Red Hat Fuse 7.2

Apache Camel Component Reference

Configuration reference for Camel components
Configuration reference for Camel components
Abstract

Apache Camel has over 100 components and each component is highly configurable. This guide describes the settings for each of the components.
### Table of Contents

**CHAPTER 1. COMPONENTS OVERVIEW** ................................................................. 79  
1.1. CONTAINER TYPES 79  
1.2. SUPPORTED COMPONENTS 79  

**CHAPTER 2. ACTIVEMQ** ..................................................................................... 97  
ACTIVEMQ COMPONENT 97  
URI FORMAT 97  
OPTIONS 97  
CAMEL ON EAP DEPLOYMENT 97  
CONFIGURING THE CONNECTION FACTORY 98  
CONFIGURING THE CONNECTION FACTORY USING SPRING XML 98  
USING CONNECTION POOLING 98  
INVOKING MESSAGELISTENER POJOS IN A ROUTE 99  
USING ACTIVEMQ DESTINATION OPTIONS 99  
CONSUMING ADVISORY MESSAGES 100  
GETTING COMPONENT JAR 101  

**CHAPTER 3. AHC COMPONENT** ......................................................................... 102  
3.1. URI FORMAT 102  
3.2. AHCENDPOINT OPTIONS 102  
  3.2.1. Path Parameters (1 parameters): 102  
  3.2.2. Query Parameters (13 parameters): 102  
3.3. AHCCOMPONENT OPTIONS 104  
3.4. MESSAGE HEADERS 105  
3.5. MESSAGE BODY 106  
3.6. RESPONSE CODE 106  
3.7. AHCOPERATIONFAILEDEXCEPTION 107  
3.8. CALLING USING GET OR POST 107  
3.9. CONFIGURING URI TO CALL 107  
3.10. CONFIGURING URI PARAMETERS 107  
3.11. HOW TO SET THE HTTP METHOD TO THE HTTP PRODUCER 108  
3.12. CONFIGURING CHARSET 108  
  3.12.1. URI Parameters from the endpoint URI 108  
  3.12.2. URI Parameters from the Message 109  
  3.12.3. Getting the Response Code 109  
3.13. CONFIGURING ASYNCHTTPCLIENT 109  
3.14. SSL SUPPORT (HTTPS) 110  
3.15. SEE ALSO 110  

**CHAPTER 4. AHC WEBSOCKET COMPONENT** .................................................. 112  
4.1. URI FORMAT 112  
4.2. AHC-WS OPTIONS 112  
  4.2.1. Path Parameters (1 parameters): 113  
  4.2.2. Query Parameters (18 parameters): 113  
4.3. WRITING AND READING DATA OVER WEBSOCKET 115  
4.4. CONFIGURING URI TO WRITE OR READ DATA 115  
4.5. SEE ALSO 116  

**CHAPTER 5. AMQP COMPONENT** .................................................................... 117  
5.1. URI FORMAT 117  
5.2. AMQP OPTIONS 117  
  5.2.1. Path Parameters (2 parameters): 129
CHAPTER 6. APNS COMPONENT ................................................................. 147
  6.1. URI FORMAT 147
  6.2. OPTIONS 147
    6.2.1. Path Parameters (1 parameters): 148
    6.2.2. Query Parameters (20 parameters): 148
    6.2.3. Component 150
      6.2.3.1. SSL Setting 150
  6.3. EXCHANGE DATA FORMAT 150
  6.4. MESSAGE HEADERS 150
  6.5. APNNSERVICEFACTORY BUILDER CALLBACK 151
  6.6. SAMPLES 151
    6.6.1. Camel Xml route 151
    6.6.2. Camel Java route 152
  6.7. SEE ALSO 153

CHAPTER 7. ASN.1 FILE DATAFORMAT ............................................... 154
  7.1. ASN.1 DATA FORMAT OPTIONS 154
  7.2. UNMARSHAL 154
  7.3. DEPENDENCIES 155

CHAPTER 8. ASTERISK COMPONENT .................................................. 156
  8.1. URI FORMAT 156
  8.2. OPTIONS 156
    8.2.1. Path Parameters (1 parameters): 156
    8.2.2. Query Parameters (8 parameters): 156
  8.3. ACTION 157

CHAPTER 9. ATMOS COMPONENT ...................................................... 158
  9.1. OPTIONS 158
    9.1.1. Path Parameters (2 parameters): 158
    9.1.2. Query Parameters (12 parameters): 159
  9.2. DEPENDENCIES 160
  9.3. INTEGRATIONS 160
  9.4. EXAMPLES 160
  9.5. SEE ALSO 161

CHAPTER 10. ATMOSPHERE WEBSOCKET COMPONENT ............................. 162
  10.1. ATMOSPHERE-WEBSOCKET OPTIONS 162
    10.1.1. Path Parameters (1 parameters): 163
    10.1.2. Query Parameters (37 parameters): 163
  10.2. URI FORMAT 167
  10.3. READING AND WRITING DATA OVER WEBSOCKET 168
  10.4. CONFIGURING URI TO READ OR WRITE DATA 168
  10.5. SEE ALSO 168

CHAPTER 11. ATOM COMPONENT ...................................................... 169
  11.1. URI FORMAT 169
  11.2. OPTIONS 169
    11.2.1. Path Parameters (1 parameters): 169

CHAPTER 24. AWS KINESIS COMPONENT ........................................... 231
24.1. URI FORMAT ................................................................. 231
24.2. URI OPTIONS ............................................................... 231
  24.2.1. Path Parameters (1 parameters): .................................. 231
  24.2.2. Query Parameters (30 parameters): ............................... 232
24.3. BATCH CONSUMER ....................................................... 235
24.4. USAGE ................................................................. 235
  24.4.1. Message headers set by the Kinesis consumer ................. 235
  24.4.2. AmazonKinesis configuration .................................... 235
  24.4.3. Providing AWS Credentials ....................................... 236
  24.4.4. Message headers used by the Kinesis producer to write to Kinesis. The producer expects that the message body is a ByteBuffer. 236
  24.4.5. Message headers set by the Kinesis producer on successful storage of a Record ................................. 236
24.5. DEPENDENCIES ......................................................... 237
24.6. SEE ALSO .............................................................. 237

CHAPTER 25. AWS KINESIS FIREHOSE COMPONENT ......................... 238
25.1. URI FORMAT ................................................................. 238
25.2. URI OPTIONS ............................................................... 238
  25.2.1. Path Parameters (1 parameters): .................................. 238
  25.2.2. Query Parameters (7 parameters): ............................... 239
25.3. USAGE ................................................................. 239
  25.3.1. Amazon Kinesis Firehose configuration ......................... 239
  25.3.2. Providing AWS Credentials ....................................... 240
  25.3.3. Message headers set by the Kinesis producer on successful storage of a Record ................................. 240
25.4. DEPENDENCIES ......................................................... 240
25.5. SEE ALSO .............................................................. 240

CHAPTER 26. AWS KMS COMPONENT ........................................ 242
26.1. URI FORMAT ................................................................. 242
26.2. URI OPTIONS ............................................................... 242
  26.2.1. Path Parameters (1 parameters): .................................. 242
  26.2.2. Query Parameters (8 parameters): ............................... 243
26.3. USAGE ................................................................. 243
  26.3.1. Message headers evaluated by the MQ producer ............ 243
26.4. SEE ALSO .............................................................. 244

CHAPTER 27. AWS LAMBDA COMPONENT ..................................... 245
27.1. URI FORMAT ................................................................. 245
27.2. URI OPTIONS ............................................................... 245
  27.2.1. Path Parameters (1 parameters): .................................. 245
  27.2.2. Query Parameters (8 parameters): ............................... 246
27.3. USAGE ................................................................. 246
  27.3.1. Message headers evaluated by the Lambda producer ........ 246
27.4. SEE ALSO .............................................................. 258

CHAPTER 28. AWS MQ COMPONENT ........................................ 260
28.1. URI FORMAT ................................................................. 260
28.2. URI OPTIONS ............................................................... 260
  28.2.1. Path Parameters (1 parameters): .................................. 260
  28.2.2. Query Parameters (8 parameters): ............................... 261
28.3. USAGE ................................................................. 261
  28.3.1. Message headers evaluated by the MQ producer ............ 261
28.4. SEE ALSO .............................................................. 262
CHAPTER 29. AWS S3 STORAGE SERVICE COMPONENT ........................................ 264
29.1. URI FORMAT .................................................................................. 264
29.2. URI OPTIONS ............................................................................. 264
  29.2.1. Path Parameters (1 parameters): .............................................. 265
  29.2.2. Query Parameters (50 parameters): ........................................ 265
29.3. BATCH CONSUMER .................................................................. 269
29.4. USAGE ......................................................................................... 270
  29.4.1. Message headers evaluated by the S3 producer ...................... 270
  29.4.2. Message headers set by the S3 producer ................................. 272
  29.4.3. Message headers set by the S3 consumer ............................... 272
  29.4.4. Advanced AmazonS3 configuration ....................................... 274
  29.4.5. Use KMS with the S3 component ............................................ 274
  29.4.6. Use "useIAMCredentials" with the s3 component ............... 275
29.5. DEPENDENCIES ....................................................................... 275
29.6. SEE ALSO .................................................................................... 275

30.1. URI FORMAT ................................................................................ 276
30.2. URI OPTIONS ............................................................................. 276
  30.2.1. Path Parameters (1 parameters): .............................................. 276
  30.2.2. Query Parameters (10 parameters): ....................................... 276
30.3. USAGE ......................................................................................... 277
  30.3.1. Message headers evaluated by the SDB producer ................. 277
  30.3.2. Message headers set during DomainMetadata operation ........ 279
  30.3.3. Message headers set during GetAttributes operation ........... 280
  30.3.4. Message headers set during ListDomains operation ............. 280
  30.3.5. Message headers set during Select operation ...................... 281
  30.3.6. Advanced AmazonSimpleDB configuration ......................... 281
30.4. DEPENDENCIES ....................................................................... 282
30.5. SEE ALSO .................................................................................... 282

CHAPTER 31. AWS SIMPLE EMAIL SERVICE COMPONENT ....................... 283
31.1. URI FORMAT ................................................................................ 283
31.2. URI OPTIONS ............................................................................. 283
  31.2.1. Path Parameters (1 parameters): .............................................. 283
  31.2.2. Query Parameters (11 parameters): ....................................... 284
31.3. USAGE ......................................................................................... 285
  31.3.1. Message headers evaluated by the SES producer ................. 285
  31.3.2. Message headers set by the SES producer ............................. 285
  31.3.3. Advanced AmazonSimpleEmailService configuration ........... 285
31.4. DEPENDENCIES ....................................................................... 286
31.5. SEE ALSO .................................................................................... 286

CHAPTER 32. AWS SIMPLE NOTIFICATION SYSTEM COMPONENT ............ 287
32.1. URI FORMAT ................................................................................ 287
32.2. URI OPTIONS ............................................................................. 287
  32.2.1. Path Parameters (1 parameters): .............................................. 288
  32.2.2. Query Parameters (11 parameters): ....................................... 288
32.3. USAGE ......................................................................................... 289
  32.3.1. Message headers evaluated by the SNS producer .................. 289
  32.3.2. Message headers set by the SNS producer ............................. 289
  32.3.3. Advanced AmazonSNS configuration .................................... 289
32.4. DEPENDENCIES ....................................................................... 289
32.5. SEE ALSO .................................................................................... 290

### CHAPTER 129. HAZELCAST REPLICAED MAP COMPONENT

**129.1. OPTIONS**

129.1.1. Path Parameters (1 parameters): 883
129.1.2. Query Parameters (16 parameters): 883

**129.2. REPLICAEDMAP CACHE PRODUCER**

129.2.1. Sample for put: 885
129.2.2. Sample for get: 886
129.2.3. Sample for delete: 886

**129.3. REPLICAEDMAP CACHE CONSUMER**

---

### CHAPTER 130. HAZELCAST RINGBUFFER COMPONENT

**130.1. OPTIONS**

130.1.1. Path Parameters (1 parameters): 889
130.1.2. Query Parameters (10 parameters): 889

**130.2. RINGBUFFER CACHE PRODUCER**

130.2.1. Sample for put: 891
130.2.2. Sample for readonce from head: 891

---

### CHAPTER 131. HAZELCAST SEDA COMPONENT

**131.1. OPTIONS**

131.1.1. Path Parameters (1 parameters): 892
131.1.2. Query Parameters (16 parameters): 892

**131.2. SEDA PRODUCER – TO(“HAZELCAST-SEDA:FOO”)**

131.3. SEDA CONSUMER – FROM(“HAZELCAST-SEDA:FOO”) 894

---

### CHAPTER 132. HAZELCAST SET COMPONENT

**132.1. OPTIONS**

132.1.1. Path Parameters (1 parameters): 896
132.1.2. Query Parameters (16 parameters): 896
CHAPTER 133. HAZELCAST TOPIC COMPONENT ........................................ 899
133.1. OPTIONS 899
  133.1.1. Path Parameters (1 parameters): 899
  133.1.2. Query Parameters (16 parameters): 899
133.2. TOPIC PRODUCER – TO(“HAZELCAST-TOPIC:FOO”) 901
  133.2.1. Sample for publish: 901
133.3. TOPIC CONSUMER – FROM(“HAZELCAST-TOPIC:FOO”) 901

CHAPTER 134. HBASE COMPONENT ...................................................... 902
134.1. APACHE HBASE OVERVIEW 902
134.2. CAMEL AND HBASE 902
134.3. CONFIGURING THE COMPONENT 902
134.4. HBASE PRODUCER 903
  134.4.1. Supported URI options 903
  134.4.2. Path Parameters (1 parameters): 904
  134.4.3. Query Parameters (16 parameters): 904
  134.4.4. Put Operations. 905
  134.4.5. Get Operations. 906
  134.4.6. Delete Operations. 907
  134.4.7. Scan Operations. 907

  140.4.2. Segment separators 941
  140.4.3. Charset 941
140.5. MESSAGE HEADERS ....................................................................... 941
140.6. OPTIONS ..................................................................................... 943
140.7. DEPENDENCIES .......................................................................... 943
140.8. TESER LANGUAGE ....................................................................... 944
140.9. HL7 VALIDATION PREDICATE ........................................................... 945
140.10. HL7 VALIDATION PREDICATE USING THE HAPICONTEXT (CAMEL 2.14) 945
140.11. HL7 ACKNOWLEDGEMENT EXPRESSION ........................................... 946
140.12. MORE SAMPLES ........................................................................ 946

CHAPTER 141. HTTP COMPONENT (DEPRECATED) ............................................... 947
141.1. URI FORMAT .................................................................................. 947
141.2. EXAMPLES ................................................................................... 947
141.3. HTTP OPTIONS ........................................................................... 948
  141.3.1. Path Parameters (1 parameters): 949
  141.3.2. Query Parameters (38 parameters): 949
141.4. MESSAGE HEADERS ..................................................................... 953
141.5. MESSAGE BODY ........................................................................ 955
141.6. RESPONSE CODE ....................................................................... 955
141.7. HTTPOPERATIONFAILEDEXCEPTION ............................................. 955
141.8. WHICH HTTP METHOD WILL BE USED .......................................... 956
141.9. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE 956
141.10. USING CLIENT TIMEOUT - SO_TIMEOUT ......................................... 956
141.11. MORE EXAMPLES ....................................................................... 956
141.11. Configuring a Proxy
141.11.2. Using proxy settings outside of URI
141.12. Configuring CHARSET
141.13. Sample with SCHEDULED POLL
141.15. Using THROWEXCEPTIONONFAILURE=FALSE to get any response back
141.16. Disabling Cookies
141.17. Advanced Usage
141.17.1. Setting MaxConnectionsPerHost
141.17.2. Using preemptive authentication
141.17.3. Accepting self signed certificates from remote server
141.17.4. Setting up SSL for HTTP Client
141.18. See Also

CHAPTER 142. HTTP4 COMPONENT

142.1. URI Format
142.2. HTTP4 Component Options
142.2.1. Path Parameters (1 parameters):
142.2.2. Query Parameters (48 parameters):
142.3. Message Headers
142.4. Message Body
142.5. Using System Properties
142.6. Response Code
142.7. HTTPOperationFailedException
142.8. Which HTTP Method Will Be Used
142.9. How to Get Access to HttpServletRequest and HttpServletResponse
142.10. Configuring URI to Call
142.11. Configuring URI Parameters
142.12. How to Set the HTTP Method (GET/PATCH/POST/PUT/DELETE/HEAD/OPTIONS/TRACE) to the HTTP Producer
142.13. Using Client Timeout - SO_TIMEOUT
142.14. Configuring a Proxy
142.14.1. Using proxy settings outside of URI

  164.5. PRODUCER EXAMPLE ......................................... 1065
164.6. CONSUMER EXAMPLE
164.7. SESSION SUPPORT
164.8. SSL SUPPORT (HTTPS)
164.8.1. Configuring general SSL properties
164.8.2. How to obtain reference to the X509Certificate
164.8.3. Configuring general HTTP properties
164.8.4. Obtaining X-Forwarded-For header with HttpServletRequest.getRemoteAddr()
164.9. DEFAULT BEHAVIOR FOR RETURNING HTTP STATUS CODES
164.10. CUSTOMIZING HTTPBINDING
164.11. JETTY HANDLERS AND SECURITY CONFIGURATION
164.12. HOW TO RETURN A CUSTOM HTTP 500 REPLY MESSAGE
164.13. MULTI-PART FORM SUPPORT
164.14. JETTY JMX SUPPORT
164.15. SEE ALSO

CHAPTER 165. JGROUPS COMPONENT ................................................. 1074
165.1. URI FORMAT
165.2. OPTIONS
165.2.1. Path Parameters (1 parameters):
165.2.2. Query Parameters (6 parameters):
165.3. HEADERS
165.4. PREDEFINED FILTERS
165.5. PREDEFINED EXPRESSIONS
165.6. EXAMPLES
165.6.1. Sending (receiving) messages to (from) the JGroups cluster
165.6.2. Receive cluster view change notifications
165.6.3. Keeping singleton route within the cluster

CHAPTER 166. JIBX DATAFORMAT ...................................................... 1080
166.1. OPTIONS
166.2. JIBX SPRING DSL
166.3. DEPENDENCIES

CHAPTER 167. JING COMPONENT ..................................................... 1082
167.1. URI FORMAT CAMEL 2.16
167.2. OPTIONS
167.2.1. Path Parameters (1 parameters):
167.2.2. Query Parameters (2 parameters):
167.3. EXAMPLE
167.4. SEE ALSO

CHAPTER 168. JIRA COMPONENT ..................................................... 1084
168.1. URI FORMAT
168.2. JIRA OPTIONS
168.2.1. Path Parameters (1 parameters):
168.2.2. Query Parameters (9 parameters):
168.3. JQL:

CHAPTER 169. JMS COMPONENT ...................................................... 1087
169.1. JMS COMPONENT
169.2. URI FORMAT
169.3. NOTES
169.3.1. Using ActiveMQ
169.3.2. Transactions and Cache Levels
170.3.7. How to use authentication with JMX
170.3.8. JMX inside an Application Server
  170.3.8.1. Tomcat 6
  170.3.8.2. JBoss AS 4
  170.3.8.3. WebSphere
  170.3.8.4. Oracle OC4j
170.3.9. Advanced JMX Configuration
170.3.10. Example:
170.3.11. jmxAgent Properties Reference
170.3.12. Configuring whether to register MBeans always, for new routes or just by default
170.4. MONITORING CAMEL USING JMX
  170.4.1. Using JConsole to monitor Camel
  170.4.2. Which endpoints are registered
  170.4.3. Which processors are registered
  170.4.4. How to use the JMX NotificationListener to listen the camel events?
  170.4.5. Using the Tracer MBean to get fine grained tracing
170.5. USING JMX FOR YOUR OWN CAMEL CODE
  170.5.1. Registering your own Managed Endpoints
  170.5.2. Programming your own Managed Services
  170.5.3. ManagementNamingStrategy
  170.5.4. Management naming pattern
  170.5.5. ManagementStrategy
  170.5.6. Configuring level of granularity for performance statistics
170.6. HIDING SENSITIVE INFORMATION
  170.6.1. Declaring which JMX attributes and operations to mask
170.7. SEE ALSO

CHAPTER 227. NETTY COMPONENT (DEPRECATED)

227.1. URI FORMAT

227.2. OPTIONS

227.2.1. Path Parameters (3 parameters):

227.2.2. Query Parameters (67 parameters):

227.3. REGISTRY BASED OPTIONS

227.3.1. Using non shareable encoders or decoders

227.4. SENDING MESSAGES TO/FROM A NETTY ENDPOINT

227.4.1. Netty Producer

227.4.2. Netty Consumer

227.5. HEADERS

227.6. USAGE SAMPLES

227.6.1. A UDP Netty endpoint using Request-Reply and serialized object payload

227.6.2. A TCP based Netty consumer endpoint using One-way communication

227.6.3. An SSL/TCP based Netty consumer endpoint using Request-Reply communication

227.6.4. Using Multiple Codecs

227.7. CLOSING CHANNEL WHEN COMPLETE

227.8. ADDING CUSTOM CHANNEL PIPELINE FACTORIES TO GAIN COMPLETE CONTROL OVER A CREATED PIPELINE

227.9. REUSING NETTY BOSS AND WORKER THREAD POOLS

227.10. SEE ALSO

CHAPTER 228. NETTY HTTP COMPONENT (DEPRECATED)

228.1. URI FORMAT

228.2. HTTP OPTIONS

228.2.1. Path Parameters (4 parameters):

228.2.2. Query Parameters (78 parameters):

228.3. MESSAGE HEADERS

228.4. ACCESS TO NETTY TYPES

228.5. EXAMPLES

228.6. HOW DO I LET NETTY MATCH WILDCARDS

228.7. USING MULTIPLE ROUTES WITH SAME PORT

228.7.1. Reusing same server bootstrap configuration with multiple routes

228.7.2. Reusing same server bootstrap configuration with multiple routes across multiple bundles in OSGi container

228.8. USING HTTP BASIC AUTHENTICATION

228.8.1. Specifying ACL on web resources

228.9. SEE ALSO

CHAPTER 229. NETTY4 COMPONENT

229.1. URI FORMAT

229.2. OPTIONS

229.2.1. Path Parameters (3 parameters):

229.2.2. Query Parameters (72 parameters):

229.3. REGISTRY BASED OPTIONS

229.3.1. Using non shareable encoders or decoders

229.4. SENDING MESSAGES TO/FROM A NETTY ENDPOINT

229.4.1. Netty Producer

229.4.2. Netty Consumer

229.5. EXAMPLES

229.5.1. A UDP Netty endpoint using Request-Reply and serialized object payload

229.5.2. A TCP based Netty consumer endpoint using One-way communication

229.5.3. An SSL/TCP based Netty consumer endpoint using Request-Reply communication

- **264.4. SEE ALSO**

# CHAPTER 265. ROUTEBOX COMPONENT (DEPRECATED)

- **265.1. THE NEED FOR A CAMEL ROUTEBOX ENDPOINT**
- **265.2. URI FORMAT**
- **265.3. OPTIONS**
  - 265.3.1. Path Parameters (1 parameters):
  - 265.3.2. Query Parameters (17 parameters):
- **265.4. SENDING/RECEIVING MESSAGES TO/FROM THE ROUTEBOX**
  - 265.4.1. Step I: Loading inner route details into the Registry
- **265.5. SEE ALSO**
265.4.2. Step 2: Optionaly using a Dispatch Strategy instead of a Dispatch Map
265.4.3. Step 2: Launching a routebox consumer
265.4.4. Step 3: Using a routebox producer

CHAPTER 266. RSS COMPONENT
266.1. URI FORMAT
266.2. OPTIONS
266.2.1. Path Parameters (1 parameters):
266.2.2. Query Parameters (27 parameters):
266.3. EXCHANGE DATA TYPES
266.4. MESSAGE HEADERS
266.5. RSS DATAFORMAT
266.6. FILTERING ENTRIES
266.7. SEE ALSO

CHAPTER 267. RSS DATAFORMAT
267.1. OPTIONS

CHAPTER 268. SALESFORCE COMPONENT
268.1. AUTHENTICATING TO SALESFORCE
268.2. URI FORMAT
268.3. PASSING IN SALESFORCE HEADERS AND FETCHING SALESFORCE RESPONSE HEADERS
268.4. SUPPORTED SALESFORCE APIs
268.4.1. Rest API
268.4.2. Rest Bulk API
268.4.3. Rest Streaming API
268.4.4. Platform events
268.5. EXAMPLES
268.5.1. Uploading a document to a ContentWorkspace
268.6. USING SALESFORCE LIMITS API
268.7. WORKING WITH APPROVALS
268.8. USING SALESFORCE RECENT ITEMS API
268.9. WORKING WITH APPROVALS
268.10. USING SALESFORCE COMPOSITE API TO SUBMIT SOBJECT TREE
268.11. USING SALESFORCE COMPOSITE API TO SUBMIT MULTIPLE REQUESTS IN A BATCH
268.12. USING SALESFORCE COMPOSITE API TO SUBMIT MULTIPLE CHAINED REQUESTS
268.13. CAMEL SALESFORCE MAVEN PLUGIN
268.14. OPTIONS
268.14.1. Path Parameters (2 parameters):
268.14.2. Query Parameters (44 parameters):
268.15. SEE ALSO

CHAPTER 269. SAP COMPONENT
269.1. OVERVIEW
   Dependencies
   Additional platform restrictions for the SAP component
   SAP JCo and SAP IDoc libraries
   Deploying in a Fuse OSGi Container
   Deploying in a JBoss EAP container
   URI format
   Options for RFC destination endpoints
   Options for RFC server endpoints
   Options for the IDoc List Server endpoint
   Summary of the RFC and IDoc endpoints
269.2. CONFIGURATION

269.2.1. Configuration Overview

Overview
Example

269.2.2. Destination Configuration

Overview
Sample destination configuration
Interceptor for tRFC and qRFC destinations
Logon and authentication options
Connection options
Connection pool options
Secure network connection options
Repository options
Trace configuration options

269.2.3. Server Configuration

Overview
Sample server configuration
Required options
Secure network connection options
Other options

269.2.4. Repository Configuration

Overview
Repository data example
Function template properties
Function template example
List field meta-data properties
Elementary list field meta-data example
Complex list field meta-data example
Record meta-data properties
Record meta-data example
Record field meta-data properties
Elementary record field meta-data example
Complex record field meta-data example

269.3. MESSAGE HEADERS

269.4. EXCHANGE PROPERTIES

269.5. MESSAGE BODY FOR RFC

Request and response objects
Structure objects
Field types
Elementary field types
Character field types
Numeric field types
Hexadecimal field types
String field types
Complex field types
Structure field types
Table field types
Table objects
269.6. MESSAGE BODY FOR IDOC
   IDoc message type
   The IDoc document model
   How an IDoc is related to a Document object
   Example of creating a Document instance
   Document attributes
   Setting document attributes in Java
   Setting document attributes in XML

269.7. TRANSACTION SUPPORT
   BAPI transaction model
   RFC transaction model
   Which transaction model to use?
   Transactional RFC destination endpoints
   Transactional RFC server endpoints

269.8. XML SERIALIZATION FOR RFC
   Overview
   XML namespace
   Request and response XML documents
   Structure fields
   Table fields
   Elementary fields
   Date and time formats

269.9. XML SERIALIZATION FOR IDOC
   Overview
   XML namespace
   Built-in type converter
   Sample IDoc message body in XML format

269.10. EXAMPLE 1: READING DATA FROM SAP
   Overview
   Java DSL for route
   XML DSL for route
   createFlightCustomerGetListRequest bean
   returnFlightCustomerInfo bean

269.11. EXAMPLE 2: WRITING DATA TO SAP
   Overview
   Java DSL for route
   XML DSL for route
   Transaction support
   Populating request parameters

269.12. EXAMPLE 3: HANDLING REQUESTS FROM SAP
   Overview
   Java DSL for route
   XML DSL for route
   BookFlightRequest bean
   BookFlightResponse bean
   FlightInfo bean
   ConnectionInfoTable bean
   ConnectionInfo bean

CHAPTER 270. SAP NETWEAVER COMPONENT
   270.1. URI FORMAT
   270.2. PREREQUISITES
   270.3. SAPNETWEAVER OPTIONS
279.8.5.3. Using a XML file 1889
279.8.5.4. Configuring propert placeholders 1890
279.8.5.5. Configuring JMX 1890
279.8.5.6. Using custom CamelContextLifecycle 1891
279.8.6. See Also 1891

CHAPTER 280. SFTP COMPONENT ........................................... 1892
280.1. URI OPTIONS 1892
   280.1.1. Path Parameters (3 parameters): 1892
   280.1.2. Query Parameters (111 parameters): 1892

CHAPTER 281. SHIRO SECURITY COMPONENT .......................... 1910
281.1. SHIRO SECURITY BASICS 1910
281.2. INSTANTIATING A SHIROSECURITYPOLICY OBJECT 1911
281.3. SHIROSECURITYPOLICY OPTIONS 1911
281.4. APPLYING SHIRO AUTHENTICATION ON A CAMEL ROUTE 1912
281.5. APPLYING SHIRO AUTHORIZATION ON A CAMEL ROUTE 1913
281.6. CREATING A SHIROSECURITYTOKEN AND INJECTING IT INTO A MESSAGE EXCHANGE 1914
281.7. SENDING MESSAGES TO ROUTES SECURED BY A SHIROSECURITYPOLICY 1914
281.8. SENDING MESSAGES TO ROUTES SECURED BY A SHIROSECURITYPOLICY (MUCH EASIER FROM CAMEL 2.12 ONWARDS) 1914
   281.8.1. Using ShiroSecurityToken 1914

CHAPTER 282. SIMPLE LANGUAGE ........................................... 1916
282.1. SIMPLE LANGUAGE CHANGES IN CAMEL 2.9 ONWARDS 1916
282.2. SIMPLE LANGUAGE OPTIONS 1917
282.3. VARIABLES 1917
282.4. OGNL EXPRESSION SUPPORT 1922
282.5. OPERATOR SUPPORT 1924
   282.5.1. Comparing with different types 1927
   282.5.2. Using Spring XML 1929
282.6. USING AND / OR 1929
282.7. SAMPLES 1929
282.8. REFERRING TO CONSTANTS OR Enums 1931
282.9. USING NEW LINES OR TABS IN XML DSLS 1931
282.10. LEADING AND TRAILING WhITESPACE HANDLING 1931
282.11. SETTING RESULT TYPE 1932
282.12. CHANGING FUNCTION START AND END TOKENS 1932
282.13. LOADING SCRIPT FROM EXTERNAL RESOURCE 1932
282.14. SETTING SPRING BEANS TO EXCHANGE PROPERTIES 1933
282.15. DEPENDENCIES 1933

CHAPTER 283. SIP COMPONENT ........................................... 1934
283.1. URI FORMAT 1934
283.2. OPTIONS 1934
   283.2.1. Path Parameters (1 parameters): 1935
   283.2.2. Query Parameters (44 parameters): 1935
283.3. SENDING MESSAGES TO/FROM A SIP ENDPOINT 1939
   283.3.1. Creating a Camel SIP Publisher 1939
   283.3.2. Creating a Camel SIP Subscriber 1939

CHAPTER 284. SIMPLE JMS BATCH COMPONENT ......................... 1941
284.1. URI FORMAT 1942
284.2. COMPONENT OPTIONS AND CONFIGURATIONS 1942

CHAPTER 1. COMPONENTS OVERVIEW

This chapter provides a summary of all the components available for Apache Camel.

