Red Hat Enterprise Linux 9.0

Preparing for disaster recovery with Identity Management

Documentation for mitigating disasters affecting an Identity Management deployment
Red Hat Enterprise Linux 9.0 Preparing for disaster recovery with Identity Management

Documentation for mitigating disasters affecting an Identity Management deployment
Abstract

This document describes common disaster scenarios that threaten an IdM deployment, along with methods to mitigate those situations through replication, Virtual Machine snapshots, and backups.

MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.

In Identity Management, planned terminology replacements include:

- *block list* replaces *blacklist*
- *allow list* replaces *whitelist*
- *secondary* replaces *slave*

- The word *master* is being replaced with more precise language, depending on the context:
  - *IdM server* replaces *IdM master*
  - *CA renewal server* replaces *CA renewal master*
  - *CRL publisher server* replaces *CRL master*
  - *multi-supplier* replaces *multi-master*
PROVIDING FEEDBACK ON RED HAT DOCUMENTATION

We appreciate your input on our documentation. Please let us know how we could make it better.

- For simple comments on specific passages:
  1. Make sure you are viewing the documentation in the *Multi-page HTML* format. In addition, ensure you see the Feedback button in the upper right corner of the document.
  2. Use your mouse cursor to highlight the part of text that you want to comment on.
  3. Click the Add Feedback pop-up that appears below the highlighted text.
  4. Follow the displayed instructions.

- For submitting feedback via Bugzilla, create a new ticket:
  1. Go to the Bugzilla website.
  2. As the Component, use Documentation.
  3. Fill in the Description field with your suggestion for improvement. Include a link to the relevant part(s) of documentation.
  4. Click Submit Bug.
A good disaster recovery strategy combines the following tools in order to recover from a disaster as soon as possible with minimal data loss:

**Replication**

Replication copies database contents between IdM servers. If an IdM server fails, you can replace the lost server by creating a new replica based on one of the remaining servers.

**Virtual machine (VM) snapshots**

A snapshot is a view of a VM’s operating system and applications on any or all available disks at a given point in time. After taking a VM snapshot, you can use it to return a VM and its IdM data to a previous state.

**IdM backups**

The `ipa-backup` utility allows you to take a backup of an IdM server’s configuration files and its data. You can later use a backup to restore an IdM server to a previous state.
CHAPTER 2. DISASTER SCENARIOS IN IDM

There are two main classes of disaster scenarios: server loss and data loss.

Table 2.1. Server loss vs. data loss

<table>
<thead>
<tr>
<th>Disaster type</th>
<th>Example causes</th>
<th>How to prepare</th>
</tr>
</thead>
<tbody>
<tr>

CHAPTER 3. PREPARING FOR SERVER LOSS WITH REPLICATION

Follow these guidelines to establish a replication topology that will allow you to respond to losing a server.

This section covers the following topics:

- Connecting the replicas in a topology
- Replica topology examples
- Protecting IdM CA data

3.1. CONNECTING THE REPLICAS IN A TOPOLOGY

Connect each replica to at least two other replicas

Configuring additional replication agreements ensures that information is replicated not just between the initial replica and the first server you installed, but between other replicas as well.

Connect a replica to a maximum of four other replicas (not a hard requirement)

A large number of replication agreements per server does not add significant benefits. A receiving replica can only be updated by one other replica at a time and meanwhile, the other replication agreements are idle. More than four replication agreements per replica typically means a waste of resources.

NOTE

This recommendation applies to both certificate replication and domain replication agreements.

There are two exceptions to the limit of four replication agreements per replica:

- You want failover paths if certain replicas are not online or responding.
- In larger deployments, you want additional direct links between specific nodes.

Configuring a high number of replication agreements can have a negative impact on overall performance: when multiple replication agreements in the topology are sending updates, certain replicas can experience a high contention on the changelog database file between incoming updates and the outgoing updates.

If you decide to use more replication agreements per replica, ensure that you do not experience replication issues and latency. However, note that large distances and high numbers of intermediate nodes can also cause latency problems.

Connect the replicas in a data center with each other

This ensures domain replication within the data center.

