEB CONSOLE

Disable Simultaneous Multi Threading (SMT) in case of attacks that misuse CPU SMT. Disabling SMT can mitigate security vulnerabilities, such as L1TF or MDS.

**IMPORTANT**

Disabling SMT might lower the system performance.

**Prerequisites**

- The web console must be installed and accessible. For details, see [Installing the web console](#).

**Procedure**

1. Log in to the RHEL web console. For details, see [Logging in to the web console](#).

2. In the **Overview** tab find the **System information** field and click **View hardware details**.

3. On the **CPU Security** line, click **Mitigations**.
   
   If this link is not present, it means that your system does not support SMT, and therefore is not vulnerable.

4. In the **CPU Security Toggles** table, turn on the **Disable simultaneous multithreading (nosmt)** option.

5. Click the **Save and reboot** button.

After the system restart, the CPU no longer uses SMT.

**Additional resources**

1.10. ADDING A BANNER TO THE LOGIN PAGE

Companies or agencies sometimes need to show a warning that usage of the computer is for lawful purposes, the user is subject to surveillance, and anyone trespassing will be prosecuted. The warning must be visible before login. Similarly to SSH, the web console can optionally show the content of a banner file on the login screen. To enable banners in your web console sessions, you need to modify the `/etc/cockpit/cockpit.conf` file. Note that the file is not required and you may need to create it manually.

Prerequisites

- The web console is installed and accessible.
- You must have sudo privileges.

Procedure

1. Create the `/etc/issue.cockpit` file in a text editor of your preference if you do not have it yet. Add the content you want to display as the banner to the file. Do not include any macros in the file as there is no re-formatting done between the file content and the displayed content. Use intended line breaks. It is possible to use ASCII art.

2. Save the file.

3. Open or create the `cockpit.conf` file in the `/etc/cockpit/` directory in a text editor of your preference.

   ```
   $ sudo vi cockpit.conf
   ```

4. Add the following text to the file:

   ```
   [Session]
   Banner=/etc/issue.cockpit
   ```

5. Save the file.

6. Restart the web console for changes to take effect.

   ```
   # systemctl try-restart cockpit
   ```

Verification steps

- Open the web console login screen again to verify that the banner is now visible.

Example 1.1. Adding an example banner to the login page

1. Create an `/etc/issue.cockpit` file with a desired text using a text editor:

   ```
   This is an example banner for the RHEL web console login page.
   ```

2. Open or create the `/etc/cockpit/cockpit.conf` file and add the following text:
By default, there is no idle timeout set in the web console interface. If you want to enable an idle timeout on your system, you can do so by modifying the `/etc/cockpit/cockpit.conf` configuration file. Note that the file is not required and you may need to create it manually.

**Prerequisites**

- The web console must be installed and accessible. For details, see [Installing the web console](#).
- You must have sudo privileges.

**Procedure**

1. Open or create the `cockpit.conf` file in the `/etc/cockpit/` directory in a text editor of your preference.

   ```bash
   $ sudo vi cockpit.conf
   ```

2. Add the following text to the file:
Substitute \( X \) with a number for a time period of your choice in minutes.

3. Save the file.

4. Restart the web console for changes to take effect.

\[ \text{# systemctl try-restart cockpit} \]

**Verification steps**

- Check if the session logs you out after a set period of time.
CHAPTER 2. CONFIGURING THE HOST NAME IN THE WEB CONSOLE

Learn how to use the Red Hat Enterprise Linux web console to configure different forms of the host name on the system that the web console is attached to.

2.1. HOST NAME

The host name identifies the system. By default, the host name is set to localhost, but you can change it.

A host name consists of two parts:

- **Host name**
  It is a unique name which identifies a system.

- **Domain**
  Add the domain as a suffix behind the host name when using a system in a network and when using names instead of just IP addresses.

A host name with an attached domain name is called a fully qualified domain name (FQDN). For example: mymachine.example.com.

Host names are stored in the /etc/hostname file.

2.2. PRETTY HOST NAME IN THE WEB CONSOLE

You can configure a pretty host name in the RHEL web console. The pretty host name is a host name with capital letters, spaces, and so on.

The pretty host name displays in the web console, but it does not have to correspond with the host name.

Example 2.1. Host name formats in the web console

<table>
<thead>
<tr>
<th>Pretty host name</th>
<th>Host name</th>
<th>Real host name - fully qualified domain name (FQDN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Machine</td>
<td>mymachine</td>
<td>mymachine.idm.company.com</td>
</tr>
</tbody>
</table>

2.3. SETTING THE HOST NAME USING THE WEB CONSOLE

This procedure sets the real host name or the pretty host name in the web console.

Prerequisites

- The web console is installed and accessible.
Procedure

1. Log into the web console.

2. Click **Overview**.

3. Click **edit** next to the current host name.

4. In the **Change Host Name** dialog box, enter the host name in the **Pretty Host Name** field.

5. The **Real Host Name** field attaches a domain name to the pretty name. You can change the real host name manually if it does not correspond with the pretty host name.

6. Click **Change**.

Verification steps

1. Log out from the web console.
2. Reopen the web console by entering an address with the new host name in the address bar of your browser.
CHAPTER 3. RED HAT WEB CONSOLE ADD-ONS

Install add-ons in the RHEL web console and learn what add-on applications are available for you.

3.1. INSTALLING ADD-ONS

The **cockpit** package is a part of Red Hat Enterprise Linux by default. To be able to use add-on applications you must install them separately.

**Prerequisites**

- Installed and enabled the **cockpit** package.

**Procedure**

- Install an add-on.

  ```
  # dnf install <add-on>
  ```

3.2. ADD-ONS FOR THE RHEL WEB CONSOLE

The following table lists available add-on applications for the RHEL web console.

<table>
<thead>
<tr>
<th>Feature name</th>
<th>Package name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Composer</td>
<td>cockpit-composer</td>
<td>Building custom OS images</td>
</tr>
<tr>
<td>Machines</td>
<td>cockpit-machines</td>
<td>Managing libvirt virtual machines</td>
</tr>

CHAPTER 4. OPTIMIZING THE SYSTEM PERFORMANCE USING THE WEB CONSOLE

Learn how to set a performance profile in the RHEL web console to optimize the performance of the system for a selected task.

4.1. PERFORMANCE TUNING OPTIONS IN THE WEB CONSOLE

Red Hat Enterprise Linux 9 provides several performance profiles that optimize the system for the following tasks:

- Systems using the desktop
- Throughput performance
- Latency performance
- Network performance
- Low power consumption
- Virtual machines

The TuneD service optimizes system options to match the selected profile.

In the web console, you can set which performance profile your system uses.

Additional resources

- Getting started with TuneD

4.2. SETTING A PERFORMANCE PROFILE IN THE WEB CONSOLE

This procedure uses the web console to optimize the system performance for a selected task.

Prerequisites

- Make sure the web console is installed and accessible. For details, see Installing the web console.

Procedure

1. Log into the RHEL web console. For details, see Logging in to the web console.
2. Click Overview.
3. In the Performance Profile field, click the current performance profile.
4. In the **Change Performance Profile** dialog box, change the profile if necessary.

5. Click **Change Profile**.

Verification steps

- The **Overview** tab now shows the selected performance profile.

### 4.3. MONITORING PERFORMANCE ON THE LOCAL SYSTEM USING THE WEB CONSOLE

Red Hat Enterprise Linux web console uses the Utilization Saturation and Errors (USE) Method for troubleshooting. The new performance metrics page has a historical view of your data organized chronologically with the newest data at the top.

Here, you can view the events, errors, and graphical representation for resource utilization and saturation.

**Prerequisites**

- The web console is installed and accessible. For details, see Installing the web console.

- The **cockpit-pcp** package, which enables collecting the performance metrics, is installed:
  
  a. To install the package from the web console interface:
     
    i. Log in to the web console with administrative privileges. For details, see Logging in to the web console.
     
    ii. In the **Overview** page, click **View details and history**.
     
    iii. Click the **Install cockpit-pcp** button.
     
    iv. In the **Install software** dialog window, click **Install**.

  b. To install the package from the command line interface, use:
```bash
# dnf install cockpit-pcp
```

- The PCP service is enabled:

```bash
# systemctl enable --now pmlogger.service pmproxy.service
```

**Procedure**

1. Log into the RHEL 9 web console. In the Overview page click **View details and history** to view the **Performance Metrics**.

4.4. **MONITORING PERFORMANCE ON SEVERAL SYSTEMS USING THE WEB CONSOLE AND GRAFANA**

Grafana enables you to collect data from several systems at once and review a graphical representation of their collected PCP metrics. You can set up performance metrics monitoring and export for several systems in the web console interface.

This procedure shows you how to enable performance metrics export with PCP from your RHEL 9 web console interface.

**Prerequisites**

- The web console must be installed and accessible. For details, see [Installing the web console](#).
- Install the **cockpit-pcp** package.
From the web console interface:

a. Log in to the web console with administrative privileges. For details, see Logging in to the web console.

b. In the Overview page, click View details and history.

c. Click the Install cockpit-pcp button.

d. In the Install software dialog window, click Install.

e. Log out and in again to see the metrics history.

2. To install the package from the command line interface, use:

   # dnf install cockpit-pcp

   - Enable the PCP service:

   # systemctl enable --now pmlogger.service pmproxy.service

   - Set up Grafana dashboard. For more information, see Setting up a grafana-server.

   - Install the redis package.

   # dnf install redis

   Alternatively, you can install the package from web console interface later in the procedure.

Procedure

1. In the Overview page, click View details and history in the Usage table.

2. Click the Metrics settings button.

3. Move the Export to network slider to active position.

Metrics settings

Performance Co-Pilot collects and analyzes performance metrics from your system.  Read more...

- Collect metrics (pmlogger.service)

- Export to network (pmproxy.service)

Save  Cancel

If you do not have the redis service installed, you will be prompted to install it.
4. To open the `pmproxy` service, select a zone from a drop down list and click the `Add pmproxy` button.

5. Click `Save`.

**Verification**

1. Click `Networking`.

2. In the `Firewall` table, click `n active zones` or the `Edit rules and zones` button.

3. Search for `pmproxy` in your selected zone.

**IMPORTANT**

Repeat this procedure on all the systems you want to watch.
CHAPTER 5. REVIEWING LOGS IN THE WEB CONSOLE

Learn how to access, review and filter logs in the RHEL web console.

5.1. REVIEWING LOGS IN THE WEB CONSOLE

The RHEL 9 web console Logs section is a UI for the `journalctl` utility. This section describes how to access system logs in the web console interface.

Prerequisites

- The RHEL 9 web console has been installed.
  For details, see Installing the web console.

Procedure

1. Log in to the RHEL web console.
   For details, see Logging in to the web console.

2. Click Logs.

3. Open log entry details by clicking on your selected log entry in the list.

   NOTE

   You can use the Pause button to pause new log entries from appearing. Once you resume new log entries, the web console will load all log entries that were reported after you used the Pause button.

You can filter the logs by time, priority or identifier. For more information, see Filtering logs in the web console.

5.2. FILTERING LOGS IN THE WEB CONSOLE

This section shows how to filter log entries in the web console.

Prerequisites

- The web console interface must be installed and accessible.
  For details, see Installing the web console.
Procedure

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.

2. Click Logs.

3. By default, web console shows the latest log entries. To filter by a specific time range, click the Time drop-down menu and choose a preferred option.

4. Error and above severity logs list is shown by default. To filter by different priority, click the Error and above drop-down menu and choose a preferred priority.

5. By default, web console shows logs for all identifiers. To filter logs for a particular identifier, click the All drop-down menu and select an identifier.

6. To open a log entry, click on a selected log.
5.3. TEXT SEARCH OPTIONS FOR FILTERING LOGS IN THE WEB CONSOLE

The text search option functionality provides a big variety of options for filtering logs. If you decide to filter logs by using the text search, you can use the predefined options that are defined in the three drop-down menus, or you can type the whole search yourself.

Drop-down menus

There are three drop-down menus that you can use to specify the main parameters of your search:

- **Time**: This drop-down menu contains predefined searches for different time ranges of your search.
- **Priority**: This drop-down menu provides options for different priority levels. It corresponds to the `journalctl --priority` option. The default priority value is *Error and above*. It is set every time you do not specify any other priority.
- **Identifier**: In this drop-down menu, you can select an identifier that you want to filter. Corresponds to the `journalctl --identifier` option.

Quantifiers

There are six quantifiers that you can use to specify your search. They are covered in the Options for filtering logs table.

Log fields

If you want to search for a specific log field, it is possible to specify the field together with its content.

Free-form text search in logs messages

You can filter any text string of your choice in the logs messages. The string can also be in the form of a regular expressions.

Advanced logs filtering I

Filter all log messages identified by 'systemd' that happened since October 22, 2020 midnight and journal field 'JOB_TYPE' is either 'start' or 'restart.

1. Type `identifier:systemd since:2020-10-22 JOB_TYPE=start,restart` to search field.

2. Check the results.

Advanced logs filtering II

Filter all log messages that come from 'cockpit.service' systemd unit that happened in the boot before last and the message body contains either "error" or "fail".

1. Type `service:cockpit boot:-1 error|fail` to the search field.

2. Check the results.
5.4. USING A TEXT SEARCH BOX TO FILTER LOGS IN THE WEB CONSOLE

Using the text search box allows you to filter logs according to different parameters. The search combines usage of the filtering drop-down menus, quantifiers, log fields and free-form string search.

Prerequisites

- The web console interface must be installed and accessible.
  For details, see Installing the web console.

Procedure

1. Log in to the RHEL web console.
   For details, see Logging in to the web console.

2. Click Logs.

3. Use the drop-down menus to specify the three main quantifiers - time range, priority, and identifier(s) - you want to filter.
   The Priority quantifier always has to have a value. If you do not specify it, it automatically filters the Error and above priority. Notice that the options you set reflect in the text search box.

4. Specify the log field you want to filter.
   It is possible to add several log fields.

5. You can use a free-form string to search for anything else. The search box also accepts regular expressions.

5.5. OPTIONS FOR LOGS FILTERING

There are several journalctl options, which you can use for filtering logs in the web console, that may be useful. Some of these are already covered as part of the drop-down menus in the web console interface.

Table 5.1. Table

<table>
<thead>
<tr>
<th>Option name</th>
<th>Usage</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option name</td>
<td>Usage</td>
<td>Notes</td>
</tr>
<tr>
<td>-------------</td>
<td>-------</td>
<td>-------</td>
</tr>
<tr>
<td><strong>priority</strong></td>
<td>Filter output by message priorities. Takes a single numeric or textual log level. The log levels are the usual syslog log levels. If a single log level is specified, all messages with this log level or a lower (therefore more important) log level are shown.</td>
<td>Covered in the <strong>Priority</strong> drop-down menu.</td>
</tr>
<tr>
<td><strong>identifier</strong></td>
<td>Show messages for the specified syslog identifier SYSLOG_IDENTIFIER. Can be specified multiple times.</td>
<td>Covered in the <strong>Identifier</strong> drop-down menu.</td>
</tr>
<tr>
<td><strong>follow</strong></td>
<td>Shows only the most recent journal entries, and continuously prints new entries as they are appended to the journal.</td>
<td>Not covered in a drop-down.</td>
</tr>
<tr>
<td><strong>service</strong></td>
<td>Show messages for the specified <strong>systemd</strong> unit. Can be specified multiple times.</td>
<td>Is not covered in a drop-down. Corresponds to the <strong>journalctl --unit</strong> parameter.</td>
</tr>
<tr>
<td><strong>boot</strong></td>
<td>Show messages from a specific boot. A positive integer will look up the boots starting from the beginning of the journal, and an equal-or-less-than zero integer will look up boots starting from the end of the journal. Therefore, 1 means the first boot found in the journal in chronological order, 2 the second and so on; while -0 is the last boot, -1 the boot before last, and so on.</td>
<td>Covered only as <strong>Current boot</strong> or <strong>Previous boot</strong> in the <strong>Time</strong> drop-down menu. Other options need to be written manually.</td>
</tr>
</tbody>
</table>
**Option name** | **Usage** | **Notes**
---|---|---
**since** | Start showing entries on or newer than the specified date, or on or older than the specified date, respectively. Date specifications should be of the format "2012-10-30 18:17:16". If the time part is omitted, "00:00:00" is assumed. If only the seconds component is omitted, "00" is assumed. If the date component is omitted, the current day is assumed. Alternatively the strings "yesterday", "today", "tomorrow" are understood, which refer to 00:00:00 of the day before the current day, the current day, or the day after the current day, respectively. "now" refers to the current time. Finally, relative times may be specified, prefixed with "-" or "+", referring to times before or after the current time, respectively. | Not covered in a drop-down. |
CHAPTER 6. MANAGING USER ACCOUNTS IN THE WEB CONSOLE

The RHEL web console offers an interface for adding, editing, and removing system user accounts.