1.1. CONTAINER TYPES

Red Hat Fuse provides a variety of container types, into which you can deploy your Camel applications:

- Spring Boot
- Apache Karaf
- JBoss Enterprise Application Platform (JBoss EAP)

In addition, a Camel application can run as containerless: that is, where a Camel application runs directly in the JVM, without any special container.

In some cases, Fuse might support a Camel component in one container, but not in the others. There are various reasons for this, but in some cases a component is not suitable for all container types. For example, the camel-ejb component is designed specifically for Java EE (that is, JBoss EAP), and cannot be supported in the other container types.

1.2. SUPPORTED COMPONENTS

Note the following key:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>✔</td>
<td>Supported</td>
</tr>
<tr>
<td>![ ]</td>
<td>Unsupported or not yet supported</td>
</tr>
<tr>
<td>![ ]</td>
<td>Deprecated</td>
</tr>
</tbody>
</table>

Table 1.1, “Apache Camel Component Support Matrix” provides comprehensive details about which Camel components are supported in which containers.

Table 1.1. Apache Camel Component Support Matrix

CHAPTER 2. ACTIVEMQ

ACTIVEMQ COMPONENT

The ActiveMQ component allows messages to be sent to a JMS Queue or Topic; or messages to be consumed from a JMS Queue or Topic using Apache ActiveMQ.

This component is based on the Chapter 169, JMS Component and uses Spring’s JMS support for declarative transactions, using Spring’s JmsTemplate for sending and a MessageListenerContainer for consuming. All the options from the Chapter 169, JMS Component component also apply for this component.

To use this component, make sure you have the activemq.jar or activemq-core.jar on your classpath along with any Apache Camel dependencies such as camel-core.jar, camel-spring.jar and camel-jms.jar.

TRANSACTED AND CACHING

See section Transactions and Cache Levels below on JMS page if you are using transactions with JMS as it can impact performance.

URI FORMAT

activemq:[queue:|topic:]destinationName

Where destinationName is an ActiveMQ queue or topic name. By default, the destinationName is interpreted as a queue name. For example, to connect to the queue, FOO.BAR, use:

activemq:FOO.BAR

You can include the optional queue: prefix, if you prefer:

activemq:queue:FOO.BAR

To connect to a topic, you must include the topic: prefix. For example, to connect to the topic, Stocks.Prices, use:

activemq:topic:Stocks.Prices

OPTIONS

See Options on the Chapter 169, JMS Component component as all these options also apply for this component.

CAMEL ON EAP DEPLOYMENT

This component is supported by the Camel on EAP (Wildfly Camel) framework, which offers a simplified deployment model on the Red Hat JBoss Enterprise Application Platform (JBoss EAP) container.

You can configure the ActiveMQ Camel component to work either with an embedded broker or an external broker. To embed a broker in the JBoss EAP container, configure the ActiveMQ Resource
Adapter in the EAP container configuration file – for details, see ActiveMQ Resource Adapter Configuration.

CONFIGURING THE CONNECTION FACTORY

The following test case shows how to add an ActiveMQComponent to the CamelContext using the activeMQComponent() method while specifying the brokerURL used to connect to ActiveMQ.

```java
camelContext.addComponent("activemq", activeMQComponent("vm://localhost?
broker.persistent=false").
```

CONFIGURING THE CONNECTION FACTORY USING SPRING XML

You can configure the ActiveMQ broker URL on the ActiveMQComponent as follows

```xml
<beans xmlns="http://www.springframework.org/schema/beans"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="
http://www.springframework.org/schema/beans
http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-
spring.xsd">
  <camelContext xmlns="http://camel.apache.org/schema/spring">
  </camelContext>
  <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
    <property name="brokerURL" value="tcp://somehost:61616"/>
  </bean>
</beans>
```

USING CONNECTION POOLING

When sending to an ActiveMQ broker using Camel it’s recommended to use a pooled connection factory to handle efficient pooling of JMS connections, sessions and producers. This is documented in the page ActiveMQ Spring Support.

You can grab Jencks AMQ pool with Maven:

```xml
<dependency>
  <groupId>org.apache.activemq</groupId>
  <artifactId>activemq-pool</artifactId>
  <version>5.3.2</version>
</dependency>
```

And then setup the activemq component as follows:

```xml
<bean id="jmsConnectionFactory" class="org.apache.activemq.ActiveMQConnectionFactory">
  <property name="brokerURL" value="tcp://localhost:61616"/>
</bean>
```
<bean id="pooledConnectionFactory" class="org.apache.activemq.pool.PooledConnectionFactory" init-method="start" destroy-method="stop">
  <property name="maxConnections" value="8"/>
  <property name="connectionFactory" ref="jmsConnectionFactory"/>
</bean>

<bean id="jmsConfig" class="org.apache.camel.component.jms.JmsConfiguration">
  <property name="connectionFactory" ref="pooledConnectionFactory"/>
  <property name="concurrentConsumers" value="10"/>
</bean>

<bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
  <property name="configuration" ref="jmsConfig"/>
</bean>

NOTE

Notice the init and destroy methods on the pooled connection factory. This is important to ensure the connection pool is properly started and shutdown.

The PooledConnectionFactory will then create a connection pool with up to 8 connections in use at the same time. Each connection can be shared by many sessions. There is an option named maxActive you can use to configure the maximum number of sessions per connection; the default value is 500. From ActiveMQ 5.7 onwards the option has been renamed to better reflect its purpose, being named as maxActiveSessionPerConnection. Notice the concurrentConsumers is set to a higher value than maxConnections is. This is okay, as each consumer is using a session, and as a session can share the same connection, we are in the safe. In this example we can have 8 * 500 = 4000 active sessions at the same time.

INVOKING MESSAGELISTENER POJOS IN A ROUTE

The ActiveMQ component also provides a helper Type Converter from a JMS MessageListener to a Processor. This means that the Chapter 41, Bean Component component is capable of invoking any JMS MessageListener bean directly inside any route.

So for example you can create a MessageListener in JMS as follows:

```java
public class MyListener implements MessageListener {
  public void onMessage(Message jmsMessage) {
    // ...
  }
}
```

Then use it in your route as follows

```camel
from("file://foo/bar").
  bean(MyListener.class);
```

That is, you can reuse any of the Apache Camel components and easily integrate them into your JMS MessageListener POJO!

USING ACTIVEMQ DESTINATION OPTIONS
Available as of ActiveMQ 5.6

You can configure the **Destination Options** in the endpoint uri, using the "destination." prefix. For example to mark a consumer as exclusive, and set its prefetch size to 50, you can do as follows:

```xml
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="file://src/test/data?noop=true"/>
    <to uri="activemq:queue:foo"/>
  </route>
  <route>
    <!-- use consumer.exclusive ActiveMQ destination option, notice we have to prefix with destination. -->
    <from uri="activemq:foo?destination.consumer.exclusive=true&destination.consumer.prefetchSize=50"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

**CONSUMING ADVISORY MESSAGES**

ActiveMQ can generate **Advisory messages** which are put in topics that you can consume. Such messages can help you send alerts in case you detect slow consumers or to build statistics (number of messages/produced per day, etc.) The following Spring DSL example shows you how to read messages from a topic.

```xml
<route>
  <from uri="activemq:topic:ActiveMQ.Advisory.Connection?mapJmsMessage=false" />
  <convertBodyTo type="java.lang.String"/>
  <transform>
    <simple>${in.body}\n</simple>
  </transform>
  <to uri="file://data/activemq/?fileExist=Append&ileName=advisoryConnection-${date:now:yyyyMMdd}.txt" />  
</route>
```

If you consume a message on a queue, you should see the following files under data/activemq folder:

advisoryConnection-20100312.txt advisoryProducer-20100312.txt

and containing string:

```java
ActiveMQMessage {commandId = 0, responseRequired = false, messageID = ID:dell-charles-3258-1268399815140-1:0:0:0:221, originalDestination = null, originalTransactionId = null, producerId = ID:dell-charles-3258-1268399815140-1:0:0:0, destination = topic://ActiveMQ.Advisory.Connection, transactionId = null, expiration = 0, timestamp = 0, arrival = 0, brokerInTime = 1268403383468, brokerOutTime = 1268403383468, correlationId = null, replyTo = null, persistent = false, type = Advisory, priority = 0, groupId = null, groupSequence = 0, targetConsumerId = null, compressed = false, userId = null, content = null, marshalledProperties = org.apache.activemq.util.ByteSequence@17e2705, dataStructure = ConnectionInfo {commandId = 1, responseRequired = true, connectionId = ID:dell-charles-3258-1268399815140-
```
GETTING COMPONENT JAR

You need this dependency:

- activemq-camel

ActiveMQ is an extension of the Chapter 169, JMS Component component released with the ActiveMQ project.

```xml
<dependency>
  <groupId>org.apache.activemq</groupId>
  <artifactId>activemq-camel</artifactId>
  <version>5.6.0</version>
</dependency>
```
CHAPTER 3. AHC COMPONENT

Available as of Camel version 2.8

The **ahc** component provides HTTP based endpoints for consuming external HTTP resources (as a client to call external servers using HTTP).

The component uses the **Async HttpClient** library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-ahc</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

### 3.1. URI FORMAT

```
ahc:http://hostname[:port][/resourceUri][?options]
ahc:https://hostname[:port][/resourceUri][?options]
```

Will by default use port 80 for HTTP and 443 for HTTPS.

You can append query options to the URI in the following format, `?option=value&option=value&…`

### 3.2. AHCENDPOINT OPTIONS

The AHC endpoint is configured using URI syntax:

```
ahc:httpUri
```

with the following path and query parameters:

#### 3.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>httpUri</code></td>
<td><strong>Required</strong> The URI to use such as <code>http://hostname:port/path</code></td>
<td></td>
<td>URI</td>
</tr>
</tbody>
</table>

#### 3.2.2. Query Parameters (13 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------------</td>
</tr>
<tr>
<td>bridgeEndpoint (producer)</td>
<td>If the option is true, then the Exchange.HTTP_URI header is ignored, and use the endpoint’s URI for request. You may also set the throwExceptionOnFailure to be false to let the AhcProducer send all the fault response back.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bufferSize (producer)</td>
<td>The initial in-memory buffer size used when transferring data between Camel and AHC Client.</td>
<td>4096</td>
<td>int</td>
</tr>
<tr>
<td>connectionClose (producer)</td>
<td>Define if the Connection Close header has to be added to HTTP Request. This parameter is false by default</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>cookieHandler (producer)</td>
<td>Configure a cookie handler to maintain a HTTP session</td>
<td>CookieHandler</td>
<td></td>
</tr>
<tr>
<td>headerFilterStrategy (producer)</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td>HeaderFilterStrategy</td>
<td></td>
</tr>
<tr>
<td>throwExceptionOnFailure (producer)</td>
<td>Option to disable throwing the AhcOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>transferException (producer)</td>
<td>If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type (for example using Jetty or Servlet Camel components). On the producer side the exception will be deserialized and thrown as is, instead of the AhcOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>binding (advanced)</td>
<td>To use a custom AhcBinding which allows to control how to bind between AHC and Camel.</td>
<td>AhcBinding</td>
<td></td>
</tr>
<tr>
<td>clientConfig (advanced)</td>
<td>To configure the AsyncHttpClient to use a custom com.ning.http.client.AsyncHttpClientConfig instance.</td>
<td>AsyncHttpClientConfig</td>
<td></td>
</tr>
<tr>
<td>clientConfigOptions (advanced)</td>
<td>To configure the AsyncHttpClientConfig using the key/values from the Map.</td>
<td>Map</td>
<td></td>
</tr>
</tbody>
</table>
Table 3.3. AHCCOMPONENT OPTIONS

The AHC component supports 8 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>client</strong> (advanced)</td>
<td>To use a custom AsyncHttpClient</td>
<td>AsyncHttpClient</td>
<td></td>
</tr>
<tr>
<td><strong>binding</strong> (advanced)</td>
<td>To use a custom AhcBinding which allows to control how to bind between AHC and Camel.</td>
<td>AhcBinding</td>
<td></td>
</tr>
<tr>
<td><strong>clientConfig</strong> (advanced)</td>
<td>To configure the AsyncHttpClient to use a custom com.ning.http.client.AsyncHttpClientConfig instance.</td>
<td>AsyncHttpClientConfig</td>
<td></td>
</tr>
<tr>
<td><strong>sslContextParameters</strong> (security)</td>
<td>Reference to a org.apache.camel.util.jsse.SSLContextParameters in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the clientConfig option at the endpoint or component level.</td>
<td>SSLContextParameters</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>allowJavaSerializedObject (advanced)</td>
<td>Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useGlobalSslContext Parameters (security)</td>
<td>Enable usage of global SSL context parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>headerFilterStrategy (filter)</td>
<td>To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

Notice that setting any of the options on the **AhcComponent** will propagate those options to **AhcEndpoints** being created. However the **AhcEndpoint** can also configure/override a custom option. Options set on endpoints will always take precedence over options from the **AhcComponent**.

### 3.4. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exchange.HTTP_URI</td>
<td>String</td>
<td>URI to call. Will override existing URI set directly on the endpoint.</td>
</tr>
<tr>
<td>Exchange.HTTP_PATH</td>
<td>String</td>
<td>Request URI's path, the header will be used to build the request URI with the HTTP_URI. If the path is start with &quot;/&quot;, http producer will try to find the relative path based on the Exchange.HTTP_BASE_URI header or the exchange.getFromEndpoint().getEndpointUri();</td>
</tr>
<tr>
<td>Exchange.HTTP_QUERY</td>
<td>String</td>
<td>Camel 2.11 onwards: URI parameters. Will override existing URI parameters set directly on the endpoint.</td>
</tr>
</tbody>
</table>
### 3.5. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

### 3.6. RESPONSE CODE

Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.

- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a `AhcOperationFailedException` with the information.

- Response code is 400+, Camel regards it as an external server failure and will throw a `AhcOperationFailedException` with the information.

### Table

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Exchange.HTTP_RESPONSE_CODE</code></td>
<td>int</td>
<td>The HTTP response code from the external server. Is 200 for OK.</td>
</tr>
<tr>
<td><code>Exchange.HTTP_CHARACTER_ENCODING</code></td>
<td>String</td>
<td>Character encoding.</td>
</tr>
<tr>
<td><code>Exchange.CONTENT_TYPE</code></td>
<td>String</td>
<td>The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as <code>text/html</code>.</td>
</tr>
<tr>
<td><code>Exchange.CONTENT_ENCODING</code></td>
<td>String</td>
<td>The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as <code>gzip</code>.</td>
</tr>
</tbody>
</table>
The option, `throwExceptionOnFailure`, can be set to `false` to prevent the `AhcOperationFailedException` from being thrown for failed response codes. This allows you to get any response from the remote server.

### 3.7. **AHCOPERATIONFAILEDEXCEPTION**

This exception contains the following information:

- The HTTP status code
- The HTTP status line (text of the status code)
- Redirect location, if server returned a redirect
- Response body as a `java.lang.String`, if server provided a body as response

### 3.8. **CALLING USING GET OR POST**

The following algorithm is used to determine if either `GET` or `POST` HTTP method should be used:

1. Use method provided in header.
2. **GET** if query string is provided in header.
3. **GET** if endpoint is configured with a query string.
4. **POST** if there is data to send (body is not null).
5. **GET** otherwise.

### 3.9. **CONFIGURING URI TO CALL**

You can set the HTTP producer’s URI directly from the endpoint URI. In the route below, Camel will call out to the external server, `oldhost`, using HTTP.

```java
from("direct:start")
  .to("ahc:http://oldhost");
```

And the equivalent Spring sample:

```xml
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ahc:http://oldhost"/>
  </route>
</camelContext>
```

You can override the HTTP endpoint URI by adding a header with the key, `Exchange.HTTP_URI`, on the message.

```java
from("direct:start")
  .setHeader(Exchange.HTTP_URI, constant("http://newhost"))
  .to("ahc:http://oldhost");
```

### 3.10. **CONFIGURING URI PARAMETERS**
The **ahc** producer supports URI parameters to be sent to the HTTP server. The URI parameters can either be set directly on the endpoint URI or as a header with the key `Exchange.HTTP_QUERY` on the message.

```java
from("direct:start")
    .to("ahc:http://oldhost?order=123&detail=short");
```

Or options provided in a header:

```java
from("direct:start")
    .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
    .to("ahc:http://oldhost");
```

### 3.11. HOW TO SET THE HTTP METHOD TO THE HTTP PRODUCER

The HTTP component provides a way to set the HTTP request method by setting the message header. Here is an example:

```java
from("direct:start")
    .setHeader(Exchange.HTTP_METHOD, constant("POST"))
    .to("ahc:http://www.google.com")
    .to("mock:results");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <setHeader headerName="CamelHttpMethod">
      <constant>POST</constant>
    </setHeader>
    <to uri="ahc:http://www.google.com"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

### 3.12. CONFIGURING CHARSET

If you are using **POST** to send data you can configure the `charset` using the `Exchange` property:

```java
exchange.setProperty(Exchange.CHARSET_NAME, "iso-8859-1");
```

#### 3.12.1. URI Parameters from the endpoint URI

In this sample we have the complete URI endpoint that is just what you would have typed in a web browser. Multiple URI parameters can of course be set using the `&` character as separator, just as you would in the web browser. Camel does no tricks here.

```
// we query for Camel at the Google page
template.sendBody("ahc:http://www.google.com/search?q=Camel", null);
```
3.12.2. URI Parameters from the Message

Map headers = new HashMap();
headers.put(Exchange.HTTP_QUERY, "q=Camel&lr=lang_en");
// we query for Camel and English language at Google
template.sendBody("ahc:http://www.google.com/search", null, headers);

In the header value above notice that it should not be prefixed with ? and you can separate parameters as usual with the & char.

3.12.3. Getting the Response Code

You can get the HTTP response code from the AHC component by getting the value from the Out message header with Exchange.HTTP_RESPONSE_CODE.

Exchange exchange = template.send("ahc:http://www.google.com/search", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().setHeader(Exchange.HTTP_QUERY, constant("hl=en&q=activemq");
    }
});
Message out = exchange.getOut();
int responseCode = out.getHeader(Exchange.HTTP_RESPONSE_CODE, Integer.class);

3.13. CONFIGURING ASYNCHTTPCLIENT

The AsyncHttpClient client uses a AsyncHttpClientConfig to configure the client. See the documentation at Async Http Client for more details.

In Camel 2.8, configuration is limited to using the builder pattern provided by AsyncHttpClientConfig.Builder. In Camel 2.8, the AsyncHttpClientConfig doesn’t support getters/setters so its not easy to create/configure using a Spring bean style (eg the <bean> tag in the XML file).

The example below shows how to use a builder to create the AsyncHttpClientConfig which we configure on the AhcComponent.

In Camel 2.9, the AHC component uses Async HTTP library 1.6.4. This newer version provides added support for plain bean style configuration. The AsyncHttpClientConfigBean class provides getters and setters for the configuration options available in AsyncHttpClientConfig. An instance of AsyncHttpClientConfigBean may be passed directly to the AHC component or referenced in an endpoint URI using the clientConfig URI parameter.

Also available in Camel 2.9 is the ability to set configuration options directly in the URI. URI parameters starting with "clientConfig." can be used to set the various configurable properties of AsyncHttpClientConfig. The properties specified in the endpoint URI are merged with those specified in the configuration referenced by the "clientConfig" URI parameter with those being set using the "clientConfig," parameter taking priority. The AsyncHttpClientConfig instance referenced is always copied for each endpoint such that settings on one endpoint will remain independent of settings on any previously created endpoints. The example below shows how to configure the AHC component using the "clientConfig:" type URI parameters.
3.14. SSL SUPPORT (HTTPS)

Using the JSSE Configuration Utility

As of Camel 2.9, the AHC component supports SSL/TLS configuration through the Camel JSSE Configuration Utility. This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the AHC component.

Programmatic configuration of the component

```java
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

AhcComponent component = context.getComponent("ahc", AhcComponent.class);
component.setSslContextParameters(scp));
```

Spring DSL based configuration of endpoint

```xml
...<camel:sslContextParameters
    id="sslContextParameters">
<camel:keyManagers
    keyPassword="keyPassword">
<camel:keyStore
    resource="/users/home/server/keystore.jks"
    password="keystorePassword"/>
</camel:keyManagers>
</camel:sslContextParameters>...
...<to uri="ahc:https://localhost/foo?sslContextParameters=#sslContextParameters"/>
```

CHAPTER 4. AHC WEBSOCKET COMPONENT

Available as of Camel version 2.14

The `ahc-ws` component provides Websocket based endpoints for a client communicating with external servers over Websocket (as a client opening a websocket connection to an external server). The component uses the AHC component that in turn uses the Async Http Client library.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-ahc-ws</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

4.1. URI FORMAT

```
ahc-ws://hostname[:port][/resourceUri][?options]
ahc-wss://hostname[:port][/resourceUri][?options]
```

Will by default use port 80 for ahc-ws and 443 for ahc-wss.

4.2. AHC-WS OPTIONS

As the AHC-WS component is based on the AHC component, you can use the various configuration options of the AHC component.

The AHC Websocket component supports 8 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>client (advanced)</td>
<td>To use a custom AsyncHttpClient</td>
<td></td>
<td>AsyncHttpClient</td>
</tr>
<tr>
<td>binding (advanced)</td>
<td>To use a custom AhcBinding which allows to control how to bind between AHC and Camel.</td>
<td></td>
<td>AhcBinding</td>
</tr>
<tr>
<td>clientConfig (advanced)</td>
<td>To configure the AsyncHttpClient to use a custom com.ning.http.client.AsyncHttpClientConfig instance.</td>
<td></td>
<td>AsyncHttpClientConfig</td>
</tr>
<tr>
<td>sslContextParameters (security)</td>
<td>Reference to a org.apache.camel.util.jsse.SSLContextParameters in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the clientConfig option at the endpoint or component level.</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
</tbody>
</table>
The AHC Websocket endpoint is configured using URI syntax:

```
ahc-ws:httpUri
```

with the following path and query parameters:

### 4.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpUri</td>
<td>Required The URI to use such as <a href="http://hostname:port/path">http://hostname:port/path</a></td>
<td></td>
<td>URI</td>
</tr>
</tbody>
</table>

### 4.2.2. Query Parameters (18 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeEndpoint</td>
<td>If the option is true, then the Exchange.HTTP_URI header is ignored, and use the endpoint's URI for request. You may also set the throwExceptionOnFailure to be false to let the AhcProducer send all the fault response back.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------</td>
</tr>
<tr>
<td><strong>bufferSize</strong> (common)</td>
<td>The initial in-memory buffer size used when transferring data between Camel and AHC Client.</td>
<td>4096</td>
<td>int</td>
</tr>
<tr>
<td><strong>headerFilterStrategy</strong> (common)</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td><strong>throwExceptionOnFailure</strong> (common)</td>
<td>Option to disable throwing the AhcOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.</td>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>transferException</strong> (common)</td>
<td>If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type (for example using Jetty or Servlet Camel components). On the producer side the exception will be deserialized and thrown as is, instead of the AhcOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>sendMessageOnError</strong> (consumer)</td>
<td>Whether to send an message if the web-socket listener received an error.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong> (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern</strong> (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Default** | **Type**
--- | --- | --- | ---
**connectionClose** (producer) | Define if the Connection Close header has to be added to HTTP Request. This parameter is false by default | false | boolean
**cookieHandler** (producer) | Configure a cookie handler to maintain a HTTP session | CookieHandler
**useStreaming** (producer) | To enable streaming to send data as multiple text fragments. | false | boolean
**binding** (advanced) | To use a custom AhcBinding which allows to control how to bind between AHC and Camel. | AhcBinding
**clientConfig** (advanced) | To configure the AsyncHttpClient to use a custom com.ning.http.client.AsyncHttpClientConfig instance. | AsyncHttpClientConfig
**clientConfigOptions** (advanced) | To configure the AsyncHttpClientConfig using the key/values from the Map. | Map
**synchronous** (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean
**clientConfigRealmOptions** (security) | To configure the AsyncHttpClientConfig Realm using the key/values from the Map. | Map
**sslContextParameters** (security) | Reference to a org.apache.camel.util.jsse.SSLContextParameters in the Registry. This reference overrides any configured SSLContextParameters at the component level. See Using the JSSE Configuration Utility. Note that configuring this option will override any SSL/TLS configuration options provided through the clientConfig option at the endpoint or component level. | SSLContextParameters

## 4.3. WRITING AND READING DATA OVER WEBsocket

An ahc-ws endpoint can either write data to the socket or read from the socket, depending on whether the endpoint is configured as the producer or the consumer, respectively.