Connect each data center to at least two other data centers

This ensures domain replication between data centers.

Connect data centers using at least a pair of replication agreements
If data centers A and B have a replication agreement from A1 to B1, having a replication agreement from A2 to B2 ensures that if one of the servers is down, the replication can continue between the two data centers.

3.2. REPLICA TOPOLOGY EXAMPLES

The figures below show examples of Identity Management (IdM) topologies based on the guidelines for creating a reliable topology.

**Replica Topology Example 1** shows four data centers, each with four servers. The servers are connected with replication agreements.

*Figure 3.1. Replica Topology Example 1*

![Replica Topology Example 1](image)

**Replica Topology Example 2** shows three data centers, each with a different number of servers. The servers are connected with replication agreements.

*Replica Topology Example 2 shows three data centers, each with a different number of servers. The servers are connected with replication agreements.*
3.3. PROTECTING IDM CA DATA

If your deployment contains the integrated IdM Certificate Authority (CA), install several CA replicas so you can create additional CA replicas if one is lost.

Procedure

1. Configure three or more replicas to provide CA services.
   a. To install a new replica with CA services, run `ipa-replica-install` with the `--setup-ca` option.

      [root@server ~]# ipa-replica-install --setup-ca

   b. To install CA services on a preexisting replica, run `ipa-ca-install`.

      [root@replica ~]# ipa-ca-install

2. Create CA replication agreements between your CA replicas.

   [root@careplica1 ~]# ipa topologysegment-add
   Suffix name: ca
   Left node: ca-replica1.example.com
   Right node: ca-replica2.example.com
   Segment name [ca-replica1.example.com-to-ca-replica2.example.com]: new_segment
   ---------------------------
   Added segment "new_segment"
   ---------------------------
   Segment name: new_segment
   Left node: ca-replica1.example.com
   Right node: ca-replica2.example.com
   Connectivity: both
WARNING

If only one server provides CA services and it is damaged, the entire environment will be lost. If you use the IdM CA, Red Hat *strongly recommends* having three or more replicas with CA services installed, with CA replication agreements between them.

Additional resources

- Planning your CA services.
- Installing an IdM replica.
- Planning the replica topology.
Virtual machine (VM) snapshots are an integral component of a data recovery strategy, since they preserve the full state of an IdM server:

- Operating system software and settings
- IdM software and settings
- IdM customer data

Preparing a VM snapshot of an IdM Certificate Authority (CA) replica allows you to rebuild an entire IdM deployment after a disaster.

**WARNING**

If your environment uses the integrated CA, a snapshot of a replica without a CA will not be sufficient for rebuilding a deployment, because certificate data will not be preserved.

Similarly, if your environment uses the IdM Key Recovery Authority (KRA), make sure you create snapshots of a KRA replica, or you may lose the storage key.

Red Hat recommends creating snapshots of a VM that has all of the IdM server roles installed which are in use in your deployment: CA, KRA, DNS.

**Prerequisites**

- A hypervisor capable of hosting RHEL VMs.

**Procedure**

1. Configure at least one **CA replica** in the deployment to run inside a VM.
   
   a. If IdM DNS or KRA are used in your environment, consider installing DNS and KRA services on this replica as well.

   b. Optionally, configure this VM replica as a **hidden replica**.

2. Periodically shutdown this VM, take a full snapshot of it, and bring it back online so it continues to receive replication updates. If the VM is a hidden replica, IdM Clients will not be disrupted during this procedure.

**Additional resources**

- **Which hypervisors are certified to run Red Hat Enterprise Linux?**

- The hidden replica mode.
CHAPTER 5. PREPARING FOR DATA LOSS WITH IDM BACKUPS

IdM provides the `ipa-backup` utility to backup IdM data, and the `ipa-restore` utility to restore servers and data from those backups.

This section covers the following topics:

- IdM backup types
- Naming conventions for IdM backup files
- Considerations when creating a backup
- Creating an IdM backup
- Creating a GPG2-encrypted IdM backup
- Creating a GPG2 key

**NOTE**

Red Hat recommends running backups as often as necessary on a hidden replica with all server roles installed, especially the Certificate Authority (CA) role if the environment uses the integrated IdM CA. See [Installing an IdM hidden replica](#).