After reading this section, you will know:

- From where the existing accounts come from.
- How to add new accounts.
- How to set password expiration.
- How and when to terminate user sessions.

Prerequisites

- Being logged into the RHEL web console with an account that has administrator permissions assigned. For details, see Logging in to the web console

6.1. SYSTEM USER ACCOUNTS MANAGED IN THE WEB CONSOLE

With user accounts displayed in the RHEL web console you can:

- Authenticate users when accessing the system.
- Set the access rights to the system.

The RHEL web console displays all user accounts located in the system. Therefore, you can see at least one user account just after the first login to the web console.

After logging into the RHEL web console, you can perform the following operations:

- Create new users accounts.
- Change their parameters.
- Lock accounts.
- Terminate user sessions.

6.2. ADDING NEW ACCOUNTS USING THE WEB CONSOLE

Use the following steps for adding user accounts to the system and setting administration rights to the accounts through the RHEL web console.

Prerequisites

- The RHEL web console must be installed and accessible. For details, see Installing the web console.

Procedure

1. Log in to the RHEL web console.
2. Click **Accounts**.

3. Click **Create New Account**.

4. In the **Full Name** field, enter the full name of the user. The RHEL web console automatically suggests a user name from the full name and fills it in the **User Name** field. If you do not want to use the original naming convention consisting of the first letter of the first name and the whole surname, update the suggestion.

5. In the **Password/Confirm** fields, enter the password and retype it for verification that your password is correct. The color bar below the fields shows you the security level of the entered password, which does not allow you to create a user with a weak password.

6. Click **Create** to save the settings and close the dialog box.

7. Select the newly created account.

8. Select **Server Administrator** in the **Roles** item.

Now you can see the new account in the **Accounts** settings and you can use its credentials to connect to the system.

### 6.3. ENFORCING PASSWORD EXPIRATION IN THE WEB CONSOLE

By default, user accounts have set passwords to never expire. You can set system passwords to expire after a defined number of days. When the password expires, the next login attempt will prompt for a password change.

**Procedure**

1. Log in to the RHEL 9 web console.

2. Click **Accounts**.

3. Select the user account for which to enforce password expiration.

4. In the user account settings, click the second **edit**.
5. In the **Password Expiration** dialog box, select **Require password change every ... days** and enter a positive whole number representing the number of days after which the password expires.

6. Click **Change**.

**Verification steps**

- To verify that the password expiration is set, open the account settings. The RHEL 9 web console displays a link with the date of expiration.

---

### 6.4. TERMINATING USER SESSIONS IN THE WEB CONSOLE

A user creates user sessions when logging into the system. Terminating user sessions means to log the user out from the system. It can be helpful if you need to perform administrative tasks sensitive to configuration changes, for example, system upgrades.

In each user account in the RHEL 9 web console, you can terminate all sessions for the account except for the web console session you are currently using. This prevents you from losing access to your system.

**Procedure**

1. Log in to the RHEL 9 web console.

2. Click **Accounts**.

3. Click the user account for which you want to terminate the session.

4. Click **Terminate Session**.
   - If the **Terminate Session** button is inactive, the user is not logged in to the system.

   The RHEL web console terminates the sessions.
CHAPTER 7. MANAGING SERVICES IN THE WEB CONSOLE

Learn how to manage system services in the RHEL web console interface. You can activate or deactivate services, restart or reload them, or manage their automatic startup.

7.1. ACTIVATING OR DEACTIVATING SYSTEM SERVICES IN THE WEB CONSOLE

This procedure activates or deactivates system services using the web console interface.

Prerequisites

- The RHEL 9 web console has been installed.
  For details, see Installing the web console.

PROCEDURE

You can filter the services by name or description and also by Enabled, Disabled, or Static automatic startup. The interface shows the current state of the service and its recent logs.

1. Log in to the RHEL web console with administrator privileges.
   For details, see Logging in to the web console.

2. Click Services in the web console menu on the left.

3. The default tab for Services is System Services. If you want to manage targets, sockets, timers, or paths, switch to the respective tab in the menu on top.

4. To open service settings, click on a selected service from the list. You can tell which services are active or inactive by checking the State column.

5. Activate or deactivate a service:
   - To activate an inactive service, click the Start button.
To deactivate an active service, click the **Stop** button.

### 7.2. RESTARTING SYSTEM SERVICES IN THE WEB CONSOLE

This procedure restarts system services using the web console interface.

**Prerequisites**

- The RHEL 9 web console has been installed.
  
  For details, see [Installing the web console](#).

**PROCEDURE**

You can filter the services by name or description and also by Enabled, Disabled, or Static automatic startup. The interface shows the current state of the service and its recent logs.

1. Log in to the RHEL web console with administrator privileges.
  
  For details, see [Logging in to the web console](#).
2. Click **Services** in the web console menu on the left.

3. The default tab for **Services** is **System Services**. If you want to manage targets, sockets, timers, or paths, switch to the respective tab in the menu on top.

4. To open service settings, click on a selected service from the list.

5. To restart a service, click the **Restart** button.
CHAPTER 8. CONFIGURING NETWORK BONDS USING THE WEB CONSOLE

Learn how network bonding works and configure network bonds in the RHEL 9 web console.

NOTE

The RHEL 9 web console is build on top of the NetworkManager service.
For details, see Getting started with NetworkManager for managing networking.

Prerequisites

- The RHEL 9 web console installed and enabled. For details, see Installing the web console.

8.1. UNDERSTANDING NETWORK BONDING

Network bonding is a method to combine or aggregate network interfaces to provide a logical interface with higher throughput or redundancy.

The active-backup, balance-tlb, and balance-alb modes do not require any specific configuration of the network switch. However, other bonding modes require configuring the switch to aggregate the links. For example, Cisco switches requires EtherChannel for modes 0, 2, and 3, but for mode 4, the Link Aggregation Control Protocol (LACP) and EtherChannel are required.

For further details, see the documentation of your switch and Linux Ethernet Bonding Driver HOWTO.

IMPORTANT

Certain network bonding features, such as the fail-over mechanism, do not support direct cable connections without a network switch. For further details, see the Is bonding supported with direct connection using crossover cables? KCS solution.

8.2. BOND MODES

In RHEL 9 there are several mode options. Each mode option is characterize by specific load balancing and fault tolerance. The behavior of the bonded interfaces depends upon the mode. The bonding modes provide fault tolerance, load balancing or both.

Load balancing modes

- **Round Robin**: Sequentially transmit packets from the first available interface to the last one.

Fault tolerance modes

- **Active Backup**: Only when the primary interface fails, one of a backup interfaces replaces it. Only a MAC address used by active interface is visible.
- **Broadcast**: All transmissions are sent on all interfaces.

NOTE

Broadcasting significantly increases network traffic on all the bonded interfaces.
Fault tolerance and load balancing modes

- **XOR**: The destination MAC addresses are distributed equally between interfaces with a modulo hash. Each interface then serves the same group of MAC addresses.

- **802.3ad**: Sets an IEEE 802.3ad dynamic link aggregation policy. Creates aggregation groups that share the same speed and duplex settings. Transmits and receives on all interfaces in the active aggregator.

  **NOTE**
  This mode requires a switch that is 802.3ad compliant.

- **Adaptive transmit load balancing**: The outgoing traffic is distributed according to the current load on each interface. Incoming traffic is received by the current interface. If the receiving interface fails, another interface takes over the MAC address of the failed one.

- **Adaptive load balancing**: Includes transmit and receive load balancing for IPv4 traffic. Receive load balancing is achieved through Address Resolution Protocol (ARP) negotiation, therefore, it is necessary to set **Link Monitoring** to **ARP** in the bond’s configuration.

### 8.3. Configuring a Network Bond Using the RHEL Web Console

This section describes how to configure a network bond using the RHEL web console.

**Prerequisites**

- You are logged in to the RHEL web console.
- Two or more physical or virtual network devices are installed on the server.
- To use Ethernet devices as members of the bond, the physical or virtual Ethernet devices must be installed on the server.
- To use team, bridge, or VLAN devices as members of the bond, create them in advance as described in:
  - Configuring a network team using the RHEL web console
  - Configuring a network bridge using nm-connection-editor
  - Configuring VLAN tagging using the RHEL web console

**Procedure**

1. Select the **Networking** tab in the navigation on the left side of the screen.
2. Click **Add bond** in the **Interfaces** section.
3. Enter the name of the bond device you want to create.
4. Select the interfaces that should be members of the bond.
5. Select the mode of the bond.
If you select **Active backup**, the web console shows the additional field **Primary** in which you can select the preferred active device.

6. Set the link monitoring mode. For example, when you use the **Adaptive load balancing** mode, set it to **ARP**.

7. Optional: Adjust the monitoring interval, link up delay, and link down delay settings. Typically, you only change the defaults for troubleshooting purposes.

![Bond settings](image)

8. Click **Apply**.

9. By default, the bond uses a dynamic IP address. If you want to set a static IP address:
   a. Click the name of the bond in the **Interfaces** section.
b. Click Edit next to the protocol you want to configure.

c. Select Manual next to Addresses, and enter the IP address, prefix, and default gateway.

d. In the DNS section, click the + button, and enter the IP address of the DNS server. Repeat this step to set multiple DNS servers.

e. In the DNS search domains section, click the + button, and enter the search domain.

f. If the interface requires static routes, configure them in the Routes section.

![IPv4 settings](image)

- Click the + button to add a new address, prefix, and gateway.
- In the DNS section, enter the IP address of the DNS server and repeat to set multiple DNS servers.
- Enter search domains in the DNS search domains section.
- Configure static routes in the Routes section.

- **Verification**

1. Select the Networking tab in the navigation on the left side of the screen, and check if there is incoming and outgoing traffic on the interface:

   ![Interfaces](image)

   - Interfaces: bond0
     - IP address: 192.0.2/24
     - Sending: 1.11 Mbps
     - Receiving: 61.2 Mbps

2. Temporarily remove the network cable from the host.
Note that there is no method to properly test link failure events using software utilities. Tools that deactivate connections, such as the web console, show only the bonding driver’s ability to handle member configuration changes and not actual link failure events.

3. Display the status of the bond:

```
# cat /proc/net/bonding/bond0
```

### 8.4. ADDING INTERFACES TO THE BOND USING THE WEB CONSOLE

Network bonds can include multiple interfaces and you can add or remove any of them at any time. Learn how to add a network interface to an existing bond.

**Prerequisites**

- Having a bond with multiple interfaces configured as described in [Configuring a network bond using the web console](#)

**Procedure**

1. Log in to the web console. For details, see [Logging in to the web console](#).
2. Open **Networking**.
3. In the **Interfaces** table, click on the bond you want to configure.
4. In the bond settings screen, scroll down to the table of members (interfaces).
5. Click the **Add member** drop down icon.
6. Select the interface in the drop down menu and click it.

**Verification steps**

- Check that the selected interface appeared in the **Interface members** table in the bond settings screen.

### 8.5. REMOVING OR DISABLING AN INTERFACE FROM THE BOND USING THE WEB CONSOLE

Network bonds can include multiple interfaces. If you need to change a device, you can remove or disable particular interfaces from the bond, which will work with the rest of the active interfaces.

To stop using an interface included in a bond, you can:

- Remove the interface from the bond.
- Disable the interface temporarily. The interface stays a part of the bond, but the bond will not use it until you enable it again.

**Prerequisites**
Having a bond with multiple interfaces configured as described in Configuring a network bond using the web console

Procedure

1. Log in to the RHEL web console. For details, see Logging in to the web console.
2. Open Networking.
3. Click the bond you want to configure.
4. In the bond settings screen, scroll down to the table of ports (interfaces).
5. Select the interface and remove or disable it:
   - To remove the interface, click the - button.
   - To disable or enable the interface, toggle the switch next to the selected interface.

Based on your choice, the web console either removes or disables the interface from the bond and you can see it back in the Networking section as a standalone interface.

8.6. REMOVING OR DISABLING A BOND USING THE WEB CONSOLE

Remove or disable a network bond using the web console. If you disable the bond, the interfaces stay in the bond, but the bond will not be used for network traffic.

Prerequisites

- There is an existing bond in the web console.

Procedure

1. Log in to the web console.
   For details, see Logging in to the web console.
2. Open Networking.
3. Click the bond you want to remove.
4. In the bond settings screen, you can disable or enable the bond by toggling a switcher or click the Delete button to remove the bond permanently.

Verification steps

- Go back to Networking and verify that all the interfaces from the bond are now standalone interfaces.
CHAPTER 9. CONFIGURING NETWORK TEAMS USING THE WEB CONSOLE

Learn how network bonding works, what are the differences between network teams and network bonds, and what are the possibilities of configuration in the web console.

Additionally you can find guidelines for:

- Adding a new network team
- Adding new interfaces to an existing network team
- Removing interfaces from an existing network team
- Removing a network team

**IMPORTANT**

Network teaming is deprecated in Red Hat Enterprise Linux 9. If you plan to upgrade your server to a future version of RHEL, consider using the kernel bonding driver as an alternative. For details, see Configuring network bonding.

Prerequisites

- The RHEL web console installed and enabled. For details, see Installing the web console.

9.1. UNDERSTANDING NETWORK TEAMING

Network teaming is a feature that combines or aggregates network interfaces to provide a logical interface with higher throughput or redundancy.

Network teaming uses a kernel driver to implement fast handling of packet flows, as well as user-space libraries and services for other tasks. This way, network teaming is an easily extensible and scalable solution for load-balancing and redundancy requirements.

**IMPORTANT**

Certain network teaming features, such as the fail-over mechanism, do not support direct cable connections without a network switch. For further details, see Is bonding supported with direct connection using crossover cables?

9.2. COMPARISON OF NETWORK TEAMING AND BONDING FEATURES

Learn about the features supported in network teams and network bonds:

</table>
9.3. CONFIGURING A NETWORK TEAM USING THE RHEL WEB CONSOLE

You can use the RHEL web console to configure a network team using a web browser.

**IMPORTANT**

Network teaming is deprecated in Red Hat Enterprise Linux 9. Consider using the network bonding driver as an alternative. For details, see [Configuring network bonding](#).

**Prerequisites**

- The `teamd` and `NetworkManager-team` packages are installed.
- Two or more physical or virtual network devices are installed on the server.
- To use Ethernet devices as ports of the team, the physical or virtual Ethernet devices must be installed on the server and connected to a switch.
- To use bond, bridge, or VLAN devices as ports of the team, create them in advance as described in:
  - [Configuring a network bridge using the RHEL web console](#)
  - [Configuring a network bond using the RHEL web console](#)
  - [Configuring VLAN tagging using the RHEL web console](#)

**Procedure**

1. Select the **Networking** tab in the navigation on the left side of the screen.
2. Click **Add team** in the **Interfaces** section.
3. Enter the name of the team device you want to create.
4. Select the interfaces that should be ports of the team.
5. Select the runner of the team.
   - If you select **Load balancing** or **802.3ad LACP**, the web console shows the additional field **Balancer**.
6. Set the link watcher:
   - If you select **Ethtool**, additionally, set a link up and link down delay.
• If you set **ARP ping** or **NSNA ping**, additionally, set a ping interval and ping target.

![Team settings window](image)

7. Click **Apply**.

8. By default, the team uses a dynamic IP address. If you want to set a static IP address:
   
a. Click the name of the team in the **Interfaces** section.
   
b. Click **Edit** next to the protocol you want to configure.
   
c. Select **Manual** next to **Addresses**, and enter the IP address, prefix, and default gateway.
   
d. In the **DNS** section, click the + button, and enter the IP address of the DNS server. Repeat this step to set multiple DNS servers.
   
e. In the **DNS search domains** section, click the + button, and enter the search domain.
   
f. If the interface requires static routes, configure them in the **Routes** section.
g. Click **Apply**

**Verification**

1. Select the **Networking** tab in the navigation on the left side of the screen, and check if there is incoming and outgoing traffic on the interface.