## 4.4. CONFIGURING URI TO WRITE OR READ DATA

In the route below, Camel will write to the specified websocket connection.
from("direct:start")
  .to("ahc-ws://targethost");

And the equivalent Spring sample:

```xml
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ahc-ws://targethost"/>
  </route>
</camelContext>
```

In the route below, Camel will read from the specified websocket connection.

```java
from("ahc-ws://targethost")
  .to("direct:next");
```

And the equivalent Spring sample:

```xml
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="ahc-ws://targethost"/>
    <to uri="direct:next"/>
  </route>
</camelContext>
```

- Atmosphere-Websocket
CHAPTER 5. AMQP COMPONENT

Available as of Camel version 1.2

The `amqp:` component supports the AMQP 1.0 protocol using the JMS Client API of the Qpid project. In case you want to use AMQP 0.9 (in particular RabbitMQ) you might also be interested in the Camel RabbitMQ component. Please keep in mind that prior to the Camel 2.17.0 AMQP component supported AMQP 0.9 and above, however since Camel 2.17.0 it supports only AMQP 1.0.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-amqp</artifactId>
  <version>${camel.version}</version>
</dependency>

<!-- use the same version as your Camel core version -->
```

5.1. URI FORMAT

`amqp:[queue:]destinationName[?options]`

5.2. AMQP OPTIONS

You can specify all of the various configuration options of the JMS component after the destination name.

The AMQP component supports 80 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use a shared JMS configuration</td>
<td></td>
<td>JmsConfiguration</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>acceptMessages</td>
<td>Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>While Stopping</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------</td>
</tr>
<tr>
<td>allowReplyManagerQuick Stop</td>
<td>Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration.isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>acknowledgmentsMode</td>
<td>The JMS acknowledgement mode defined as an Integer. Allows you to set vendor-specific extensions to the acknowledgment mode. For the regular modes, it is preferable to use the acknowledgementModeName instead.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>eagerLoadingOfProperties</td>
<td>Enables eager loading of JMS properties as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>acknowledgmentsModeName</td>
<td>The JMS acknowledgement name, which is one of: SESSION_TRANSACTED, CLIENT_ACKNOWLEDGE, AUTO_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE.</td>
<td>AUTO_ACKNOWLEDGE</td>
<td>String</td>
</tr>
<tr>
<td>autoStartup</td>
<td>Specifies whether the consumer container should auto-startup.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>cacheLevel</td>
<td>Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>cacheLevelName</td>
<td>Sets the cache level by name for the underlying JMS resources. Possible values are: CACHE_AUTO, CACHE_CONNECTION, CACHE_CONSUMER, CACHE_NONE, and CACHE_SESSION. The default setting is CACHE_AUTO. See the Spring documentation and Transactions Cache Levels for more information.</td>
<td>CACHE_AUTO</td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------</td>
</tr>
<tr>
<td>replyToCacheLevelName (producer)</td>
<td>Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: CACHE_CONSUMER for exclusive or shared w/ replyToSelectorName. And CACHE_SESSION for shared without replyToSelectorName. Some JMS brokers such as IBM WebSphere may require to set the replyToCacheLevelName=CACHE_NONE to work. Note: If using temporary queues then CACHE_NONE is not allowed, and you must use a higher value such as CACHE_CONSUMER or CACHE_SESSION.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>clientId (common)</td>
<td>Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>concurrentConsumers (consumer)</td>
<td>Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the maxMessagesPerTask option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option replyToConcurrentConsumers is used to control number of concurrent consumers on the reply message listener.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>replyToConcurrentConsumers (producer)</td>
<td>Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>connectionFactory (common)</td>
<td>The connection factory to be use. A connection factory must be configured either on the component or endpoint.</td>
<td></td>
<td>ConnectionFactor</td>
</tr>
<tr>
<td>username (security)</td>
<td>Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>password (security)</td>
<td>Password to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------------</td>
</tr>
<tr>
<td>deliveryPersistennt (producer)</td>
<td>Specifies whether persistent delivery is used by default.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>deliveryMode (producer)</td>
<td>Specifies the delivery mode to be used. Possibles values are those defined by javax.jms.DeliveryMode. NON_PERSISTENT = 1 and PERSISTENT = 2.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>durableSubscriptionName (common)</td>
<td>The durable subscriber name for specifying durable topic subscriptions. The clientId option must be configured as well.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>exceptionListener (advanced)</td>
<td>Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions.</td>
<td></td>
<td>ExceptionListener</td>
</tr>
<tr>
<td>errorHandler (advanced)</td>
<td>Specifies a org.springframework.util.ErrorHandler to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using errorHandlerLoggingLevel and errorHandlerLogStackTrace options. This makes it much easier to configure, than having to code a custom errorHandler.</td>
<td></td>
<td>ErrorHandler</td>
</tr>
<tr>
<td>errorHandlerLogging Level (logging)</td>
<td>Allows to configure the default errorHandler logging level for logging uncaught exceptions.</td>
<td>WARN</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>errorHandlerLogStackTrace (logging)</td>
<td>Allows to control whether stacktraces should be logged or not, by the default errorHandler.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>explicitQosEnabled (producer)</td>
<td>Set if the deliveryMode, priority or timeToLive qualities of service should be used when sending messages. This option is based on Spring’s JmsTemplate. The deliveryMode, priority and timeToLive options are applied to the current endpoint. This contrasts with the preserveMessageQos option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exposeListenerSession (consumer)</td>
<td>Specifies whether the listener session should be exposed when consuming messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>---------</td>
<td>------</td>
</tr>
<tr>
<td>idleTaskExecutionLimit (advanced)</td>
<td>Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the maxConcurrentConsumers setting). There is additional doc available from Spring.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>idleConsumerLimit (advanced)</td>
<td>Specify the limit for the number of consumers that are allowed to be idle at any given time.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>maxConcurrentConsumers (consumer)</td>
<td>Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the maxMessagesPerTask option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option replyToMaxConcurrentConsumers is used to control number of concurrent consumers on the reply message listener.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>replyToMaxConcurrentConsumers (producer)</td>
<td>Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>replyOnTimeoutToMaxConcurrentConsumers (producer)</td>
<td>Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>maxMessagesPerTask (advanced)</td>
<td>The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>messageConverter (advanced)</td>
<td>To use a custom Spring org.springframework.jms.support.converter.MessageConverter so you can be in control how to map to/from a javax.jms.Message.</td>
<td>MessageConverter</td>
<td></td>
</tr>
<tr>
<td>mapJmsMessage (advanced)</td>
<td>Specifies whether Camel should auto map the received JMS message to a suited payload type, such as javax.jms.TextMessage to a String etc.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td><code>messageIdEnable</code> (advanced)</td>
<td>When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>messageTimestampEnabled</code> (advanced)</td>
<td>Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>alwaysCopyMessage</code> (producer)</td>
<td>If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a <code>replyToDestinationSelectorName</code> is set (incidentally, Camel will set the <code>alwaysCopyMessage</code> option to true, if a <code>replyToDestinationSelectorName</code> is set)</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>useMessageIDAsCorrelationID</code> (advanced)</td>
<td>Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>priority</code> (producer)</td>
<td>Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The <code>explicitQosEnabled</code> option must also be enabled in order for this option to have any effect.</td>
<td>4</td>
<td>int</td>
</tr>
<tr>
<td><code>pubSubNoLocal</code> (advanced)</td>
<td>Specifies whether to inhibit the delivery of messages published by its own connection.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>receiveTimeout</code> (advanced)</td>
<td>The timeout for receiving messages (in milliseconds).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td><code>recoveryInterval</code> (advanced)</td>
<td>Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds.</td>
<td>5000</td>
<td>long</td>
</tr>
<tr>
<td><code>taskExecutor</code> (consumer)</td>
<td>Allows you to specify a custom task executor for consuming messages.</td>
<td></td>
<td>TaskExecutor</td>
</tr>
<tr>
<td><code>timeToLive</code> (producer)</td>
<td>When sending messages, specifies the time-to-live of the message (in milliseconds).</td>
<td>-1</td>
<td>long</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------------</td>
</tr>
<tr>
<td><strong>transacted</strong> (transaction)</td>
<td>Specifies whether to use transacted mode</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>lazyCreateTransactionManager</strong></td>
<td>If true, Camel will create a JmsTransactionManager, if there is no transactionManager injected when option transacted=true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>transactionManager</strong> (transaction)</td>
<td>The Spring transaction manager to use.</td>
<td></td>
<td>PlatformTransactionManager</td>
</tr>
<tr>
<td><strong>transactionName</strong> (transaction)</td>
<td>The name of the transaction to use.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>transactionTimeout</strong> (transaction)</td>
<td>The timeout value of the transaction (in seconds), if using transacted mode.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td><strong>testConnectionOnStartup</strong> (common)</td>
<td>Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>asyncStartListener</strong> (advanced)</td>
<td>Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>asyncStopListener</strong> (advanced)</td>
<td>Whether to stop the JmsConsumer message listener asynchronously, when stopping a route.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>forceSendOriginalMessage</strong> (producer)</td>
<td>When using mapJmsMessage=false Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td><strong>requestTimeout</strong>&lt;br&gt;(producer)</td>
<td>The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header CamelJmsRequestTimeout to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the requestTimeoutCheckerInterval option.</td>
<td>20000</td>
<td>long</td>
</tr>
<tr>
<td><strong>requestTimeoutChecker Interval</strong>&lt;br&gt;(advanced)</td>
<td>Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td><strong>transferExchange</strong>&lt;br&gt;(advanced)</td>
<td>You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>transferException</strong>&lt;br&gt;(advanced)</td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>

<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td><strong>transferFault</strong></td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on Message.isFault() will be send back in the response as a JMS header with the key <code>org.apache.camel.component.jms.JmsConstants.JMS_TRANSFER_FAULT</code>. If the client is Camel, the returned fault flag will be set on the link <code>org.apache.camel.Messages.setFault(boolean)</code>. You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>jmsOperations</strong></td>
<td>Allows you to use your own implementation of the <code>org.springframework.jms.core.JmsOperations</code> interface. Camel uses JmsTemplate as default. Can be used for testing purpose, but not used much as stated in the spring API docs.</td>
<td></td>
<td>JmsOperations</td>
</tr>
<tr>
<td><strong>destinationResolver</strong></td>
<td>A pluggable <code>org.springframework.jms.support.destination.DestinationResolver</code> that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry).</td>
<td></td>
<td>DestinationResolver</td>
</tr>
<tr>
<td><strong>replyToType</strong></td>
<td>Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive.</td>
<td></td>
<td>ReplyToType</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>

<tr>
<td>preserveMessage Qos (producer)</td>
<td>Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>asyncConsumer (consumer)</td>
<td>Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>allowNullBody (producer)</td>
<td>Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSException is thrown.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>includeSentJMS MessageID (producer)</td>
<td>Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>includeAllJMSX Properties (advanced)</td>
<td>Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply.</td>
<td>false</td>
<td>boolean</td>

<tr>
<td><code>defaultTaskExecutor Type</code> (consumer)</td>
<td>Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring’s SimpleAsyncTaskExecutor) or ThreadPool (uses Spring’s ThreadPoolTaskExecutor with optimal values – cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.</td>
<td>DefaultTaskExecutor Type</td>
<td></td>
</tr>
<tr>
<td><code>jmsKeyFormatStrategy</code> (advanced)</td>
<td>Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and - ). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the org.apache.camel.component.jms.JmsKeyFormatStrategy and refer to it using the notation.</td>
<td>JmsKeyFormatStrategy</td>
<td></td>
</tr>
<tr>
<td><code>allowAdditionalHeaders</code> (producer)</td>
<td>This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td><code>queueBrowseStrategy</code> (advanced)</td>
<td>To use a custom QueueBrowseStrategy when browsing queues</td>
<td>QueueBrowseStrategy</td>
<td></td>
</tr>
<tr>
<td><code>messageCreatedStrategy</code> (advanced)</td>
<td>To use the given MessageCreatedStrategy which are invoked when Camel creates new instances of javax.jms.Message objects when Camel is sending a JMS message.</td>
<td>MessageCreatedStrategy</td>
<td></td>
</tr>
<tr>
<td><code>waitForProvisionCorrelationToBeUpdated Counter</code> (advanced)</td>
<td>Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled.</td>
<td>50 int</td>
<td></td>
</tr>
<tr>
<td>Name</td>

<td>waitForProvision CorrelationToBeUpdated ThreadSleepingTime (advanced)</td>
<td>Interval in millis to sleep each time while waiting for provisional correlation id to be updated.</td>
<td>100</td>
<td>long</td>
</tr>
<tr>
<td>correlationProperty (producer)</td>
<td>Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of JMSCorrelationID property. This allows you to exchange messages with systems that do not correlate messages using JMSCorrelationID JMS property. If used JMSCorrelationID will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>subscriptionDurable (consumer)</td>
<td>Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>subscriptionShared (consumer)</td>
<td>Set whether to make the subscription shared. The shared subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a shared subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with subscriptionDurable as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. Requires a JMS 2.0 compatible message broker.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
---|---|---|---
**subscriptionName** *(consumer)* | Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client’s JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0). | | String

### Name | Description | Default | Type
---|---|---|---
**streamMessageType Enabled** *(producer)* | Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either by sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data. | false | boolean

### Name | Description | Default | Type
---|---|---|---
**formatDateHeadersTo Iso8601** *(producer)* | Sets whether date headers should be formatted according to the ISO 8601 standard. | false | boolean

### Name | Description | Default | Type
---|---|---|---
**headerFilterStrategy** *(filter)* | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. | HeaderFilterStrategy

### Name | Description | Default | Type
---|---|---|---
**resolvePropertyPlaceholders** *(advanced)* | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean

The AMQP endpoint is configured using URI syntax:

```
amqp:destinationType:destinationName
```

with the following path and query parameters:

#### 5.2.1. Path Parameters (2 parameters):

### Name | Description | Default | Type
---|---|---|---
**destinationType** | The kind of destination to use | queue | String
### 5.2.2. Query Parameters (91 parameters):

<table>
<thead>

<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>acceptMessagesWhileStopping</code> (consumer)</td>
<td>Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration.isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.

The consumer type to use, which can be one of: Simple, Default, or Custom. The consumer type determines which Spring JMS listener to use. Default will use org.springframework.jms.listener.DefaultMessageListenerContainer, Simple will use org.springframework.jms.listener.SimpleMessageListenerContainer. When Custom is specified, the MessageListenerContainerFactory defined by the messageListenerContainerFactory option will determine what org.springframework.jms.listener.AbstractMessageListenerContainer to use.

Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring’s SimpleAsyncTaskExecutor) or ThreadPool (uses Spring’s ThreadPoolTaskExecutor with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.

Enables eager loading of JMS properties and payload as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties.

<tbody>
<tr>
<td>replyToType</td>
<td>Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive.</td>
<td></td>
<td>ReplyToType</td>
</tr>
<tr>
<td>requestTimeout</td>
<td>The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header CamelJmsRequestTimeout to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the requestTimeoutCheckerInterval option.</td>
<td>20000</td>
<td>long</td>
</tr>
<tr>
<td>timeToLive</td>
<td>When sending messages, specifies the time-to-live of the message (in milliseconds).</td>
<td>-1</td>
<td>long</td>
</tr>
<tr>
<td>allowAdditionalHeaders</td>
<td>This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>allowNullBody</td>
<td>Whether to allow sending messages with no body. If this option is false and the message body is null, then a JMSException is thrown.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>alwaysCopyMessage</td>
<td>If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set)</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>correlationProperty (producer)</td>
<td>When using InOut exchange pattern use this JMS property instead of JMSCorrelationID JMS property to correlate messages. If set messages will be correlated solely on the value of this property JMSCorrelationID property will be ignored and not set by Camel.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>disableTimeToLive (producer)</td>
<td>Use this option to force disabling time to live. For example when you do request/reply over JMS, then Camel will by default use the requestTimeout value as time to live on the message being sent. The problem is that the sender and receiver systems have to have their clocks synchronized, so they are in sync. This is not always so easy to archive. So you can use disableTimeToLive=true to not set a time to live value on the sent message. Then the message will not expire on the receiver system. See below in section About time to live for more details.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>forceSendOriginalMessage (producer)</td>
<td>When using mapJmsMessage=false Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>includeSentJMSMessageID (producer)</td>
<td>Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>replyToCacheLevelName (producer)</td>
<td>Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: CACHE_CONSUMER for exclusive or shared w/ replyToSelectorName. And CACHE_SESSION for shared without replyToSelectorName. Some JMS brokers such as IBM WebSphere may require to set the replyToCacheLevelName=CACHE_NONE to work. Note: If using temporary queues then CACHE_NONE is not allowed, and you must use a higher value such as CACHE_CONSUMER or CACHE_SESSION.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>replyToDestinationSelector Name (producer)</td>
<td>Sets the JMS Selector using the fixed name to be used so you can filter out your own replies from the others when using a shared queue (that is, if you are not using a temporary reply queue).</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------------</td>
</tr>
<tr>
<td>streamMessageTypeEnabled (producer)</td>
<td>Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>allowSerializedHeaders (advanced)</td>
<td>Controls whether or not to include serialized headers. Applies only when transferExchange is true. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>asyncStartListener (advanced)</td>
<td>Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>asyncStopListener (advanced)</td>
<td>Whether to stop the JmsConsumer message listener asynchronously, when stopping a route.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>destinationResolver (advanced)</td>
<td>A pluggable org.springframework.jms.support.destination.DestinationResolver that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry).</td>
<td></td>
<td>DestinationResolver</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>errorHandler (advanced)</td>
<td>Specifies a org.springframework.util.ErrorHandler to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using errorHandlerLoggingLevel and errorHandlerLogStackTrace options. This makes it much easier to configure, than having to code a custom errorHandler.</td>
<td></td>
<td>ErrorHandler</td>
</tr>
<tr>
<td>exceptionListener (advanced)</td>
<td>Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions.</td>
<td></td>
<td>ExceptionListener</td>
</tr>
<tr>
<td>headerFilterStrategy (advanced)</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>idleConsumerLimit (advanced)</td>
<td>Specify the limit for the number of consumers that are allowed to be idle at any given time.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>idleTaskExecutionLimit (advanced)</td>
<td>Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the maxConcurrentConsumers setting). There is additional doc available from Spring.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>includeAllJMSXProperties (advanced)</td>
<td>Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>jmsKeyFormatStrategy (advanced)</td>
<td>Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens ( . and - ). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the org.apache.camel.component.jms.JmsKeyFormatStrategy and refer to it using the notation.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>mapJmsMessage</td>
<td>Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a String etc.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>maxMessagesPerTask</td>
<td>The number of messages per task. <code>-1</code> is unlimited. If you use a range for concurrent consumers (eg <code>min max</code>), then this option can be used to set a value to eg <code>100</code> to control how fast the consumers will shrink when less work is required.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>messageConverter</td>
<td>To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code>.</td>
<td>MessageConverter</td>
<td></td>
</tr>
<tr>
<td>messageCreatedStrategy</td>
<td>To use the given <code>MessageCreatedStrategy</code> which are invoked when Camel creates new instances of <code>javax.jms.Message</code> objects when Camel is sending a JMS message.</td>
<td>MessageCreatedStrategy</td>
<td></td>
</tr>
<tr>
<td>messageIdEnabled</td>
<td>When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>messageListenerContainerFactory</td>
<td>Registry ID of the <code>MessageListenerContainerFactory</code> used to determine what <code>org.springframework.jms.listener.AbstractMessageListenerContainer</code> to use to consume messages. Setting this will automatically set <code>consumerType</code> to <code>Custom</code>.</td>
<td>MessageListenerContainerFactory</td>
<td></td>
</tr>
<tr>
<td>messageTimestampEnabled</td>
<td>Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>pubSubNoLocal</td>
<td>Specifies whether to inhibit the delivery of messages published by its own connection.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>receiveTimeout</td>
<td>The timeout for receiving messages (in milliseconds).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td>recoveryInterval (advanced)</td>
<td>Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds.</td>
<td>5000</td>
<td>long</td>
</tr>
<tr>
<td>requestTimeoutChecker Interval (advanced)</td>
<td>Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferException (advanced)</td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing – for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange (advanced)</td>
<td>You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>transferFault <em>(advanced)</em></td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on Message.isFault() will be send back in the response as a JMS header with the key org.apache.camel.component.jms.JmsConstantsJMS_TRANSFER_FAULT. If the client is Camel, the returned fault flag will be set on the link org.apache.camel.Messages.setFault(boolean). You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useMessageIDAsCorrelationID <em>(advanced)</em></td>
<td>Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>waitForProvisionCorrelationToBeUpdatedCounter <em>(advanced)</em></td>
<td>Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled.</td>
<td>50</td>
<td>int</td>
</tr>
<tr>
<td>waitForProvisionCorrelationToBeUpdatedThreadSleepingTime <em>(advanced)</em></td>
<td>Interval in millis to sleep each time while waiting for provisional correlation id to be updated.</td>
<td>100</td>
<td>long</td>
</tr>
<tr>
<td>errorHandlerLoggingLevel <em>(logging)</em></td>
<td>Allows to configure the default errorHandler logging level for logging uncaught exceptions.</td>
<td>WARN</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>errorHandlerLogStackTrace <em>(logging)</em></td>
<td>Allows to control whether stacktraces should be logged or not, by the default errorHandler.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>password <em>(security)</em></td>
<td>Password to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>username <em>(security)</em></td>
<td>Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>transacted <em>(transaction)</em></td>
<td>Specifies whether to use transacted mode</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### 5.3. USAGE

As AMQP component is inherited from JMS component, the usage of the former is almost identical to the latter:

**Using AMQP component**

```java
// Consuming from AMQP queue
from("amqp:queue:incoming").
to(...);

// Sending message to the AMQP topic
from(...).
to("amqp:topic:notify");
```

### 5.4. CONFIGURING AMQP COMPONENT

Starting from the Camel 2.16.1 you can also use the `AMQPComponent#amqp10Component(String connectionURI)` factory method to return the AMQP 1.0 component with the pre-configured topic prefix:

**Creating AMQP 1.0 component**

```java
AMQPComponent amqp = AMQPComponent.amqp10Component("amqp://guest:guest@localhost:5672");
```

Keep in mind that starting from the Camel 2.17 the `AMQPComponent#amqp10Component(String connectionURI)` factory method has been deprecated on the behalf of the `AMQPComponent#amqpComponent(String connectionURI)`:

**Creating AMQP 1.0 component**

```java
AMQPComponent amqp = AMQPComponent.amqpComponent("amqp://localhost:5672");
AMQPComponent authorizedAmqp = AMQPComponent.amqpComponent("amqp://localhost:5672",
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lazyCreateTransactionManager</code></td>
<td>If true, Camel will create a JmsTransactionManager, if there is no transactionManager injected when option transacted=true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>transactionManager</code></td>
<td>The Spring transaction manager to use.</td>
<td></td>
<td>PlatformTransactionManager</td>
</tr>
<tr>
<td><code>transactionName</code></td>
<td>The name of the transaction to use.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>transactionTimeout</code></td>
<td>The timeout value of the transaction (in seconds), if using transacted mode.</td>
<td>-1</td>
<td>int</td>
</tr>
</tbody>
</table>
Starting from Camel 2.17, in order to automatically configure the AMQP component, you can also add an instance of `org.apache.camel.component.amqp.AMQPConnectionDetails` to the registry. For example for Spring Boot you just have to define bean:

**AMQP connection details auto-configuration**

```java
@Bean
AMQPConnectionDetails amqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672");
}

@Bean
AMQPConnectionDetails securedAmqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672", "username", "password");
}
```

Likewise, you can also use CDI producer methods when using Camel-CDI

**AMQP connection details auto-configuration for CDI**

```java
@Produces
AMQPConnectionDetails amqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672");
}
```

You can also rely on the Camel properties to read the AMQP connection details. Factory method `AMQPConnectionDetails.discoverAMQP()` attempts to read Camel properties in a Kubernetes-like convention, just as demonstrated on the snippet below:

**AMQP connection details auto-configuration**

```properties
export AMQP_SERVICE_HOST = "mybroker.com"
export AMQP_SERVICE_PORT = "6666"
export AMQP_SERVICE_USERNAME = "username"
export AMQP_SERVICE_PASSWORD = "password"

... AMQP connection details auto-configuration

@Bean
AMQPConnectionDetails amqpConnection() {
    return AMQPConnectionDetails.discoverAMQP();
}
```

**Enabling AMQP specific options**

If you, for example, need to enable `amqp.traceFrames` you can do that by appending the option to your URI, like the following example:

```java
AMQPComponent amqp = AMQPComponent.amqpComponent("amqp://localhost:5672?
    amqp.traceFrames=true");
```

For reference take a look at the QPID JMS client configuration
5.5. USING TOPICS

To have using topics working with camel-amqp you need to configure the component to use **topic://** as topic prefix, as shown below:

```xml
<bean id="amqp" class="org.apache.camel.component.amqp.AmqpComponent">
    <property name="connectionFactory">
        <bean class="org.apache.qpid.jms.JmsConnectionFactory" factory-method="createFromURL">
            <property name="remoteURI" value="amqp://localhost:5672" />
            <property name="topicPrefix" value="topic://" /> <!-- only necessary when connecting to ActiveMQ over AMQP 1.0 -->
        </bean>
    </property>
</bean>
```

Keep in mind that both AMQPComponent#amqpComponent() methods and AMQPConnectionDetails pre-configure the component with the topic prefix, so you don’t have to configure it explicitly.

- Getting Started
CHAPTER 6. APNS COMPONENT

Available as of Camel version 2.8

The **apns** component is used for sending notifications to iOS devices. The apns components use javapns library.

The component supports sending notifications to Apple Push Notification Servers (APNS) and consuming feedback from the servers.

The consumer is configured with 3600 seconds for polling by default because it is a best practice to consume feedback stream from Apple Push Notification Servers only from time to time. For example: every 1 hour to avoid flooding the servers.

The feedback stream gives informations about inactive devices. You only need to get this informations every some hours if your mobile application is not a heavily used one.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-apns</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

6.1. URI FORMAT

To send notifications:

```
apns:notify[?options]
```

To consume feedback:

```
apns:consumer[?options]
```

6.2. OPTIONS

The APNS component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>apnsService</td>
<td>Required The ApnsService to use. The org.apache.camel.component.apns.factory.ApnsServiceFactory can be used to build a ApnsService</td>
<td></td>
<td>ApnsService</td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholder</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The APNS endpoint is configured using URI syntax:

```
apns:name
```

with the following path and query parameters:

### 6.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the endpoint</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 6.2.2. Query Parameters (20 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>tokens (common)</td>
<td>Configure this property in case you want to statically declare tokens related to devices you want to notify. Tokens are separated by comma.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>backoffIdleThreshold (scheduler)</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>backoffMultiplier (scheduler)</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>delay (scheduler)</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy (scheduler)</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay (scheduler)</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel (scheduler)</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService (scheduler)</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td></td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>scheduler</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumerScheduler</td>
</tr>
<tr>
<td>schedulerProperties</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>startScheduler</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLIES</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

You can append query options to the URI in the following format, `?option=value&option=value&…`

### 6.2.3. Component

The `ApnsComponent` must be configured with a `com.notnoop.apns.ApnsService`. The service can be created and configured using the `org.apache.camel.component.apns.factory.ApnsServiceFactory`. See further below for an example. And as well in the test source code.

#### 6.2.3.1. SSL Setting

In order to use secure connection, an instance of `org.apache.camel.util.jsse.SSLContextParameters` should be injected to `org.apache.camel.component.apns.factory.ApnsServiceFactory` which is used to configure the component. See the test resources for an example. [ssl example](#)

### 6.3. EXCHANGE DATA FORMAT

When Camel will fetch feedback data corresponding to inactive devices, it will retrieve a List of `InactiveDevice` objects. Each `InactiveDevice` object of the retrieved list will be setted as the In body, and then processed by the consumer endpoint.