### 5.1. IDM BACKUP TYPES

With the `ipa-backup` utility, you can create two types of backups:

**Full-server backup**

- **Contains** all server configuration files related to IdM, and LDAP data in LDAP Data Interchange Format (LDIF) files
- IdM services must be **offline**.
- Suitable for rebuilding an IdM deployment from scratch.

**Data-only backup**

- **Contains** LDAP data in LDIF files and the replication changelog
- IdM services can be **online** or **offline**.
- Suitable for restoring IdM data to a state in the past

### 5.2. NAMING CONVENTIONS FOR IDM BACKUP FILES

By default, IdM stores backups as `.tar` archives in subdirectories of the `/var/lib/ipa/backup/` directory.

The archives and subdirectories follow these naming conventions:

**Full-server backup**
An archive named \texttt{ipa-full.tar} in a directory named \texttt{ipa-full-<YEAR-MM-DD-HH-MM-SS>}, with the time specified in GMT time.

\begin{verbatim}
[root@server ~]# ll /var/lib/ipa/backup/ipa-full-2021-01-29-12-11-46
total 3056
-rw-r--r--. 1 root root 158 Jan 29 12:11 header
-rw-r--r--. 1 root root 3121511 Jan 29 12:11 ipa-full.tar
\end{verbatim}

Data-only backup

An archive named \texttt{ipa-data.tar} in a directory named \texttt{ipa-data-<YEAR-MM-DD-HH-MM-SS>}, with the time specified in GMT time.

\begin{verbatim}
[root@server ~]# ll /var/lib/ipa/backup/ipa-data-2021-01-29-12-14-23
total 1072
-rw-r--r--. 1 root root 158 Jan 29 12:14 header
-rw-r--r--. 1 root root 1090388 Jan 29 12:14 ipa-data.tar
\end{verbatim}

\begin{itemize}
\item Uninstalling an IdM server does not automatically remove any backup files.
\end{itemize}

\section*{5.3. CONSIDERATIONS WHEN CREATING A BACKUP}

This section describes important behaviors and limitations of the \texttt{ipa-backup} command.

\begin{itemize}
\item By default, the \texttt{ipa-backup} utility runs in offline mode, which stops all IdM services. The utility automatically restarts IdM services after the backup is finished.
\item A full-server backup must \textbf{always} run with IdM services offline, but a data-only backup may be performed with services online.
\item By default, the \texttt{ipa-backup} utility creates backups on the file system containing the \texttt{/var/lib/ipa/backup/} directory. Red Hat recommends creating backups regularly on a file system separate from the production filesystem used by IdM, and archiving the backups to a fixed medium, such as tape or optical storage.
\item Consider performing backups on \textbf{hidden replicas}. IdM services can be shut down on hidden replicas without affecting IdM clients.
\item The \texttt{ipa-backup} utility checks if all of the services used in your IdM cluster, such as a Certificate Authority (CA), Domain Name System (DNS), and Key Recovery Agent (KRA), are installed on the server where you are running the backup. If the server does not have all these services installed, the \texttt{ipa-backup} utility exits with a warning, because backups taken on that host would not be sufficient for a full cluster restoration. For example, if your IdM deployment uses an integrated Certificate Authority (CA), a backup run on a non-CA replica will not capture CA data. Red Hat recommends verifying that the replica where you perform an \texttt{ipa-backup} has all of the IdM services used in the cluster installed.
\end{itemize}

You can bypass the IdM server role check with the \texttt{ipa-backup --disable-role-check} command, but the resulting backup will not contain all the data necessary to restore IdM fully.

\section*{5.4. CREATING AN IDM BACKUP}
This section describes how to create a full-server and data-only backup in offline and online modes using the `ipa-backup` command.

**Prerequisites**

- You must have `root` privileges to run the `ipa-backup` utility.