<table>
<thead>
<tr>
<th>Interfaces</th>
<th>Add bond</th>
<th>Add team</th>
<th>Add bridge</th>
<th>Add VLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td><strong>IP address</strong></td>
<td><strong>Sending</strong></td>
<td><strong>Receiving</strong></td>
<td></td>
</tr>
<tr>
<td><strong>team0</strong></td>
<td>192.0.2/24</td>
<td>1.11 Mbps</td>
<td>61.2 Mbps</td>
<td></td>
</tr>
</tbody>
</table>

2. Display the status of the team:

```
# teamdctl team0 state
setup:
  runner: activebackup
ports:
enp7s0
  link watches:
    link summary: up
instance[link_watch_0]:
  name: ethtool
  link: up
```
In this example, both ports are up.

Additional resources

- Network team runners

9.4. ADDING NEW INTERFACES TO THE TEAM USING THE WEB CONSOLE

Network teams can include multiple interfaces and it is possible to add or remove any of them at any time. The following section describes how to add a new network interface to an existing team.

Prerequisites

- A network team with is configured.

Procedure

1. Log in to the web console. For details, see Logging in to the web console.

2. Switch to the Networking tab.

3. In the Interfaces table, click on the team you want to configure.

4. In the team settings window, scroll down to the Ports table.

5. Click on the + button.

6. Select the interface you wish to add from the drop down list.

<table>
<thead>
<tr>
<th>Ports</th>
<th>Sending</th>
<th>Receiving</th>
</tr>
</thead>
<tbody>
<tr>
<td>enp7s0</td>
<td>0 bps</td>
<td>0 bps</td>
</tr>
<tr>
<td>enp8s0</td>
<td>0 bps</td>
<td>0 bps</td>
</tr>
</tbody>
</table>

| enp1s0 | enp9s0 |

The RHEL web console adds the interface to the team.

9.5. REMOVING OR DISABLING AN INTERFACE FROM THE TEAM USING THE WEB CONSOLE
Network teams can include multiple interfaces. If you need to change a device, you can remove or disable particular interfaces from the network team, which will work together with the rest of active interfaces.

There are two options how to stop using an interface included in a team:

- Removing the interface from the team
- Temporarily disabling the interface. The interface then stays as part of the team, but the team will not use it until you enable it again.

**Prerequisites**

- A network team with multiple interfaces exists on the host.

**Procedure**

1. Log in to the RHEL web console. For details, see [Logging in to the web console](#).
2. Switch to the **Networking** tab.
3. Click the team you want to configure.
4. In the team settings window, scroll down to the table of ports (interfaces).
5. Select an interface and remove or disable it.
   
   a. Switch the **ON/OFF** button to Off to disable the interface.
   
   b. Click the **-** button to remove the interface.

Based on your choice, the web console either removes or disables the interface. If you remove the interface, it will be available in **Networking** as a standalone interface.

### 9.6. REMOVING OR DISABLING A TEAM USING THE WEB CONSOLE

Remove or disable a network team using the web console. If you only disable the team, interfaces in the team will stay in it but the team will not be used for network traffic.

**Prerequisites**

- A network team is configured on the host.

**Procedure**

1. Log in to the web console.
For details, see Logging in to the web console.

2. Switch to the Networking tab.

3. Click the team you wish to remove or disable.

4. Remove or disable the selected team.
   a. You can remove the team by clicking the Delete button.
   b. You can disable the team by moving the ON/OFF switch to a disabled position.

![Team Management Interface]

Verification steps

- If you removed the team, go to Networking, and verify that all the interfaces from your team are now listed as standalone interfaces.
CHAPTER 10. CONFIGURING NETWORK BRIDGES IN THE WEB CONSOLE

Network bridges are used to connect multiple interfaces to the one subnet with the same range of IP addresses.

Prerequisites
- The RHEL 9 web console installed and enabled. For details, see Installing the web console.

10.1. CONFIGURING A NETWORK BRIDGE USING THE RHEL WEB CONSOLE

This section explains how to configure a network bridge using the RHEL web console.

Prerequisites
- Two or more physical or virtual network devices are installed on the server.
- To use Ethernet devices as ports of the bridge, the physical or virtual Ethernet devices must be installed on the server.
- To use team, bond, or VLAN devices as ports of the bridge, you can either create these devices while you create the bridge or you can create them in advance as described in:
  - Configuring a network team using the RHEL web console
  - Configuring a network bond using the RHEL web console
  - Configuring VLAN tagging using the RHEL web console

Procedure
1. Select the Networking tab in the navigation on the left side of the screen.
2. Click Add bridge in the Interfaces section.
3. Enter the name of the bridge device you want to create.
4. Select the interfaces that should be ports of the bridge.
5. Optional: Enable the Spanning tree protocol (STP) feature to avoid bridge loops and broadcast radiation.
6. Click **Apply**.

7. By default, the bridge uses a dynamic IP address. If you want to set a static IP address:
   
   a. Click the name of the bridge in the **Interfaces** section.
   
   b. Click **Edit** next to the protocol you want to configure.
   
   c. Select **Manual** next to **Addresses**, and enter the IP address, prefix, and default gateway.
   
   d. In the **DNS** section, click the + button, and enter the IP address of the DNS server. Repeat this step to set multiple DNS servers.
   
   e. In the **DNS search domains** section, click the + button, and enter the search domain.
   
   f. If the interface requires static routes, configure them in the **Routes** section.
g. Click Apply

Verification

1. Select the Networking tab in the navigation on the left side of the screen, and check if there is incoming and outgoing traffic on the interface:

<table>
<thead>
<tr>
<th>Name</th>
<th>IP address</th>
<th>Sending</th>
<th>Receiving</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridge0</td>
<td>192.0.2.1/24</td>
<td>1.11 Mbps</td>
<td>61.2 Mbps</td>
</tr>
</tbody>
</table>

10.2. REMOVING INTERFACES FROM THE BRIDGE USING THE WEB CONSOLE

Network bridges can include multiple interfaces. You can remove them from the bridge. Each removed interface will be automatically changed to the standalone interface.

Learn how to remove a network interface from a software bridge created in the RHEL 9 system.

Prerequisites

- Having a bridge with multiple interfaces in your system.
Procedure

1. Log in to the RHEL web console. For details, see Logging in to the web console.
2. Open Networking.
3. Click the bridge you want to configure.
4. In the bridge settings screen, scroll down to the table of ports (interfaces).
5. Select an interface and click the - button.

Verification steps

- Go to Networking to check that you can see the interface as a standalone interface in the Interface members table.

10.3. DELETING BRIDGES IN THE WEB CONSOLE

You can delete a software network bridge in the RHEL web console. All network interfaces included in the bridge will be changed automatically to standalone interfaces.

Prerequisites

- Having a bridge in your system.

Procedure

1. Log in to the RHEL web console.
   For details, see Logging in to the web console.
2. Open the Networking section.
3. Click the bridge you want to configure.
4. Click Delete.

   ![Delete Button](image)

Verification steps

- Go back to Networking and verify that all the network interfaces are displayed in the Interface members table.

Some interfaces that were previously part of the bridge can become inactive. If necessary, activate them and set network parameters manually.
CHAPTER 11. CONFIGURING VLANS IN THE WEB CONSOLE

This section describes how to configure Virtual Local Area Network (VLAN). A VLAN is a logical network within a physical network. The VLAN interface tags packets with the VLAN ID as they pass through the interface, and removes tags of returning packets.

11.1. CONFIGURING VLAN TAGGING USING THE RHEL WEB CONSOLE

Use the RHEL web console to configure VLAN tagging if you prefer to configure network settings using a web browser-based interface.

Prerequisites

- The interface you plan to use as a parent to the virtual VLAN interface supports VLAN tags.
- If you configure the VLAN on top of a bond interface:
  - The ports of the bond are up.
  - The bond is not configured with the `fail_over_mac=follow` option. A VLAN virtual device cannot change its MAC address to match the parent’s new MAC address. In such a case, the traffic would still be sent with the incorrect source MAC address.
  - The bond is usually not expected to get IP addresses from a DHCP server or IPv6 auto-configuration. Ensure it by disabling the IPv4 and IPv6 protocol creating the bond. Otherwise, if DHCP or IPv6 auto-configuration fails after some time, the interface might be brought down.
- The switch, the host is connected to, is configured to support VLAN tags. For details, see the documentation of your switch.

Procedure

1. Select the Networking tab in the navigation on the left side of the screen.
2. Click Add VLAN in the Interfaces section.
3. Select the parent device.
4. Enter the VLAN ID.
5. Enter the name of the VLAN device or keep the automatically-generated name.
6. Click Apply.
7. By default, the VLAN device uses a dynamic IP address. If you want to set a static IP address:
   a. Click the name of the VLAN device in the **Interfaces** section.
   b. Click **Edit** next to the protocol you want to configure.
   c. Select **Manual** next to **Addresses**, and enter the IP address, prefix, and default gateway.
   d. In the **DNS** section, click the + button, and enter the IP address of the DNS server. Repeat this step to set multiple DNS servers.
   e. In the **DNS search domains** section, click the + button, and enter the search domain.
   f. If the interface requires static routes, configure them in the **Routes** section.
   g. Click **Apply**

**Verification**

- Select the **Networking** tab in the navigation on the left side of the screen, and check if there is incoming and outgoing traffic on the interface:
### Interfaces

<table>
<thead>
<tr>
<th>Name</th>
<th>IP address</th>
<th>Sending</th>
<th>Receiving</th>
</tr>
</thead>
<tbody>
<tr>
<td>enp1s0.10</td>
<td>192.0.2.1/24</td>
<td>1.11 Mbps</td>
<td>61.2 Mbps</td>
</tr>
</tbody>
</table>
CHAPTER 12. CONFIGURING THE WEB CONSOLE LISTENING PORT

Learn how to allow new ports or change the existing ports using the RHEL 9 web console.

12.1. ALLOWING A NEW PORT ON A SYSTEM WITH ACTIVE SELINUX

Enable the web console to listen on a selected port.

Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.

Procedure

- For ports that are not defined by any other part of SELinux, run:
  
  $ sudo semanage port -a -t websm_port_t -p tcp PORT_NUMBER

- For ports that already are defined by other part of SELinux, run:
  
  $ sudo semanage port -m -t websm_port_t -p tcp PORT_NUMBER

The changes should take effect immediately.

12.2. ALLOWING A NEW PORT ON A SYSTEM WITH FIREWALLD

Enable the web console to receive connections on a new port.

Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.
- The firewalld service must be running.

Procedure

1. To add a new port number, run the following command:
   
   $ sudo firewall-cmd --permanent --service cockpit --add-port=PORT_NUMBER/tcp

2. To remove the old port number from the cockpit service, run:
   
   $ sudo firewall-cmd --permanent --service cockpit --remove-port=OLD_PORT_NUMBER/tcp

IMPORTANT

If you only run the firewall-cmd --service cockpit --add-port=PORT_NUMBER/tcp without the --permanent option, your change will disappear with the next reload of firewalld or a system reboot.
12.3. CHANGING THE WEB CONSOLE PORT

Change default transmission control protocol (TCP) on port 9090 to a different one.

Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.

- If you have SELinux protecting your system, you need to set it to allow Cockpit to listen on a new port. For more information, see Allowing a new port on a system with active SELinux.

- If you have firewalld configured as your firewall, you need to set it to allow Cockpit receive connections on a new port, for more information, see Allowing a new port on a system with firewalld.

Procedure

1. Change the listening port with one of the following methods:
   a. Using the systemctl edit cockpit.socket command:
      i. Run the following command:
         
         ```
         $ sudo systemctl edit cockpit.socket
         
         This will open the /etc/systemd/system/cockpit.socket.d/override.conf file.
         ```
      ii. Modify the content of override.conf or add a new content in the following format:
         
         ```
         [Socket]
         ListenStream=
         ListenStream=PORT_NUMBER
         ```
   b. Alternatively, add the above mentioned content to the /etc/systemd/system/cockpit.socket.d/listen.conf file. Create the cockpit.socket.d. directory and the listen.conf file if they do not exist yet.

2. Run the following commands for changes to take effect:
   
   ```
   $ sudo systemctl daemon-reload
   $ sudo systemctl restart cockpit.socket
   ```
   If you used systemctl edit cockpit.socket in the previous step, running systemctl daemon-reload is not necessary.

Verification steps

- To verify that the change was successful, try to connect to the web console with the new port.
CHAPTER 13. MANAGING FIREWALL USING THE WEB CONSOLE

A firewall is a way to protect machines from any unwanted traffic from outside. It enables users to control incoming network traffic on host machines by defining a set of firewall rules. These rules are used to sort the incoming traffic and either block it or allow through.

Prerequisites

- The RHEL 9 web console configures the `firewalld` service. For details about the `firewalld` service, see Getting started with `firewalld`.

13.1. RUNNING FIREWALL USING THE WEB CONSOLE

This section describes where and how to run the RHEL 9 system firewall in the web console.

**NOTE**

The RHEL 9 web console configures the `firewalld` service.

**Procedure**

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.
2. Open the Networking section.
3. In the Firewall section, click the slider to run the firewall.

If you do not see the Firewall slider, log in to the web console with the administrative privileges.

At this stage, your firewall is running.

To configure firewall rules, see Enabling services on the firewall using the web console

13.2. STOPPING FIREWALL USING THE WEB CONSOLE

This section describes where and how to stop the RHEL 9 system firewall in the web console.

**NOTE**

The RHEL 9 web console configures the `firewalld` service.

**Procedure**

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.
2. Open the **Networking** section.

3. In the **Firewall** section, click the slider to stop the firewall.

![Firewall section of RHEL 9 web console](image)

If you do not see the **Firewall** slider, log in to the web console with the administrative privileges.

At this stage, the firewall has been stopped and does not secure your system.

### 13.3. ZONES

**firewalld** can be used to separate networks into different zones according to the level of trust that the user has decided to place on the interfaces and traffic within that network. A connection can only be part of one zone, but a zone can be used for many network connections.

**NetworkManager** notifies **firewalld** of the zone of an interface. You can assign zones to interfaces with:

- **NetworkManager**
- **firewall-config** tool
- **firewall-cmd** command-line tool
- The RHEL web console

The latter three can only edit the appropriate **NetworkManager** configuration files. If you change the zone of the interface using the web console, **firewall-cmd** or **firewall-config**, the request is forwarded to **NetworkManager** and is not handled by **firewalld**.

The predefined zones are stored in the `/usr/lib/firewalld/zones/` directory and can be instantly applied to any available network interface. These files are copied to the `/etc/firewalld/zones/` directory only after they are modified. The default settings of the predefined zones are as follows:

**block**

Any incoming network connections are rejected with an icmp-host-prohibited message for **IPv4** and icmp6-adm-prohibited for **IPv6**. Only network connections initiated from within the system are possible.

**dmz**

For computers in your demilitarized zone that are publicly-accessible with limited access to your internal network. Only selected incoming connections are accepted.

**drop**

Any incoming network packets are dropped without any notification. Only outgoing network connections are possible.

**external**

For use on external networks with masquerading enabled, especially for routers. You do not trust the other computers on the network to not harm your computer. Only selected incoming connections are accepted.
home
For use at home when you mostly trust the other computers on the network. Only selected incoming connections are accepted.

internal
For use on internal networks when you mostly trust the other computers on the network. Only selected incoming connections are accepted.

public
For use in public areas where you do not trust other computers on the network. Only selected incoming connections are accepted.

trusted
All network connections are accepted.

work
For use at work where you mostly trust the other computers on the network. Only selected incoming connections are accepted.

One of these zones is set as the default zone. When interface connections are added to NetworkManager, they are assigned to the default zone. On installation, the default zone in firewalld is set to be the public zone. The default zone can be changed.

NOTE
The network zone names should be self-explanatory and to allow users to quickly make a reasonable decision. To avoid any security problems, review the default zone configuration and disable any unnecessary services according to your needs and risk assessments.

Additional resources
- The firewalld.zone(5) man page.

13.4. ZONES IN THE WEB CONSOLE
The Red Hat Enterprise Linux web console implements major features of the firewalld service and enables you to:

- Add predefined firewall zones to a particular interface or range of IP addresses
- Configure zones with selecting services into the list of enabled services
- Disable a service by removing this service from the list of enabled service
- Remove a zone from an interface

13.5. ENABLING ZONES USING THE WEB CONSOLE
The web console enables you to apply predefined and existing firewall zones on a particular interface or a range of IP addresses. This section describes how to enable a zone on an interface.

Prerequisites
- The RHEL 9 web console has been installed. For details, see Installing the web console.
The firewall must be enabled. For details, see Running firewall using the web console.

Procedure

1. Log in to the RHEL web console with administrative privileges. For details, see Logging in to the web console.

2. Click Networking.

3. Click on the Edit rules and zones button.

![Firewall settings](image)

If you do not see the Edit rules and zones button, log in to the web console with the administrator privileges.