### 6.4. MESSAGE HEADERS

Camel Apns uses these headers.
<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel Apns Tokens</td>
<td>Empty by default.</td>
<td>In case you choose PAYLOAD for the message type, then the message will be considered as an APNS payload and sent as is. In case you choose STRING, message will be converted as an APNS payload. From Camel 2.16 onwards APNS_NOTIFICATION is used for sending message body as com.notnoop.apns.ApnsNotification types.</td>
</tr>
<tr>
<td>Camel Apns MessageType</td>
<td>STRING, PAYLOAD, APNS_NOTIFICATION</td>
<td></td>
</tr>
</tbody>
</table>

### 6.5. APNSSERVICEFACTORY BUILDER CALLBACK

The `ApnsServiceFactory` comes with the empty callback method that could be used to configure (or even replace) the default `ApnsServiceBuilder` instance. The signature of the method could look as follows:

```java
protected ApnsServiceBuilder configureServiceBuilder(ApnsServiceBuilder serviceBuilder);
```

And could be used like as follows:

```java
ApnsServiceFactory proxiedApnsServiceFactory = new ApnsServiceFactory(){
    @Override
    protected ApnsServiceBuilder configureServiceBuilder(ApnsServiceBuilder serviceBuilder) {
        return serviceBuilder.withSocksProxy("my.proxy.com", 6666);
    }
};
```

### 6.6. SAMPLES

#### 6.6.1. Camel Xml route

```xml
<beans xmlns="http://www.springframework.org/schema/beans"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xmlns:camel="http://camel.apache.org/schema/spring"
      xsi:schemaLocation="http://www.springframework.org/schema/beans
                          http://www.springframework.org/schema/beans/spring-beans.xsd
  <!-- Replace by desired values -->
  <bean id="apnsServiceFactory" class="org.apache.camel.component.apns.factory.ApnsServiceFactory"/>
</beans>
```
6.6.2. Camel Java route

Create camel context and declare apns component programmatically

```java
protected CamelContext createCamelContext() throws Exception {
    CamelContext camelContext = super.createCamelContext();

    ApnsServiceFactory apnsServiceFactory = new ApnsServiceFactory();
apnsServiceFactory.setCertificatePath("classpath:/certificate.p12");
apnsServiceFactory.setCertificatePassword("MyCertPassword");
```

---

<!-- Optional configuration of feedback host and port -->
<!-- <property name="feedbackHost" value="localhost" /> -->
<!-- <property name="feedbackPort" value="7843" /> -->

<!-- Optional configuration of gateway host and port -->
<!-- <property name="gatewayHost" value="localhost" /> -->
<!-- <property name="gatewayPort" value="7654" /> -->

<!-- Declaration of certificate used -->
<!-- from Camel 2.11 onwards you can use prefix: classpath:, file: to refer to load the certificate from classpath or file. Default it classpath -->
@property name="certificatePath" value="certificate.p12" />
@property name="certificatePassword" value="MyCertPassword" />

<!-- Optional connection strategy - By Default: No need to configure -->
<!-- Possible options: NON_BLOCKING, QUEUE, POOL or Nothing -->
<!-- <property name="connectionStrategy" value="POOL" /> -->
<!-- Optional pool size -->
<!-- <property name="poolSize" value="15" /> -->

<!-- Optional connection strategy - By Default: No need to configure -->
<!-- Possible options: EVERY_HALF_HOUR, EVERY_NOTIFICATION or Nothing (Corresponds to NEVER javapns option) -->
<!-- <property name="reconnectionPolicy" value="EVERY_HALF_HOUR" /> -->

</bean>

<bean id="apnsService" factory-bean="apnsServiceFactory" factory-method="getApnsService" />

<!-- Replace this declaration by wanted configuration -->
<bean id="apns" class="org.apache.camel.component.apns.ApnsComponent">
    <property name="apnsService" ref="apnsService" />
</bean>

<camelContext id="camel-apns-test" xmlns="http://camel.apache.org/schema/spring">
    <route id="apns-test">
        <from uri="apns:consumer?initialDelay=10&delay=3600&timeUnit=SECONDS" />
        <to uri="log:org.apache.camel.component.apns?showAll=true&multiline=true" />
        <to uri="mock:result" />
    </route>
</camelContext>
```

---

Red Hat Fuse 7.2 Apache Camel Component Reference
ApnsService apnsService = apnsServiceFactory.getApnsService(camelContext);

ApnsComponent apnsComponent = new ApnsComponent(apnsService);
camelContext.addComponent("apns", apnsComponent);

return camelContext;
}

protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() throws Exception {
            from("direct:test").
                setHeader(ApnsConstants.HEADER_TOKENS, constant(IOS_DEVICE_TOKEN)).
                to("apns:notify");
        }
    };
}

ApnsProducer - iOS target device dynamically configured via header: "CamelApnsTokens"

protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() throws Exception {
            from("direct:test").
                to("apns:notify?tokens=" + IOS_DEVICE_TOKEN);
        }
    };
}

ApnsProducer - iOS target device statically configured via uri

ApnsConsumer

from("apns:consumer?initialDelay=10&delay=3600&timeUnit=SECONDS")
    .to("log:com.apache.camel.component.apns?showAll=true&multiline=true")
    .to("mock:result");

CHAPTER 7. ASN.1 FILE DATAFORMAT

Available as of Camel version 2.20

The ASN.1 Data Format Data Format [Introduction to ASN.1](https://www.itu.int/en/ITU-T/asn1/Pages/introduction.aspx) is a Camel Framework's data format implementation based on Bouncy Castle's bcprov-jdk15on library and jASN.1's java compiler for the formal notation used for describing data transmitted by telecommunications protocols, regardless of language implementation and physical representation of these data, whatever the application, whether complex or very simple. Messages can be unmarshalled (conversion to simple Java POJO(s)) to plain Java objects. By the help of Camel's routing engine and data transformations you can then play with POJO(s) and apply customised formatting and call other Camel Component's to convert and send messages to upstream systems.

7.1. ASN.1 DATA FORMAT OPTIONS

The ASN.1 File dataformat supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>usingIterator</td>
<td>false</td>
<td>Boolean</td>
<td>If the asn1 file has more then one entry, the setting this option to true, allows to work with the splitter EIP, to split the data using an iterator in a streaming mode.</td>
</tr>
<tr>
<td>clazzName</td>
<td></td>
<td>String</td>
<td>Name of class to use when unmarshalling</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.</td>
</tr>
</tbody>
</table>

7.2. UNMARSHAL

There are 3 different ways to unmarshal ASN.1 structured messages. (Usually binary files)

In this first example we unmarshal BER file payload to OutputStream and send it to mock endpoint.

```java
from("direct:unmarshal").unmarshal(asn1).to("mock:unmarshal");
```

In the second example we unmarshal BER file payload to byte array using Split EIP. The reason for applying Split EIP is that usually each BER file or (ASN.1 structured file) contains multiple records to process and Split EIP helps us to get each record in a file as byte arrays which is actually ASNIPrimitive’s instance (by the use of Bouncy Castle’s ASN.1 support in bcprov-jdk15on library) Byte arrays then may be converted to ASNIPrimitive by the help of public static method in (ASNIPrimitive.fromByteArray) In such example, note that you need to set usingIterator=true

```java
from("direct:unmarshal").unmarshal(asn1).split(body(Iterator.class)).streaming().to("mock:unmarshal");
```
In the last example we unmarshal BER file payload to plain old Java Objects using Split EIP. The reason for applying Split EIP is already mentioned in the previous example. Please note and keep in mind that reason. In such example we also need to set the fully qualified name of the class or `<YourObject>.class` reference through data format. The important thing to note here is that your object should have been generated by jasn1 compiler which is a nice tool to generate java object representations of your ASN.1 structure. For the reference usage of jasn1 compiler see [JASN.1 Project Page](https://www.openmuc.org/asn1/) and please also see how the compiler is invoked with the help of maven’s exec plugin. For example, in this data format’s unit tests an example ASN.1 structure (TestSMSBerCdr.asn1) is added in `src/test/resources/asn1_structure`. jasn1 compiler is invoked and java object’s representations are generated in `$ {basedir}/target/generated/src/test/java`. The nice thing about this example, you will get POJO instance at the mock endpoint or at whatever your endpoint is.

```java
from("direct:unmarshaldsl")
  .unmarshal()
  .asn1("org.apache.camel.dataformat.asn1.model.testsmsbercdr.SmsCdr")
  .split(body(Iterator.class)).streaming()
  .to("mock:unmarshaldsl");
```

### 7.3. DEPENDENCIES

To use ASN.1 data format in your camel routes you need to add a dependency on `camel-asn1` which implements this data format.

If you use Maven you can just add the following to your `pom.xml`, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-asn1</artifactId>
  <version>xx.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```
CHAPTER 8. ASTERISK COMPONENT

Available as of Camel version 2.18

The asterisk: component allows you to work easily with an Asterisk PBX Server using asterisk-java

This component helps to interface with Asterisk Manager Interface

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-asterisk</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

8.1. URI FORMAT

asterisk:name[?options]

8.2. OPTIONS

The Asterisk component has no options.

The Asterisk endpoint is configured using URI syntax:

asterisk:name

with the following path and query parameters:

8.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required Logical name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

8.2.2. Query Parameters (8 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Required The hostname of the asterisk server</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>password</td>
<td>Required Login password</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### 8.3. ACTION

Supported actions are:

- QUEUE_STATUS, Queue Status
- SIP_PEERS, List SIP Peers
- EXTENSION_STATE, Check Extension Status
CHAPTER 9. ATMOS COMPONENT

Available as of Camel version 2.15

Camel-Atmos is an Apache Camel component that allows you to work with ViPR object data services using the Atmos Client.

```
from("atmos:foo/get?remotePath=/path").to("mock:test");
```

9.1. OPTIONS

The Atmos component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>fullTokenId (security)</td>
<td>The token id to pass to the Atmos client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (security)</td>
<td>The secret key to pass to the Atmos client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>uri (advanced)</td>
<td>The URI of the server for the Atmos client to connect to</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sslValidation (security)</td>
<td>Whether the Atmos client should perform SSL validation</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Atmos endpoint is configured using URI syntax:

```
atmos:name/operation
```

with the following path and query parameters:

9.1.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Atmos name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>operation</td>
<td>Required Operation to perform</td>
<td></td>
<td>AtmosOperation</td>
</tr>
</tbody>
</table>
### 9.1.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>enableSslValidation</td>
<td>Atmos SSL validation</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>fullTokenId</td>
<td>Atmos client fullTokenId</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>localPath</td>
<td>Local path to put files</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>newRemotePath</td>
<td>New path on Atmos when moving files</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>query</td>
<td>Search query on Atmos</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>remotePath</td>
<td>Where to put files on Atmos</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Atmos shared secret</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>uri</td>
<td>Atomos server uri</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
9.2. DEPENDENCIES

To use Atmos in your camel routes you need to add the dependency on camel-atmos which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atmos</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

9.3. INTEGRATIONS

When you look at atmos integrations, there is one type of consumer, GetConsumer, which is a type of ScheduledPollConsumer.

- Get

Whereas there are 4 types of producers which are

- Get
- Del
- Move
- Put

9.4. EXAMPLES

These example are taken from tests:

```camel
from("atmos:foo/get?remotePath=/path").to("mock:test");
```

Here, this is a consumer example. remotePath represents the path from where the data will be read and passes the camel exchange to regarding producer Underneath, this component uses atmos client API for this and every other operations.

```camel
from("direct:start")
  .to("atmos://get?remotePath=/dummy/dummy.txt")
  .to("mock:result");
```

Here, this a producer sample. remotePath represents the path where the operations occur on ViPR object data service. In producers, operations(Get,Del, Move,Put) run on ViPR object data services and results are set on headers of camel exchange.

Regarding the operations, the following headers are set on camel exchange

```camel
DOWNLOADED_FILE, DOWNLOADED_FILES, UPLOADED_FILE, UPLOADED_FILES,
FOUND_FILES, DELETED_PATH, MOVED_PATH;
```

CHAPTER 10. ATMOSPHERE WEBSOCKET COMPONENT

Available as of Camel version 2.14

The atmosphere-websocket: component provides Websocket based endpoints for a servlet communicating with external clients over Websocket (as a servlet accepting websocket connections from external clients).

The component uses the SERVLET component and uses the Atmosphere library to support the Websocket transport in various Servlet containers (e.g., Jetty, Tomcat, ...).

Unlike the Websocket component that starts the embedded Jetty server, this component uses the servlet provider of the container.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atmosphere-websocket</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

10.1. ATMOSPHERE-WEBSOCKET OPTIONS

The Atmosphere Websocket component supports 8 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>servletName (common)</td>
<td>Default name of servlet to use. The default name is CamelServlet.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>httpRegistry (common)</td>
<td>To use a custom org.apache.camel.component.servlet.HttpRegistry.</td>
<td></td>
<td>HttpRegistry</td>
</tr>
<tr>
<td>attachmentMultipartBinding</td>
<td>Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options attachmentMultipartBinding=true and disableStreamCache=false cannot work together. Remove disableStreamCache to use AttachmentMultipartBinding. This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>httpBinding (advanced)</td>
<td>To use a custom HttpBinding to control the mapping between Camel message and HttpClient.</td>
<td></td>
<td>HttpBinding</td>
</tr>
<tr>
<td>httpConfiguration (advanced)</td>
<td>To use the shared HttpConfiguration as base configuration.</td>
<td></td>
<td>HttpConfiguration</td>
</tr>
</tbody>
</table>
allowJavaSerializedObject (advanced)

Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.

false  boolean

headerFilterStrategy (filter)

To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.

HeaderFilterStrategy

resolveProperty Placeholders (advanced)

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

true  boolean

The Atmosphere Websocket endpoint is configured using URI syntax:

atmosphere-websocket:servicePath

with the following path and query parameters:

10.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>servicePath</td>
<td>Required Name of websocket endpoint</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

10.1.2. Query Parameters (37 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>chunked</td>
<td>If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>disableStreamCache</td>
<td>Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>headerFilterStrategy</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>sendToAll</td>
<td>Whether to send to all (broadcast) or send to a single receiver.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferException</td>
<td>If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type. On the producer side the exception will be deserialized and thrown as is, instead of the HttpOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useStreaming</td>
<td>To enable streaming to send data as multiple text fragments.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>httpBinding</td>
<td>To use a custom HttpBinding to control the mapping between Camel message and HttpClient.</td>
<td></td>
<td>HttpBinding</td>
</tr>
<tr>
<td>async</td>
<td>Configure the consumer to work in async mode</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
--- | --- | --- | ---
**bridgeErrorHandler** (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pick up incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean

**httpMethodRestrict** (consumer) | Used to only allow consuming if the HttpMethod matches, such as GET/POST/PUT etc. Multiple methods can be specified separated by comma. | | String

**matchOnUriPrefix** (consumer) | Whether or not the consumer should try to find a target consumer by matching the URI prefix if no exact match is found. | false | boolean

**responseBufferSize** (consumer) | To use a custom buffer size on the javax.servlet.ServletResponse. | | Integer

**servletName** (consumer) | Name of the servlet to use | Camel Servlet | String

**attachmentMultipartBinding** (consumer) | Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options attachmentMultipartBinding=true and disableStreamCache=false cannot work together. Remove disableStreamCache to use AttachmentMultipartBinding. This is turn off by default as this may require servlet specific configuration to enable this when using Servlet’s. | false | boolean

**eagerCheckContentAvailable** (consumer) | Whether to eager check whether the HTTP requests has content if the content-length header is 0 or not present. This can be turned on in case HTTP clients do not send streamed data. | false | boolean

**exceptionHandler** (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler

**exchangePattern** (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>optionsEnabled</td>
<td>Specifies whether to enable HTTP OPTIONS for this Servlet consumer. By default OPTIONS is turned off.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>traceEnabled</td>
<td>Specifies whether to enable HTTP TRACE for this Servlet consumer. By default TRACE is turned off.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeEndpoint</td>
<td>If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint’s URI for request. You may also set the option throwExceptionOnFailure to be false to let the HttpProducer send all the fault response back.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>connectionClose</td>
<td>Specifies whether a Connection Close header must be added to HTTP Request. By default connectionClose is false.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>copyHeaders</td>
<td>If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>httpMethod</td>
<td>Configure the HTTP method to use. The HttpMethod header cannot override this option if set.</td>
<td></td>
<td>HttpMethod</td>
</tr>
<tr>
<td>ignoreResponseBody</td>
<td>If this option is true, The http producer won’t read response body and cache the input stream</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>preserveHostHeader</td>
<td>If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL’s for a proxied service</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>throwExceptionOnFailure</td>
<td>Option to disable throwing the HttpOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>cookieHandler</td>
<td>Configure a cookie handler to maintain a HTTP session</td>
<td></td>
<td>CookieHandler</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>okStatusCodeRange (producer)</td>
<td>The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.</td>
<td>200-299</td>
<td>String</td>
</tr>
<tr>
<td>urlRewrite (producer)</td>
<td><strong>Deprecated</strong> Refers to a custom org.apache.camel.component.http.UrlRewrite which allows you to rewrite urls when you bridge/proxy endpoints. See more details at <a href="http://camel.apache.org/urlrewrite.html">http://camel.apache.org/urlrewrite.html</a></td>
<td>NULL</td>
<td>UrlRewrite</td>
</tr>
<tr>
<td>mapHttpMessageBody (advanced)</td>
<td>If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>mapHttpMessageFormUrlEncodedBody (advanced)</td>
<td>If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>mapHttpMessageHeaders (advanced)</td>
<td>If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>proxyAuthScheme (proxy)</td>
<td>Proxy authentication scheme to use</td>
<td>NULL</td>
<td>String</td>
</tr>
<tr>
<td>proxyHost (proxy)</td>
<td>Proxy hostname to use</td>
<td>NULL</td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (proxy)</td>
<td>Proxy port to use</td>
<td>NULL</td>
<td>int</td>
</tr>
<tr>
<td>authHost (security)</td>
<td>Authentication host to use with NTML</td>
<td>NULL</td>
<td>String</td>
</tr>
</tbody>
</table>

**10.2. URI FORMAT**

atmosphere-websocket://relative path[?options]
10.3. READING AND WRITING DATA OVER WEBSOCKET

An atmosphere-websocket endpoint can either write data to the socket or read from the socket, depending on whether the endpoint is configured as the producer or the consumer, respectively.

10.4. CONFIGURING URI TO READ OR WRITE DATA

In the route below, Camel will read from the specified websocket connection.

```java
from("atmosphere-websocket:///servicepath")
.to("direct:next");
```

And the equivalent Spring sample:

```xml
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="atmosphere-websocket:///servicepath"/>
    <to uri="direct:next"/>
  </route>
</camelContext>
```

In the route below, Camel will read from the specified websocket connection.

```java
from("direct:next")
.to("atmosphere-websocket:///servicepath");
```

And the equivalent Spring sample:

```xml
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:next"/>
    <to uri="atmosphere-websocket:///servicepath"/>
  </route>
</camelContext>
```

CHAPTER 11. ATOM COMPONENT

Available as of Camel version 1.2

The atom: component is used for polling Atom feeds.

Camel will poll the feed every 60 seconds by default.
Note: The component currently only supports polling (consuming) feeds.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atom</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

11.1. URI FORMAT

atom://atomUri[?options]

Where atomUri is the URI to the Atom feed to poll.

11.2. OPTIONS

The Atom component has no options.

The Atom endpoint is configured using URI syntax:

atom:feedUri

with the following path and query parameters:

11.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedUri</td>
<td>Required The URI to the feed to poll.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

11.2.2. Query Parameters (27 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>feedHeader</td>
<td>Sets whether to add the feed object as a header</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>filter</td>
<td>Sets whether to use filtering or not of the entries.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>lastUpdate</td>
<td>Sets the timestamp to be used for filtering entries from the atom feeds. This options is only in conjunction with the splitEntries.</td>
<td></td>
<td>Date</td>
</tr>
<tr>
<td>password</td>
<td>Sets the password to be used for basic authentication when polling from a HTTP feed</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sendEmtpyMessageWhenIdle</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sortEntries</td>
<td>Sets whether to sort entries by published date. Only works when splitEntries = true.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>splitEntries</td>
<td>Sets whether or not entries should be sent individually or whether the entire feed should be sent as a single message</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>throttleEntries</td>
<td>Sets whether all entries identified in a single feed poll should be delivered immediately. If true, only one entry is processed per consumer.delay. Only applicable when splitEntries = true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>username</td>
<td>Sets the username to be used for basic authentication when polling from a HTTP feed</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffIdleThreshold (scheduler)</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffMultiplier (scheduler)</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>delay (scheduler)</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy (scheduler)</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay (scheduler)</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel (scheduler)</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
</tbody>
</table>
### 11.3. EXCHANGE DATA FORMAT

Camel will set the In body on the returned Exchange with the entries. Depending on the `splitEntries` flag Camel will either return one Entry or a List<Entry>.

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>splitEntries</td>
<td>true</td>
<td>Only a single entry from the currently being processed feed is set: exchange.in.body(Entry)</td>
</tr>
<tr>
<td>splitEntries</td>
<td>false</td>
<td>The entire list of entries from the feed is set: exchange.in.body(List&lt;Entry&gt;)</td>
</tr>
</tbody>
</table>

Camel can set the Feed object on the In header (see `feedHeader` option to disable this):

### 11.4. MESSAGE HEADERS

Camel atom uses these headers.
### 11.5. SAMPLES

In this sample we poll James Strachan’s blog.

```
```

In this sample we want to filter only good blogs we like to a SEDA queue. The sample also shows how to setup Camel standalone, not running in any Container or using Spring.

CHAPTER 12. ATOMIX MAP COMPONENT

Available as of Camel version 2.20

The camel atomix-map component allows you to work with Atomix’s Distributed Map collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-atomix</artifactId>
    <version>${camel-version}</version>
</dependency>
```

12.1. URI FORMAT

atomix-map:mapName

12.2. OPTIONS

The Atomix Map component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (common)</td>
<td>The shared component configuration</td>
<td></td>
<td>AtomixMapConfiguration</td>
</tr>
<tr>
<td>atomix (common)</td>
<td>The shared AtomixClient instance</td>
<td></td>
<td>AtomixClient</td>
</tr>
<tr>
<td>nodes (common)</td>
<td>The nodes the AtomixClient should connect to</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>configurationUri (common)</td>
<td>The path to the AtomixClient configuration</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Atomix Map endpoint is configured using URI syntax:

atomix-map:resourceName

with the following path and query parameters:

12.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceName</td>
<td><strong>Required</strong> The distributed resource name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 12.2.2. Query Parameters (18 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomix (common)</td>
<td>The Atomix instance to use</td>
<td></td>
<td>Atomix</td>
</tr>
<tr>
<td>configurationUri (common)</td>
<td>The Atomix configuration uri.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>defaultAction (common)</td>
<td>The default action.</td>
<td>PUT</td>
<td>Action</td>
</tr>
<tr>
<td>key (common)</td>
<td>The key to use if none is set in the header or to listen for events for a specific key.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>nodes (common)</td>
<td>The address of the nodes composing the cluster.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resultHeader (common)</td>
<td>The header that will carry the result.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>transport (common)</td>
<td>Sets the Atomix transport.</td>
<td></td>
<td>io.atomix.catalyst.transport.netty.NettyTransport</td>
</tr>
<tr>
<td>ttl (common)</td>
<td>The resource ttl.</td>
<td></td>
<td>long</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### exceptionHandler (consumer)

To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.

- **Default**: ExceptionHandler

### exchangePattern (consumer)

Sets the exchange pattern when the consumer creates an exchange.

- **Default**: ExchangePattern

### defaultResourceConfig (advanced)

The cluster wide default resource configuration.

- **Default**: Properties

### defaultResourceOptions (advanced)

The local default resource options.

- **Default**: Properties

### ephemeral (advanced)

Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.

- **Default**: false
- **Type**: boolean

### readConsistency (advanced)

The read consistency level.

- **Default**: ReadConsistency

### resourceConfigs (advanced)

Cluster wide resources configuration.

- **Default**: Map

### resourceOptions (advanced)

Local resources configurations

- **Default**: Map

### synchronous (advanced)

Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

- **Default**: false
- **Type**: boolean

## 12.3. HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type</td>
<td>Values</td>
<td>Description</td>
</tr>
<tr>
<td>12.3. HEADERS</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Name | Type | Values | Description
---|---|---|---
**Camel Atomix ResourceAction** | Atomix Map.Action | ● PUT  
● PUT_IF_ABSENT  
● GET  
● CLEAR  
● SIZE  
● CONTAINS_KEY  
● CONTAINS_VALUE  
● IS_EMPTY  
● ENTRY_SET  
● REMOVE  
● REPLACE  
● VALUES | The action to perform

**Camel Atomix ResourceKey** | Object | - | The key to operate on

**Camel Atomix ResourceValue** | Object | - | The value, if missing In Body is used

**Camel Atomix ResourceOldValue** | Object | - | The old value

**Camel Atomix ResourceTTL** | String/long | - | The entry TTL
12.4. CONFIGURING THE COMPONENT TO CONNECT TO AN ATOMIX CLUSTER

The nodes of the Atomix cluster you want to join can be set at Endpoint or component level (recommended), below some examples:

- **Endpoint:**

  ```xml
  <beans xmlns="...">
    <camelContext xmlns="http://camel.apache.org/schema/spring">
      <from uri="direct:start"/>
      <to uri="atomix-map:myMap?nodes=node-1.atomix.cluster:8700,node-2.atomix.cluster:8700"/>
    </route>
    </camelContext>
  </beans>
  
  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <from uri="direct:start"/>
    <to uri="atomix-map:myMap"/>
    </route>
    </camelContext>
  </beans>
  
- **Component:**

  ```xml
  <beans xmlns="...">
    <bean id="atomix-map" class="org.apache.camel.component.atomix.client.map.AtomixMapComponent">
      <property name="nodes" value="nodes=node-1.atomix.cluster:8700,node-2.atomix.cluster:8700"/>
    </bean>
    
    <camelContext xmlns="http://camel.apache.org/schema/spring">
      <from uri="direct:start"/>
      <to uri="atomix-map:myMap"/>
    </route>
    </camelContext>
  </beans>
  
12.5. USAGE EXAMPLES:

- PUT an element with TTL of 1 second:

  ```java
  FluentProducerTemplate.on(context)
    .withHeader(AtomixClientConstants.RESOURCE_ACTION, AtomixMap.Action.PUT)
    .withHeader(AtomixClientConstants.RESOURCE_KEY, key)
  ```
.withHeader(AtomixClientConstants.RESOURCE_TTL, "1s")
.withBody(val)
.to("direct:start")
.send();
CHAPTER 13. ATOMIX MESSAGING COMPONENT

Available as of Camel version 2.20

The camel atomix-messaging component allows you to work with Atomix’s Group Messaging.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

13.1. URI FORMAT

atomix-messaging:group

The Atomix Messaging component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The shared component configuration</td>
<td></td>
<td>AtomixMessaging Configuration</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>atomix</td>
<td>The shared AtomixClient instance</td>
<td></td>
<td>AtomixClient</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>nodes</td>
<td>The nodes the AtomixClient should connect to</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>configurationUri</td>
<td>The path to the AtomixClient configuration</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>placeholders on itself when starting. Only</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>properties which are of String type can use</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>property placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Atomix Messaging endpoint is configured using URI syntax:

atomix-messaging:resourceName

with the following path and query parameters:

13.1.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceName</td>
<td>Required The distributed resource name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 13.1.2. Query Parameters (19 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomix (common)</td>
<td>The Atomix instance to use</td>
<td></td>
<td>Atomix</td>
</tr>
<tr>
<td>broadcastType</td>
<td>The broadcast type.</td>
<td>ALL</td>
<td>BroadcastType</td>
</tr>
<tr>
<td>channelName</td>
<td>The messaging channel name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>configurationUri</td>
<td>The Atomix configuration uri.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>defaultAction</td>
<td>The default action.</td>
<td>DIRECT</td>
<td>Action</td>
</tr>
<tr>
<td>memberName</td>
<td>The Atomix Group member name.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>nodes</td>
<td>The address of the nodes composing the cluster.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resultHeader</td>
<td>The header that will carry the result.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>transport</td>
<td>Sets the Atomix transport.</td>
<td>io.atomix.catalyst.transport.netty.NettyTransport</td>
<td>Transport</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------------------</td>
</tr>
<tr>
<td><code>exceptionHandler</code></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><code>exchangePattern</code></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>defaultResourceConfig</code></td>
<td>The cluster wide default resource configuration.</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td><code>defaultResourceOptions</code></td>
<td>The local default resource options.</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td><code>ephemeral</code></td>
<td>Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.</td>

<td>Map</td>
</tr>
<tr>
<td><code>synchronous</code></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
CHAPTER 14. ATOMIX MULTIMAP COMPONENT

Available as of Camel version 2.20

The camel atomix-multimap component allows you to work with Atomix’s Distributed MultiMap collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

14.1. URI FORMAT

atomix-multimap:multiMapName

The Atomix MultiMap component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (consumer)</td>
<td>The shared component configuration</td>
<td></td>
<td>AtomixMultiMap Configuration</td>
</tr>
<tr>
<td>atomix (consumer)</td>
<td>The shared AtomixClient instance</td>
<td></td>
<td>AtomixClient</td>
</tr>
<tr>
<td>nodes (consumer)</td>
<td>The nodes the AtomixClient should connect to</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>configurationUri (consumer)</td>
<td>The path to the AtomixClient configuration</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Atomix MultiMap endpoint is configured using URI syntax:

atomix-multimap:resourceName

with the following path and query parameters:

14.1.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceName</td>
<td><strong>Required</strong> The distributed resource name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 14.1.2. Query Parameters (18 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomix (consumer)</td>
<td>The Atomix instance to use</td>
<td></td>
<td>Atomix</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>configurationUri (consumer)</td>
<td>The Atomix configuration uri.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>defaultAction (consumer)</td>
<td>The default action.</td>
<td>PUT</td>
<td>Action</td>
</tr>
<tr>
<td>key (consumer)</td>
<td>The key to use if none is set in the header or to listen for events for a specific key.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>nodes (consumer)</td>
<td>The address of the nodes composing the cluster.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resultHeader (consumer)</td>
<td>The header that wil carry the result.</td>
<td></td>
<td>String</td>
</tr>
<tr>