**Procedure**

- To create a full-server backup in offline mode, use the `ipa-backup` utility without additional options.

```
[root@server ~]# ipa-backup
Preparing backup on server.example.com
Stopping IPA services
Backing up ipaca in EXAMPLE-COM to LDIF
Backing up userRoot in EXAMPLE-COM to LDIF
Backing up EXAMPLE-COM
Backing up files
Starting IPA service
Backed up to /var/lib/ipa/backup/ipa-full-2020-01-14-11-26-06
The ipa-backup command was successful
```

- To create an offline data-only backup, specify the `--data` option.

```
[root@server ~]# ipa-backup --data
```

- To create a full-server backup that includes IdM log files, use the `--logs` option.

```
[root@server ~]# ipa-backup --logs
```

- To create a data-only backup while IdM services are running, specify both `--data` and `--online` options.

```
[root@server ~]# ipa-backup --data --online
```

**NOTE**

If the backup fails due to insufficient space in the `/tmp` directory, use the `TMPDIR` environment variable to change the destination for temporary files created by the backup process:

```
[root@server ~]# TMPDIR=/new/location ipa-backup
```

For more details, see `ipa-backup Command Fails to Finish`.

**Verification Steps**

- The backup directory contains an archive with the backup.

```
[root@server ~]# ls /var/lib/ipa/backup/ipa-full-2020-01-14-11-26-06
header  ipa-full.tar
```
5.5. CREATING A GPG2-ENCRYPTED IDM BACKUP

You can create encrypted backups using GNU Privacy Guard (GPG) encryption. The following procedure creates an IdM backup and encrypts it using a GPG2 key.

Prerequisites

- You have created a GPG2 key. See Creating a GPG2 key.

Procedure

- Create a GPG-encrypted backup by specifying the --gpg option.

  ```bash
  [root@server ~]# ipa-backup --gpg
  Preparing backup on server.example.com
  Stopping IPA services
  Backing up ipaca in EXAMPLE-COM to LDIF
  Backing up userRoot in EXAMPLE-COM to LDIF
  Backing up EXAMPLE-COM
  Backing up files
  Starting IPA service
  Encrypting /var/lib/ipa/backup/ipa-full-2020-01-13-14-38-00/ipa-full.tar
  Backed up to /var/lib/ipa/backup/ipa-full-2020-01-13-14-38-00
  The ipa-backup command was successful
  ```

Verification Steps

- Ensure that the backup directory contains an encrypted archive with a .gpg file extension.

  ```bash
  [root@server ~]# ls /var/lib/ipa/backup/ipa-full-2020-01-13-14-38-00
  header ipa-full.tar.gpg
  ```

Additional resources

- Creating a backup.

5.6. CREATING A GPG2 KEY

The following procedure describes how to generate a GPG2 key to use with encryption utilities.

Prerequisites

- You need root privileges.

Procedure

1. Install and configure the pinentry utility.

  ```bash
  [root@server ~]# dnf install pinentry
  [root@server ~]# mkdir ~/.gnupg -m 700
  [root@server ~]# echo "pinentry-program /usr/bin/pinentry-curses" >> ~/.gnupg/gpg-agent.conf
  ```
2. Create a **key-input** file used for generating a GPG keypair with your preferred details. For example:

```bash
[root@server ~]# cat >key-input <<EOF
%echo Generating a standard key
Key-Type: RSA
Key-Length: 2048
Name-Real: GPG User
Name-Comment: first key
Name-Email: root@example.com
Expire-Date: 0
%commit
%echo Finished creating standard key
EOF
```

3. *(Optional)* By default, GPG2 stores its keyring in the `~/.gnupg` file. To use a custom keyring location, set the `GNUPGHOME` environment variable to a directory that is only accessible by root.

```bash
[root@server ~]# export GNUPGHOME=/root/backup
[root@server ~]# mkdir -p $GNUPGHOME -m 700
```

4. Generate a new GPG2 key based on the contents of the **key-input** file.

```bash
[root@server ~]# gpg2 --batch --gen-key key-input
```

5. Enter a passphrase to protect the GPG2 key. You use this passphrase to access the private key for decryption.

```
Please enter the passphrase to protect your new key
Passphrase: <passphrase>
<OK> <Cancel>
```