4. In the Firewall section, click Add new zone.

5. In the Add zone dialog box, select a zone from the Trust level options.
   You can see here all zones predefined in the firewalld service.

6. In the Interfaces part, select an interface or interfaces on which the selected zone is applied.

7. In the Allowed Addresses part, you can select whether the zone is applied on:
   
   - the whole subnet
   
   - or a range of IP addresses in the following format:
     
     - 192.168.1.0
     
     - 192.168.1.0/24
     
     - 192.168.1.0/24, 192.168.1.0

8. Click on the Add zone button.
13.6. ENABLING SERVICES ON THE FIREWALL USING THE WEB CONSOLE

By default, services are added to the default firewall zone. If you use more firewall zones on more network interfaces, you must select a zone first and then add the service with port.

The RHEL 9 web console displays predefined firewalld services and you can add them to active firewall zones.

IMPORTANT

The RHEL 9 web console configures the firewalld service.

The web console does not allow generic firewalld rules which are not listed in the web console.
Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.
- The firewall must be enabled. For details, see Running firewall using the web console.

Procedure

1. Log in to the RHEL web console with administrator privileges. For details, see Logging in to the web console.
2. Click Networking.
3. Click on the Edit rules and zones button.
4. In the Firewall section, select a zone for which you want to add the service and click Add Services.
5. In the Add Services dialog box, find the service you want to enable on the firewall.
6. Enable desired services.
7. Click Add Services.

At this point, the RHEL 9 web console displays the service in the zone’s list of Services.

13.7. CONFIGURING CUSTOM PORTS USING THE WEB CONSOLE

The web console allows you to add:

- Services listening on standard ports: Enabling services on the firewall using the web console
- Services listening on custom ports.

This section describes how to add services with custom ports configured.

Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.
- The firewall must be enabled. For details, see Running firewall using the web console.

Procedure

1. Log in to the RHEL 9 web console with administrator privileges. For details, see Logging in to the web console.

2. Click Networking.

3. Click on the Edit rules and zones button.
If you do not see the **Edit rules and zones** button, log in to the web console with the administrative privileges.

4. In the **Firewall** section, select a zone for which you want to configure a custom port and click **Add Services**.

5. In the **Add services** dialog box, click on the **Custom Ports** radio button.

6. In the TCP and UDP fields, add ports according to examples. You can add ports in the following formats:
   - Port numbers such as 22
   - Range of port numbers such as 5900-5910
   - Aliases such as nfs, rsync

   **NOTE**
   You can add multiple values into each field. Values must be separated with the comma and without the space, for example: 8080,8081,http

7. After adding the port number in the **TCP** field, the **UDP** field, or both, verify the service name in the **Name** field.
   The **Name** field displays the name of the service for which this port reserved. You can rewrite the name if you are sure that this port is free to use and no server needs to communicate on this port.

8. In the **Name** field, add a name for the service including defined ports.

9. Click on the **Add Ports** button.
To verify the settings, go to the Firewall page and find the service in the list of zone’s Services.

13.8. DISABLING ZONES USING THE WEB CONSOLE

This section describes how to disable a firewall zone in your firewall configuration using the web console.

Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.

Procedure

1. Log in to the RHEL web console with administrator privileges. For details, see Logging in to the web console.

2. Click Networking.

3. Click on the Edit rules and zones button.
If you do not see the **Edit rules and zones** button, log in to the web console with the administrator privileges.

4. Click on the **Options** icon at the zone you want to remove.

5. Click **Delete**.

The zone is now disabled and the interface does not include opened services and ports which were configured in the zone.
CHAPTER 14. SETTING UP SYSTEM-WIDE CRYPTOGRAPHIC POLICIES IN THE WEB CONSOLE

You can choose from predefined system-wide cryptographic policy levels and switch between them directly in the Red Hat Enterprise Linux web console interface. If you set a custom policy on your system, the web console displays the policy in the **Overview** page as well as the **Change crypto policy** dialog window.

**Prerequisites**

- The RHEL 9 web console has been installed. For details, see [Installing and enabling the web console](#).
- You have administrator privileges.

**Procedure**

1. Log in to the RHEL web console. For more information, see [Logging in to the web console](#).
2. In the **Configuration** card of the **Overview** page, click your current policy value next to **Crypto policy**.
3. In the **Change crypto policy** dialog window, click on the policy level that you want to start using.
4. Click the **Apply and reboot** button.

**Verification**

- Log back in and check that the **Crypto policy** value corresponds to the one you selected.
CHAPTER 15. APPLYING A GENERATED ANSIBLE PLAYBOOK

When troubleshooting issues with SELinux, the web console is able to generate a shell script or an Ansible playbook that you can then export and apply for more machines.

Prerequisites

- The web console interface needs to be installed and accessible. For details, see Installing the web console.

Procedure

1. Click SELinux.

2. Click "View the automation script" on the upper right side. A window with the generated script opens. You can navigate between a shell script and an Ansible playbook generation options tab.

3. Click the Copy to clipboard button to select the script or playbook and apply it.

As a result, you have an automation script that you can apply to more machines.

Additional resources

- Troubleshooting problems related to SELinux
- Deploying the same SELinux configuration on multiple systems
- For details about the ansible-playbook command, see the ansible-playbook(1) man page.
CHAPTER 16. MANAGING PARTITIONS USING THE WEB CONSOLE

Learn how to manage file systems on RHEL 9 using the web console.

For details about the available file systems, see the Overview of available file systems.

16.1. DISPLAYING PARTITIONS FORMATTED WITH FILE SYSTEMS IN THE WEB CONSOLE

The Storage section in the web console displays all available file systems in the Filesystems table.

This section navigates you to get to the list of partitions formatted with file systems displayed in the web console.

Prerequisites

- The cockpit-storaged package is installed on your system.
- The web console must be installed and accessible. For details, see Installing the web console.

Procedure

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.
2. Click on the Storage tab.

In the Filesystems table, you can see all available partitions formatted with file systems, its name, size and how much space is available on each partition.
16.2. CREATING PARTITIONS IN THE WEB CONSOLE

To create a new partition:

- Use an existing partition table
- Create a partition

Prerequisites

- The **cockpit-storaged** package is installed on your system.
- The web console must be installed and accessible. For details, see Installing the web console.
- An unformatted volume connected to the system visible in the Other Devices table of the Storage tab.

Procedure

1. Log in to the RHEL web console. For details, see Logging in to the web console.
2. Click the Storage tab.
3. In the Other Devices table, click a volume in which you want to create the partition.
4. In the Content section, click the Create Partition button.
5. In the Create partition dialog box, select the size of the new partition.

6. In the Erase drop down menu, select:
   - Don’t overwrite existing data— the RHEL web console rewrites only the disk header. Advantage of this option is speed of formatting.
   - Overwrite existing data with zeros— the RHEL web console rewrites the whole disk with zeros. This option is slower because the program has to go through the whole disk, but it is more secure. Use this option if the disk includes any data and you need to overwrite it.

7. In the Type drop down menu, select a file system:
   - XFS file system supports large logical volumes, switching physical drives online without outage, and growing an existing file system. Leave this file system selected if you do not have a different strong preference.
   - ext4 file system supports:
     - Logical volumes
     - Switching physical drives online without outage
     - Growing a file system
     - Shrinking a file system

   Additional option is to enable encryption of partition done by LUKS (Linux Unified Key Setup), which allows you to encrypt the volume with a passphrase.

8. In the Name field, enter the logical volume name.

9. In the Mounting drop down menu, select Custom. The Default option does not ensure that the file system will be mounted on the next boot.

10. In the Mount Point field, add the mount path.

11. Select Mount at boot.

12. Click the Create Partition button. Formatting can take several minutes depending on the volume size and which formatting options are selected.

   After the formatting has completed successfully, you can see the details of the formatted logical volume on the Filesystem tab.

Verification steps

- To verify that the partition has been successfully added, switch to the Storage tab and check the Filesystems table.

16.3. DELETING PARTITIONS IN THE WEB CONSOLE

The following procedure teaches you how to delete partitions in the web console interface.

Prerequisites
• The **cockpit-storaged** package is installed on your system.

• The web console must be installed and accessible. For details, see [Installing the web console](#).

• Unmount the partition’s file system.
  For details about mounting and unmounting partitions, see [Mounting and unmounting file systems in the web console](#).

### Procedure

1. Log in to the RHEL web console. For details, see [Logging in to the web console](#).

2. Click on the **Storage** tab.

3. In the **Filesystems** table, select a volume in which you want to delete the partition.

4. In the **Content** section, click on the partition you want to delete.

5. The partition rolls down and you can click on the **Delete** button.
   The partition must not be mounted and used.

### Verification steps

• To verify that the partition has been successfully removed, switch to the **Storage** tab and check the **Content** table.

### 16.4. MOUNTING AND UNMOUNTING FILE SYSTEMS IN THE WEB CONSOLE

To be able to use partitions on RHEL systems, you need to mount a file system on the partition as a device.

**NOTE**

You also can unmount a file system and the RHEL system will stop using it. Unmounting the file system enables you to delete, remove, or re-format devices.

### Prerequisites

• The **cockpit-storaged** package is installed on your system.

• The web console must be installed and accessible. For details, see [Installing the web console](#).

• If you want to unmount a file system, ensure that the system does not use any file, service, or application stored in the partition.

### Procedure

1. Log in to the RHEL web console. For details, see [Logging in to the web console](#).

2. Click on the **Storage** tab.

3. In the **Filesystems** table, select a volume in which you want to delete the partition.

4. In the **Content** section, click on the partition whose file system you want to mount or unmount.
5. Click on the **Mount** or **Unmount** button.
   At this point, the file system has been mounted or unmounted according to your action.
CHAPTER 17. MANAGING NFS MOUNTS IN THE WEB CONSOLE

The RHEL 9 web console enables you to mount remote directories using the Network File System (NFS) protocol.

NFS makes it possible to reach and mount remote directories located on the network and work with the files as if the directory was located on your physical drive.

Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.
- The cockpit-storaged package is installed on your system.
- NFS server name or IP address.
- Path to the directory on the remote server.

17.1. CONNECTING NFS MOUNTS IN THE WEB CONSOLE

Connect a remote directory to your file system using NFS.

Prerequisites

- NFS server name or IP address.
- Path to the directory on the remote server.

Procedure

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.

2. Click Storage.

3. Click + in the NFS mounts section.

4. In the New NFS Mount dialog box, enter the server or IP address of the remote server.

5. In the Path on Server field, enter the path to the directory you want to mount.

6. In the Local Mount Point field, enter the path where you want to find the directory in your local system.

7. Select Mount at boot. This ensures that the directory will be reachable also after the restart of the local system.

8. Optionally, select Mount read only if you do not want to change the content.
9. Click **Add**.

**Verification steps**
- Open the mounted directory and verify that the content is accessible.

To troubleshoot the connection, you can adjust it with the Custom Mount Options.

### 17.2. CUSTOMIZING NFS MOUNT OPTIONS IN THE WEB CONSOLE

Edit an existing NFS mount and add custom mount options.

Custom mount options can help you to troubleshoot the connection or change parameters of the NFS mount such as changing timeout limits or configuring authentication.

**Prerequisites**
- NFS mount added.

**Procedure**

1. Log in to the RHEL 9 web console. For details, see [Logging in to the web console](#).

2. Click **Storage**.

3. Click on the NFS mount you want to adjust.

4. If the remote directory is mounted, click **Unmount**.
   The directory must not be mounted during the custom mount options configuration. Otherwise the web console does not save the configuration and this will cause an error.

1. Click **Edit**.

1. In the **NFS Mount** dialog box, select **Custom mount option**.

2. Enter mount options separated by a comma. For example:
   - `nfsvers=4` – the NFS protocol version number
- **soft** – type of recovery after an NFS request times out
- **sec=krb5** – files on the NFS server can be secured by Kerberos authentication. Both the NFS client and server have to support Kerberos authentication.

For a complete list of the NFS mount options, enter `man nfs` in the command line.

1. Click **Apply**.
2. Click **Mount**.

**Verification steps**

- Open the mounted directory and verify that the content is accessible.
CHAPTER 18. MANAGING REDUNDANT ARRAYS OF INDEPENDENT DISKS IN THE WEB CONSOLE

Redundant Arrays of Independent Disks (RAID) represents a way how to arrange more disks into one storage. RAID protects data stored in the disks against disk failure.

RAID uses the following data distribution strategies:

- Mirroring — data are copied to two different locations. If one disk fails, you have a copy and your data is not lost.
- Striping — data are evenly distributed among disks.

Level of protection depends on the RAID level.

The RHEL web console supports the following RAID levels:

- RAID 0 (Stripe)
- RAID 1 (Mirror)
- RAID 4 (Dedicated parity)
- RAID 5 (Distributed parity)
- RAID 6 (Double Distributed Parity)
- RAID 10 (Stripe of Mirrors)

Before you can use disks in RAID, you need to:

- Create a RAID.
- Format it with file system.
- Mount the RAID to the server.

Prerequisites

- The RHEL 9 web console is installed and accessible. For details, see Installing the web console.
- The `cockpit-storaged` package is installed on your system.

18.1. CREATING RAID IN THE WEB CONSOLE

Configure RAID in the RHEL 9 web console.

Prerequisites

- Physical disks connected to the system. Each RAID level requires different amount of disks.

Procedure

1. Open the RHEL 9 web console.
2. Click **Storage**.

3. Click the **Devices** table.

4. Click **Create RAID device**.

5. In the **Create RAID Device** dialog box, enter a name for a new RAID.

6. In the **RAID Level** drop-down list, select a level of RAID you want to use.

7. In the **Chunk Size** drop-down list, leave the predefined value as it is.
   
   The **Chunk Size** value specifies how large is each block for data writing. If the chunk size is 512 KiB, the system writes the first 512 KiB to the first disk, the second 512 KiB is written to the second disk, and the third chunk will be written to the third disk. If you have three disks in your RAID, the fourth 512 KiB will be written to the first disk again.

8. Select disks you want to use for RAID.

9. Click **Create**.

**Verification steps**

- Go to the **Storage** section and check that you can see the new RAID in the **RAID devices** box and format it.

You have the following options how to format and mount the new RAID in the web console:

- Formatting RAID
- Creating partitions on partition table
- Creating a volume group on top of RAID

## 18.2. FORMATTING RAID IN THE WEB CONSOLE

Format the new software RAID device created in the RHEL 9 web interface.

**Prerequisites**

- Physical disks are connected and visible by RHEL 9.
- RAID is created.
- Consider the file system which will be used for the RAID.
- Consider creating of a partitioning table.

**Procedure**

1. Open the RHEL 9 web console.

2. Click **Storage**.

3. In the **RAID devices** box, choose the RAID you want to format by clicking on it.

4. In the RAID details screen, scroll down to the **Content** part.
5. Click to the newly created RAID.

6. Click the **Format** button.

7. In the **Erase** drop-down list, select:
   
   - **Don’t overwrite existing data**— the RHEL web console rewrites only the disk header. Advantage of this option is speed of formatting.
   
   - **Overwrite existing data with zeros**— the RHEL web console rewrites the whole disk with zeros. This option is slower because the program has to go through the whole disk. Use this option if the RAID includes any data and you need to rewrite it.

8. In the **Type** drop-down list, select a XFS file system, if you do not have another strong preference.

9. Enter a name of the file system.

10. In the **Mounting** drop down list, select **Custom**.
    The **Default** option does not ensure that the file system will be mounted on the next boot.

11. In the **Mount Point** field, add the mount path.

12. Select **Mount at boot**.

13. Click the **Format** button.
    Formatting can take several minutes depending on the used formatting options and size of RAID.

    After successful finish, you can see the details of the formatted RAID on the **Filesystenm** tab.

14. To use the RAID, click **Mount**.

At this point, the system uses the mounted and formatted RAID.

### 18.3. USING THE WEB CONSOLE FOR CREATING A PARTITION TABLE ON RAID

Format RAID with the partition table on the new software RAID device created in the RHEL 9 interface. RAID requires formatting as any other storage device. You have two options:

- Format the RAID device without partitions
- Create a partition table with partitions

**Prerequisites**

- Physical disks are connected and visible by .
- RAID is created.
- Consider the file system used for the RAID.
- Consider creating a partitioning table.
**Procedure**

1. Open the RHEL 9 console.

2. Click *Storage*.

3. In the **RAID devices** box, select the RAID you want to edit.

4. In the RAID details screen, scroll down to the **Content** part.

5. Click to the newly created RAID.

6. Click the **Create partition table** button.

7. In the **Erase** drop-down list, select:
   - **Don’t overwrite existing data**— the RHEL web console rewrites only the disk header. Advantage of this option is speed of formatting.
   - **Overwrite existing data with zeros**— the RHEL web console rewrites the whole RAID with zeros. This option is slower because the program has to go through the whole RAID. Use this option if RAID includes any data and you need to rewrite it.