CHAPTER 15. ATOMIX QUEUE COMPONENT

Available as of Camel version 2.20

The camel atomix-queue component allows you to work with Atomix’s Distributed Queue collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-atomix</artifactId>
    <version>${camel-version}</version>
</dependency>
```

15.1. URI FORMAT

atomix-queue:queueName

The Atomix Queue component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The shared component configuration</td>
<td>AtomixQueueConfiguration</td>
<td></td>
</tr>
<tr>
<td>atomix</td>
<td>The shared AtomixClient instance</td>
<td>AtomixClient</td>
<td></td>
</tr>
<tr>
<td>nodes</td>
<td>The nodes the AtomixClient should connect to</td>
<td>List</td>
<td></td>
</tr>
<tr>
<td>configurationUri</td>
<td>The path to the AtomixClient configuration</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Atomix Queue endpoint is configured using URI syntax:

atomix-queue:resourceName

with the following path and query parameters:

15.1.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceName</td>
<td>Required The distributed resource name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

15.1.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomix (common)</td>
<td>The Atomix instance to use</td>
<td></td>
<td>Atomix</td>
</tr>
<tr>
<td>configurationUri (common)</td>
<td>The Atomix configuration uri.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>defaultAction (common)</td>
<td>The default action.</td>
<td>ADD</td>
<td>Action</td>
</tr>
<tr>
<td>nodes (common)</td>

</tbody>
</table>
CHAPTER 16. ATOMIX SET COMPONENT

Available as of Camel version 2.20

The camel atomix-set component allows you to work with Atomix’s Distributed Set collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-atomix</artifactId>
    <version>${camel-version}</version>
</dependency>
```

### 16.1. URI FORMAT

(atomix-set:setName)

The Atomix Set component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (common)</td>
<td>The shared component configuration</td>
<td></td>
<td>AtomixSetConfig</td>
</tr>
<tr>
<td>atomix (common)</td>
<td>The shared AtomixClient instance</td>
<td></td>
<td>AtomixClient</td>
</tr>
<tr>
<td>nodes (common)</td>
<td>The nodes the AtomixClient should connect to</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>configurationUri (common)</td>
<td>The path to the AtomixClient configuration</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Atomix Set endpoint is configured using URI syntax:

(atomix-set:resourceName)

with the following path and query parameters:

#### 16.1.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceName</td>
<td>Required The distributed resource name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 16.1.2. Query Parameters (17 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomix (common)</td>
<td>The Atomix instance to use</td>
<td></td>
<td>Atomix</td>
</tr>
<tr>
<td>configurationUri</td>
<td>The Atomix configuration uri.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>defaultAction</td>
<td>The default action.</td>
<td>ADD</td>
<td>Action</td>
</tr>
<tr>
<td>nodes (common)</td>
<td>The address of the nodes composing the cluster.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resultHeader</td>
<td>The header that will carry the result.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>transport (common)</td>
<td>Sets the Atomix transport.</td>
<td>io.atomix.catalyst.transport.netty.NettyTransport</td>
<td>Transport</td>
</tr>
<tr>
<td>ttl (common)</td>
<td>The resource ttl.</td>
<td></td>
<td>long</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>defaultResourceConfig</td>
<td>The cluster wide default resource configuration.</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td>defaultResourceOptions</td>
<td>The local default resource options.</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td>ephemeral</td>
<td>Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>

<td>Local resources configurations</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
CHAPTER 17. ATOMIX VALUE COMPONENT

Available as of Camel version 2.20

The camel atomix-value component allows you to work with Atomix’s Distributed Value.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

17.1. URI FORMAT

atomix-value:valueName

The Atomix Value component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The shared component configuration</td>
<td>AtomixValue Configuration</td>
<td></td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>atomix</td>
<td>The shared AtomixClient instance</td>
<td>AtomixClient</td>
<td></td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>nodes</td>
<td>The nodes the AtomixClient should connect to</td>
<td>List</td>
<td></td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>configurationUri</td>
<td>The path to the AtomixClient configuration</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>placeholders on itself when starting. Only properties</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Atomix Value endpoint is configured using URI syntax:

atomix-value:resourceName

with the following path and query parameters:

17.1.1. Path Parameters (1 parameters):
### Resource Table

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceName</td>
<td>Required The distributed resource name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 17.1.2. Query Parameters (17 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomix (common)</td>
<td>The Atomix instance to use</td>

<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
CHAPTER 18. AVRO COMPONENT

Available as of Camel version 2.10

This component provides a dataformat for avro, which allows serialization and deserialization of messages using Apache Avro’s binary dataformat. Moreover, it provides support for Apache Avro’s rpc, by providing producers and consumers endpoint for using avro over netty or http.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-avro</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

18.1. APACHE AVRO OVERVIEW

Avro allows you to define message types and a protocol using a json like format and then generate java code for the specified types and messages. An example of how a schema looks like is below.

```json
{"namespace": "org.apache.camel.avro.generated",
 "protocol": "KeyValueProtocol",

 "types": [
  {"name": "Key", "type": "record",
   "fields": [
    {"name": "key", "type": "string"}
   ]
  },
  {"name": "Value", "type": "record",
   "fields": [
    {"name": "value", "type": "string"}
   ]
  }
 ],

 "messages": {
  "put": {
   "request": [{"name": "key", "type": "Key"}, {"name": "value", "type": "Value"} ],
   "response": "null"
  },
  "get": {
   "request": [{"name": "key", "type": "Key"}],
   "response": "Value"
  }
 }
```

You can easily generate classes from a schema, using maven, ant etc. More details can be found at the Apache Avro documentation.

However, it doesn’t enforce a schema first approach and you can create schema for your existing
classes. Since 2.12 you can use existing protocol interfaces to make RCP calls. You should use interface for the protocol itself and POJO beans or primitive/String classes for parameter and result types. Here is an example of the class that corresponds to schema above:

```java
package org.apache.camel.avro.reflection;

public interface KeyValueProtocol {
    void put(String key, Value value);
    Value get(String key);
}

class Value {
    private String value;
    public String getValue() { return value; }
    public void setValue(String value) { this.value = value; }
}
```

Note: Existing classes can be used only for RPC (see below), not in data format.

18.2. USING THE AVRO DATA FORMAT

Using the avro data format is as easy as specifying that the class that you want to marshal or unmarshal in your route.

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
    <route>
        <from uri="direct:in"/>
        <marshal>
            <avro instanceClass="org.apache.camel.dataformat.avro.Message"/>
        </marshal>
        <to uri="log:out"/>
    </route>
</camelContext>
```

An alternative can be to specify the dataformat inside the context and reference it from your route.

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
    <dataFormats>
        <avro id="avro" instanceClass="org.apache.camel.dataformat.avro.Message"/>
    </dataFormats>
    <route>
        <from uri="direct:in"/>
        <marshal ref="avro"/>
        <to uri="log:out"/>
    </route>
</camelContext>
```

In the same manner you can unmarshal using the avro data format.

18.3. USING AVRO RPC IN CAMEL

As mentioned above Avro also provides RPC support over multiple transports such as http and netty. Camel provides consumers and producers for these two transports.
The supported transport values are currently http or netty.

**Since 2.12** you can specify message name right in the URI:

```
avro:[transport]:[host]:[port][/messageName][?options]
```

For consumers this allows you to have multiple routes attached to the same socket. Dispatching to correct route will be done by the avro component automatically. Route with no messageName specified (if any) will be used as default.

When using camel producers for avro ipc, the "in" message body needs to contain the parameters of the operation specified in the avro protocol. The response will be added in the body of the "out" message.

In a similar manner when using camel avro consumers for avro ipc, the requests parameters will be placed inside the "in" message body of the created exchange and once the exchange is processed the body of the "out" message will be send as a response.

**Note:** By default consumer parameters are wrapped into array. If you've got only one parameter, **since 2.12** you can use `singleParameter` URI option to receive it directly in the "in" message body without array wrapping.

### 18.4. AVRO RPC URI OPTIONS

The Avro component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>To use a shared AvroConfiguration to configure options once</td>
<td></td>
<td>AvroConfiguration</td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Avro endpoint is configured using URI syntax:

```
avro:transport:host:port/messageName
```

with the following path and query parameters:

### 18.4.1. Path Parameters (4 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>transport</td>
<td>Required Transport to use</td>
<td></td>
<td>AvroTransport</td>
</tr>
</tbody>
</table>
### 18.4.2. Query Parameters (10 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol (common)</td>
<td>Avro protocol to use</td>
<td></td>
<td>Protocol</td>
</tr>
<tr>
<td>protocolClassName (common)</td>
<td>Avro protocol to use defined by the FQN class name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>protocolLocation (common)</td>
<td>Avro protocol location</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>reflectionProtocol (common)</td>
<td>If protocol object provided is reflection protocol. Should be used only with protocol parameter because for protocolClassName protocol type will be auto detected</td>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td>singleParameter (common)</td>
<td>If true, consumer parameter won’t be wrapped into array. Will fail if protocol specifies more then 1 parameter for the message</td>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td>uriAuthority (common)</td>
<td>Authority to use (username and password)</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>boolean</td>
</tr>
</tbody>
</table>
### 18.5. AVRO RPC HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAvroMessageName</td>
<td>The name of the message to send. In consumer overrides message name from URI (if any)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 18.6. EXAMPLES

An example of using camel avro producers via http:

```xml
<route>
    <from uri="direct:start"/>
    <to uri="avro:http:localhost:{{avroport}}?protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
    <to uri="log:avro"/>
</route>
```

In the example above you need to fill **CamelAvroMessageName** header. Since 2.12 you can use following syntax to call constant messages:

```xml
<route>
    <from uri="direct:start"/>
    <to uri="log:avro"/>
</route>
```

An example of consuming messages using camel avro consumers via netty:

```xml
<route>
    <from uri="avro:netty:localhost:{{avroport}}?protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
    <choice>
```

---

Name | Description                                                                 | Default | Type         |
--- | --- | --- | --- |
**exceptionHandler** (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
**exchangePattern** (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
**synchronous** (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
Since 2.12 you can set up two distinct routes to perform the same task:

```
<route>
  <from uri="avro:netty:localhost:{avroport}/put?
  protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol">
    <process ref="putProcessor"/>
  </from>
</route>

<route>
  <from uri="avro:netty:localhost:{avroport}/get?
  protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol&singleParameter=true">
    <process ref="getProcessor"/>
  </from>
</route>
```

In the example above, get takes only one parameter, so `singleParameter` is used and `getProcessor` will receive Value class directly in body, while `putProcessor` will receive an array of size 2 with String key and Value value filled as array contents.
CHAPTER 19. AVRO DATAFORMAT

CHAPTER 19. AVRO DATAFORMAT
Available as of Camel version 2.14
This component provides a dataformat for avro, which allows serialization and deserialization of
messages using Apache Avro’s binary dataformat. Moreover, it provides support for Apache Avro’s rpc,
by providing producers and consumers endpoint for using avro over netty or http.
Maven users will need to add the following dependency to their pom.xml for this component:
<dependency>
<groupId>org.apache.camel</groupId>
<artifactId>camel-avro</artifactId>
<version>x.x.x</version>
<!-- use the same version as your Camel core version -->
</dependency>

19.1. APACHE AVRO OVERVIEW
Avro allows you to define message types and a protocol using a json like format and then generate java
code for the specified types and messages. An example of how a schema looks like is below.
{"namespace": "org.apache.camel.avro.generated",
"protocol": "KeyValueProtocol",
"types": [
{"name": "Key", "type": "record",
"fields": [
{"name": "key", "type": "string"}
]
},
{"name": "Value", "type": "record",
"fields": [
{"name": "value", "type": "string"}
]
}
],
"messages": {
"put": {
"request": [{"name": "key", "type": "Key"}, {"name": "value", "type": "Value"} ],
"response": "null"
},
"get": {
"request": [{"name": "key", "type": "Key"}],
"response": "Value"
}
}
}
You can easily generate classes from a schema, using maven, ant etc. More details can be found at the
Apache Avro documentation.
However, it doesn’t enforce a schema first approach and you can create schema for your existing

201


classes. Since 2.12 you can use existing protocol interfaces to make RCP calls. You should use interface for the protocol itself and POJO beans or primitive/String classes for parameter and result types. Here is an example of the class that corresponds to schema above:

```java
package org.apache.camel.avro.reflection;

public interface KeyValueProtocol {
    void put(String key, Value value);
    Value get(String key);
}

class Value {
    private String value;
    public String getValue() { return value; }
    public void setValue(String value) { this.value = value; }
}
```

Note: Existing classes can be used only for RPC (see below), not in data format.

### 19.2. USING THE AVRO DATA FORMAT

Using the avro data format is as easy as specifying that the class that you want to marshal or unmarshal in your route.

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
    <route>
        <from uri="direct:in"/>
        <marshal>
            <avro instanceClass="org.apache.camel.dataformat.avro.Message"/>
        </marshal>
        <to uri="log:out"/>
    </route>
</camelContext>
```

An alternative can be to specify the dataformat inside the context and reference it from your route.

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
    <dataFormats>
        <avro id="avro" instanceClass="org.apache.camel.dataformat.avro.Message"/>
    </dataFormats>
    <route>
        <from uri="direct:in"/>
        <marshal ref="avro"/>
        <to uri="log:out"/>
    </route>
</camelContext>
```

In the same manner you can unmarshal using the avro data format.

### 19.3. AVRO DATAFORMAT OPTIONS

The Avro dataformat supports 2 options which are listed below.
<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceClassName</td>
<td></td>
<td>String</td>
<td>Class name to use for marshal and unmarshalling</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>
CHAPTER 20. AWS CLOUDWATCH COMPONENT

Available as of Camel version 2.11

The CW component allows messages to be sent to an Amazon CloudWatch metrics. The implementation of the Amazon API is provided by the AWS SDK.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon CloudWatch. More information are available at Amazon CloudWatch.

20.1. URI FORMAT

```
aws-cw://namespace[?options]
```

The metrics will be created if they don’t already exists. You can append query options to the URI in the following format, `?options=value&option2=value&...

20.2. URI OPTIONS

The AWS CloudWatch component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS CW default configuration</td>
<td></td>
<td>CwConfiguration</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(producer)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(producer)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>region</td>
<td>The region in which CW client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(producer)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>

<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td>placeholders.</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS CloudWatch endpoint is configured using URI syntax:

```
aws-cw:namespace
```

with the following path and query parameters:

20.2.1. Path Parameters (1 parameters):
20.2.2. Query Parameters (11 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Required The metric namespace</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>amazonCwClient</td>
<td>To use the AmazonCloudWatch as the client</td>
<td></td>
<td>AmazonCloudWatch</td>
</tr>
<tr>
<td>name</td>
<td>The metric name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyHost</td>
<td>To define a proxy host when instantiating the CW client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>To define a proxy port when instantiating the CW client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region</td>
<td>The region in which CW client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>timestamp</td>
<td>The metric timestamp</td>
<td></td>
<td>Date</td>
</tr>
<tr>
<td>unit</td>
<td>The metric unit</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>value</td>
<td>The metric value</td>
<td></td>
<td>Double</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

Required CW component options

You have to provide the amazonCwClient in the Registry or your accessKey and secretKey to access the Amazon’s CloudWatch.

20.3. USAGE
## 20.3.1. Message headers evaluated by the CW producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsCWMetricName</td>
<td>String</td>
<td>The Amazon CW metric name.</td>
</tr>
<tr>
<td>Camel AwsCWMetricValue</td>
<td>Double</td>
<td>The Amazon CW metric value.</td>
</tr>
<tr>
<td>Camel AwsCWMetricUnit</td>
<td>String</td>
<td>The Amazon CW metric unit.</td>
</tr>
<tr>
<td>Camel AwsCWMetricNamespace</td>
<td>String</td>
<td>The Amazon CW metric namespace.</td>
</tr>
<tr>
<td>Camel AwsCWMetricTimestamp</td>
<td>Date</td>
<td>The Amazon CW metric timestamp.</td>
</tr>
<tr>
<td>Camel AwsCWMetricDimensionName</td>
<td>String</td>
<td>Camel 2.12: The Amazon CW metric dimension name.</td>
</tr>
<tr>
<td>Camel AwsCWMetricDimensionValue</td>
<td>String</td>
<td>Camel 2.12: The Amazon CW metric dimension value.</td>
</tr>
</tbody>
</table>
### 20.3.2. Advanced AmazonCloudWatch configuration

If you need more control over the `AmazonCloudWatch` instance configuration you can create your own instance and refer to it from the URI:

```java
from("direct:start")
  .to("aws-cw://namespace?amazonCwClient=#client");
```

The `#client` refers to a `AmazonCloudWatch` in the Registry.

For example if your Camel Application is running behind a firewall:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonCloudWatch client = new AmazonCloudWatchClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

### 20.4. DEPENDENCIES

Maven users will need to add the following dependency to their `pom.xml`.

`pom.xml`

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.10 or higher).

CHAPTER 21. AWS DYNAMODB COMPONENT

Available as of Camel version 2.10

The DynamoDB component supports storing and retrieving data from/to Amazon's DynamoDB service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon DynamoDB. More information are available at Amazon DynamoDB.

21.1. URI FORMAT

```
aws-ddb://domainName[?options]
```

You can append query options to the URI in the following format, `?options=value&option2=value&...`

21.2. URI OPTIONS

The AWS DynamoDB component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>The AWS DDB default configuration</td>
<td></td>
<td>DdbConfiguration</td>
</tr>
<tr>
<td>accessKey (producer)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (producer)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region (producer)</td>
<td>The region in which DDB client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS DynamoDB endpoint is configured using URI syntax:

```
aws-ddb:tableName
```

with the following path and query parameters:

21.2.1. Path Parameters (1 parameters):
### 21.2.2. Query Parameters (13 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>amazonDDBClient</code> (producer)</td>
<td>To use the AmazonDynamoDB as the client</td>
<td></td>
<td>AmazonDynamoDB</td>
</tr>
<tr>
<td><code>consistentRead</code> (producer)</td>
<td>Determines whether or not strong consistency should be enforced when data is read.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>keyAttributeName</code> (producer)</td>
<td>Attribute name when creating table</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>keyAttributeType</code> (producer)</td>
<td>Attribute type when creating table</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>operation</code> (producer)</td>
<td>What operation to perform</td>
<td><code>PutItem</code></td>
<td>DdbOperations</td>
</tr>
<tr>
<td><code>proxyHost</code> (producer)</td>
<td>To define a proxy host when instantiating the DDB client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>proxyPort</code> (producer)</td>
<td>To define a proxy port when instantiating the DDB client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td><code>readCapacity</code> (producer)</td>
<td>The provisioned throughput to reserve for reading resources from your table</td>
<td></td>
<td>Long</td>
</tr>
<tr>
<td><code>region</code> (producer)</td>
<td>The region in which DDB client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>writeCapacity</code> (producer)</td>
<td>The provisioned throughput to reserved for writing resources to your table</td>
<td></td>
<td>Long</td>
</tr>
<tr>
<td><code>synchronous</code> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>accessKey</code> (security)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
Required DDB component options

You have to provide the amazonDDBClient in the Registry or your accessKey and secretKey to access the Amazon’s DynamoDB.

21.3. USAGE

21.3.1. Message headers evaluated by the DDB producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDdbBatchItems</td>
<td>Map&lt;String, KeysAndAttributes&gt;</td>
<td>A map of the table name and corresponding items to get by primary key.</td>
</tr>
<tr>
<td>CamelAwsDdbTableName</td>
<td>String</td>
<td>Table Name for this operation.</td>
</tr>
<tr>
<td>CamelAwsDdbKey</td>
<td>Key</td>
<td>The primary key that uniquely identifies each item in a table. From Camel 2.16.0 the type of this header is Map&lt;String, AttributeValue&gt; and not Key</td>
</tr>
<tr>
<td>CamelAwsDdbReturnValues</td>
<td>String</td>
<td>Use this parameter if you want to get the attribute name-value pairs before or after they are modified(NONE, ALL_OLD, UPDATED_OLD, ALL_NEW, UPDATED_NEW).</td>
</tr>
<tr>
<td>CamelAwsDdbUpdateCondition</td>
<td>Map&lt;String, ExpectedAttributeValue&gt;</td>
<td>Designates an attribute for a conditional modification.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Camel AwsD dbAttributeNames</td>
<td>Collection&lt;String&gt;</td>
<td>If attribute names are not specified then all attributes will be returned.</td>
</tr>
<tr>
<td>Camel AwsD dbConsistentRead</td>
<td>Boolean</td>
<td>If set to true, then a consistent read is issued, otherwise eventually consistent is used.</td>
</tr>
<tr>
<td>Camel AwsD dbIndexName</td>
<td>String</td>
<td>If set will be used as Secondary Index for Query operation.</td>
</tr>
<tr>
<td>Camel AwsD dbItem</td>
<td>Map&lt;String, AttributeValue&gt;</td>
<td>A map of the attributes for the item, and must include the primary key values that define the item.</td>
</tr>
<tr>
<td>Camel AwsD dbExactCount</td>
<td>Boolean</td>
<td>If set to true, Amazon DynamoDB returns a total number of items that match the query parameters, instead of a list of the matching items and their attributes. From Camel 2.16.0 this header doesn’t exist anymore.</td>
</tr>
<tr>
<td>Camel AwsD dbHashKeyConditions</td>
<td>Map&lt;String, Condition&gt;</td>
<td>From Camel 2.16.0. This header specify the selection criteria for the query, and merge together the two old headers CamelAwsDdbHashKeyValue and CamelAwsDdbScanRangeKeyCondition</td>
</tr>
<tr>
<td>Camel AwsD dbStartKey</td>
<td>Key</td>
<td>Primary key of the item from which to continue an earlier query.</td>
</tr>
<tr>
<td>Camel AwsD dbHashKeyValue</td>
<td>AttributeValue</td>
<td>Value of the hash component of the composite primary key. From Camel 2.16.0 this header doesn’t exist anymore.</td>
</tr>
</tbody>
</table>
### 21.3.2. Message headers set during BatchGetItems operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsD dbLimit</td>
<td>Integer</td>
<td>The maximum number of items to return.</td>
</tr>
<tr>
<td>Camel AwsD dbScanRangeKeyCondition</td>
<td>Condition</td>
<td>A container for the attribute values and comparison operators to use for the query. From Camel 2.16.0 this header doesn’t exist anymore.</td>
</tr>
<tr>
<td>Camel AwsD dbScanIndexForward</td>
<td>Boolean</td>
<td>Specifies forward or backward traversal of the index.</td>
</tr>
<tr>
<td>Camel AwsD dbScanFilter</td>
<td>Map&lt;String, Condition&gt;</td>
<td>Evaluates the scan results and returns only the desired values.</td>
</tr>
<tr>
<td>Camel AwsD dbUpdateValues</td>
<td>Map&lt;String, AttributeValueUpdate&gt;</td>
<td>Map of attribute name to the new value and action for the update.</td>
</tr>
</tbody>
</table>

Table names and the respective item attributes from the tables.
<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDbUnprocessedKeys</td>
<td>Map&lt;String,KeysAndAttributes&gt;</td>
<td>Contains a map of tables and their respective keys that were not processed with the current response.</td>
</tr>
</tbody>
</table>

**21.3.3. Message headers set during DeleteItem operation**

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDbAttributes</td>
<td>Map&lt;String,AttributeValue&gt;</td>
<td>The list of attributes returned by the operation.</td>
</tr>
</tbody>
</table>

**21.3.4. Message headers set during DeleteTable operation**

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDbProvisionedThroughput</td>
<td>Map&lt;String,AttributeValue&gt;</td>
<td>The value of the ProvisionedThroughput property for this table</td>
</tr>
<tr>
<td>Provisioned Throughput Description</td>
<td>Date</td>
<td>Creation DateTime of this table.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CamelAwsDdbTableItemCount</td>
<td>Long</td>
<td>Item count for this table.</td>
</tr>
<tr>
<td>CamelAwsDdbKeySchema</td>
<td>KeySchema</td>
<td>The KeySchema that identifies the primary key for this table. From Camel 2.16.0 the type of this header is List&lt;KeySchemaElement&gt; and not KeySchema</td>
</tr>
<tr>
<td>CamelAwsDdbTableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>CamelAwsDdbTableSize</td>
<td>Long</td>
<td>The table size in bytes.</td>
</tr>
<tr>
<td>CamelAwsDdbTableStatus</td>
<td>String</td>
<td>The status of the table: CREATING, UPDATING, Deleting, ACTIVE</td>
</tr>
</tbody>
</table>

21.3.5. Message headers set during DescribeTable operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDdbProvisionedThroughput</td>
<td>{{ProvisionedThroughputDescription}}</td>
<td>The value of the ProvisionedThroughput property for this table</td>
</tr>
<tr>
<td>CamelAwsDdbCreationDate</td>
<td>Date</td>
<td>Creation DateTime of this table.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Camel AwsD dbTableItemCount</td>
<td>Long</td>
<td>Item count for this table.</td>
</tr>
<tr>
<td>Camel AwsD dbKeySchema</td>
<td>{{KeySchema}}</td>
<td>The KeySchema that identifies the primary key for this table. From Camel 2.16.0 the type of this header is List&lt;KeySchemaElement&gt; and not KeySchema</td>
</tr>
<tr>
<td>Camel AwsD dbTableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>Camel AwsD dbTableSize</td>
<td>Long</td>
<td>The table size in bytes.</td>
</tr>
<tr>
<td>Camel AwsD dbTableStatus</td>
<td>String</td>
<td>The status of the table: CREATING, UPDATING, DELETING, ACTIVE</td>
</tr>
<tr>
<td>Camel AwsD dbReadCapacity</td>
<td>Long</td>
<td>ReadCapacityUnits property of this table.</td>
</tr>
<tr>
<td>Camel AwsD dbWriteCapacity</td>
<td>Long</td>
<td>WriteCapacityUnits property of this table.</td>
</tr>
</tbody>
</table>

21.3.6. Message headers set during GetItem operation
### 21.3.7. Message headers set during PutItem operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDdbAttributes</td>
<td>Map&lt;String, AttributeValue&gt;</td>
<td>The list of attributes returned by the operation.</td>
</tr>
</tbody>
</table>

### 21.3.8. Message headers set during Query operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDdbItems</td>
<td>List&lt;java.util.Map&lt;String,AttributeValue&gt;&gt;</td>
<td>The list of attributes returned by the operation.</td>
</tr>
<tr>
<td>CamelAwsDdbLastEvaluatedKey</td>
<td>Key</td>
<td>Primary key of the item where the query operation stopped, inclusive of the previous result set.</td>
</tr>
<tr>
<td>CamelAwsDdbConsumedCapacity</td>
<td>Double</td>
<td>The number of Capacity Units of the provisioned throughput of the table consumed during the operation.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Camel AwsD dbCo unt</td>
<td>Integer</td>
<td>Number of items in the response.</td>
</tr>
<tr>
<td>Camel AwsD dbItems</td>
<td>List&lt;java.util.Map&lt;String, AttributeValue&gt;&gt;</td>
<td>The list of attributes returned by the operation.</td>
</tr>
<tr>
<td>Camel AwsD dbLastEvalu atedKey</td>
<td>Key</td>
<td>Primary key of the item where the query operation stopped, inclusive of the previous result set.</td>
</tr>
<tr>
<td>Camel AwsD dbConsum edCa pacity</td>
<td>Double</td>
<td>The number of Capacity Units of the provisioned throughput of the table consumed during the operation.</td>
</tr>
<tr>
<td>Camel AwsD dbCo unt</td>
<td>Integer</td>
<td>Number of items in the response.</td>
</tr>
<tr>
<td>Camel AwsD dbScannedC ount</td>
<td>Integer</td>
<td>Number of items in the complete scan before any filters are applied.</td>
</tr>
</tbody>
</table>

21.3.9. Message headers set during Scan operation

21.3.10. Message headers set during UpdateItem operation
21.3.11. Advanced AmazonDynamoDB configuration

If you need more control over the AmazonDynamoDB instance configuration you can create your own instance and refer to it from the URI:

```java
from("direct:start")
  .to("aws-ddb://domainName?amazonDDBClient=#client");
```

The `#client` refers to a AmazonDynamoDB in the Registry.

For example if your Camel Application is running behind a firewall:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonDynamoDB client = new AmazonDynamoDBClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

### 21.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<pom.xml>
  <dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws</artifactId>
    <version>${camel-version}</version>
  </dependency>
</pom.xml>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.10 or higher).