6. Confirm the correct passphrase by entering it again.

```
Please re-enter this passphrase
Passphrase: <passphrase>
<OK> <Cancel>
```

7. Verify that the new GPG2 key was created successfully.

```
gpg: keybox '/root/backup/pubring.kbx' created
gpg: Generating a standard key
gpg: /root/backup/trustdb.gpg: trustdb created
```
gpg: key BF28FFA302EF4557 marked as ultimately trusted
gpg: directory ‘/root/backup/openpgp-revocs.d’ created
gpg: revocation certificate stored as ’/root/backup/openpgp-revocs.d/8F6FCF10C80359D5A05AED67BF28FFA302EF4557.rev’
gpg: **Finished creating standard key**

Verification Steps

- List the GPG keys on the server.

```
[root@server ~]# gpg2 --list-secret-keys
```

```
gpg: checking the trustdb
  gpg: marginals needed: 3  completes needed: 1  trust model: pgp
  gpg: depth: 0  valid: 1  signed: 0  trust: 0-, 0q, 0n, 0m, 0f, 1u
  /root/backup/pubring.kbx

sec rsa2048 2020-01-13 [SCEA]
  8F6FCF10C80359D5A05AED67BF28FFA302EF4557
uid [ultimate] GPG User (first key) <root@example.com>
```

Additional resources

- GNU Privacy Guard
CHAPTER 6. BACKING UP IDM SERVERS USING ANSIBLE PLAYBOOKS

Using the ipabackup Ansible role, you can automate backing up an IdM server and transferring backup files between servers and your Ansible controller.

This section covers the following topics:

- Preparing your Ansible control node for managing IdM
- Using Ansible to create a backup of an IdM server
- Using Ansible to create a backup of an IdM server on your Ansible controller
- Using Ansible to copy a backup of an IdM server to your Ansible controller
- Using Ansible to copy a backup of an IdM server from your Ansible controller to the IdM server
- Using Ansible to remove a backup from an IdM server

6.1. PREPARING YOUR ANSIBLE CONTROL NODE FOR MANAGING IDM

As a system administrator managing Identity Management (IdM), when working with Red Hat Ansible Engine, it is good practice to do the following:

- Create a subdirectory dedicated to Ansible playbooks in your home directory, for example ~/MyPlaybooks.
- Copy and adapt sample Ansible playbooks from the /usr/share/doc/ansible-freeipa/* and /usr/share/doc/rhel-system-roles/* directories and subdirectories into your ~/MyPlaybooks directory.
- Include your inventory file in your ~/MyPlaybooks directory.

By following this practice, you can find all your playbooks in one place and you can run your playbooks without invoking root privileges.

NOTE

You only need root privileges on the managed nodes to execute the ipaserver, ipareplica, ipaclient and ipabackup ansible-freeipa roles. These roles require privileged access to directories and the dnf software package manager.

This section describes how to create the ~/MyPlaybooks directory and configure it so that you can use it to store and run Ansible playbooks.

Prerequisites

- You have installed an IdM server on your managed nodes, server.idm.example.com and replica.idm.example.com.
- You have configured DNS and networking so you can log in to the managed nodes, server.idm.example.com and replica.idm.example.com, directly from the control node.
• You know the IdM admin password.

Procedure

1. Create a directory for your Ansible configuration and playbooks in your home directory:

   
   $ mkdir ~/MyPlaybooks/
   
2. Change into the ~/MyPlaybooks/ directory:

   
   $ cd ~/MyPlaybooks
   
3. Create the ~/MyPlaybooks/ansible.cfg file with the following content:

   
   [defaults]
   inventory = /home/your_username/MyPlaybooks/inventory
   
   [privilege_escalation]
   become=True
   
4. Create the ~/MyPlaybooks/inventory file with the following content:

   
   [eu]
   server.idm.example.com
   
   [us]
   replica.idm.example.com
   
   [ipaserver:children]
   eu
   us

   This configuration defines two host groups, eu and us, for hosts in these locations. Additionally, this configuration defines the ipaserver host group, which contains all hosts from the eu and us groups.