8. In the **Partitioning** drop-down list, select:
   - **Compatible with modern system and hard disks > 2TB (GPT)** — GUID Partition Table is a modern recommended partitioning system for large RAIDs with more than four partitions.
   - **Compatible with all systems and devices (MBR)** — Master Boot Record works with disks up to 2 TB in size. MBR also support four primary partitions max.

9. Click **Format**.

At this point, the partitioning table has been created and you can create partitions.

For creating partitions, see *Using the web console for creating partitions on RAID*.

**18.4. USING THE WEB CONSOLE FOR CREATING PARTITIONS ON RAID**

Create a partition in the existing partition table.

**Prerequisites**

- Partition table is created. For details, see *Using the web console for creating a partition table on RAID*.

**Procedure**

1. Open the RHEL 9 web console.

2. Click *Storage*.

3. In the **RAID devices** box, click to the RAID you want to edit.

4. In the RAID details screen, scroll down to the **Content** part.
5. Click to the newly created RAID.

6. Click **Create Partition**

7. In the **Create partition** dialog box, set up the size of the first partition.

8. In the **Erase** drop-down list, select:
   - **Don’t overwrite existing data**— the RHEL web console rewrites only the disk header. Advantage of this option is speed of formatting.
   - **Overwrite existing data with zeros**— the RHEL web console rewrites the whole RAID with zeros. This option is slower because the program have to go through the whole RAID. Use this option if RAID includes any data and you need to rewrite it.

9. In the **Type** drop-down list, select a XFS file system, if you do not have another strong preference.

10. Enter any name for the file system. Do not use spaces in the name.

11. In the **Mounting** drop down list, select **Custom**. The **Default** option does not ensure that the file system will be mounted on the next boot.

12. In the **Mount Point** field, add the mount path.

13. Select **Mount at boot**.

14. Click **Create partition**.

Formatting can take several minutes depending on used formatting options and the size of the RAID.

After a successful finish, you can continue with creating other partitions.

At this point, the system uses mounted and formatted RAID.

**18.5. USING THE WEB CONSOLE FOR CREATING A VOLUME GROUP ON TOP OF RAID**

Build a volume group from software RAID.

**Prerequisites**

- RAID device, which is not formatted and mounted.

**Procedure**

1. Open the RHEL 9 web console.

2. Click **Storage**.

3. Click the + button in the **Volume Groups** box.

4. In the **Create Volume Group** dialog box, enter a name for the new volume group.

5. In the **Disks** list, select a RAID device.
If you do not see the RAID in the list, unmount the RAID from the system. The RAID device must not be used by the RHEL 9 system.

6. Click Create.

The new volume group has been created and you can continue with creating a logical volume.
CHAPTER 19. USING THE WEB CONSOLE FOR CONFIGURING LVM LOGICAL VOLUMES

Red Hat Enterprise Linux 9 supports the LVM logical volume manager. When you install a Red Hat Enterprise Linux 9, it will be installed on LVM automatically created during the installation.

The screenshot shows the web console view of a clean installation of a RHEL 9 system with two logical volumes automatically created during the installation.

To find out more about logical volumes, follow the sections describing:

- What is logical volume manager and when to use it
- What are volume groups and how to create them
- What are logical volumes and how to create them
- How to format logical volumes
- How to resize logical volumes

Prerequisites

- The RHEL 9 web console has been installed. For instructions, see Installing and enabling the web console.
- The cockpit-storaged package is installed on your system.
- Physical drives, RAID devices, or any other type of block device from which you can create the logical volume.

19.1. LOGICAL VOLUME MANAGER IN THE WEB CONSOLE

The RHEL 9 web console provides a graphical interface to create LVM volume groups and logical volumes.

Volume groups create a layer between physical and logical volumes. It makes you possible to add or remove physical volumes without influencing logical volume itself. Volume groups appear as one drive with capacity consisting of capacities of all physical drives included in the group.

You can join physical drives into volume groups in the web console.

Logical volumes act as a single physical drive and it is built on top of a volume group in your system.
Main advantages of logical volumes are:

- Better flexibility than the partitioning system used on your physical drive.
- Ability to connect more physical drives into one volume.
- Possibility of expanding (growing) or reducing (shrinking) capacity of the volume on-line, without restart.
- Ability to create snapshots.

Additional resources

- Configuring and managing logical volumes

19.2. CREATING VOLUME GROUPS IN THE WEB CONSOLE

Create volume groups from one or more physical drives or other storage devices.

Logical volumes are created from volume groups. Each volume group can include multiple logical volumes.

For details, see Managing LVM volume groups.

Prerequisites

- Physical drives or other types of storage devices from which you want to create volume groups.

Procedure

1. Log in to the RHEL 9 web console.

2. Click Storage.

3. In the Devices section, select Create LVM2 volume group in the drop down menu.

4. In the Name field, enter a name of a group without spaces.
5. Select the drives you want to combine to create the volume group.

**Create volume group**

<table>
<thead>
<tr>
<th>Name</th>
<th>rhel-volume-group</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Disks</th>
<th>16.0 GB RAID device raid-device /dev/md/raid-device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>16.0 GB VirtIO Disk /dev/vdb</td>
</tr>
</tbody>
</table>

It might happen that you cannot see devices as you expected. The RHEL web console displays only unused block devices. Used devices means, for example:

- Devices formatted with a file system
- Physical volumes in another volume group
- Physical volumes being a member of another software RAID device
  If you do not see the device, format it to be empty and unused.

6. Click **Create**.

The web console adds the volume group in the **Devices** section. After clicking the group, you can create logical volumes that are allocated from that volume group.

**Devices**

<table>
<thead>
<tr>
<th>raid-device</th>
</tr>
</thead>
<tbody>
<tr>
<td>16.0 GB RAID device /dev/md/raid-device</td>
</tr>
</tbody>
</table>

**rhel-volume-group**

| 32.0 GB LVM2 volume group /dev/rhel-volume-group/

19.3. CREATING LOGICAL VOLUMES IN THE WEB CONSOLE

Logical volumes act as physical drives. You can use the RHEL 9 web console to create LVM logical volumes in a volume group.

**Prerequisites**

- The **cockpit-storaged** package is installed on your system.
- Volume group created. For details, see [Creating volume groups in the web console](#).

**Procedure**
1. Log in to the RHEL 9 web console.

2. Click **Storage**.

3. In the **Devices** section, click the volume group in which you want to create logical volumes.

4. In the **Logical volumes** section, click **Create new Logical Volume**.

5. In the **Name** field, enter a name for the new logical volume without spaces.

6. In the **Purpose** drop down menu, select **Block device for filesystems**. This configuration enables you to create a logical volume with the maximum volume size which is equal to the sum of the capacities of all drives included in the volume group.

7. Define the size of the logical volume. Consider:
   - How much space the system using this logical volume will need.
   - How many logical volumes you want to create.

   You do not have to use the whole space. If necessary, you can grow the logical volume later.

8. Click **Create**.

To verify the settings, click your logical volume and check the details.
At this stage, the logical volume has been created and you need to create and mount a file system with the formatting process.

### 19.4. FORMATTING LOGICAL VOLUMES IN THE WEB CONSOLE

Logical volumes act as physical drives. To use them, you need to format them with a file system.

**WARNING**
Formatting logical volumes will erase all data on the volume.

The file system you select determines the configuration parameters you can use for logical volumes. For example, some the XFS file system does not support shrinking volumes. For details, see Resizing logical volumes in the web console.

The following steps describe the procedure to format logical volumes.

**Prerequisites**
- The **cockpit-storaged** package is installed on your system.
- Logical volume created. For details, see Creating logical volumes in the web console.

**Procedure**
1. Log in to the RHEL 9 web console.
2. Click **Storage**.
3. In the **Devices** section, click the volume group in which the logical volume is placed.
4. In the **Logical volumes** section, click **Format**.
5. In the **Name** field, enter a name for the file system.

6. In the **Type** drop down menu, select a file system:

   - **XFS** file system supports large logical volumes, switching physical drives online without outage, and growing an existing file system. Leave this file system selected if you do not have a different strong preference.

   - **ext4** file system supports:
     - Logical volumes
     - Switching physical drives online without outage
     - Growing a file system
     - Shrinking a file system

   You can also select a version with the LUKS (Linux Unified Key Setup) encryption, which allows you to encrypt the volume with a passphrase.

7. Select the **Overwrite** option:

   - **Don’t overwrite existing data**— the RHEL web console rewrites only the disk header. Advantage of this option is speed of formatting.

   - **Overwrite existing data with zeros**— the RHEL web console rewrites the whole disk with zeros. This option is slower because the program have to go through the whole disk. Use this option if the disk includes any data and you need to overwrite it.

8. In the **Mount Point** field, add the mount path.
9. Click **Format**.
Formatting can take several minutes depending on the volume size and which formatting options are selected.

After the formatting has completed successfully, you can see the details of the formatted logical volume on the **Filesystem** tab.

10. To use the logical volume, click **Mount**.

At this point, the system can use mounted and formatted logical volume.

### 19.5. RESIZING LOGICAL VOLUMES IN THE WEB CONSOLE

Learn how to extend or reduce logical volumes in the RHEL 9 web console.

Whether you can resize a logical volume depends on which file system you are using. Most file systems enable you to extend (grow) the volume online (without outage).

You can also reduce (shrink) the size of logical volumes, if the logical volume contains a file system which supports shrinking. It should be available, for example, in the ext3/ext4 file systems.
Prerequisites

- Existing logical volume containing a file system that supports resizing logical volumes.

Procedure

The following steps provide the procedure for growing a logical volume without taking the volume offline:

1. Log in to the RHEL web console.
2. Click Storage.
3. In the Devices section, click the volume group in which the logical volume is placed.
4. In the Logical volumes section, click the logical volume.
5. On the Volume tab, click Grow.

6. In the Grow logical volume dialog box, adjust volume size.

7. Click Grow.

LVM grows the logical volume without system outage.

19.6. ADDITIONAL RESOURCES

- Configuring and managing logical volumes
Thinly-provisioned logical volumes enable you to allocate more space for designated applications or servers than how much space logical volumes actually contain.

For details, see Creating thin provisioned snapshot volumes.

The following sections describe:

- Creating pools for the thinly provisioned logical volumes.
- Creating thin logical volumes.
- Formatting thin logical volumes.

Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.
- The cockpit-storaged package is installed on your system.
- Physical drives or other types of storage devices from which you want to create volume groups.

20.1. CREATING POOLS FOR THIN LOGICAL VOLUMES IN THE WEB CONSOLE

Create a pool for thin-provisioned volumes.

Prerequisites

- Volume group created.

Procedure

1. Log in to the RHEL 9 web console.
2. Click Storage.
3. Click the volume group in which you want to create thin volumes.
4. Click Create new Logical Volume
5. In the Name field, enter a name for the new pool of thin volumes without spaces.
6. In the Purpose drop down menu, select Pool for thin-provisioned volumes This configuration enables you to create the thin volume.
7. Define the size of the pool of thin volumes. Consider:
   - How many thin volumes you will need in this pool?
   - What is the expected size of each thin volume?
You do not have to use the whole space. If necessary, you can grow the pool later.

8. Click Create.
The pool for thin volumes has been created and you can add thin volumes.

20.2. CREATING THIN LOGICAL VOLUMES IN THE WEB CONSOLE

Create a thin logical volume in the pool. The pool can include multiple thin volumes and each thin volume can be as large as the pool for thin volumes itself.

IMPORTANT
Using thin volumes requires regular checkup of actual free physical space of the logical volume.

Prerequisites
- Pool for thin volumes created.
  For details, see Creating pools for thin logical volumes in the web console.

Procedure

1. Log in to the RHEL 9 web console.
2. Click Storage.
3. Click the volume group in which you want to create thin volumes.
4. Click the desired pool.
5. Click Create Thin Volume.
6. In the Create Thin Volume dialog box, enter a name for the thin volume without spaces.
7. Define the size of the thin volume.
8. Click Create.

At this stage, the thin logical volume has been created and you need to format it.

20.3. FORMATTING LOGICAL VOLUMES IN THE WEB CONSOLE

Logical volumes act as physical drives. To use them, you need to format them with a file system.

WARNING
Formatting logical volumes will erase all data on the volume.
The file system you select determines the configuration parameters you can use for logical volumes. For example, some the XFS file system does not support shrinking volumes. For details, see Resizing logical volumes in the web console.

The following steps describe the procedure to format logical volumes.

**Prerequisites**

- The cockpit-storaged package is installed on your system.
- Logical volume created. For details, see Creating logical volumes in the web console.

**Procedure**

1. Log in to the RHEL 9 web console.
2. Click Storage.
3. In the Devices section, click the volume group in which the logical volume is placed.
4. In the Logical volumes section, click Format.
5. In the Name field, enter a name for the file system.
6. In the Type drop down menu, select a file system:
   - XFS file system supports large logical volumes, switching physical drives online without outage, and growing an existing file system. Leave this file system selected if you do not have a different strong preference.
   - XFS does not support reducing the size of a volume formatted with an XFS file system
   - ext4 file system supports:
     - Logical volumes
     - Switching physical drives online without outage
     - Growing a file system
     - Shrinking a file system

   You can also select a version with the LUKS (Linux Unified Key Setup) encryption, which allows you to encrypt the volume with a passphrase.
7. Select the Overwrite option:
   - Don’t overwrite existing data – the RHEL web console rewrites only the disk header. Advantage of this option is speed of formatting.
- **Overwrite existing data with zeros**— the RHEL web console rewrites the whole disk with zeros. This option is slower because the program have to go through the whole disk. Use this option if the disk includes any data and you need to overwrite it.

8. In the **Mount Point** field, add the mount path.

⚠️ **Format /dev/rhel-volume-group/rhel-logical-volume**

<table>
<thead>
<tr>
<th>Name</th>
<th>rhel-fs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>XFS (recommended)</td>
</tr>
<tr>
<td>Overwrite</td>
<td>Overwrite existing data with zeros (slower)</td>
</tr>
<tr>
<td>Mount point</td>
<td>/media</td>
</tr>
<tr>
<td>Mount options</td>
<td></td>
</tr>
<tr>
<td>Encryption</td>
<td>No encryption</td>
</tr>
</tbody>
</table>

*Formatting erases all data on a storage device.*

[Format]  [Cancel]

9. Click **Format**.

Formatting can take several minutes depending on the volume size and which formatting options are selected.

After the formatting has completed successfully, you can see the details of the formatted logical volume on the **Filesystem** tab.

<table>
<thead>
<tr>
<th>Logical volumes</th>
<th>Create new logical volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>rhel-logical-volume</td>
<td>xfs filesystem</td>
</tr>
</tbody>
</table>

10. To use the logical volume, click **Mount**.

At this point, the system can use mounted and formatted logical volume.
CHAPTER 21. USING THE WEB CONSOLE FOR CHANGING PHYSICAL DRIVES IN VOLUME GROUPS

Change the drive in a volume group using the RHEL 9 web console.

The change of physical drives consists of the following procedures:

- Adding physical drives from logical volumes.
- Removing physical drives from logical volumes.

Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.
- The cockpit-storaged package is installed on your system.
- A new physical drive for replacing the old or broken one.
- The configuration expects that physical drives are organized in a volume group.

21.1. ADDING PHYSICAL DRIVES TO VOLUME GROUPS IN THE WEB CONSOLE

The RHEL 9 web console enables you to add a new physical drive or other type of volume to the existing logical volume.

Prerequisites

- A volume group must be created.
- A new drive connected to the machine.

Procedure

1. Log in to the RHEL 9 console.
2. Click Storage.
3. In the Volume Groups box, click the volume group in which you want to add a physical volume.
4. In the Physical Volumes box, click the + button.
5. In the Add Disks dialog box, select the preferred drive and click Add.

As a result, the RHEL 9 web console adds the physical volume.

Verification steps

- Check the Physical Volumes for section, and the logical volume can immediately start to write on the drive.
21.2. REMOVING PHYSICAL DRIVES FROM VOLUME GROUPS IN THE WEB CONSOLE

If a logical volume includes multiple physical drives, you can remove one of the physical drives online.