### 21.5. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
- AWS Component
CHAPTER 22. AWS DYNAMODB STREAMS COMPONENT

Available as of Camel version 2.17

The DynamoDB Stream component supports receiving messages from Amazon DynamoDB Stream service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon DynamoDB Streams. More information are available at [AWS DynamoDB](https://aws.amazon.com/dynamodb/)

### 22.1. URI FORMAT

```
aws-ddbstream://tableName[?options]
```

The stream needs to be created prior to it being used. You can append query options to the URI in the following format, `?options=value&option2=value&...`

### 22.2. URI OPTIONS

The AWS DynamoDB Streams component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS DDB stream default configuration</td>
<td>DdbStreamConfig</td>
<td>(advanced)</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td>String</td>
<td>(consumer)</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td>String</td>
<td>(consumer)</td>
</tr>
<tr>
<td>region</td>
<td>Amazon AWS Region</td>
<td>String</td>
<td>(consumer)</td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS DynamoDB Streams endpoint is configured using URI syntax:

```
aws-ddbstream:tableName
```

with the following path and query parameters:

#### 22.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td><strong>Required</strong> Name of the dynamodb table</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 22.2.2. Query Parameters (28 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>amazonDynamoDBstreamsClient (consumer)</td>
<td>Amazon DynamoDB client to use for all requests for this endpoint</td>
<td></td>
<td>AmazonDynamoDBStreams</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>iteratorType (consumer)</td>
<td>Defines where in the DynamoDB stream to start getting records. Note that using TRIM_HORIZON can cause a significant delay before the stream has caught up to real-time. if AT,AFTER_SEQUENCE_NUMBER are used, then a sequenceNumberProvider MUST be supplied.</td>
<td>LATEST</td>
<td>ShardIteratorType</td>
</tr>
<tr>
<td>maxResultsPerRequest (consumer)</td>
<td>Maximum number of records that will be fetched in each poll</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>proxyHost (consumer)</td>
<td>To define a proxy host when instantiating the DDBStreams client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (consumer)</td>
<td>To define a proxy port when instantiating the DDBStreams client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region (consumer)</td>
<td>The region in which DDBStreams client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>sequenceNumber Provider (consumer)</strong></td>
<td>Provider for the sequence number when using one of the two ShardIteratorType.AT,AFTER_SEQUENCE_NUMBER iterator types. Can be a registry reference or a literal sequence number.</td>
<td></td>
<td>SequenceNumber Provider</td>
</tr>
<tr>
<td><strong>exceptionHandler (consumer)</strong></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern (consumer)</strong></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><strong>pollStrategy (consumer)</strong></td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td><strong>synchronous (advanced)</strong></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>backoffErrorThreshold (scheduler)</strong></td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td><strong>backoffIdleThreshold (scheduler)</strong></td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td><strong>backoffMultiplier (scheduler)</strong></td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td><strong>delay (scheduler)</strong></td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>greedy (scheduler)</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay (scheduler)</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel (scheduler)</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService (scheduler)</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td></td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>scheduler (scheduler)</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumer</td>
</tr>
<tr>
<td>schedulerProperties (scheduler)</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>startScheduler (scheduler)</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit (scheduler)</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLISECONDS</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay (scheduler)</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>accessKey (security)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (security)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

**22.3. SEQUENCE NUMBERS**

**Required DynamoDBStream component options**

You have to provide the amazonDynamoDbStreamsClient in the Registry with proxies and relevant credentials configured.
You can provide a literal string as the sequence number or provide a bean in the registry. An example of using the bean would be to save your current position in the change feed and restore it on Camel startup.

It is an error to provide a sequence number that is greater than the largest sequence number in the describe-streams result, as this will lead to the AWS call returning an HTTP 400.

### 22.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

### 22.5. USAGE

#### 22.5.1. AmazonDynamoDBStreamsClient configuration

You will need to create an instance of AmazonDynamoDBStreamsClient and bind it to the registry:

```java
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonDynamoDBStreamsClient.class, null, clientConfiguration);
```

#### 22.5.2. Providing AWS Credentials

It is recommended that the credentials are obtained by using the `DefaultAWSCredentialsProviderChain` that is the default when creating a new `ClientConfiguration` instance, however, a different `AWSCredentialsProvider` can be specified when calling `createClient(...)`.

### 22.6. COPING WITH DOWNTIME

#### 22.6.1. AWS DynamoDB Streams outage of less than 24 hours

The consumer will resume from the last seen sequence number (as implemented for `CAMEL-9515`), so you should receive a flood of events in quick succession, as long as the outage did not also include DynamoDB itself.

#### 22.6.2. AWS DynamoDB Streams outage of more than 24 hours

Given that AWS only retain 24 hours worth of changes, you will have missed change events no matter what mitigations are in place.

### 22.7. DEPENDENCIES
Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.7 or higher).

### 22.8. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started

CHAPTER 23. AWS EC2 COMPONENT

Available as of Camel version 2.16

The EC2 component supports create, run, start, stop and terminate AWS EC2 instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon EC2. More information are available at Amazon EC2.

23.1. URI FORMAT

```
aws-ec2://label/?options=
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

23.2. URI OPTIONS

The AWS EC2 component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>The AWS EC2 default configuration</td>
<td></td>
<td>EC2Configuration</td>
</tr>
<tr>
<td>region (producer)</td>
<td>The region in which EC2 client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>accessKey (producer)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (producer)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS EC2 endpoint is configured using URI syntax:

```
aws-ec2://label
```

with the following path and query parameters:

23.2.1. Path Parameters (1 parameters):
### 23.2.2. Query Parameters (8 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>amazonEc2Client</td>
<td>To use a existing configured AmazonEC2Client as client</td>
<td></td>
<td>AmazonEC2Client</td>
</tr>
<tr>
<td>operation</td>
<td>Required The operation to perform. It can be createAndRunInstances, startInstances, stopInstances, terminateInstances, describeInstances, describeInstancesStatus, rebootInstances, monitorInstances, unmonitorInstances, createTags or deleteTags</td>
<td></td>
<td>EC2Operations</td>
</tr>
<tr>
<td>proxyHost</td>
<td>To define a proxy host when instantiating the EC2 client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>To define a proxy port when instantiating the EC2 client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region</td>
<td>The region in which EC2 client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

**Required EC2 component options**

You have to provide the amazonEc2Client in the Registry or your accessKey and secretKey to access the Amazon EC2 service.

### 23.3. USAGE

#### 23.3.1. Message headers evaluated by the EC2 producer
<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsEC2ImageId</td>
<td>String</td>
<td>An image ID of the AWS marketplace</td>
</tr>
<tr>
<td>Camel AwsEC2InstanceType</td>
<td>String</td>
<td>The instance type we want to create and run</td>
</tr>
<tr>
<td>Camel AwsEC2Operation</td>
<td>String</td>
<td>The operation we want to perform</td>
</tr>
<tr>
<td>Camel AwsEC2InstanceMinCount</td>
<td>Int</td>
<td>The minimum number of instances we want to run.</td>
</tr>
<tr>
<td>Camel AwsEC2InstanceMaxCount</td>
<td>Int</td>
<td>The maximum number of instances we want to run.</td>
</tr>
<tr>
<td>Camel AwsEC2InstanceMonitoring</td>
<td>Boolean</td>
<td>Define if we want the running instances to be monitored</td>
</tr>
<tr>
<td>Camel AwsEC2InstanceEbsOptimized</td>
<td>Boolean</td>
<td>Define if the creating instance is optimized for EBS I/O.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CamelAwsEC2InstancesSecurityGroups</td>
<td>Collection</td>
<td>The security groups to associate to the instances</td>
</tr>
<tr>
<td>CamelAwsEC2InstancesIds</td>
<td>Collection</td>
<td>A collection of instances IDS to execute start, stop, describe and terminate operations on.</td>
</tr>
<tr>
<td>CamelAwsEC2InstancesTags</td>
<td>Collection</td>
<td>A collection of tags to add or remove from EC2 resources</td>
</tr>
</tbody>
</table>

**Dependencies**

Maven users will need to add the following dependency to their pom.xml.

```xml
<pom.xml>
  <dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws</artifactId>
    <version>${camel-version}</version>
  </dependency>
</pom.xml>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

### 23.4. SEE ALSO

- Component
- Endpoint
- Getting Started
- AWS Component
CHAPTER 24. AWS KINESIS COMPONENT

Available as of Camel version 2.17

The Kinesis component supports receiving messages from and sending messages to Amazon Kinesis service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Kinesis. More information are available at AWS Kinesis

24.1. URI FORMAT

```
aws-kinesis://stream-name[?options]
```

The stream needs to be created prior to it being used. You can append query options to the URI in the following format, ?options=value&option2=value&...

24.2. URI OPTIONS

The AWS Kinesis component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS S3 default configuration</td>
<td></td>
<td>KinesisConfiguration</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>region</td>
<td>Amazon AWS Region</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS Kinesis endpoint is configured using URI syntax:

```
aws-kinesis:streamName
```

with the following path and query parameters:

24.2.1. Path Parameters (1 parameters):
### Name | Description | Default | Type
--- | --- | --- | ---
streamName | Required Name of the stream | | String

#### 24.2.2. Query Parameters (30 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>amazonKinesisClient (common)</td>
<td>Amazon Kinesis client to use for all requests for this endpoint</td>
<td></td>
<td>AmazonKinesis</td>
</tr>
<tr>
<td>proxyHost (common)</td>
<td>To define a proxy host when instantiating the DDBStreams client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (common)</td>
<td>To define a proxy port when instantiating the DDBStreams client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region (common)</td>
<td>The region in which Kinesis client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>iteratorType (consumer)</td>
<td>Defines where in the Kinesis stream to start getting records</td>
<td>TRIM_HORIZON</td>
<td>ShardIteratorType</td>
</tr>
<tr>
<td>maxResultsPerRequest (consumer)</td>
<td>Maximum number of records that will be fetched in each poll</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sequenceNumber (consumer)</td>
<td>The sequence number to start polling from. Required if iteratorType is set to AFTER_SEQUENCE_NUMBER or AT_SEQUENCE_NUMBER</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>shardClosed (consumer)</td>
<td>Define what will be the behavior in case of shard closed. Possible value are ignore, silent and fail. In case of ignore a message will be logged and the consumer will restart from the beginning, in case of silent there will be no logging and the consumer will start from the beginning, in case of fail a ReachedClosedStateException will be raised</td>
<td>ignore</td>
<td>KinesisShardCloseStrategyEnum</td>
</tr>
<tr>
<td>shardId (consumer)</td>
<td>Defines which shardId in the Kinesis stream to get records from</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td>ExchangePattern</td>
<td></td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td>PollingConsumerPollingStrategy</td>
<td></td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffIdleThreshold (scheduler)</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffMultiplier (scheduler)</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td>int</td>
<td></td>
</tr>
</tbody>
</table>
### Required Kinesis component options

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>delay (scheduler)</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy (scheduler)</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay (scheduler)</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel (scheduler)</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService (scheduler)</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td>null</td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>scheduler (scheduler)</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumerScheduler</td>
</tr>
<tr>
<td>schedulerProperties (scheduler)</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td>null</td>
<td>Map</td>
</tr>
<tr>
<td>startScheduler (scheduler)</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeZone (scheduler)</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLIECONDS</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay (scheduler)</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>accessKey (security)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (security)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
You have to provide the `amazonKinesisClient` in the Registry with proxies and relevant credentials configured.

### 24.3. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

### 24.4. USAGE

#### 24.4.1. Message headers set by the Kinesis consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsKinesisSequenceNumber</td>
<td>String</td>
<td>The sequence number of the record. This is represented as a String as it size is not defined by the API. If it is to be used as a numerical type then use</td>
</tr>
<tr>
<td>CamelAwsKinesisApproximateArrivalTimestamp</td>
<td>String</td>
<td>The time AWS assigned as the arrival time of the record.</td>
</tr>
<tr>
<td>CamelAwsKinesisPartitionKey</td>
<td>String</td>
<td>Identifies which shard in the stream the data record is assigned to.</td>
</tr>
</tbody>
</table>

#### 24.4.2. AmazonKinesis configuration

You will need to create an instance of `AmazonKinesisClient` and bind it to the registry

```java
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonKinesisClient.class, null, clientConfiguration);

// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
```
You then have to reference the AmazonKinesisClient in the `amazonKinesisClient` URI option.

```java
registry.bind("kinesisClient", client);
from("aws-kinesis://mykinesisstream?amazonKinesisClient=#kinesisClient")
  .to("log:out?showAll=true");
```

### 24.4.3. Providing AWS Credentials

It is recommended that the credentials are obtained by using the `DefaultAWSCredentialsProviderChain` that is the default when creating a new `ClientConfiguration` instance, however, a different `AWSCredentialsProvider` can be specified when calling `createClient(...)`.  

### 24.4.4. Message headers used by the Kinesis producer to write to Kinesis. The producer expects that the message body is a `ByteBuffer`

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsKinesis PartitionKey</td>
<td>String</td>
<td>The PartitionKey to pass to Kinesis to store this record.</td>
</tr>
<tr>
<td>Camel AwsKinesis SequenceNumber</td>
<td>String</td>
<td>Optional parameter to indicate the sequence number of this record.</td>
</tr>
</tbody>
</table>

### 24.4.5. Message headers set by the Kinesis producer on successful storage of a Record

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsKinesis SequenceNumber</td>
<td>String</td>
<td>The sequence number of the record, as defined in Response Syntax</td>
</tr>
<tr>
<td>Camel AwsKinesis ShardId</td>
<td>String</td>
<td>The shard ID of where the Record was stored</td>
</tr>
</tbody>
</table>
24.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.17 or higher).

24.6. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
- AWS Component
CHAPTER 25. AWS KINESIS FIREHOSE COMPONENT

Available as of Camel version 2.19

The Kinesis Firehose component supports sending messages to Amazon Kinesis Firehose service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Kinesis Firehose. More information are available at AWS Kinesis Firehose

25.1. URI FORMAT

aws-kinesis-firehose://delivery-stream-name[?options]

The stream needs to be created prior to it being used. You can append query options to the URI in the following format, ?options=value&option2=value&...

25.2. URI OPTIONS

The AWS Kinesis Firehose component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS Kinesis Firehose default configuration</td>
<td></td>
<td>KinesisFirehose Configuration</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region</td>
<td>Amazon AWS Region</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS Kinesis Firehose endpoint is configured using URI syntax:

aws-kinesis-firehose:streamName

with the following path and query parameters:

25.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>streamName</td>
<td>Required Name of the stream</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 25.2.2. Query Parameters (7 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>amazonKinesisFirehoseClient (producer)</td>
<td>Amazon Kinesis Firehose client to use for all requests for this endpoint</td>
<td></td>
<td>AmazonKinesisFirehose</td>
</tr>
<tr>
<td>proxyHost (producer)</td>
<td>To define a proxy host when instantiating the DDBStreams client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (producer)</td>
<td>To define a proxy port when instantiating the DDBStreams client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region (producer)</td>
<td>The region in which Kinesis client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>accessKey (security)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (security)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

**Required Kinesis Firehose component options**

You have to provide the `amazonKinesisClient` in the Registry with proxies and relevant credentials configured.

### 25.3. USAGE

#### 25.3.1. Amazon Kinesis Firehose configuration

You will need to create an instance of `AmazonKinesisClient` and bind it to the registry.

```java
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonKinesisClient.class, null, clientConfiguration);
```
You then have to reference the AmazonKinesisFirehoseClient in the `amazonKinesisFirehoseClient` URI option.

```java
from("aws-kinesis-firehose://mykinesisdeliverystream?amazonKinesisFirehoseClient=#kinesisClient")
.to("log:out?showAll=true");
```

### 25.3.2. Providing AWS Credentials

It is recommended that the credentials are obtained by using the `DefaultAWSCredentialsProviderChain` that is the default when creating a new `ClientConfiguration` instance, however, a different `AWSCredentialsProvider` can be specified when calling `createClient(...)`.  

#### 25.3.3. Message headers set by the Kinesis producer on successful storage of a Record

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsKinesis FirehoseRecordId</td>
<td>String</td>
<td>The record ID, as defined in Response Syntax</td>
</tr>
</tbody>
</table>

### 25.4. DEPENDENCIES

Maven users will need to add the following dependency to their `pom.xml`.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId.camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.19 or higher).

CHAPTER 26. AWS KMS COMPONENT

Available as of Camel version 2.21

The KMS component supports create, run, start, stop and terminate AWS KMS instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon KMS. More information are available at Amazon KMS.

26.1. URI FORMAT

```
aws-kms://label[/options]
```

You can append query options to the URI in the following format, `?options=value&option2=value&...`

26.2. URI OPTIONS

The AWS KMS component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS MQ default configuration</td>
<td></td>
<td>KMSConfiguration</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(producer)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region</td>
<td>The region in which MQ client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(producer)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS KMS endpoint is configured using URI syntax:

```
aws-kms:label/path
```

with the following path and query parameters:

26.2.1. Path Parameters (1 parameters):
### 26.2.2. Query Parameters (8 parameters):  

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>kmsClient</td>
<td>To use a existing configured AWS KMS as client</td>
<td></td>
<td>AWSKMS</td>
</tr>
<tr>
<td>operation</td>
<td>Required The operation to perform</td>
<td></td>
<td>KMSOperations</td>
</tr>
<tr>
<td>proxyHost</td>
<td>To define a proxy host when instantiating the KMS client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>To define a proxy port when instantiating the KMS client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region</td>
<td>The region in which KMS client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

**Required KMS component options**

You have to provide the amazonKmsClient in the Registry or your accessKey and secretKey to access the Amazon KMS service.

### 26.3. USAGE

#### 26.3.1. Message headers evaluated by the MQ producer
<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsKMSLimit</td>
<td>Integer</td>
<td>The limit number of keys to return while performing a listKeys operation</td>
</tr>
<tr>
<td>CamelAwsKMSOperation</td>
<td>String</td>
<td>The operation we want to perform</td>
</tr>
<tr>
<td>CamelAwsKMSDescription</td>
<td>String</td>
<td>A key description to use while performing a createKey operation</td>
</tr>
<tr>
<td>CamelAwsKMSKeyId</td>
<td>String</td>
<td>The key Id</td>
</tr>
</tbody>
</table>

Dependencies

Maven users will need to add the following dependency to their pom.xml.

```xml
<pom.xml>
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws</artifactId>
    <version>${camel-version}</version>
</dependency>
</pom.xml>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

### 26.4. SEE ALSO

- Configuring Camel

- AWS Component
CHAPTER 27. AWS LAMBDA COMPONENT

Available as of Camel version 2.20

The Lambda component supports create, get, list, delete and invoke AWS Lambda functions.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Lambda. More information are available at Amazon Lambda.

When creating a Lambda function, you need to specify a IAM role which has at least the AWSLambdaBasicExecuteRole policy attached.

Warning

Lambda is regional service. Unlike S3 bucket, Lambda function created in a given region is not available on other regions.

27.1. URI FORMAT

aws-lambda://functionName[?options]

You can append query options to the URI in the following format, ?options=value&option2=value&...

27.2. URI OPTIONS

The AWS Lambda component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>The AWS Lambda default configuration</td>
<td></td>
<td>LambdaConfigura</td>
</tr>
<tr>
<td>accessKey (producer)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (producer)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region (producer)</td>
<td>Amazon AWS Region</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS Lambda endpoint is configured using URI syntax:

aws-lambda:function
with the following path and query parameters:

### 27.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>function</td>
<td>Required Name of the Lambda function.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 27.2.2. Query Parameters (8 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation (producer)</td>
<td>Required The operation to perform. It can be listFunctions, getFunction, createFunction, deleteFunction or invokeFunction</td>
<td></td>
<td>LambdaOperation</td>
</tr>
<tr>
<td>region (producer)</td>
<td>Amazon AWS Region</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>awsLambdaClient (advanced)</td>
<td>To use a existing configured AwsLambdaClient as client</td>
<td></td>
<td>AWSLambda</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>proxyHost (proxy)</td>
<td>To define a proxy host when instantiating the Lambda client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (proxy)</td>
<td>To define a proxy port when instantiating the Lambda client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>accessKey (security)</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey (security)</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

Required Lambda component options

You have to provide the awsLambdaClient in the Registry or your accessKey and secretKey to access the Amazon Lambda service.

### 27.3. USAGE

#### 27.3.1. Message headers evaluated by the Lambda producer
<table>
<thead>
<tr>
<th>Operation</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>String</td>
<td>The operation we want to perform. Override operation passed as query parameter</td>
</tr>
<tr>
<td>createFunction</td>
<td>String</td>
<td>Amazon S3 bucket name where the .zip file containing your deployment package is stored. This bucket must reside in the same AWS region where you are creating the Lambda function.</td>
</tr>
<tr>
<td>Operation</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create AWS Lambda Function</td>
<td>Camel Key</td>
<td>The Amazon S3 object (the deployment package) key name you want to upload.</td>
</tr>
<tr>
<td>Create AWS Lambda Function</td>
<td>Camel Object Version</td>
<td>The Amazon S3 object (the deployment package) version you want to upload.</td>
</tr>
</tbody>
</table>
### Operation | Type | Description
--- | --- | ---
_createFunction | **String** | The local path of the zip file (the deployment package). Content of zip file can also be put in Message body.

The Amazon Resource Name (ARN) of the IAM role that Lambda assumes when it executes your function to access any other Amazon Web Services (AWS) resources.
<table>
<thead>
<tr>
<th>Operation</th>
<th>Type</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>createFunction</td>
<td>String</td>
<td>The runtime environment for the Lambda function you are uploading. (nodejs, nodejs4.3, nodejs6.10, java8, python2.7, python3.6, dotnetcore1.0, nodejs4.3-edge)</td>
<td>Yes</td>
</tr>
<tr>
<td>createFunction</td>
<td>String</td>
<td>The function within your code that Lambda calls to begin execution. For Node.js, it is the module-name.exports value in your function. For Java, it can be package.class-name:handler or package.class-name.</td>
<td>Yes</td>
</tr>
<tr>
<td>Operation</td>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>--------------------</td>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>create Function</td>
<td>String</td>
<td>The user-provided description.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>String</td>
<td>The parent object that contains the target ARN (Amazon Resource Name) of an</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Amazon SQS queue or Amazon SNS topic.</td>
<td></td>
</tr>
<tr>
<td>Operation</td>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------</td>
<td>--------</td>
<td>------------------------------------------------------------</td>
</tr>
<tr>
<td>create function</td>
<td>Camel</td>
<td>Integer</td>
<td>The memory size, in MB, you configured for the function. Must be a multiple of 64 MB.</td>
</tr>
<tr>
<td>Operation</td>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Create Function</td>
<td>String</td>
<td>The Amazon Resource Name (ARN) of the KMS key used to encrypt your function’s environment variables. If not provided, AWS Lambda will use a default service key.</td>
<td></td>
</tr>
<tr>
<td>Create Function</td>
<td>Boolean</td>
<td>This boolean parameter can be used to request AWS Lambda to create the Lambda function and publish a version as an atomic operation.</td>
<td></td>
</tr>
<tr>
<td>Operation</td>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>----------------------</td>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Create Function</td>
<td>Integer</td>
<td>The function execution time at which Lambda should terminate the function. The default is 3 seconds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>String</td>
<td>Your function’s tracing settings (Active or PassThrough).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Red Hat Fuse 7.2 Apache Camel Component Reference
<table>
<thead>
<tr>
<th>Operation</th>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createFunction</td>
<td>CamelAWSLambdaEnvironmentVariables</td>
<td>Map&lt;String, String&gt;</td>
<td>The key-value pairs that represent your environment’s configuration settings.</td>
</tr>
</tbody>
</table>

The key-value pairs that represent your environment’s configuration settings.
<table>
<thead>
<tr>
<th>Operation</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createFunction</td>
<td>Map&lt;String, String&gt;</td>
<td>The list of tags (key-value pairs) assigned to the new function.</td>

<td>List&lt;String&gt;</td>
<td>If your Lambda function accesses resources in a VPC, a list of one or more security groups IDs in your VPC.</td>
</tr>
</tbody>
</table>
If your Lambda function accesses resources in a VPC, a list of one or more subnet IDs in your VPC.

Dependencies

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws</artifactId>
    <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

CHAPTER 28. AWS MQ COMPONENT

Available as of Camel version 2.21

The EC2 component supports create, run, start, stop and terminate AWS MQ instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon MQ. More information are available at Amazon MQ.

28.1. URI FORMAT

/aws-mq://label[?options]

You can append query options to the URI in the following format, ?options=value&option2=value&...

28.2. URI OPTIONS

The AWS MQ component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS MQ default configuration</td>
<td></td>
<td>MQConfiguration</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region</td>
<td>The region in which MQ client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS MQ endpoint is configured using URI syntax:

/aws-mq:label

with the following path and query parameters:

28.2.1. Path Parameters (1 parameters):
### 28.2.2. Query Parameters (8 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>amazonMqClient</td>
<td>To use an existing configured AmazonMQClient as client</td>
<td></td>
<td>AmazonMQ</td>
</tr>
<tr>
<td>operation</td>
<td>Required The operation to perform. It can be listBrokers, createBroker, deleteBroker</td>
<td></td>
<td>MQOperations</td>
</tr>
<tr>
<td>proxyHost</td>
<td>To define a proxy host when instantiating the MQ client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>To define a proxy port when instantiating the MQ client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region</td>
<td>The region in which MQ client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

**Required EC2 component options**

You have to provide the amazonEcc2Client in the Registry or your accessKey and secretKey to access the Amazon EC2 service.

### 28.3. USAGE

#### 28.3.1. Message headers evaluated by the MQ producer
<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsM QMax Result s</td>
<td>String</td>
<td>The number of results that must be retrieved from listBrokers operation</td>
</tr>
<tr>
<td>Camel AwsM QBrokerName</td>
<td>String</td>
<td>The broker name</td>
</tr>
<tr>
<td>Camel AwsM QOperation</td>
<td>String</td>
<td>The operation we want to perform</td>
</tr>
<tr>
<td>Camel AwsM QBrokerId</td>
<td>String</td>
<td>The broker id</td>
</tr>
<tr>
<td>Camel AwsM QBrokerDeploymentModel</td>
<td>String</td>
<td>The deployment mode for the broker in the createBroker operation</td>
</tr>
</tbody>
</table>

**Dependencies**

Maven users will need to add the following dependency to their pom.xml.

```xml
<pom.xml>
  <dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws</artifactId>
    <version>${camel-version}</version>
  </dependency>
</pom.xml>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

CHAPTER 29. AWS S3 STORAGE SERVICE COMPONENT

Available as of Camel version 2.8

The S3 component supports storing and retrieving objects from/to Amazon’s S3 service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon S3. More information are available at Amazon S3.

29.1. URI FORMAT

aws-s3://bucketNameOrArn[?options]

The bucket will be created if it don’t already exists. You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to read file hello.txt from bucket helloBucket, use the following snippet:

```
from("aws-s3:helloBucket?accessKey=yourAccessKey&secretKey=yourSecretKey&prefix=hello.txt")
.to("file:/var/downloaded");
```

29.2. URI OPTIONS

The AWS S3 Storage Service component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS S3 default configuration</td>
<td></td>
<td>S3Configuration</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>region</td>
<td>The region where the bucket is located. This option is used in the</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>com.amazonaws.services.s3.model.CreateBucketRequest.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS S3 Storage Service endpoint is configured using URI syntax:
aws-s3:bucketNameOrArn

with the following path and query parameters:

### 29.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bucketNameOrArn</td>
<td>Required Bucket name or ARN</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 29.2.2. Query Parameters (50 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>amazonS3Client</td>
<td>Reference to a com.amazonaws.services.sqs.AmazonS3 in the link:registry.htmlRegistry.</td>
<td></td>
<td>AmazonS3</td>
</tr>
<tr>
<td>pathStyleAccess</td>
<td>Whether or not the S3 client should use path style access</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>policy</td>
<td>The policy for this queue to set in the com.amazonaws.services.s3.AmazonS3.setBucketPolicy() method.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyHost</td>
<td>To define a proxy host when instantiating the SQS client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>Specify a proxy port to be used inside the client definition.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region</td>
<td>The region in which S3 client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>useIAMCredentials</td>
<td>Set whether the S3 client should expect to load credentials on an EC2 instance or to expect static credentials to be passed in.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>encryptionMaterials</td>
<td>The encryption materials to use in case of Symmetric/Asymmetric client usage</td>
<td></td>
<td>EncryptionMaterials</td>
</tr>
<tr>
<td>useEncryption</td>
<td>Define if encryption must be used or not</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>deleteAfterRead (consumer)</td>
<td>Delete objects from S3 after they have been retrieved. The delete is only performed if the Exchange is committed. If a rollback occurs, the object is not deleted. If this option is false, then the same objects will be retrieve over and over again on the polls. Therefore you need to use the Idempotent Consumer EIP in the route to filter out duplicates. You can filter using the link S3ConstantsBUCKET_NAME and link S3ConstantsKEY headers, or only the link S3ConstantsKEY header.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>fileName (consumer)</td>
<td>To get the object from the bucket with the given file name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>includeBody (consumer)</td>
<td>If it is true, the exchange body will be set to a stream to the contents of the file. If false, the headers will be set with the S3 object metadata, but the body will be null. This option is strongly related to autocloseBody option. In case of setting includeBody to true and autocloseBody to false, it will be up to the caller to close the S3Object stream. Setting autocloseBody to true, will close the S3Object stream automatically.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>maxConnections (consumer)</td>
<td>Set the maxConnections parameter in the S3 client configuration</td>
<td>60</td>
<td>int</td>
</tr>
<tr>
<td>maxMessagesPerPoll (consumer)</td>
<td>Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited.</td>
<td>10</td>
<td>int</td>
</tr>
<tr>
<td>prefix (consumer)</td>
<td>The prefix which is used in the com.amazonaws.services.s3.model.ListObjectsRequest to only consume objects we are interested in.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>autocloseBody (consumer)</td>
<td>If this option is true and includeBody is true, then the S3Object.close() method will be called on exchange completion. This option is strongly related to includeBody option. In case of setting includeBody to true and autocloseBody to false, it will be up to the caller to close the S3Object stream. Setting autocloseBody to true, will close the S3Object stream automatically.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>deleteAfterWrite (producer)</td>
<td>Delete file object after the S3 file has been uploaded</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>multiPartUpload (producer)</td>
<td>If it is true, camel will upload the file with multi part format, the part size is decided by the option of partSize</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>operation (producer)</td>
<td>The operation to do in case the user don’t want to do only an upload</td>
<td></td>
<td>S3Operations</td>

<td>chunkedEncoding Disabled (advanced)</td>
<td>Define if disabled Chunked Encoding is true or false</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>dualstackEnabled (advanced)</td>
<td>Define if Dualstack enabled is true or false</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>forceGlobalBucketAccessEnabled (advanced)</td>
<td>Define if Force Global Bucket Access enabled is true or false</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>payloadSigningEnabled (advanced)</td>
<td>Define if Payload Signing enabled is true or false</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffIdleThreshold (scheduler)</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffMultiplier (scheduler)</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>delay (scheduler)</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy (scheduler)</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>

<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td>none</td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>scheduler</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumerScheduler</td>
</tr>
<tr>
<td>schedulerProperties</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td>Map</td>
<td></td>
</tr>
<tr>
<td>startScheduler</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLIESCONDS</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

Required S3 component options

You have to provide the amazonS3Client in the Registry or your accessKey and secretKey to access the Amazon's S3.