5. [Optional] Create an SSH public and private key. To simplify access in your test environment, do not set a password on the private key:

   
   $ ssh-keygen
   
6. Copy the SSH public key to the IdM admin account on each managed node:

   
   $ ssh-copy-id admin@server.idm.example.com
   $ ssh-copy-id admin@replica.idm.example.com

   You must enter the IdM admin password when you enter these commands.

Additional resources

• Installing an Identity Management server using an Ansible playbook.

• How to build your inventory.
6.2. USING ANSIBLE TO CREATE A BACKUP OF AN IDM SERVER

The following procedure describes how to use the ipabackup role in an Ansible playbook to create a backup of an IdM server and store it on the IdM server.

Prerequisites

- You have configured an Ansible control node that meets the following requirements:
  - You are using Ansible version 2.8 or later.
  - You have installed the ansible-freeipa package.
  - You have created an Ansible inventory file with the fully-qualified domain name (FQDN) of the IdM server where you are configuring these options.
  - Your Ansible inventory file is located in the ~/MyPlaybooks/ directory.

Procedure

1. Navigate to the ~/MyPlaybooks/ directory:

   ```
   $ cd ~/MyPlaybooks/
   ```

2. Make a copy of the backup-server.yml file located in the /usr/share/doc/ansible-freeipa/playbooks directory:

   ```
   $ cp /usr/share/doc/ansible-freeipa/playbooks/backup-server.yml backup-my-server.yml
   ```

3. Open the backup-my-server.yml Ansible playbook file for editing.

4. Adapt the file by setting the hosts variable to a host group from your inventory file. In this example, set it to the ipaserver host group:

   ```
   ---
   - name: Playbook to backup IPA server
     hosts: ipaserver
     become: true
     
     roles:
     - role: ipabackup
       state: present
   ```

5. Save the file.

6. Run the Ansible playbook, specifying the inventory file and the playbook file:

   ```
   $ ansible-playbook -v -i ~/MyPlaybooks/inventory backup-my-server.yml
   ```

Verification steps

1. Log into the IdM server that you have backed up.

2. Verify that the backup is in the /var/lib/ipa/backup directory.
6.3. USING ANSIBLE TO CREATE A BACKUP OF AN IDM SERVER ON YOUR ANSIBLE CONTROLLER

The following procedure describes how to use the ipabackup role in an Ansible playbook to create a backup of an IdM server and automatically transfer it on your Ansible controller. Your backup file name begins with the host name of the IdM server.

Prerequisites

- You have configured an Ansible control node that meets the following requirements:
  - You are using Ansible version 2.8 or later.
  - You have installed the ansible-freeipa package.
  - You have created an Ansible inventory file with the fully-qualified domain name (FQDN) of the IdM server where you are configuring these options.
  - Your Ansible inventory file is located in the ~/MyPlaybooks/ directory.

Procedure

1. To store the backups, create a subdirectory in your home directory on the Ansible controller.
   
   ```
   $ mkdir ~/ipabackups
   ```

2. Navigate to the ~/MyPlaybooks/ directory:
   
   ```
   $ cd ~/MyPlaybooks/
   ```

3. Make a copy of the backup-server-to-controller.yml file located in the /usr/share/doc/ansible-freeipa/playbooks directory:
   
   ```
   $ cp /usr/share/doc/ansible-freeipa/playbooks/backup-server-to-controller.yml backup-my-server-to-my-controller.yml
   ```

4. Open the backup-my-server-to-my-controller.yml file for editing.

5. Adapt the file by setting the following variables:
   a. Set the hosts variable to a host group from your inventory file. In this example, set it to the ipaserver host group.
b. *(Optional)* To maintain a copy of the backup on the IdM server, uncomment the following line:

```
# ipabackup_keep_on_server: yes
```

6. By default, backups are stored in the present working directory of the Ansible controller. To specify the backup directory you created in Step 1, add the `ipabackup_controller_path` variable and set it to the `/home/user/ipabackups` directory.

```
---
- name: Playbook to backup IPA server to controller
  hosts: ipaserver
  become: true
  vars:
    ipabackup_to_controller: yes
    # ipabackup_keep_on_server: yes
    ipabackup_controller_path: /home/user/ipabackups
  roles:
    - role: ipabackup
      state: present
```