The system moves automatically all data from the drive to be removed to other drives during the removal process. Notice that it can take some time.

The web console also verifies, if there is enough space for removing the physical drive.

Prerequisites
- A volume group with more than one physical drive connected.

Procedure
The following steps describe how to remove a drive from the volume group without causing outage in the RHEL 9 web console.

1. Log in to the RHEL 9 web console.
2. Click Storage.
3. Click the volume group in which you have the logical volume.
4. In the Physical Volumes section, locate the preferred volume.
5. Click the - button.
   The RHEL 9 web console verifies whether the logical volume has enough free space for removing the disk. If not, you cannot remove the disk and it is necessary to add another disk first. For details, see Adding physical drives to logical volumes in the web console.

As results, the RHEL 9 web console removes the physical volume from the created logical volume without causing an outage.
CHAPTER 22. USING THE WEB CONSOLE FOR MANAGING VIRTUAL DATA OPTIMIZER VOLUMES

Configure the Virtual Data Optimizer (VDO) using the RHEL 9 web console.

You will learn how to:

- Create VDO volumes
- Format VDO volumes
- Extend VDO volumes

Prerequisites

- The RHEL 9 web console is installed and accessible. For details, see Installing the web console.
- The `cockpit-storaged` package is installed on your system.

22.1. VDO VOLUMES IN THE WEB CONSOLE

Red Hat Enterprise Linux 9 supports Virtual Data Optimizer (VDO).

VDO is a block virtualization technology that combines:

Compression

For details, see Enabling or disabling compression in VDO.

Deduplication

For details, see Enabling or disabling compression in VDO.

Thin provisioning

For details, see Creating and managing thin provisioned volumes (thin volumes).

Using these technologies, VDO:

- Saves storage space inline
- Compresses files
- Eliminates duplications
- Enables you to allocate more virtual space than how much the physical or logical storage provides
- Enables you to extend the virtual storage by growing

VDO can be created on top of many types of storage. In the RHEL 9 web console, you can configure VDO on top of:

- LVM

NOTE

It is not possible to configure VDO on top of thinly-provisioned volumes.
Physical volume

Software RAID

For details about placement of VDO in the Storage Stack, see System Requirements.

Additional resources

- For details about VDO, see Deduplicating and compressing storage.

22.2. CREATING VDO VOLUMES IN THE WEB CONSOLE

Create a VDO volume in the RHEL web console.

Prerequisites

- Physical drives, LVMs, or RAID from which you want to create VDO.

Procedure

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.

2. Click Storage.

3. Click the + button in the VDO Devices box.

4. In the Name field, enter a name of a VDO volume without spaces.

5. Select the drive that you want to use.

6. In the Logical Size bar, set up the size of the VDO volume. You can extend it more than ten times, but consider for what purpose you are creating the VDO volume:
   - For active VMs or container storage, use logical size that is ten times the physical size of the volume.
   - For object storage, use logical size that is three times the physical size of the volume.
   For details, see Deploying VDO.

7. In the Index Memory bar, allocate memory for the VDO volume. For details about VDO system requirements, see System Requirements.

8. Select the Compression option. This option can efficiently reduce various file formats. For details, see Enabling or disabling compression in VDO.

9. Select the Deduplication option. This option reduces the consumption of storage resources by eliminating multiple copies of duplicate blocks. For details, see Enabling or disabling compression in VDO.

10. [Optional] If you want to use the VDO volume with applications that need a 512 bytes block size, select Use 512 Byte emulation. This reduces the performance of the VDO volume, but should be very rarely needed. If in doubt, leave it off.

11. Click Create.
Verification steps

- Check that you can see the new VDO volume in the Storage section. Then you can format it with a file system.

22.3. FORMATTING VDO VOLUMES IN THE WEB CONSOLE

VDO volumes act as physical drives. To use them, you need to format them with a file system.

**WARNING**

Formatting VDO will erase all data on the volume.

The following steps describe the procedure to format VDO volumes.

**Prerequisites**

- A VDO volume is created. For details, see [Creating VDO volumes in the web console](#).

**Procedure**

1. Log in to the RHEL 9 web console. For details, see [Logging in to the web console](#).
2. Click **Storage**.
3. Click the VDO volume.
4. Click on the **Unrecognized Data** tab.
5. Click **Format**.
6. In the **Erase** drop down menu, select:
   - **Don’t overwrite existing data**
     The RHEL web console rewrites only the disk header. The advantage of this option is the speed of formatting.
   - **Overwrite existing data with zeros**
     The RHEL web console rewrites the whole disk with zeros. This option is slower because the program has to go through the whole disk. Use this option if the disk includes any data and you need to rewrite them.
7. In the **Type** drop down menu, select a filesystem:
   - The **XFS** file system supports large logical volumes, switching physical drives online without outage, and growing. Leave this file system selected if you do not have a different strong preference.
     XFS does not support shrinking volumes. Therefore, you will not be able to reduce volume formatted with XFS.
The **ext4** file system supports logical volumes, switching physical drives online without outage, growing, and shrinking.

You can also select a version with the LUKS (Linux Unified Key Setup) encryption, which allows you to encrypt the volume with a passphrase.

8. In the **Name** field, enter the logical volume name.

9. In the **Mounting** drop down menu, select **Custom**. The **Default** option does not ensure that the file system will be mounted on the next boot.

10. In the **Mount Point** field, add the mount path.

11. Select **Mount at boot**

12. Click **Format**. Formatting can take several minutes depending on the used formatting options and the volume size.

   After a successful finish, you can see the details of the formatted VDO volume on the **Filesystem** tab.

13. To use the VDO volume, click **Mount**.

At this point, the system uses the mounted and formatted VDO volume.

**22.4. EXTENDING VDO VOLUMES IN THE WEB CONSOLE**

Extend VDO volumes in the RHEL 9 web console.

**Prerequisites**

- The **cockpit-storaged** package is installed on your system.
- The VDO volume created.

**Procedure**

1. Log in to the RHEL 9 web console. For details, see [Logging in to the web console](#).

2. Click **Storage**.

3. Click your VDO volume in the **VDO Devices** box.

4. In the VDO volume details, click the **Grow** button.

5. In the **Grow logical size of VDO** dialog box, extend the logical size of the VDO volume.

   1. Click **Grow**.

**Verification steps**

- Check the VDO volume details for the new size to verify that your changes have been successful.
CHAPTER 23. LOCKING DATA WITH LUKS PASSWORD IN THE RHEL WEB CONSOLE

In the web console’s Storage tab, you can now create, lock, unlock, resize, and otherwise configure encrypted devices using the LUKS (Linux Unified Key Setup) version 2 format.

This new version of LUKS offers:

- More flexible unlocking policies
- Stronger cryptography
- Better compatibility with future changes

Prerequisites

- The RHEL 9 web console has been installed. For details, see Installing the web console.
- The cockpit-storaged package is installed on your system.

23.1. LUKS DISK ENCRYPTION

The Linux Unified Key Setup-on-disk-format (LUKS) enables you to encrypt block devices and it provides a set of tools that simplifies managing the encrypted devices. LUKS allows multiple user keys to decrypt a master key, which is used for the bulk encryption of the partition.

RHEL uses LUKS to perform block device encryption. By default, the option to encrypt the block device is unchecked during the installation. If you select the option to encrypt your disk, the system prompts you for a passphrase every time you boot the computer. This passphrase “unlocks” the bulk encryption key that decrypts your partition. If you choose to modify the default partition table, you can choose which partitions you want to encrypt. This is set in the partition table settings.

What LUKS does

- LUKS encrypts entire block devices and is therefore well-suited for protecting contents of mobile devices such as removable storage media or laptop disk drives.
- The underlying contents of the encrypted block device are arbitrary, which makes it useful for encrypting swap devices. This can also be useful with certain databases that use specially formatted block devices for data storage.
- LUKS uses the existing device mapper kernel subsystem.
- LUKS provides passphrase strengthening, which protects against dictionary attacks.
- LUKS devices contain multiple key slots, allowing users to add backup keys or passphrases.

What LUKS does not do

- Disk-encryption solutions like LUKS protect the data only when your system is off. Once the system is on and LUKS has decrypted the disk, the files on that disk are available to anyone who would normally have access to them.
- LUKS is not well-suited for scenarios that require many users to have distinct access keys to the same device. The LUKS1 format provides eight key slots, LUKS2 up to 32 key slots.
LUKS is not well-suited for applications requiring file-level encryption.

Ciphers
The default cipher used for LUKS is **aes-xts-plain64**. The default key size for LUKS is 512 bits. The default key size for LUKS with Anaconda (XTS mode) is 512 bits. Ciphers that are available are:

- AES - Advanced Encryption Standard
- Twofish (a 128-bit block cipher)
- Serpent

Additional resources
- LUKS Project Home Page
- LUKS On-Disk Format Specification
- FIPS PUB 197

23.2. CONFIGURING THE LUKS PASSPHRASE IN THE WEB CONSOLE

If you want to add encryption to an existing logical volume on your system, you can only do so through formatting the volume.

Prerequisites
- The web console must be installed and accessible. For details, see Installing the web console.
- The **cockpit-storaged** package is installed on your system.
- Available existing logical volume without encryption.

Procedure
1. Log in to the RHEL 9 web console.
   For details, see Logging in to the web console.
2. Click Storage.
3. Select the storage device you want to format.
4. Click the menu icon and select Format option.
5. Select the Encrypt data box to activate encryption on your storage device.
6. Set and confirm your new passphrase.
8. Finalize formatting settings.
9. Click Format.

23.3. CHANGING THE LUKS PASSPHRASE IN THE WEB CONSOLE
Change a LUKS passphrase on an encrypted disk or partition in the web console.

Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.
- The cockpit-storaged package is installed on your system.

Procedure

1. Log in to the web console. For details, see Logging in to the web console.
2. Click Storage
3. In the Drives table, select the disk with encrypted data.
4. In Content, select the encrypted partition.
5. Click Encryption.
6. In the Keys table, click the pen icon.
7. In the Change passphrase dialog window:
   a. Enter your current passphrase.
   b. Enter your new passphrase.
   c. Confirm your new passphrase.
8. Click Save
CHAPTER 24. MANAGING SOFTWARE UPDATES IN THE WEB CONSOLE

Lear how to manage software updates in the RHEL 9 web console and ways to automate them.

The Software Updates module in the web console is based on the `dnf` utility. For more information about updating software with `dnf`, see the Updating packages section.

24.1. MANAGING MANUAL SOFTWARE UPDATES IN THE WEB CONSOLE

This section describes how to manually update your software using the web console.

**Prerequisites**

- The web console must be installed and accessible. For details, see Installing the web console.

**Procedure**

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.

2. Click **Software Updates**.
   - The list of available updates refreshes automatically if the last check happened more than 24 hours ago. To trigger a refresh, click the **Check for Updates** button.

3. Apply updates. You can watch the update log while the update is running.
   - To install all available updates, click the **Install all updates** button.
   - If you have security updates available, you can install them separately by clicking the **Install Security Updates** button.
   - If you have kpatch updates available, you can install them separately by clicking the **Install kpatch updates** button.

4. Optional: You can turn on the **Reboot after completion** switch for an automatic restart of your system. If you perform this step, you can skip the remaining steps of this procedure.

5. After the system applies updates, you get a recommendation to restart your system. We recommend this especially if the update included a new kernel or system services that you do not want to restart individually.

6. Click **Ignore** to cancel the restart, or **Restart Now** to proceed with restarting your system. After the system restart, log in to the web console and go to the **Software Updates** page to verify that the update has been successful.

24.2. MANAGING AUTOMATIC SOFTWARE UPDATES IN THE WEB CONSOLE

In the web console, you can choose to apply all updates, or security updates and also manage periodicity and time of your automatic updates.
Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.

Procedure

1. Log in to RHEL 9 web console. For details, see Logging in to the web console.

2. Click Software Updates.

3. In the Settings table, click the Edit button.

4. Pick one of the types of automatic updates. You can select from Security updates only, or All updates.

5. To modify the day of the automatic update, click on the every day drop-down menu and select a specific day.

6. To modify the time of the automatic update, click into the 6:00 field and select or type a specific time.

7. If you want to disable automatic software updates, select the No updates type.

24.3. MANAGING ON-DEMAND RESTARTING AFTER APPLYING SOFTWARE UPDATES IN THE WEB CONSOLE

The intelligent restarting feature informs the users whether it is necessary to reboot the whole system after you apply a software update or if it is sufficient to only restart certain services.

Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.

Procedure

1. Log in to the RHEL 9 web console. For details, see Logging in to the web console.

2. Click Software Updates.

3. Apply an update of your system.

4. After a successful update, click Reboot system..., Restart services..., or Ignore

5. If you decide to ignore, you can return to the restart or reboot menu by doing one of the following:
   a. Rebooting:
      i. Click the Reboot system button in the Status field of the Software Updates page.
      ii. (Optional) Write a message to the logged in users.
      iii. Select a delay from the Delay drop down menu.
      iv. Click Reboot.
b. Restarting services:
   
   i. Click the Restart services… button in the Status field of the Software Updates page. You will see a list of all the services that require a restart.
   
   ii. Click Restart services.
       Depending on your choice, the system will reboot or your services will restart.

24.4. APPLYING PATCHES WITH KERNEL LIVE PATCHING IN THE WEB CONSOLE

The web console allows users to apply kernel security patches without forcing reboots by using the kpatch framework. The following procedure shows how to set up the preferred type of patching.

Prerequisites

- The web console must be installed and accessible. For details, see Installing the web console.

Procedure

1. Log in to the web console with administrative privileges. For details, see Logging in to the web console.

2. Click Software Updates.

3. Check the status of your kernel patching settings.
   
   a. If the patching is not installed, click Install.

   ![Settings]

   ![Settings]

   b. To enable kernel patching, click Enable.

   ![Settings]

   c. Check the check box for applying kernel patches.

   d. Select whether you want to apply patches for current and future kernels, or for the current kernel only. If you choose to subscribe to applying patches for future kernels, the system will apply patches also for the upcoming kernel releases.
Verification

- Check that the kernel patching is now Enabled in the Settings table of the Software updates section.

Additional resources

- Applying patches with kernel live patching
CHAPTER 25. MANAGING SUBSCRIPTIONS IN THE WEB CONSOLE

Manage your subscription for Red Hat Enterprise Linux 9 from the web console.

To get a subscription for your Red Hat Enterprise Linux, you need to have an account in the Red Hat Customer Portal or an activation key.

This chapter covers:

- Subscription management in the RHEL 9 web console.
- Registering subscriptions for your system in the web console with the Red Hat user name and password.
- Registering subscriptions with the activation key.

Prerequisites

- Purchased subscriptions.
- The system subjected to subscription has to be connected to the internet because the web console needs to communicate with the Red Hat Customer Portal.

25.1. SUBSCRIPTION MANAGEMENT IN THE WEB CONSOLE

The RHEL 9 web console provides an interface for using Red Hat Subscription Manager installed on your local system.

The Subscription Manager connects to the Red Hat Customer Portal and verifies all available:

- Active subscriptions
- Expired subscriptions
- Renewed subscriptions

If you want to renew the subscription or get a different one in Red Hat Customer Portal, you do not have to update the Subscription Manager data manually. The Subscription Manager synchronizes data with Red Hat Customer Portal automatically.

25.2. REGISTERING SUBSCRIPTIONS WITH CREDENTIALS IN THE WEB CONSOLE

Use the following steps to register a newly installed Red Hat Enterprise Linux with account credentials using the RHEL web console.

Prerequisites

- A valid user account on the Red Hat Customer Portal. See the Create a Red Hat Login page.
- Active subscription for your RHEL system.
Procedure

1. Log in to the RHEL web console. For details, see Logging in to the web console.

2. In the Health field in the Overview page, click the Not registered warning, or click Subscriptions in the main menu to move to page with your subscription information.

3. In the Overview field, click Register.

4. In the Register system dialog box, select that you want to register using your account credentials.
5. Enter your username.

6. Enter your password.

7. Optionally, enter your organization’s name or ID.
   If your account belongs to more than one organization on the Red Hat Customer Portal, you have to add the organization name or organization ID. To get the org ID, go to your Red Hat contact point.
   
   • If you do not want to connect your system to Red Hat Insights, clear the Insights check box.

8. Click the Register button.

At this point, your Red Hat Enterprise Linux Enterprise Linux system has been successfully registered.