## 29.3. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.
### 29.4. USAGE

#### 29.4.1. Message headers evaluated by the S3 producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>

<td>CamelAwsS3DestinationKey</td>
<td>String</td>
<td>Camel 2.18: The Destination key which will be used for the current operation</td>
</tr>
<tr>
<td>CamelAwsS3Key</td>
<td>String</td>
<td>The key under which this object will be stored or which will be used for the current operation</td>
</tr>
<tr>
<td>CamelAwsS3LastModified</td>
<td>java.util.Date</td>
<td>Camel 2.8.2: The last modified timestamp of this object.</td>
</tr>
<tr>
<td>CamelAwsS3Operation</td>
<td>String</td>
<td>Camel 2.18: The operation to perform. Permitted values are copyObject, listBuckets, deleteBucket, downloadLink</td>
</tr>
<tr>
<td>CamelAwsS3StorageClass</td>
<td>String</td>
<td>Camel 2.8.4: The storage class of this object.</td>
</tr>
<tr>
<td>CamelAwsS3CannedAcl</td>
<td>String</td>
<td>Camel 2.11.0: The canned acl that will be applied to the object. see com.amazonaws.services.s3.model.CannedAccessControlList for allowed values.</td>
</tr>
<tr>
<td>CamelAwsS3Acl</td>
<td>com.amazonaws.services.s3.model.AccessControlList</td>
<td>Camel 2.11.0: a well constructed Amazon S3 Access Control List object. see com.amazonaws.services.s3.model.AccessControlList for more details</td>
</tr>
</tbody>
</table>
### 29.4.2. Message headers set by the S3 producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsS3ETag</td>
<td>String</td>
<td>The ETag value for the newly uploaded object.</td>
</tr>
<tr>
<td>CamelAwsS3VersionId</td>
<td>String</td>
<td>The optional version ID of the newly uploaded object.</td>
</tr>
<tr>
<td>CamelAwsS3DownloadLinkExpri</td>
<td>String</td>
<td>The expiration (millis) of URL download link. The link will be stored into</td>
</tr>
<tr>
<td></td>
<td></td>
<td>CamelAwsS3DownloadLink response header.</td>
</tr>
</tbody>
</table>

### 29.4.3. Message headers set by the S3 consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsS3Key</td>
<td>String</td>
<td>The key under which this object is stored.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>--------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CamelAwsS3BucketName</td>
<td>String</td>
<td>The name of the bucket in which this object is contained.</td>
</tr>
<tr>
<td>CamelAwsS3ETag</td>
<td>String</td>
<td>The hex encoded 128-bit MD5 digest of the associated object according to RFC 1864. This data is used as an integrity check to verify that the data received by the caller is the same data that was sent by Amazon S3.</td>
</tr>
<tr>
<td>CamelAwsS3LastModified</td>
<td>Date</td>
<td>The value of the Last-Modified header, indicating the date and time at which Amazon S3 last recorded a modification to the associated object.</td>
</tr>
<tr>
<td>CamelAwsS3VersionId</td>
<td>String</td>
<td>The version ID of the associated Amazon S3 object if available. Version IDs are only assigned to objects when an object is uploaded to an Amazon S3 bucket that has object versioning enabled.</td>
</tr>
<tr>
<td>CamelAwsS3ContentType</td>
<td>String</td>
<td>The Content-Type HTTP header, which indicates the type of content stored in the associated object. The value of this header is a standard MIME type.</td>
</tr>
<tr>
<td>CamelAwsS3ContentMD5</td>
<td>String</td>
<td>The base64 encoded 128-bit MD5 digest of the associated object (content - not including headers) according to RFC 1864. This data is used as a message integrity check to verify that the data received by Amazon S3 is the same data that the caller sent.</td>
</tr>
<tr>
<td>CamelAwsS3ContentLength</td>
<td>Long</td>
<td>The Content-Length HTTP header indicating the size of the associated object in bytes.</td>
</tr>
<tr>
<td>CamelAwsS3ContentEncoding</td>
<td>String</td>
<td>The optional Content-Encoding HTTP header specifying what content encodings have been applied to the object and what decoding mechanisms must be applied in order to obtain the media-type referenced by the Content-Type field.</td>
</tr>
</tbody>
</table>
### 29.4.4. Advanced AmazonS3 configuration

If your Camel Application is running behind a firewall or if you need to have more control over the AmazonS3 instance configuration, you can create your own instance:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");

ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonS3 client = new AmazonS3Client(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

and refer to it in your Camel aws-s3 component configuration:

```java
from("aws-s3://MyBucket?amazonS3Client=#client&delay=5000&maxMessagesPerPoll=5")
  .to("mock:result");
```

### 29.4.5. Use KMS with the S3 component

To use AWS KMS to encrypt/decrypt data by using AWS infrastructure you can use the options introduced in 2.21.x like in the following example:

```java
from("file:tmp/test?fileName=test.txt")
  .setHeader(S3Constants.KEY, constant("testFile"))
  .to("aws-s3://mybucket?amazonS3Client=#client&useAwsKMS=true&awsKMSKeyId=3f0637ad-..."
In this way you’ll ask to S3, to use the KMS key 3f0637ad-296a-3dfe-a796-e60654fb128c, to encrypt the file test.txt. When you’ll ask to download this file, the decryption will be done directly before the download.

29.4.6. Use "useIAMCredentials" with the s3 component

To use AWS IAM credentials, you must first verify that the EC2 in which you are launching the Camel application on has an IAM role associated with it containing the appropriate policies attached to run effectively. Keep in mind that this feature should only be set to "true" on remote instances. To clarify even further, you must still use static credentials locally since IAM is an AWS specific component, but AWS environments should now be easier to manage. After this is implemented and understood, you can set the query parameter "useIAMCredentials" to "true" for AWS environments! To effectively toggle this on and off based on local and remote environments, you can consider enabling this query parameter with system environment variables. For example, your code could set the "useIAMCredentials" query parameter to "true", when the system environment variable called "isRemote" is set to true (there are many other ways to do this and this should act as a simple example). Although it doesn’t take away the need for static credentials completely, using IAM credentials on AWS environments takes away the need to refresh on remote environments and adds a major security boost (IAM credentials are refreshed automatically every 6 hours and update when their policies are updated). This is the AWS recommended way to manage credentials and therefore should be used as often as possible.

29.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.8 or higher).

29.6. SEE ALSO

- Component
- Endpoint
- Getting Started
- AWS Component
CHAPTER 30. AWS SIMPLEDB COMPONENT

Available as of Camel version 2.9

The sdb component supports storing and retrieving data from/to Amazon’s SDB service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SDB. More information are available at Amazon SDB.

30.1. URI FORMAT

/aws-sdb://domainName[?options]

You can append query options to the URI in the following format, ?options=value&option2=value&...

30.2. URI OPTIONS

The AWS SimpleDB component has no options.

The AWS SimpleDB endpoint is configured using URI syntax:

/aws-sdb:domainName

with the following path and query parameters:

30.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>Required The name of the domain currently worked with.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

30.2.2. Query Parameters (10 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>amazonSDBClient</td>
<td>To use the AmazonSimpleDB as the client</td>
<td></td>
<td>AmazonSimpleDB</td>
</tr>
<tr>
<td>consistentRead</td>
<td>Determines whether or not strong consistency should be enforced when data is read.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### Required SDB component options

You have to provide the amazonSDBClient in the Registry or your accessKey and secretKey to access the Amazon’s SDB.

### 30.3. USAGE

#### 30.3.1. Message headers evaluated by the SDB producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsSdbAttributes</td>
<td>Collection&lt;Attribute&gt;</td>
<td>List of attributes to be acted upon.</td>
</tr>
<tr>
<td>CamelAwsSdbAttributeNames</td>
<td>Collection&lt;String&gt;</td>
<td>The names of the attributes to be retrieved.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Camel AwsS dbConsistentRead</td>
<td>Boolean</td>
<td>Determines whether or not strong consistency should be enforced when data is read.</td>
</tr>
<tr>
<td>Camel AwsS dbDeletableItems</td>
<td>Collection</td>
<td>A list of items on which to perform the delete operation in a batch.</td>
</tr>
<tr>
<td>Camel AwsS dbDomainName</td>
<td>String</td>
<td>The name of the domain currently worked with.</td>
</tr>
<tr>
<td>Camel AwsS dbDelitemName</td>
<td>String</td>
<td>The unique key for this item</td>
</tr>
<tr>
<td>Camel AwsS dbMaxNumberOfDomains</td>
<td>Integer</td>
<td>The maximum number of domain names you want returned. The range is 1 to 100.</td>
</tr>
<tr>
<td>Camel AwsS dbNextToken</td>
<td>String</td>
<td>A string specifying where to start the next list of domain/item names.</td>
</tr>
<tr>
<td>Camel AwsS dbOperation</td>
<td>String</td>
<td>To override the operation from the URI options.</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CamelAwsSdbRepPlaceableAttributes</td>
<td>Collection&lt;ReplaceableAttribute&gt;</td>
<td>List of attributes to put in an Item.</td>
</tr>
<tr>
<td>CamelAwsSdbRepPlaceableItems</td>
<td>Collection&lt;ReplaceableItem&gt;</td>
<td>A list of items to put in a Domain.</td>
</tr>
<tr>
<td>CamelAwsSdbSelectExpression</td>
<td>String</td>
<td>The expression used to query the domain.</td>
</tr>
<tr>
<td>CamelAwsSdbUpdateCondition</td>
<td>UpdateCondition</td>
<td>The update condition which, if specified, determines whether the specified attributes will be updated/deleted or not.</td>
</tr>
</tbody>
</table>

### 30.3.2. Message headers set during DomainMetadata operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsSdbTimestamp</td>
<td>Integer</td>
<td>The data and time when metadata was calculated, in Epoch (UNIX) seconds.</td>
</tr>
<tr>
<td>CamelAwsSdbItemCount</td>
<td>Integer</td>
<td>The number of all items in the domain.</td>
</tr>
</tbody>
</table>
### CamelAwsSdbAttributeNameCount
- **Type:** Integer
- **Description:** The number of unique attribute names in the domain.

### CamelAwsSdbAttributeValueCount
- **Type:** Integer
- **Description:** The number of all attribute name/value pairs in the domain.

### CamelAwsSdbAttributeNameSize
- **Type:** Long
- **Description:** The total size of all unique attribute names in the domain, in bytes.

### CamelAwsSdbAttributeValueSize
- **Type:** Long
- **Description:** The total size of all attribute values in the domain, in bytes.

### CamelAwsSdbItemNameSize
- **Type:** Long
- **Description:** The total size of all item names in the domain, in bytes.

### 30.3.3. Message headers set during GetAttributes operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsSdbAttributes</td>
<td>List&lt;Attribute&gt;</td>
<td>The list of attributes returned by the operation.</td>
</tr>
</tbody>
</table>

### 30.3.4. Message headers set during ListDomains operation
<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsS dbDo mainNames</td>
<td>List&lt;String&gt;</td>
<td>A list of domain names that match the expression.</td>
</tr>
<tr>
<td>Camel AwsS dbNextTok en</td>
<td>String</td>
<td>An opaque token indicating that there are more domains than the specified MaxNumberOfDomains still available.</td>
</tr>
</tbody>
</table>

### 30.3.5. Message headers set during Select operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsS dbItems</td>
<td>List&lt;Item&gt;</td>
<td>A list of items that match the select expression.</td>
</tr>
<tr>
<td>Camel AwsS dbNextTok en</td>
<td>String</td>
<td>An opaque token indicating that more items than MaxNumberOfItems were matched, the response size exceeded 1 megabyte, or the execution time exceeded 5 seconds.</td>
</tr>
</tbody>
</table>

### 30.3.6. Advanced AmazonSimpleDB configuration

If you need more control over the AmazonSimpleDB instance configuration you can create your own instance and refer to it from the URI:

```java
from("direct:start")
  .to("aws-sdb://domainName?amazonSDBClient=#client");
```

The `#client` refers to a AmazonSimpleDB in the Registry.

For example if your Camel Application is running behind a firewall:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonSimpleDB client = new AmazonSimpleDBClient(awsCredentials, clientConfiguration);
registry.bind("client", client);
```
30.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.8.4 or higher).

CHAPTER 31. AWS SIMPLE EMAIL SERVICE COMPONENT

Available as of Camel version 2.9

The ses component supports sending emails with Amazon’s SES service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SES. More information are available at Amazon SES.

31.1. URI FORMAT

aws-ses://from[?options]

You can append query options to the URI in the following format, ?options=value&option2=value&...

31.2. URI OPTIONS

The AWS Simple Email Service component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS SES default configuration</td>
<td></td>
<td>SesConfiguration</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region</td>
<td>The region in which SES client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS Simple Email Service endpoint is configured using URI syntax:

aws-ses:from

with the following path and query parameters:

31.2.1. Path Parameters (1 parameters):
### 31.2.2. Query Parameters (11 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>from</td>
<td>Required The sender’s email address.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>amazonSESClient</td>
<td>(producer) To use the AmazonSimpleEmailService as the client</td>
<td></td>
<td>AmazonSimpleEmailService</td>
</tr>
<tr>
<td>proxyHost</td>
<td>(producer) To define a proxy host when instantiating the SES client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>(producer) To define a proxy port when instantiating the SES client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>region</td>
<td>(producer) The region in which SES client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>replyToAddresses</td>
<td>(producer) List of reply-to email address(es) for the message, override it using ‘CamelAwsSesReplyToAddresses’ header.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>returnPath</td>
<td>(producer) The email address to which bounce notifications are to be forwarded, override it using ‘CamelAwsSesReturnPath’ header.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>subject</td>
<td>(producer) The subject which is used if the message header ‘CamelAwsSesSubject’ is not present.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>to</td>
<td>(producer) List of destination email address. Can be overridden with ‘CamelAwsSesTo’ header.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>synchronous</td>
<td>(advanced) Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>accessKey</td>
<td>(security) Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>(security) Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

Required SES component options

You have to provide the amazonSESClient in the Registry or your accessKey and secretKey to access the Amazon’s SES.
31.3. USAGE

31.3.1. Message headers evaluated by the SES producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsSesFrom</td>
<td>String</td>
<td>The sender’s email address.</td>
</tr>
<tr>
<td>Camel AwsSesTo</td>
<td>List&lt;String&gt;</td>
<td>The destination(s) for this email.</td>
</tr>
<tr>
<td>Camel AwsSesSubject</td>
<td>String</td>
<td>The subject of the message.</td>
</tr>
<tr>
<td>Camel AwsSesReplyToAdresses</td>
<td>List&lt;String&gt;</td>
<td>The reply-to email address(es) for the message.</td>
</tr>
<tr>
<td>Camel AwsSesReturnPath</td>
<td>String</td>
<td>The email address to which bounce notifications are to be forwarded.</td>
</tr>
<tr>
<td>Camel AwsSesHtmlEmail</td>
<td>Boolean</td>
<td>Since Camel 2.12.3 The flag to show if email content is HTML.</td>
</tr>
</tbody>
</table>

31.3.2. Message headers set by the SES producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsSesMessageId</td>
<td>String</td>
<td>The Amazon SES message ID.</td>
</tr>
</tbody>
</table>

31.3.3. Advanced AmazonSimpleEmailService configuration
If you need more control over the `AmazonSimpleEmailService` instance configuration you can create your own instance and refer to it from the URI:

```java
from("direct:start")
  .to("aws-ses://example@example.com?amazonSESClient=#client");
```

The `#client` refers to a `AmazonSimpleEmailService` in the Registry.

For example if your Camel Application is running behind a firewall:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
AmazonSimpleEmailService client = new AmazonSimpleEmailServiceClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

### 31.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.8.4 or higher).

CHAPTER 32. AWS SIMPLE NOTIFICATION SYSTEM COMPONENT

Available as of Camel version 2.8

The SNS component allows messages to be sent to an Amazon Simple Notification Topic. The implementation of the Amazon API is provided by the AWS SDK.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SNS. More information are available at Amazon SNS.

32.1. URI FORMAT

```
aws-sns://topicNameOrArn?[options]
```

The topic will be created if they don’t already exists. You can append query options to the URI in the following format, `?options=value&option2=value&...

32.2. URI OPTIONS

The AWS Simple Notification System component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS SNS default configuration</td>
<td></td>
<td>SnsConfiguration</td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region</td>
<td>The region in which SNS client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The AWS Simple Notification System endpoint is configured using URI syntax:

```
aws-sns:topicNameOrArn
```

with the following path and query parameters:
### 32.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>topicNameOrArn</code></td>
<td>Required Topic name or ARN</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 32.2.2. Query Parameters (11 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>amazonSNSClient</code></td>
<td>To use the AmazonSNS as the client</td>
<td></td>
<td>AmazonSNS</td>
</tr>
<tr>
<td><code>headerFilterStrategy</code></td>
<td>To use a custom HeaderFilterStrategy to map headers to/from Camel.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td><code>messageStructure</code></td>
<td>The message structure to use such as json</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>policy</code></td>
<td>The policy for this queue</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>proxyHost</code></td>
<td>To define a proxy host when instantiating the SNS client</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>proxyPort</code></td>
<td>To define a proxy port when instantiating the SNS client</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td><code>region</code></td>
<td>The region in which SNS client needs to work</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>subject</code></td>
<td>The subject which is used if the message header 'CamelAwsSnsSubject' is not present.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>synchronous</code></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>accessKey</code></td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>secretKey</code></td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

**Required SNS component options**

You have to provide the `amazonSNSClient` in the Registry or your `accessKey` and `secretKey` to access the Amazon's SNS.
32.3. USAGE

32.3.1. Message headers evaluated by the SNS producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsSnsSubject</td>
<td>String</td>
<td>The Amazon SNS message subject. If not set, the subject from the SnsConfiguration is used.</td>
</tr>
</tbody>
</table>

32.3.2. Message headers set by the SNS producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsSnsMessageID</td>
<td>String</td>
<td>The Amazon SNS message ID.</td>
</tr>
</tbody>
</table>

32.3.3. Advanced AmazonSNS configuration

If you need more control over the AmazonSNS instance configuration you can create your own instance and refer to it from the URI:

```java
from("direct:start")
.to("aws-sns://MyTopic?amazonSNSClient=#client");
```

The #client refers to a AmazonSNS in the Registry.

For example if your Camel Application is running behind a firewall:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
AmazonSNS client = new AmazonSNSClient(awsCredentials, clientConfiguration);
registry.bind("client", client);
```

32.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<pom.xml>
<dependency>
  <groupId>org.apache.camel</groupId>
</dependency>
```
$\text{artifactId}\text{-camel-aws}\text{/artifactId}$
$\text{version}\text{-${\text{camel-version}}\text{/version}$}
$\text{</dependency>}$

where $\text{{camel-version}}$ must be replaced by the actual version of Camel (2.8 or higher).

CHAPTER 33. AWS SIMPLE QUEUE SERVICE COMPONENT

Available as of Camel version 2.6

The sqs component supports sending and receiving messages to Amazon’s SQS service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SQS. More information are available at Amazon SQS.

33.1. URI FORMAT

```
aws-sqs://queueNameOrArn[?options]
```

The queue will be created if they don’t already exists. You can append query options to the URI in the following format, ?options=value&option2=value&...

33.2. URI OPTIONS

The AWS Simple Queue Service component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS SQS default configuration</td>
<td></td>
<td>SqsConfiguration</td>

<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>region</td>
<td>Specify the queue region which could be used with queueOwnerAWSAccountId to build the service URL.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>

</tbody>
</table>

The AWS Simple Queue Service endpoint is configured using URI syntax:

```
aws-sqs:queueNameOrArn
```

with the following path and query parameters:

33.2.1. Path Parameters (1 parameters):
### queueNameOrArn

- **Required**: Queue name or ARN
- **Type**: String

---

### 33.2.2. Query Parameters (46 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>amazonAWSHost</td>
<td>The hostname of the Amazon AWS cloud.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>amazonSQSClient</td>
<td>To use the AmazonSQS as client</td>
<td></td>
<td>AmazonSQS</td>
</tr>
<tr>
<td>headerFilterStrategy</td>
<td>To use a custom HeaderFilterStrategy to map headers to/from Camel.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>queueOwnerAWSAccountId</td>
<td>Specify the queue owner aws account id when you need to connect the queue with different account owner.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>region</td>
<td>Specify the queue region which could be used with queueOwnerAWSAccountId to build the service URL.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>attributeNames</td>
<td>A list of attribute names to receive when consuming. Multiple names can be separated by comma.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrentConsumers</td>
<td>Allows you to use multiple threads to poll the sqs queue to increase throughput</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>defaultVisibilityTimeout</td>
<td>The default visibility timeout (in seconds)</td>
<td></td>

<tr>
<td>backoffMultiplier</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>delay</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
---|---|---|---
**greedy** (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean

**initialDelay** (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long

**runLoggingLevel** (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel

**scheduledExecutorService** (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | ScheduledExecutorService |

**scheduler** (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler

**schedulerProperties** (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | Map |

**startScheduler** (scheduler) | Whether the scheduler should be auto started. | true | boolean

**timeUnit** (scheduler) | Time unit for initialDelay and delay options. | MILLIES | TimeUnit

**useFixedDelay** (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean

**proxyHost** (proxy) | To define a proxy host when instantiating the SQS client | String |

**proxyPort** (proxy) | To define a proxy port when instantiating the SQS client | Integer |

**maximumMessageSize** (queue) | The maximumMessageSize (in bytes) an SQS message can contain for this queue. | Integer |

**messageRetentionPeriod** (queue) | The messageRetentionPeriod (in seconds) a message will be retained by SQS for this queue. | Integer |
### Policy for this queue

- **Name**: `policy (queue)`
- **Description**: The policy for this queue
- **Default**: String

### Receive Message Wait Time Seconds

- **Name**: `receiveMessageWaitTime Seconds (queue)`
- **Description**: If you do not specify `WaitTimeSeconds` in the request, the queue attribute `ReceiveMessageWaitTimeSeconds` is used to determine how long to wait.
- **Type**: Integer

### Redrive Policy

- **Name**: `redrivePolicy (queue)`
- **Description**: Specify the policy that send message to DeadLetter queue. See detail at Amazon docs.
- **Type**: String

### Access Key

- **Name**: `accessKey (security)`
- **Description**: Amazon AWS Access Key
- **Type**: String

### Secret Key

- **Name**: `secretKey (security)`
- **Description**: Amazon AWS Secret Key
- **Type**: String

### Required SQS Component Options

You have to provide the `amazonSQSClient` in the Registry or your accessKey and secretKey to access the Amazon's SQS.

### 33.3. Batch Consumer

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

### 33.4. Usage

#### 33.4.1. Message Headers Set by the SQS Producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsSqsMD5OfBody</td>
<td>String</td>
<td>The MD5 checksum of the Amazon SQS message.</td>
</tr>
<tr>
<td>CamelAwsSqsMessageId</td>
<td>String</td>
<td>The Amazon SQS message ID.</td>
</tr>
</tbody>
</table>
Since Camel 2.11, the delay seconds that the Amazon SQS message can be seen by others.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsSqsDelaySeconds</td>
<td>Integer</td>
<td>The delay seconds that the Amazon SQS message can be seen by others.</td>
</tr>
</tbody>
</table>

### 33.4.2. Message headers set by the SQS consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsSqsMD5OfBody</td>
<td>String</td>
<td>The MD5 checksum of the Amazon SQS message.</td>
</tr>
<tr>
<td>Camel AwsSqsMessageID</td>
<td>String</td>
<td>The Amazon SQS message ID.</td>
</tr>
<tr>
<td>Camel AwsSqsReceiptHandle</td>
<td>String</td>
<td>The Amazon SQS message receipt handle.</td>
</tr>
<tr>
<td>Camel AwsSqsAttributes</td>
<td>Map&lt;String, String&gt;</td>
<td>The Amazon SQS message attributes.</td>
</tr>
</tbody>
</table>

### 33.4.3. Advanced AmazonSQS configuration

If your Camel Application is running behind a firewall or if you need to have more control over the AmazonSQS instance configuration, you can create your own instance:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");

ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
```
AmazonSQS client = new AmazonSQSClient(awsCredentials, clientConfiguration);
registry.bind("client", client);

and refer to it in your Camel aws-sqs component configuration:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.6 or higher).

### 33.6. JMS-STYLE SELECTORS

SQS does not allow selectors, but you can effectively achieve this by using the Camel Filter EIP and setting an appropriate `visibilityTimeout`. When SQS dispatches a message, it will wait up to the visibility timeout before it will try to dispatch the message to a different consumer unless a DeleteMessage is received. By default, Camel will always send the DeleteMessage at the end of the route, unless the route ended in failure. To achieve appropriate filtering and not send the DeleteMessage even on successful completion of the route, use a Filter:

```xml
from("aws-sqs://MyQueue?amazonSQSClient=#client&defaultVisibilityTimeout=5000&deleteIfFiltered=false")
  .filter("${header.login} == true")
  .to("mock:result");
```

In the above code, if an exchange doesn’t have an appropriate header, it will not make it through the filter AND also not be deleted from the SQS queue. After 5000 milliseconds, the message will become visible to other consumers.

CHAPTER 34. AWS SIMPLE WORKFLOW COMPONENT

Available as of Camel version 2.13

The Simple Workflow component supports managing workflows from Amazon’s Simple Workflow service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Simple Workflow. More information are available at Amazon Simple Workflow.

34.1. URI FORMAT

```
aws-swf://<workflow|activity>[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

34.2. URI OPTIONS

The AWS Simple Workflow component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>The AWS SWF default configuration</td>
<td></td>
<td>SWFConfiguration</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>accessKey</td>
<td>Amazon AWS Access Key.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>secretKey</td>
<td>Amazon AWS Secret Key.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>region</td>
<td>Amazon AWS Region.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>(common)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS Simple Workflow endpoint is configured using URI syntax:

```
aws-swf:type
```

with the following path and query parameters:

34.2.1. Path Parameters (1 parameters):
### 34.2.2. Query Parameters (30 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>amazonSWClient</code></td>
<td>To use the given AmazonSimpleWorkflowClient as client</td>

<td></td>
<td>ActivityTypeRegistrationOptions</td>
</tr>
<tr>
<td><code>childPolicy</code></td>
<td>The policy to use on child workflows when terminating a workflow.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>executionStartToCloseTimeout</code></td>
<td>Set the execution start to close timeout.</td>
<td>3600</td>
<td>String</td>
</tr>
<tr>
<td><code>operation</code></td>
<td>Workflow operation</td>
<td>START</td>
<td>String</td>
</tr>
<tr>
<td><code>signalName</code></td>
<td>The name of the signal to send to the workflow.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>stateResultType</code></td>
<td>The type of the result when a workflow state is queried.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### Required SWF component options

You have to provide the amazonSWClient in the Registry or your accessKey and secretKey to access the Amazon’s Simple Workflow Service.