7. Save the file.

8. Run the Ansible playbook, specifying the inventory file and the playbook file:

```
$ ansible-playbook -v -i ~/MyPlaybooks/inventory backup-my-server-to-my-controller.yml
```

**Verification steps**

- Verify that the backup is in the `/home/user/ipabackups` directory of your Ansible controller:

```
[user@controller ~]$ ls /home/user/ipabackups
server.idm.example.com_ipa-full-2021-04-30-13-12-00
```

**Additional resources**

- For more sample Ansible playbooks that use the `ipabackup` role, see:
  
  - The `README.md` file in the `/usr/share/doc/ansible-freeipa/roles/ipabackup` directory.
  - The `/usr/share/doc/ansible-freeipa/playbooks/` directory.

### 6.4. USING ANSIBLE TO COPY A BACKUP OF AN IDM SERVER TO YOUR ANSIBLE CONTROLLER

The following procedure describes how to use an Ansible playbook to copy a backup of an IdM server from the IdM server to your Ansible controller.

**Prerequisites**

- You have configured an Ansible control node that meets the following requirements:
You are using Ansible version 2.8 or later.

You have installed the `ansible-freeipa` package.

You have created an Ansible inventory file with the fully-qualified domain name (FQDN) of the IdM server where you are configuring these options.

Your Ansible inventory file is located in the `~/MyPlaybooks/` directory.

Procedure

1. To store the backups, create a subdirectory in your home directory on the Ansible controller.

   ```bash
   $ mkdir ~/ipabackups
   ```

2. Navigate to the `~/MyPlaybooks/` directory:

   ```bash
   $ cd ~/MyPlaybooks/
   ```

3. Make a copy of the `copy-backup-from-server.yml` file located in the `/usr/share/doc/ansible-freeipa/playbooks` directory:

   ```bash
   $ cp /usr/share/doc/ansible-freeipa/playbooks/copy-backup-from-server.yml copy-backup-from-my-server-to-my-controller.yml
   ```

4. Open the `copy-my-backup-from-my-server-to-my-controller.yml` file for editing.

5. Adapt the file by setting the following variables:

   a. Set the `hosts` variable to a host group from your inventory file. In this example, set it to the `ipaserver` host group.

   ```yaml
   hosts:
   ipaserver
   ```

   b. Set the `ipabackup_name` variable to the name of the `ipabackup` on your IdM server to copy to your Ansible controller.

   ```yaml
   ipabackup_name: ipa-full-2021-04-30-13-12-00
   ```

   c. By default, backups are stored in the present working directory of the Ansible controller. To specify the directory you created in Step 1, add the `ipabackup_controller_path` variable and set it to the `~/home/user/ipabackups` directory.

   ```yaml
   ipabackup_controller_path: /home/user/ipabackups
   ```

6. Save the file.

7. Run the Ansible playbook, specifying the inventory file and the playbook file:
NOTE
To copy all IdM backups to your controller, set the ipabackup_name variable in the
Ansible playbook to all:

vars:
    ipabackup_name: all
    ipabackup_to_controller: yes

For an example, see the copy-all-backups-from-server.yml Ansible playbook in the
/usr/share/doc/ansible-freeipa/playbooks directory.

Verification steps

- Verify your backup is in the /home/user/ipabackups directory on your Ansible controller:

  [user@controller ~]$ ls /home/user/ipabackups
  server.idm.example.com_ipa-full-2021-04-30-13-12-00

Additional resources

- The README.md file in the /usr/share/doc/ansible-freeipa/roles/ipabackup directory.
- The /usr/share/doc/ansible-freeipa/playbooks/ directory.

6.5. USING ANSIBLE TO COPY A BACKUP OF AN IDM SERVER FROM
YOUR ANSIBLE CONTROLLER TO THE IDM SERVER

The following procedure describes how to use an Ansible playbook to copy a backup of an IdM server
from your Ansible controller to the IdM server.