25.3. REGISTERING SUBSCRIPTIONS WITH ACTIVATION KEYS IN THE WEB CONSOLE

Use the following steps to register a newly installed Red Hat Enterprise Linux with an activation key using the RHEL web console.

Prerequisites

• If you do not have a user account in the portal, your vendor provides you with the activation key.

Procedure

1. Log in to the RHEL web console. For details, see Logging in to the web console.

2. In the Health filed in the Overview page, click the Not registered warning, or click Subscriptions in the main menu to move to page with your subscription information.

3. In the Overview filed, click Register.
4. In the **Register system** dialog box, select that you want to register using an activation key.

**Register System**

- **URL**: Default
- **Use proxy server**: unchecked
- **Method**: Account - **Activation key**
  - Activation Key: `key_one,key_two`
  - Organization: blank
- **Subscriptions**: checked - Attach automatically
- **Insights**: checked - Connect this system to [Red Hat Insights](https://insights.redhat.com).

[Register] [Cancel]

5. Enter your key or keys.

6. Enter your organization's name or ID.
   To get the organization ID, go to your Red Hat contact point.
   - If you do not want to connect your system to Red Hat Insights, clear the **Insights** check box.

7. Click the **Register** button.

At this point, your Red Hat Enterprise Linux system has been successfully registered.
CHAPTER 26. CONFIGURING KDUMP IN THE WEB CONSOLE

Setup and test the `kdump` configuration in the RHEL 9 web console.

The web console is part of a default installation of RHEL 9 and enables or disables the `kdump` service at boot time. Further, the web console enables you to configure the reserved memory for `kdump`; or to select the `vmcore` saving location in an uncompressed or compressed format.

26.1. CONFIGURING KDUMP MEMORY USAGE AND TARGET LOCATION IN WEB CONSOLE

The procedure below shows you how to use the Kernel Dump tab in the RHEL web console interface to configure the amount of memory that is reserved for the `kdump` kernel. The procedure also describes how to specify the target location of the `vmcore` dump file and how to test your configuration.

Procedure

1. Open the Kernel Dump tab and start the `kdump` service.

2. Configure the `kdump` memory usage using the command line.

3. Click the link next to the Crash dump location option.

4. Select the Local Filesystem option from the drop-down and specify the directory you want to save the dump in.
Alternatively, select the **Remote over SSH** option from the drop-down to send the vmcore to a remote machine using the SSH protocol. Fill the **Server**, **ssh key**, and **Directory** fields with the remote machine address, ssh key location, and a target directory.

Another choice is to select the **Remote over NFS** option from the drop-down and fill the **Mount** field to send the vmcore to a remote machine using the NFS protocol.

**NOTE**

Tick the **Compression** check box to reduce the size of the vmcore file.

5. Test your configuration by crashing the kernel.

   ![Status](image)
   
   **Status**
   
   **Reserved memory** 192 MiB
   
   **Crash dump location** locally in /var/crash

   ![Test configuration]
   
   ![Test configuration]

   a. Click **Test configuration**.

   b. In the **Test kdump settings** field, click **Crash system**.

**WARNING**

This step disrupts execution of the kernel and results in a system crash and loss of data.

**Additional resources**

- Supported kdump targets
- Using secure communications between two systems with OpenSSH

**26.2. ADDITIONAL RESOURCES**

- Getting started using the RHEL web console
CHAPTER 27. MANAGING VIRTUAL MACHINES IN THE WEB CONSOLE

To manage virtual machines in a graphical interface on a RHEL 9 host, you can use the Virtual Machines pane in the RHEL 9 web console.

### 27.1. OVERVIEW OF VIRTUAL MACHINE MANAGEMENT USING THE WEB CONSOLE

The RHEL 9 web console is a web-based interface for system administration. As one of its features, the web console provides a graphical view of virtual machines (VMs) on the host system, and makes it possible to create, access, and configure these VMs.

Note that to use the web console to manage your VMs on RHEL 9, you must first install a web console plug-in for virtualization.

**Next steps**

- For instructions on enabling VMs management in your web console, see Setting up the web console to manage virtual machines.

- For a comprehensive list of VM management actions that the web console provides, see Virtual machine management features available in the web console.

### 27.2. SETTING UP THE WEB CONSOLE TO MANAGE VIRTUAL MACHINES

Before using the RHEL 9 web console to manage virtual machines (VMs), you must install the web console virtual machine plug-in on the host.

**Prerequisites**

- Ensure that the web console is installed and enabled on your machine.

```
# systemctl status cockpit.socket
cockpit.socket - Cockpit Web Service Socket
```
### Procedure

- Install the `cockpit-machines` plug-in.

```bash
# dnf install cockpit-machines
```

### Verification

1. Access the web console, for example by entering the `https://localhost:9090` address in your browser.

2. Log in.

3. If the installation was successful, `Virtual Machines` appears in the web console side menu.

### Additional resources

- Managing systems using the RHEL 9 web console

### 27.3. RENAMING VIRTUAL MACHINES USING THE WEB CONSOLE

After create a virtual machine (VM), you might wish to rename the VM to avoid conflicts or assign a new unique name based on your use case. You can use the RHEL web console to rename the VM.

#### Prerequisites

- The web console VM plug-in is installed on your system.

- Ensure that the VM is shut down.

#### Procedure

1. In the `Virtual Machines` interface, click the Menu button of the VM that you want to rename.
A drop down menu appears with controls for various VM operations.

2. Click **Rename**.
   The Rename a VM dialog appears.

2. In the **New name** field, enter a name for the VM.

4. Click **Rename**.

**Verification**

- The new VM name should appear in the **Virtual Machines** interface.

### 27.4. VIRTUAL MACHINE MANAGEMENT FEATURES AVAILABLE IN THE WEB CONSOLE

Using the RHEL 9 web console, you can perform the following actions to manage the virtual machines (VMs) on your system.

**Table 27.1. VM tasks that can be performed in the RHEL 9 web console**

CHAPTER 28. MANAGING REMOTE SYSTEMS IN THE WEB CONSOLE

Connect to the remote systems and manage them in the RHEL 9 web console.

The following chapter describes:

- The optimal topology of connected systems.
- How to add and remove remote systems.
- When, why, and how to use SSH keys for remote system authentication.
- How to configure a web console client to allow a user authenticated with a smart card to SSH to a remote host and access services on it.

Prerequisites

- Opened the SSH service on remote systems.

28.1. REMOTE SYSTEM MANAGER IN THE WEB CONSOLE

Using the RHEL 9 web console to manage remote systems in the network requires considering the topology of connected servers.

For optimal security, Red Hat recommends the following connection setup:

- Use one system with the web console as a bastion host. The bastion host is a system with opened HTTPS port.
- All other systems communicate through SSH.

With the web interface running on the bastion host, you can reach all other systems through the SSH protocol using port 22 in the default configuration.
28.2. ADDING REMOTE HOSTS TO THE WEB CONSOLE

This section helps you to connect other systems with a user name and password.

Prerequisites

- You need to be logged into the web console with administration privileges. For details, see Logging in to the web console.

Procedure

1. In the RHEL 9 web console, click on your `username@hostname` in the top left corner of the Overview page.
2. In the drop down menu, click the **Add new host** button.
3. In the **Add new host** dialog box, specify the host you want to add.

4. (Optional) Add the user name for the account to which you want to connect.
   You can use any user account of the remote system. However, if you use credentials of a user account without administration privileges, you will not be able to perform administration tasks.

   If you use the same credentials as for your local system, the web console will authenticate remote systems automatically every time you log in. However, using the same credentials on more machines could be a potential security risk.

5. (Optional) Click the **Color** field to change the color of the system.

6. Click **Add**.
The new host will appear in the list of hosts in the username@hostname drop down menu.

NOTE

The web console does not save passwords used to log in to remote systems which means that you have to log in again after each system restart. Next time you log in, click the Log in button placed on the main screen of the disconnected remote system to open the login dialog.

28.3. REMOVING REMOTE HOSTS FROM THE WEB CONSOLE

This section guides you on removing other systems from the web console.

Prerequisites

- Remote systems added.
  For details, see Adding remote hosts to the web console.

- You must be logged into the web console with administrator privileges.
  For details, see Logging in to the web console.

Procedure

1. Log in to the RHEL 9 web console.

2. Click on your username@hostname in the top left corner of the Overview page.
3. Click the **Edit hosts** icon.
4. To remove a host from web console, click the red minus sign - button next to its host name. Note that you cannot remove a host you are currently connected to.
As a result, the server is removed from your web console.

### 28.4. ENABLING SSH LOGIN FOR A NEW HOST

When you add a new host you can also log into it with an SSH key. If you already have an SSH key on your system, the web console will use the existing one; otherwise, the web console can create a key.

**Prerequisites**
You need to be logged into the web console with administration privileges. For details, see Logging in to the web console.

Procedure

1. In the RHEL 9 web console, click on your username@hostname in the top left corner of the Overview page.

2. In the drop down menu, click the Add new host button.
3. In the **Add new host** dialog box, specify the host you want to add.

4. Add the user name for the account to which you want to connect.
   You can use any user account of the remote system. However, if you use credentials of a user account without administration privileges, you will not be able to perform administration tasks.

5. (Optional) Click the **Color** field to change the color of the system.

6. Click **Add**.
   A new dialog window will appear asking for a password.

7. Enter the user account password.
8. Check Authorize ssh key if you already have an SSH key.

9. Check Create a new SSH key and authorize it if you do not have an SSH key. The web console will create it for you.

   a. Add a password for the SSH key.
b. Confirm the password.

10. Click Log in
    The new host will appear in the list of hosts in the `username@hostname` drop down menu.

**Verification steps**

1. Log out.

2. Log back in.

3. Click Log in in the Not connected to host screen.

4. Select **SSH key** as your authentication option.

5. Enter your key password.

6. Click Log in.

### 28.5. CONSTRAINED DELEGATION IN IDENTITY MANAGEMENT

The Service for User to Proxy (S4U2proxy) extension provides a service that obtains a service ticket to another service on behalf of a user. This feature is known as **constrained delegation**. The second service is typically a proxy performing some work on behalf of the first service, under the authorization context of the user. Using constrained delegation eliminates the need for the user to delegate their full ticket-granting ticket (TGT).
Identity Management (IdM) traditionally uses the Kerberos S4U2proxy feature to allow the web server framework to obtain an LDAP service ticket on the user’s behalf. The IdM-AD trust system also uses constrained delegation to obtain a cifs principal.

You can use the S4U2proxy feature to configure a web console client to allow an IdM user that has authenticated with a smart card to achieve the following:

- Run commands with superuser privileges on the RHEL host on which the web console service is running without being asked to authenticate again.
- Access a remote host using SSH and access services on the host without being asked to authenticate again.

Additional resources

- Using Ansible to configure a web console to allow a user authenticated with a smart card to SSH to a remote host without being asked to authenticate again
- Using Ansible to configure a web console to allow a user authenticated with a smart card to run sudo without being asked to authenticate again
- S4U2proxy
- Service constrained delegation

28.6. CONFIGURING A WEB CONSOLE TO ALLOW A USER AUTHENTICATED WITH A SMART CARD TO SSH TO A REMOTE HOST WITHOUT BEING ASKED TO AUTHENTICATE AGAIN

After you have logged in to a user account on the RHEL web console, as an Identity Management (IdM) system administrator you might need to connect to remote machines by using the SSH protocol. You can use the constrained delegation feature to use SSH without being asked to authenticate again.

This procedure describes how to configure the web console to use constrained delegation. In the example below, the web console session runs on the myhost.idm.example.com host and it is being configured to access the remote.idm.example.com host by using SSH on behalf of the authenticated user.

Prerequisites

- You have obtained an IdM admin ticket-granting ticket (TGT).
- You have root access to remote.idm.example.com.
- The web console service is present in IdM.
- The remote.idm.example.com host is present in IdM.
- The web console has created an S4U2Proxy Kerberos ticket in the user session. To verify that this is the case, log in to the web console as an IdM user, open the Terminal page, and enter:

  ```shell
  $ klist
  Ticket cache: FILE:/run/user/1894000001/cockpit-session-3692.ccache
  Default principal: user@IDM.EXAMPLE.COM
  ```
Valid starting     Expires            Service principal
07/30/21 09:19:06 07/31/21 09:19:06
HTTP/myhost.idm.example.com@IDM.EXAMPLE.COM
07/30/21 09:19:06 07/31/21 09:19:06 krbtgt/IDM.EXAMPLE.COM@IDM.EXAMPLE.COM
for client HTTP/myhost.idm.example.com@IDM.EXAMPLE.COM

Procedure

1. Create a list of the target hosts that can be accessed by the delegation rule:
   a. Create a service delegation target:
      
      ```bash
      $ ipa servicedelegationtarget-add cockpit-target
      ```
   b. Add the target host to the delegation target:
      
      ```bash
      $ ipa servicedelegationtarget-add-member cockpit-target -- principals=host/remote.idm.example.com@IDM.EXAMPLE.COM
      ```

2. Allow cockpit sessions to access the target host list by creating a service delegation rule and adding the HTTP service Kerberos principal to it:
   a. Create a service delegation rule:
      
      ```bash
      $ ipa servicedelegationrule-add cockpit-delegation
      ```
   b. Add the web console client to the delegation rule:
      
      ```bash
      $ ipa servicedelegationrule-add-member cockpit-delegation -- principals=HTTP/myhost.idm.example.com@IDM.EXAMPLE.COM
      ```
   c. Add the delegation target to the delegation rule:
      
      ```bash
      $ ipa servicedelegationrule-add-target cockpit-delegation -- servicedelegationtargets=cockpit-target
      ```

3. Enable Kerberos authentication on the remote.idm.example.com host:
   a. SSH to remote.idm.example.com as root.
   b. Open the /etc/ssh/sshd_config file for editing.
      
      ```bash
      $ cat /etc/ssh/sshd_config
      ```
   c. Enable GSSAPIAuthentication by uncommenting the GSSAPIAuthentication no line and replacing it with GSSAPIAuthentication yes.

4. Restart the SSH service on remote.idm.example.com so that the above changes take effect immediately:
   
   ```bash
   $ systemctl try-restart sshd.service
   ```

Additional resources

- Logging in to the web console with smart cards
Constrained delegation in Identity Management

28.7. USING ANSIBLE TO CONFIGURE A WEB CONSOLE TO ALLOW A USER AUTHENTICATED WITH A SMART CARD TO SSH TO A REMOTE HOST WITHOUT BEING ASKED TO AUTHENTICATE AGAIN

After you have logged in to a user account on the RHEL web console, as an Identity Management (IdM) system administrator you might need to connect to remote machines by using the SSH protocol. You can use the constrained delegation feature to use SSH without being asked to authenticate again.

This procedure describes how to use the servicedelegationrule and servicedelegationtarget ansible-freeipa modules to configure a web console to use constrained delegation. In the example below, the web console session runs on the myhost.idm.example.com host and it is being configured to access the remote.idm.example.com host by using SSH on behalf of the authenticated user.

Prerequisites

- The IdM admin password.
- root access to remote.idm.example.com.
- The web console service is present in IdM.
- The remote.idm.example.com host is present in IdM.
- The web console has created an S4U2Proxy Kerberos ticket in the user session. To verify that this is the case, log in to the web console as an IdM user, open the Terminal page, and enter:

  ```
  $ klist
  Ticket cache: FILE:/run/user/1894000001/cockpit-session-3692.ccache
  Default principal: user@IDM.EXAMPLE.COM
  Valid starting     Expires            Service principal
  07/30/21 09:19:06 07/31/21 09:19:06 HTTP/myhost.idm.example.com@IDM.EXAMPLE.COM
  07/30/21 09:19:06  07/31/21 09:19:06  krbtgt/IDM.EXAMPLE.COM@IDM.EXAMPLE.COM
  for client HTTP/myhost.idm.example.com@IDM.EXAMPLE.COM
  ```

- You have configured an Ansible control node that meets the following requirements:
  - You are using Ansible version 2.8 or later.
  - You have installed the ansible-freeipa package.
  - In the ~/MyPlaybooks/ directory, you have created an Ansible inventory file with the fully-qualified domain name (FQDN) of the IdM server where you are configuring the constrained delegation.

Procedure

1. Navigate to your ~/MyPlaybooks/ directory:

  ```
  $ cd ~/MyPlaybooks/
  ```
2. Create a `web-console-smart-card-ssh.yml` playbook with the following content:

   a. Create a task that ensures the presence of a delegation target:

   ```yaml
   ---
   - name: Playbook to create a constrained delegation target
     hosts: ipaserver
     become: true
     tasks:
       - name: Ensure servicedelegationtarget web-console-delegation-target is present
         ipaservicedelegationtarget:
           ipaadmin_password: SomeADMINpassword
           name: web-console-delegation-target
   
   b. Add a task that adds the target host to the delegation target:

   ```yaml
   - name: Ensure servicedelegationtarget web-console-delegation-target member
     principal host/remote.idm.example.com@IDM.EXAMPLE.COM is present
     ipaservicedelegationtarget:
       ipaadmin_password: SomeADMINpassword
       name: web-console-delegation-target
       principal: host/remote.idm.example.com@IDM.EXAMPLE.COM
       action: member
   
   c. Add a task that ensures the presence of a delegation rule:

   ```yaml
   - name: Ensure servicedelegationrule delegation-rule is present
     ipaservicedelegationrule:
       ipaadmin_password: SomeADMINpassword
       name: web-console-delegation-rule
   
   d. Add a task that ensures that the Kerberos principal of the web console client service is a member of the constrained delegation rule:

   ```yaml
   - name: Ensure the Kerberos principal of the web console client service is added to the servicedelegationrule web-console-delegation-rule
     ipaservicedelegationrule:
       ipaadmin_password: SomeADMINpassword
       name: web-console-delegation-rule
       principal: HTTP/myhost.idm.example.com
       action: member
   
   e. Add a task that ensures that the constrained delegation rule is associated with the web-console-delegation-target delegation target:

   ```yaml
   - name: Ensure a constrained delegation rule is associated with a specific delegation target
     ipaservicedelegationrule:
       ipaadmin_password: SomeADMINpassword
       name: web-console-delegation-rule
       target: web-console-delegation-target
       action: member
3. Save the file.

4. Run the Ansible playbook specifying the playbook file and the inventory file:

   $ ansible-playbook -v -i inventory web-console-smart-card-ssh.yml

5. Enable Kerberos authentication on remote.idm.example.com:

   a. SSH to remote.idm.example.com as root.

   b. Open the /etc/sshd/sshd_config file for editing.

   c. Enable GSSAPIAuthentication by uncommenting the GSSAPIAuthentication no line and replacing it with GSSAPIAuthentication yes.

Additional resources

- Logging in to the web console with smart cards
- Constrained delegation in Identity Management
- README-servicedelegationrule.md and README-servicedelegationtarget.md in the /usr/share/doc/ansible-freeipa/ directory

CHAPTER 29. CONFIGURING SINGLE SIGN-ON FOR THE RHEL 9 WEB CONSOLE IN THE IDM DOMAIN

Learn how to use Single Sign-on (SSO) authentication provided by Identity Management (IdM) in the RHEL 9 web console.

Advantages:

- IdM domain administrators can use the RHEL 9 web console to manage local machines.
- Users with a Kerberos ticket in the IdM domain do not need to provide login credentials to access the web console.
- All hosts known to the IdM domain are accessible via SSH from the local instance of the RHEL 9 web console.
- Certificate configuration is not necessary. The console’s web server automatically switches to a certificate issued by the IdM certificate authority and accepted by browsers.

This chapter covers the following steps to configure SSO for logging into the RHEL web console:

1. Add machines to the IdM domain using the RHEL 9 web console.
   For details, see Joining a RHEL 9 system to an IdM domain using the web console.

2. If you want to use Kerberos for authentication, you need to obtain a Kerberos ticket on your machine.
   For details, see Logging in to the web console using Kerberos authentication.

3. Allow administrators on the IdM server to run any command on any host.
   For details, see Enabling admin sudo access to domain administrators on the IdM server

Prerequisites

- The RHEL web console installed on RHEL 9 systems.
  For details, see Installing the web console.

- IdM client installed on systems with the RHEL web console.
  For details, see IdM client installation.

29.1. JOINING A RHEL 9 SYSTEM TO AN IDM DOMAIN USING THE WEB CONSOLE

You can use the web console to join the Red Hat Enterprise Linux 9 system to the Identity Management (IdM) domain.

Prerequisites

- The IdM domain is running and reachable from the client you want to join.
- You have the IdM domain administrator credentials.

Procedure

1. Log into the RHEL web console.
For details, see Logging in to the web console.

2. In the Configuration field of the Overview tab click Join Domain.

3. In the Join a Domain dialog box, enter the host name of the IdM server in the Domain Address field.

4. In the Domain administrator name field, enter the user name of the IdM administration account.

5. In the Domain administrator password, add a password.

6. Click Join.

Verification steps

1. If the RHEL 9 web console did not display an error, the system has been joined to the IdM domain and you can see the domain name in the System screen.

2. To verify that the user is a member of the domain, click the Terminal page and type the id command:

   ```
   $ id
   euid=548800004(example_user) gid=548800004(example_user)
groups=548800004(example_user) context=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023
   ```

Additional resources

- Planning Identity Management
- Installing Identity Management
- Managing IdM users, groups, hosts, and access control rules

29.2. LOGGING IN TO THE WEB CONSOLE USING KERBEROS AUTHENTICATION

The following procedure describes steps on how to set up the RHEL 9 system to use Kerberos authentication.

**IMPORTANT**

With SSO you usually do not have any administrative privileges in the web console. This only works if you configured passwordless sudo. The web console does not interactively ask for a sudo password.

Prerequisites

- IdM domain running and reachable in your company environment.
  For details, see Joining a RHEL 9 system to an IdM domain using the web console.

- Enable the cockpit.socket service on remote systems to which you want to connect and manage them with the RHEL web console.
For details, see Installing the web console.

- If the system does not use a Kerberos ticket managed by the SSSD client, try to request the ticket with the `kinit` utility manually.

### Procedure

Log in to the RHEL web console with the following address: `https://dns_name:9090`.

At this point, you are successfully connected to the RHEL web console and you can start with configuration.

#### 29.3. ENABLING ADMIN SUDO ACCESS TO DOMAIN ADMINISTRATORS ON THE IDM SERVER

The following procedure describes steps on how to allow domain administrators to run any command on any host in the Identity Management (IdM) domain.

To accomplish this, enable sudo access to the `admins` user group created automatically during the IdM server installation.

All users added to the `admins` group will have sudo access if you run `ipa-advise` script on the group.

### Prerequisites

- The server runs IdM 4.7.1 or later.

### Procedure

1. Connect to the IdM server.

2. Run the `ipa-advise` script:

   ```bash
   $ ipa-advise enable-admins-sudo | sh -ex
   ```
If the console did not display an error, the **admins** group have admin permissions on all machines in the IdM domain.
CHAPTER 30. CONFIGURING SMART CARD AUTHENTICATION WITH THE WEB CONSOLE FOR CENTRALLY MANAGED USERS

Configure smart card authentication in the RHEL web console for users who are centrally managed by:

- Identity Management
- Active Directory which is connected in the cross-forest trust with Identity Management

Prerequisites

- The system for which you want to use the smart card authentication must be a member of an Active Directory or Identity Management domain.
- The certificate used for the smart card authentication must be associated with a particular user in Identity Management or Active Directory.
  For more details about associating a certificate with the user in Identity Management, see Adding a certificate to a user entry in the IdM Web UI or Adding a certificate to a user entry in the IdM CLI.

30.1. SMART CARD AUTHENTICATION FOR CENTRALLY MANAGED USERS

A smart card is a physical device, which can provide personal authentication using certificates stored on the card. Personal authentication means that you can use smart cards in the same way as user passwords.

You can store user credentials on the smart card in the form of a private key and a certificate. Special software and hardware is used to access them. You insert the smart card into a reader or a USB socket and supply the PIN code for the smart card instead of providing your password.

Identity Management (IdM) supports smart card authentication with:

- User certificates issued by the IdM certificate authority.
- User certificates issued by the Active Directory Certificate Service (ADCS) certificate authority.

NOTE

If you want to start using smart card authentication, see the hardware requirements: Smart Card support in RHEL8+.

30.2. INSTALLING TOOLS FOR MANAGING AND USING SMART CARDS

To configure your smart card, you need tools which can generate certificates and store them on a smart card.

You must:

- Install the gnutls-utils package, which helps you to manage certificates.
- Install the opensc package, which provides a set of libraries and utilities to work with smart cards.

- Start the pcscd service, which communicates with the smart card reader.

**Procedure**

1. Install the opensc and gnutls-utils packages:
   ```bash
   # dnf -y install opensc gnutls-utils
   ```

2. Start the pcscd service.
   ```bash
   # systemctl start pcscd
   ```

Verify that the pcscd service is up and running.

**30.3. PREPARING YOUR SMART CARD AND UPLOADING YOUR CERTIFICATES AND KEYS TO YOUR SMART CARD**

This section describes smart card configuration with the pkcs15-init tool, which helps you to configure:

- Erasing your smart card
- Setting new PINs and optional PIN Unblocking Keys (PUKs)
- Creating a new slot on the smart card
- Storing the certificate, private key, and public key in the slot
- If required, locking the smart card settings as certain smart cards require this type of finalization

**NOTE**

The pkcs15-init tool may not work with all smart cards. You must use the tools that work with the smart card you are using.

**Prerequisites**

- The opensc package, which includes the pkcs15-init tool, is installed. For details, see Installing tools for managing and using smart cards.

- The card is inserted in the reader and connected to the computer.

- You have the private key, public key, and certificate to store on the smart card. In this procedure, testuser.key, testuserpublic.key, and testuser.crt are the names used for the private key, public key, and the certificate.

- You have your current smart card user PIN and Security Officer PIN (SO-PIN).

**Procedure**

1. Erase your smart card and authenticate yourself with your PIN:
$ pkcs15-init --erase-card --use-default-transport-keys
Using reader with a card: Reader name
PIN [Security Officer PIN] required.
Please enter PIN [Security Officer PIN]:

The card has been erased.

2. Initialize your smart card, set your user PIN and PUK, and your Security Officer PIN and PUK:

$ pkcs15-init --create-pkcs15 --use-default-transport-keys
   --pin 963214 --puk 321478 --so-pin 65498714 --so-puk 784123
Using reader with a card: Reader name

The `pkcs15-init` tool creates a new slot on the smart card.

3. Set the label and the authentication ID for the slot:

$ pkcs15-init --store-pin --label testuser
   --auth-id 01 --so-pin 65498714 --pin 963214 --puk 321478
Using reader with a card: Reader name

The label is set to a human-readable value, in this case, testuser. The auth-id must be two hexadecimal values, in this case it is set to 01.

4. Store and label the private key in the new slot on the smart card:

$ pkcs15-init --store-private-key testuser.key --label testuser_key
   --auth-id 01 --id 01 --pin 963214
Using reader with a card: Reader name

**NOTE**

The value you specify for --id must be the same when storing your private key and storing your certificate in the next step. Specifying your own value for --id is recommended as otherwise a more complicated value is calculated by the tool.

5. Store and label the certificate in the new slot on the smart card:

$ pkcs15-init --store-certificate testuser.crt --label testuser_crt
   --auth-id 01 --id 01 --format pem --pin 963214
Using reader with a card: Reader name

6. (Optional) Store and label the public key in the new slot on the smart card:

$ pkcs15-init --store-public-key testuserpublic.key
   --label testuserpublic_key --auth-id 01 --id 01 --pin 963214
Using reader with a card: Reader name

**NOTE**

If the public key corresponds to a private key or certificate, specify the same ID as the ID of the private key or certificate.
7. (Optional) Certain smart cards require you to finalize the card by locking the settings:

```
$pkcs15-init -F
```

At this stage, your smart card includes the certificate, private key, and public key in the newly created slot. You have also created your user PIN and PUK and the Security Officer PIN and PUK.

### 30.4. ENABLING SMART CARD AUTHENTICATION FOR THE WEB CONSOLE

To be able to use smart card authentication in the web console, enable smart card authentication in the `cockpit.conf` file.

Additionally, you can disable password authentication in the same file.

**Prerequisites**

- The RHEL web console has been installed.

**Procedure**

1. Log in to the RHEL web console with administrator privileges.
2. Click **Terminal**.
3. In the `/etc/cockpit/cockpit.conf`, set the `ClientCertAuthentication` to `yes`:

   ```
   [WebService]
   ClientCertAuthentication = yes
   ```

4. Optionally, disable password based authentication in `cockpit.conf` with:

   ```
   [Basic]
   action = none
   ```

   This configuration disables password authentication and you must always use the smart card.

5. Restart the web console to ensure that the `cockpit.service` accepts the change:

   ```
   # systemctl restart cockpit
   ```

### 30.5. LOGGING IN TO THE WEB CONSOLE WITH SMART CARDS

You can use smart cards to log in to the web console.

**Prerequisites**

- A valid certificate stored in your smart card that is associated to a user account created in an Active Directory or Identity Management domain.

- PIN to unlock the smart card.
The smart card has been put into the reader.

Procedure

1. Open your web browser and add the web console's address in the address bar. The browser asks you to add the PIN protecting the certificate stored on the smart card.

2. In the Password Required dialog box, enter PIN and click OK.

3. In the User Identification Request dialog box, select the certificate stored in the smart card.

4. Select Remember this decision. The system does not open this window next time.

   **NOTE**
   
   This step does not apply to Google Chrome users.

5. Click OK.

You are now connected and the web console displays its content.

30.6. ENABLING PASSWORD-LESS SUDO FOR SMART CARD USERS

Once you logged into web console with a certificate, you may need to switch to administrative mode (root privileges through sudo). If your user account has a password, it can be used to authenticate to sudo.

As an alternative, if you are using Red Hat Identity Management, you can declare the initial web console certificate authentication as trusted for authenticating to sudo, SSH, or other services. For that purpose, the web console automatically creates an S4U2Proxy Kerberos ticket in the user session.

Prerequisites

- Identity Management
- Active Directory connected in the cross-forest trust with Identity Management
- Smart card set up to log in to the web console. See Configuring smart card authentication with the web console for centrally managed users for more information.

Procedure

1. Set up constraint delegation rules to list which hosts the ticket can access.
   
   **Example 30.1. Setting up constraint delegation rules**
   
   The web console session runs host host.example.com and should be trusted to access its own host with sudo. Additionally, we are adding second trusted host - remote.example.com.

   - Create the following delegation:
     
     - Run the following commands to add a list of target machines a particular rule can access:
To allow web console sessions (HTTP/principal) to access that host list, run the following commands:

```
# ipa servicedelegationtarget-add cockpit-target
# ipa servicedelegationtarget-add-member cockpit-target \
--principals=host/host.example.com@EXAMPLE.COM \
--principals=host/remote.example.com@EXAMPLE.COM
```

2. Enable GSS authentication in the corresponding services:

   a. For sudo, enable the `pam_sss_gss` module in the `/etc/sssd/sssd.conf` file:
     
      i. As root, add an entry for your domain to the `/etc/sssd/sssd.conf` configuration file.

      ```
      [domain/example.com]
      pam_gssapi_services = sudo, sudo-i
      ```

      ii. Enable the module in the `/etc/pam.d/sudo` file on the first line.

      ```
      auth sufficient pam_sss_gss.so
      ```

   b. For SSH, update the `GSSAPIAuthentication` option in the `/etc/ssh/sshd_config` file to `yes`.

WARNING

The delegated S4U ticket is not forwarded to remote SSH hosts when connecting to them from the web console. Authenticating to sudo on a remote host with your ticket will not work.

Verification

1. Log in to the web console using a smart card.

2. Click the Limited access button.

3. Authenticate using your smart card.

OR

1. Try to connect to a different host with SSH.
30.7. LIMITING USER SESSIONS AND MEMORY TO PREVENT A DOS ATTACK

Certificate authentication is protected by separating and isolating instances of the cockpit-ws web server against attackers who wants to impersonate another user. However, this introduces a potential Denial of Service (DoS) attack: A remote attacker could create a large number of certificates and send a large number of HTTPS requests to cockpit-ws each using a different certificate.

To prevent this DoS, the collective resources of these web server instances are limited. By default, limits to the number of connections and to memory usage are set to 200 threads and a 75% (soft) / 90% (hard) memory limit.

The following procedure describes resource protection by limiting the number of connections and memory.

Procedure

1. In the terminal, open the system-cockpithttps.slice configuration file:

```
# systemctl edit system-cockpithttps.slice
```

2. Limit the TasksMax to 100 and CPUQuota to 30%:

```
[Slice]
# change existing value
TasksMax=100
# add new restriction
CPUQuota=30%
```

3. To apply the changes, restart the system:

```
# systemctl daemon-reload
# systemctl stop cockpit
```

Now, the new memory and user session limits protect the cockpit-ws web server from DoS attacks.