Prerequisites

- You have configured an Ansible control node that meets the following requirements:
  - You are using Ansible version 2.8 or later.
  - You have installed the ansible-freeipa package.
  - You have created an Ansible inventory file with the fully-qualified domain name (FQDN) of
    the IdM server where you are configuring these options.
  - Your Ansible inventory file is located in the ~/MyPlaybooks/ directory.

Procedure

1. Navigate to the ~/MyPlaybooks/ directory:

  $ cd ~/MyPlaybooks/
2. Make a copy of the `copy-backup-from-controller.yml` file located in the
   `/usr/share/doc/ansible-freeipa/playbooks` directory:

   ```bash
   
   3. Open the `copy-my-backup-from-my-controller-to-my-server.yml` file for editing.

   4. Adapt the file by setting the following variables:
      a. Set the `hosts` variable to a host group from your inventory file. In this example, set it to the
         `ipaserver` host group.
      b. Set the `ipabackup_name` variable to the name of the `ipabackup` on your Ansible controller
         to copy to the IdM server.

      ```yaml
      ---
      - name: Playbook to copy a backup from controller to the IPA server
        hosts: ipaserver
        become: true

        vars:
          ipabackup_name: server.idm.example.com_ipa-full-2021-04-30-13-12-00
          ipabackup_from_controller: yes

        roles:
          - role: ipabackup
            state: copied
      
      5. Save the file.

   6. Run the Ansible playbook, specifying the inventory file and the playbook file:

      ```bash
      $ ansible-playbook -v -i ~/MyPlaybooks/inventory copy-backup-from-my-controller-to-my-server.yml
      
      Additional resources
      
      - The `README.md` file in the `/usr/share/doc/ansible-freeipa/roles/ipabackup` directory.
      - The `/usr/share/doc/ansible-freeipa/playbooks/` directory.

      6.6. USING ANSIBLE TO REMOVE A BACKUP FROM AN IDM SERVER

      The following procedure describes how to use an Ansible playbook to remove a backup from an IdM server.

      Prerequisites
      
      - You have configured an Ansible control node that meets the following requirements:
        - You are using Ansible version 2.8 or later.
        - You have installed the `ansible-freeipa` package.
You have created an Ansible inventory file with the fully-qualified domain name (FQDN) of the IdM server where you are configuring these options.

Your Ansible inventory file is located in the `~/MyPlaybooks/` directory.

**Procedure**

1. Navigate to the `~/MyPlaybooks/` directory:
   
   ```
   $ cd ~/MyPlaybooks/
   ```

2. Make a copy of the `remove-backup-from-server.yml` file located in the
   `/usr/share/doc/ansible-freeipa/playbooks` directory:
   
   ```
   $ cp /usr/share/doc/ansible-freeipa/playbooks/remove-backup-from-server.yml remove-
   backup-from-my-server.yml
   ```

3. Open the `remove-backup-from-my-server.yml` file for editing.

4. Adapt the file by setting the following variables:
   a. Set the `hosts` variable to a host group from your inventory file. In this example, set it to the `ipaserver` host group.
   b. Set the `ipabackup_name` variable to the name of the `ipabackup` to remove from your IdM server.

   ```
   ---
   - name: Playbook to remove backup from IPA server
     hosts: ipaserver
     become: true
     
     vars:
       ipabackup_name: ipa-full-2021-04-30-13-12-00

     roles:
       - role: ipabackup
         state: absent
   ```

5. Save the file.

6. Run the Ansible playbook, specifying the inventory file and the playbook file:
   
   ```
   $ ansible-playbook -v -i ~/MyPlaybooks/inventory remove-backup-from-my-server.yml
   ```
NOTE

To remove all IdM backups from the IdM server, set the `ipabackup_name` variable in the Ansible playbook to `all`:

```yaml
vars:
  ipabackup_name: all
```

For an example, see the `remove-all-backups-from-server.yml` Ansible playbook in the `/usr/share/doc/ansible-freeipa/playbooks` directory.

Additional resources

- The `README.md` file in the `/usr/share/doc/ansible-freeipa/roles/ipabackup` directory.