### 34.3. USAGE

#### 34.3.1. Message headers evaluated by the SWF Workflow Producer

A workflow producer allows interacting with a workflow. It can start a new workflow execution, query its state, send signals to a running workflow, or terminate and cancel it.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelSWFOperation</td>
<td>String</td>
<td>The operation to perform on the workflow. Supported operations are: SIGNAL, CANCEL, TERMINATE, GET_STATE, START, DESCRIBE, GET_HISTORY.</td>
</tr>
<tr>
<td>CamelSWFWorkflowId</td>
<td>String</td>
<td>A workflow ID to use.</td>
</tr>
</tbody>
</table>
### 34.3.2. Message headers set by the SWF Workflow Producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelAwsDbKey</td>
<td>String</td>
<td>A workflow run ID to use.</td>
</tr>
<tr>
<td>CamelSWFRunId</td>
<td>String</td>
<td>The type of the result when a workflow state is queried.</td>
</tr>
<tr>
<td>CamelSWFSResultType</td>
<td>String</td>
<td>The workflow or activity event name to use.</td>
</tr>
<tr>
<td>CamelSWFEventName</td>
<td>String</td>
<td>The workflow or activity event version to use.</td>
</tr>
<tr>
<td>CamelSWFVersion</td>
<td>String</td>
<td>The reason for terminating a workflow.</td>
</tr>
<tr>
<td>CamelSWFReason</td>
<td>String</td>
<td>Details for terminating a workflow.</td>
</tr>
<tr>
<td>CamelSWFChildPolicy</td>
<td>String</td>
<td>The policy to use on child workflows when terminating a workflow.</td>
</tr>
</tbody>
</table>
### 34.3.3. Message headers set by the SWF Workflow Consumer

A workflow consumer represents the workflow logic. When it is started, it will start polling workflow decision tasks and process them. In addition to processing decision tasks, a workflow consumer route, will also receive signals (send from a workflow producer) or state queries. The primary purpose of a workflow consumer is to schedule activity tasks for execution using activity producers. Actually activity tasks can be scheduled only from a thread started by a workflow consumer.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel AwsD dbKey Camelfl SWFR unId</td>
<td>String</td>
<td>The workflow run ID used or generated.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel SWFAction</td>
<td>String</td>
<td>Indicates what type is the current event: CamelSWFActionExecute, CamelSWFSignalReceivedAction or CamelSWFGetStateAction.</td>
</tr>
<tr>
<td>Camel SWFWorkflowReplaying</td>
<td>boolean</td>
<td>Indicates whether the current decision task is a replay or not.</td>
</tr>
<tr>
<td>Camel SWFWorkflowStartTime</td>
<td>long</td>
<td>The time of the start event for this decision task.</td>
</tr>
</tbody>
</table>

### 34.3.4. Message headers set by the SWF Activity Producer

An activity producer allows scheduling activity tasks. An activity producer can be used only from a thread started by a workflow consumer ie, it can process synchronous exchanges started by a workflow consumer.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel SWFEventName</td>
<td>String</td>
<td>The activity name to schedule.</td>
</tr>
</tbody>
</table>
### 34.3.5. Message headers set by the SWF Activity Consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel SWF Version</td>
<td>String</td>
<td>The activity version to schedule.</td>
</tr>
<tr>
<td>Camel SWFTaskToken</td>
<td>String</td>
<td>The task token that is required to report task completion for manually completed tasks.</td>
</tr>
</tbody>
</table>

### 34.3.6. Advanced amazonSWClient configuration

If you need more control over the AmazonSimpleWorkflowClient instance configuration you can create your own instance and refer to it from the URI:

The `#client` refers to a AmazonSimpleWorkflowClient in the Registry.

For example if your Camel Application is running behind a firewall:

```java
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonSimpleWorkflowClient client = new AmazonSimpleWorkflowClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

### 34.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws</artifactId>
    <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.13 or higher).
34.5. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started

AWS Component
CHAPTER 35. AWS XRAY COMPONENT

Available as of Camel 2.21

The camel-aws-xray component is used for tracing and timing incoming and outgoing Camel messages using AWS XRay.

Events (subsegments) are captured for incoming and outgoing messages being sent to/from Camel.

35.1. DEPENDENCY

In order to include AWS XRay support into Camel, the archive containing the Camel related AWS XRay related classes need to be added to the project. In addition to that, AWS XRay libraries also need to be available.

To include both, AWS XRay and Camel, dependencies use the following Maven imports:

```xml
<dependencyManagement>
    <dependencies>
        <dependency>
            <groupId>com.amazonaws</groupId>
            <artifactId>aws-xray-recorder-sdk-bom</artifactId>
            <version>1.3.1</version>
            <type>pom</type>
            <scope>import</scope>
        </dependency>
    </dependencies>
</dependencyManagement>

<dependencies>
    <dependency>
        <groupId>org.apache.camel</groupId>
        <artifactId.camel-aws-xray</artifactId>
    </dependency>
    <dependency>
        <groupId>com.amazonaws</groupId>
        <artifactId>aws-xray-recorder-sdk-core</artifactId>
    </dependency>
    <dependency>
        <groupId>com.amazonaws</groupId>
        <artifactId>aws-xray-recorder-sdk-aws-sdk</artifactId>
    </dependency>
</dependencies>
```

35.2. CONFIGURATION

The configuration properties for the AWS XRay tracer are:
### Option Default Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addExcludePatterns</td>
<td></td>
<td>Sets exclude pattern(s) that will disable tracing for Camel messages that matches the pattern. The content is a <code>Set&lt;String&gt;</code> where the key is a pattern matching routeld’s. The pattern uses the rules from Intercept.</td>
</tr>
<tr>
<td>setTracingStrategy</td>
<td>NoopTracingStrategy</td>
<td>Allows a custom Camel <code>InterceptStrategy</code> to be provided in order to track invoked processor definitions like <code>BeanDefinition</code> or <code>ProcessDefinition</code>. <code>TraceAnnotatedTracingStrategy</code> will track any classes invoked via <code>.bean(...)</code> or <code>.process(...)</code> that contain a <code>@XRayTrace</code> annotation at class level.</td>
</tr>
</tbody>
</table>

There is currently only one way an AWS XRay tracer can be configured to provide distributed tracing for a Camel application:

#### 35.2.1. Explicit

Include the `camel-aws-xray` component in your POM, along with any specific dependencies associated with the AWS XRay Tracer.

To explicitly configure AWS XRay support, instantiate the `XRayTracer` and initialize the camel context. You can optionally specify a `Tracer`, or alternatively it can be implicitly discovered using the `Registry` or `ServiceLoader`.

```java
XRayTracer xrayTracer = new XRayTracer();
// By default it uses a NoopTracingStrategy, but you can override it with a specific InterceptStrategy implementation.
xrayTracer.setTracingStrategy(...);
// And then initialize the context
xrayTracer.init(camelContext);
```

To use XRayTracer in XML, all you need to do is to define the AWS XRay tracer bean. Camel will automatically discover and use it.

```xml
<bean id="tracingStrategy" class="..."/>
<bean id="aws-xray-tracer" class="org.apache.camel.component.aws.xray.XRayTracer" />
<property name="tracer" ref="tracingStrategy"/>
</bean>
```

In case of the default `NoopTracingStrategy` only the creation and deletion of exchanges is tracked but not the invocation of certain beans or EIP patterns.

#### 35.2.2. Tracking of comprehensive route execution

In order to track the execution of an exchange among multiple routes, on exchange creation a unique trace ID is generated and stored in the headers if no corresponding value was yet available. This trace ID is copied over to new exchanges in order to keep a consistent view of the processed exchange.

As AWS XRay traces work on a thread-local basis the current sub/segment should be copied over to the new thread and set as explained in the AWS XRay documentation. The Camel AWS XRay component therefore provides an additional header field that the component will use in order to set the passed AWS XRay `Entity` to the new thread and thus keep the tracked data to the route rather than exposing a new segment which seems uncorrelated with any of the executed routes.
The component will use the following constants found in the headers of the exchange:

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel-AWS-XRay-Trace-ID</td>
<td>Contains a reference to the AWS XRay TraceID object to provide a comprehensive view of the invoked routes</td>
</tr>
<tr>
<td>Camel-AWS-XRay-Trace-Entity</td>
<td>Contains a reference to the actual AWS XRay Segment or Subsegment which is copied over to the new thread. This header should be set in case a new thread is spawned and the performed tasks should be exposed as part of the executed route instead of creating a new unrelated segment.</td>
</tr>
</tbody>
</table>

Note that the AWS XRay Entity (i.e., Segment and Subsegment) are not serializable and therefore should not get passed to other JVM processes.

### 35.3. EXAMPLE

You can find an example demonstrating the way to configure AWS XRay tracing within the tests accompanying this project.
CHAPTER 36. CAMEL COMPONENTS FOR WINDOWS AZURE SERVICES

The Camel Components for Windows Azure Services provide connectivity to Azure services from Camel.

<table>
<thead>
<tr>
<th>Azure Service</th>
<th>Camel Component</th>
<th>Camel Version</th>
<th>Component Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage Blob Service</td>
<td>Azure-Blob</td>
<td>2.9.0</td>
<td>Supports storing and retrieving of blobs</td>
</tr>
<tr>
<td>Storage Queue Service</td>
<td>Azure-Queue</td>
<td>2.9.0</td>
<td>Supports storing and retrieving of messages in the queues</td>
</tr>
</tbody>
</table>
CHAPTER 37. AZURE STORAGE BLOB SERVICE COMPONENT

Available as of Camel version 2.19

The Azure Blob component supports storing and retrieving the blobs to/from Azure Storage Blob service.

Prerequisites

You must have a valid Windows Azure Storage account. More information is available at Azure Documentation Portal.

37.1. URI FORMAT

```
azure-blob://accountName/containerName/blobName/?options
```

In most cases a blobName is required and the blob will be created if it does not already exist. You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to download a blob content from the public block blob `blockBlob` located on the container1 in the camelazure storage account, use the following snippet:

```
from("azure-blob:/camelazure/container1/blockBlob").
to("file://blobdirectory");
```

37.2. URI OPTIONS

The Azure Storage Blob Service component has no options.

The Azure Storage Blob Service endpoint is configured using URI syntax:

```
azure-blob:containerOrBlobUri
```

with the following path and query parameters:

### 37.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>containerOrBlobUri</td>
<td>Required Container or Blob compact Uri</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 37.2.2. Query Parameters (19 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>azureBlobClient</td>
<td>The blob service client</td>
<td></td>
<td>CloudBlob</td>
</tr>
<tr>
<td>blobOffset</td>
<td>Set the blob offset for the upload or download operations, default is 0</td>
<td>0</td>
<td>Long</td>
</tr>
<tr>
<td>blobType</td>
<td>Set a blob type, 'blockblob' is default</td>
<td>blockblo</td>
<td>BlobType</td>
</tr>
<tr>
<td>closeStreamAfterRead</td>
<td>Close the stream after read or keep it open, default is true</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>credentials</td>
<td>Set the storage credentials, required in most cases</td>
<td></td>
<td>StorageCredentials</td>
</tr>
<tr>
<td>dataLength</td>
<td>Set the data length for the download or page blob upload operations</td>
<td></td>
<td>Long</td>
</tr>
<tr>
<td>fileDir</td>
<td>Set the file directory where the downloaded blobs will be saved to</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>publicForRead</td>
<td>Storage resources can be public for reading their content, if this property is enabled then the credentials do not have to be set</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>streamReadSize</td>
<td>Set the minimum read size in bytes when reading the blob content</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
--- | --- | --- | ---
**blobMetadata** (producer) | Set the blob meta-data |  | Map
**blobPrefix** (producer) | Set a prefix which can be used for listing the blobs |  | String
**closeStreamAfterWrite** (producer) | Close the stream after write or keep it open, default is true | true | boolean
**operation** (producer) | Blob service operation hint to the producer | listBlobs | BlobServiceOperations
**streamWriteSize** (producer) | Set the size of the buffer for writing block and page blocks | int |  
**useFlatListing** (producer) | Specify if the flat or hierarchical blob listing should be used | true | boolean
**synchronous** (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean

### Required Azure Storage Blob Service component options

You have to provide the containerOrBlob name and the credentials if the private blob needs to be accessed.

## 37.3. USAGE

### 37.3.1. Message headers evaluated by the Azure Storage Blob Service producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 37.3.2. Message headers set by the Azure Storage Blob Service producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CamelFileName</strong></td>
<td>String</td>
<td>The file name for the downloaded blob content.</td>
</tr>
</tbody>
</table>
37.3.3. Message headers set by the Azure Storage Blob Service producer consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelFileName</td>
<td>String</td>
<td>The file name for the downloaded blob content.</td>
</tr>
</tbody>
</table>

37.3.4. Azure Blob Service operations

Operations common to all block types

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getBlob</td>
<td>Get the content of the blob. You can restrict the output of this operation to a blob range.</td>
</tr>
<tr>
<td>deleteBlob</td>
<td>Delete the blob.</td>
</tr>
<tr>
<td>listBlobs</td>
<td>List the blobs.</td>
</tr>
</tbody>
</table>

Block blob operations

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>updateBlockBlob</td>
<td>Put block blob content that either creates a new block blob or overwrites the existing block blob content.</td>
</tr>
<tr>
<td>uploadBlobBlocks</td>
<td>Upload block blob content, by first generating a sequence of blob blocks and then committing them to a blob. If you enable the message CommitBlockListLater property, you can execute the commit later with the commitBlobBlockList operation. You can later update individual block blobs.</td>
</tr>
<tr>
<td>commitBlobBlockList</td>
<td>Commit a sequence of blob blocks to the block list that you previously uploaded to the blob service (by using the updateBlockBlob operation with the message CommitBlockListLater property enabled).</td>
</tr>
<tr>
<td>getBlobBlockList</td>
<td>Get the block blob list.</td>
</tr>
</tbody>
</table>

Append blob operations

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createAppendBlob</td>
<td>Create an append block. By default, if the block already exists then it is not reset. Note that you can alternately create an append blob by enabling the message AppendBlobCreated property and using the updateAppendBlob operation.</td>
</tr>
</tbody>
</table>
Append the new content to the blob. This operation also creates the blob if it does not already exist and if you enabled a message `AppendBlobCreated` property.

### Page Block operations

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createPageBlob</td>
<td>Create a page block. By default, if the block already exists then it is not reset. Note that you can also create a page block (and set its contents) by enabling a message <code>PageBlobCreated</code> property and by using the <code>updatePageBlob</code> operation.</td>
</tr>
<tr>
<td>updatePageBlob</td>
<td>Create a page block (unless you enable a message <code>PageBlobCreated</code> property and the identically named block already exists) and set the content of this blob.</td>
</tr>
<tr>
<td>resizePageBlob</td>
<td>Resize the page blob.</td>
</tr>
<tr>
<td>clearPageBlob</td>
<td>Clear the page blob.</td>
</tr>
<tr>
<td>getPageBlobRanges</td>
<td>Get the page blob page ranges.</td>
</tr>
</tbody>
</table>

### 37.3.5. Azure Blob Client configuration

If your Camel Application is running behind a firewall or if you need to have more control over the Azure Blob Client configuration, you can create your own instance:

```java
StorageCredentials credentials = new StorageCredentialsAccountAndKey("camelazure", "thekey");
CloudBlob client = new CloudBlob("camelazure", credentials);
registry.bind("azureBlobClient", client);
```

and refer to it in your Camel azure-blob component configuration:

```java
from("azure-blob:/camelazure/container1/blockBlob?azureBlobClient=#client")
.to("mock:result");
```

### 37.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-azure</artifactId>
</dependency>
```
<version>${camel-version}</version>
</dependency>

where ${camel-version} must be replaced by the actual version of Camel (2.19.0 or higher).

37.5. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
- Azure Component
CHAPTER 38. AZURE STORAGE QUEUE SERVICE COMPONENT

Available as of Camel version 2.19

The Azure Queue component supports storing and retrieving the messages to/from Azure Storage Queue service.

Prerequisites

You must have a valid Windows Azure Storage account. More information is available at Azure Documentation Portal.

38.1. URI FORMAT

```
azure-queue://accountName/queueName[?options]
```

The queue will be created if it does not already exist.
You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to get a message content from the queue `messageQueue` in the `camelazure` storage account and, use the following snippet:

```
from("azure-queue:/camelazure/messageQueue").
to("file://queuedirectory");
```

38.2. URI OPTIONS

The Azure Storage Queue Service component has no options.

The Azure Storage Queue Service endpoint is configured using URI syntax:

```
azure-queue:containerAndQueueUri
```

with the following path and query parameters:

38.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>containerAndQueueUri</td>
<td>Required Container Queue compact Uri</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

38.2.2. Query Parameters (10 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>azureQueueClient</td>
<td>The queue service client</td>
<td></td>
<td>CloudQueue</td>
</tr>
<tr>
<td>credentials</td>
<td>Set the storage credentials, required in most cases</td>
<td></td>
<td>StorageCredentials</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>messageTimeToLive</td>
<td>Message Time To Live in seconds</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>messageVisibility</td>
<td>Message Visibility Delay in seconds</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>operation</td>
<td>Queue service operation hint to the producer</td>
<td>listQueues</td>
<td>QueueServiceOperations</td>
</tr>
<tr>
<td>queuePrefix</td>
<td>Set a prefix which can be used for listing the queues</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

**Required Azure Storage Queue Service component options**

You have to provide the containerAndQueue URI and the credentials.

**38.3. USAGE**
38.3.1. Message headers evaluated by the Azure Storage Queue Service producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

38.3.2. Message headers set by the Azure Storage Queue Service producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

38.3.3. Message headers set by the Azure Storage Queue Service producer consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

38.3.4. Azure Queue Service operations

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listQueues</td>
<td>List the queues.</td>
</tr>
<tr>
<td>createQueue</td>
<td>Create the queue.</td>
</tr>
<tr>
<td>deleteQueue</td>
<td>Delete the queue.</td>
</tr>
<tr>
<td>addMessage</td>
<td>Add a message to the queue.</td>
</tr>
<tr>
<td>retrieveMessage</td>
<td>Retrieve a message from the queue.</td>
</tr>
<tr>
<td>peekMessage</td>
<td>View the message inside the queue, for example, to determine whether the message arrived at the correct queue.</td>
</tr>
<tr>
<td>updateMessage</td>
<td>Update the message in the queue.</td>
</tr>
<tr>
<td>deleteMessage</td>
<td>Delete the message in the queue.</td>
</tr>
</tbody>
</table>

38.3.5. Azure Queue Client configuration

If your Camel Application is running behind a firewall or if you need to have more control over the Azure Queue Client configuration, you can create your own instance:
and refer to it in your Camel azure-queue component configuration:

```java
from("azure-queue:/camelazure/messageQueue?azureQueueClient=#client")
  .to("mock:result");
```

### 38.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-azure</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.19.0 or higher).

### 38.5. SEE ALSO

- Component
- Endpoint
- Getting Started
- Azure Component
CHAPTER 39. BARCODE DATAFORMAT

Available as of Camel version 2.14

The barcode data format is based on the zxing library. The goal of this component is to create a barcode image from a String (marshal) and a String from a barcode image (unmarshal). You’re free to use all features that zxing offers.

39.1. DEPENDENCIES

To use the barcode data format in your camel routes you need to add the a dependency on camel-barcode which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-barcode</artifactId>
  <version>x.x.x</version>
</dependency>
```

39.2. BARCODE OPTIONS

The Barcode dataformat supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td></td>
<td>Integer</td>
<td>Width of the barcode</td>
</tr>
<tr>
<td>height</td>
<td></td>
<td>Integer</td>
<td>Height of the barcode</td>
</tr>
<tr>
<td>imageType</td>
<td></td>
<td>String</td>
<td>Image type of the barcode such as png</td>
</tr>
<tr>
<td>barcodeFormat</td>
<td></td>
<td>String</td>
<td>Barcode format such as QR-Code</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

39.3. USING THE JAVA DSL

First you have to initialize the barcode data format class. You can use the default constructor, or one of parameterized (see JavaDoc). The default values are:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>image type (BarcodeImageType)</td>
<td>PNG</td>
</tr>
<tr>
<td>width</td>
<td>100 px</td>
</tr>
<tr>
<td>height</td>
<td>100 px</td>
</tr>
<tr>
<td>encoding</td>
<td>UTF-8</td>
</tr>
<tr>
<td>barcode format (BarcodeFormat)</td>
<td>QR-Code</td>
</tr>
</tbody>
</table>

If you want to use zxing hints, you can use the `addToHintMap` method of your BarcodeDataFormat instance:

```java
// QR-Code default
DataFormat code = new BarcodeDataFormat();

code.addToHintMap(DecodeHintType.TRY_HARDER, Boolean.TRUE);
```

For possible hints, please consult the xzing documentation.

### 39.3.1. Marshalling

```java
from("direct://code")
  .marshal(code)
  .to("file://barcode_out");
```

You can call the route from a test class with:

```java
template.sendBody("direct://code", "This is a testmessage!");
```

You should find inside the 'barcode_out' folder this image:
39.3.2. Unmarshalling

The unmarshaller is generic. For unmarshalling you can use any BarcodeDataFormat instance. If you've two instances, one for (generating) QR-Code and one for PDF417, it doesn't matter which one will be used.

```java
from("file://barcode_in?noop=true")
.unmarshal(code) // for unmarshalling, the instance doesn't matter
.to("mock:out");
```

If you'll paste the QR-Code image above into the 'barcode_in' folder, you should find 'This is a testmessage!' inside the mock. You can find the barcode data format as header variable:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
CHAPTER 40. BASE64 DATAFORMAT

Available as of Camel version 2.11

The Base64 data format is used for base64 encoding and decoding.

40.1. OPTIONS

The Base64 dataformat supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineLength</td>
<td>76</td>
<td>Integer</td>
<td>To specify a maximum line length for the encoded data. By default 76 is used.</td>
</tr>
<tr>
<td>lineSeparator</td>
<td></td>
<td>String</td>
<td>The line separators to use. Uses new line characters (CRLF) by default.</td>
</tr>
<tr>
<td>urlSafe</td>
<td>false</td>
<td>Boolean</td>
<td>Instead of emitting ‘‘ and ‘/’ we emit ‘-’ and ‘_’ respectively. urlSafe is only applied to encode operations. Decoding seamlessly handles both modes. Is by default false.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.</td>
</tr>
</tbody>
</table>

In Spring DSL, you configure the data format using this tag:

```xml
<camelContext>
  <dataFormats>
    <!-- for a newline character (\n), use the HTML entity notation coupled with the ASCII code. -->
    <base64 lineSeparator="\n" id="base64withNewLine"/>
    <base64 lineLength="64" id="base64withLineLength64"/>
  </dataFormats>
...
</camelContext>
```

Then you can use it later by its reference:

```xml
<route>
  <from uri="direct:startEncode"/>
  <marshal ref="base64withLineLength64"/>
  <to uri="mock:result"/>
</route>
```

Most of the time, you won’t need to declare the data format if you use the default options. In that case, you can declare the data format inline as shown below.
40.2. MARSHAL

In this example we marshal the file content to base64 object.

```xml
<from uri="file://data.bin">
  <marshal>
    <base64/>
  </marshal>
  <to uri="jms://myqueue"/>
</from>
```

In Spring DSL:

```java
from("file://data.bin")
    .marshal().base64()
    .to("jms://myqueue");
```

40.3. UNMARSHAL

In this example we unmarshal the payload from the JMS queue to a byte[] object, before its processed by the newOrder processor.

```xml
<from uri="jms://queue/order">
  <marshal>
    <base64/>
  </marshal>
  <to uri="bean:newOrder"/>
</from>
```

In Spring DSL:

```java
from("jms://queue/order")
    .unmarshal().base64()
    .process("newOrder");
```

40.4. DEPENDENCIES

To use Base64 in your Camel routes you need to add a dependency on camel-base64 which implements this data format.

If you use Maven you can just add the following to your pom.xml:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-base64</artifactId>
  <version>x.x.x</version>  <!-- use the same version as your Camel core version -->
</dependency>
```
CHAPTER 41. BEAN COMPONENT

Available as of Camel version 1.0

The bean: component binds beans to Camel message exchanges.

41.1. URI FORMAT

bean:beanName[?options]

Where beanID can be any string which is used to look up the bean in the Registry

41.2. OPTIONS

The Bean component has no options.

The Bean endpoint is configured using URI syntax:

bean:beanName

with the following path and query parameters:

41.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>beanName</td>
<td>Required Sets the name of the bean to invoke</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

41.2.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>method (producer)</td>
<td>Sets the name of the method to invoke on the bean</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>cache (advanced)</td>
<td>If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>multiParameterArray (advanced)</td>
<td>Deprecated How to treat the parameters which are passed from the message body; if it is true, the message body should be an array of parameters. Note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### Chapter 41. Bean Component

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameters (advanced)</td>
<td>Used for configuring additional properties on the bean</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

You can append query options to the URI in the following format, `?option=value&option=value&…`

#### 41.3. Using

The object instance that is used to consume messages must be explicitly registered with the Registry. For example, if you are using Spring you must define the bean in the Spring configuration, `spring.xml`; or if you don’t use Spring, by registering the bean in JNDI.

Once an endpoint has been registered, you can build Camel routes that use it to process exchanges.

A bean: endpoint cannot be defined as the input to the route; i.e. you cannot consume from it, you can only route from some inbound message Endpoint to the bean endpoint as output. So consider using a direct: or queue: endpoint as the input.

You can use the `createProxy()` methods on `ProxyHelper` to create a proxy that will generate BeanExchanges and send them to any endpoint:

And the same route using Spring DSL:

```xml
<route>
  <from uri="direct:hello">  
  <to uri="bean:bye"/>  
</route>
```

#### 41.4. Bean as Endpoint

Camel also supports invoking Bean as an Endpoint. In the route below:

What happens is that when the exchange is routed to the `myBean` Camel will use the Bean Binding to invoke the bean.

The source for the bean is just a plain POJO:

Camel will use Bean Binding to invoke the `sayHello` method, by converting the Exchange’s In body to the `String` type and storing the output of the method on the Exchange Out body.

#### 41.5. Java DSL Bean Syntax

Java DSL comes with syntactic sugar for the Bean component. Instead of specifying the bean explicitly as the endpoint (i.e. `to("bean:beanName")`) you can use the following syntax:
Instead of passing name of the reference to the bean (so that Camel will lookup for it in the registry), you can specify the bean itself:

```java
// Send message to the bean endpoint
// and invoke method resolved using Bean Binding.
from("direct:start").beanRef("beanName");

// Send message to the bean endpoint
// and invoke given method.
from("direct:start").beanRef("beanName", "methodName");

Instead of passing name of the reference to the bean (so that Camel will lookup for it in the registry), you can specify the bean itself:

```java
// Send message to the given bean instance.
from("direct:start").bean(new ExampleBean());

// Explicit selection of bean method to be invoked.
from("direct:start").bean(new ExampleBean(), "methodName");

// Camel will create the instance of bean and cache it for you.
from("direct:start").bean(ExampleBean.class);
```

### 41.6. BEAN BINDING

How bean methods to be invoked are chosen (if they are not specified explicitly through the `method` parameter) and how parameter values are constructed from the Message are all defined by the Bean Binding mechanism which is used throughout all of the various Bean Integration mechanisms in Camel.

### 41.7. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
- **Class** component
- Bean Binding
- Bean Integration
CHAPTER 42. BEANIO DATAFORMAT

Available as of Camel version 2.10

The BeanIO Data Format uses BeanIO to handle flat payloads (such as XML, CSV, delimited, or fixed length formats).

BeanIO is configured using a mappings XML file where you define the mapping from the flat format to Objects (POJOs). This mapping file is mandatory to use.

42.1. OPTIONS

The BeanIO dataformat supports 9 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mapping</td>
<td>String</td>
<td></td>
<td>The BeanIO mapping file. Is by default loaded from the classpath. You can prefix with file:, http:, or classpath: to denote from where to load the mapping file.</td>
</tr>
<tr>
<td>streamName</td>
<td>String</td>
<td></td>
<td>The name of the stream to use.</td>
</tr>
<tr>
<td>ignoreUnidentifiedRecords</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to ignore unidentified records.</td>
</tr>
<tr>
<td>ignoreUnexpectedRecords</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to ignore unexpected records.</td>
</tr>
<tr>
<td>ignoreInvalidRecords</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to ignore invalid records.</td>
</tr>
<tr>
<td>encoding</td>
<td>String</td>
<td></td>
<td>The charset to use. Is by default the JVM platform default charset.</td>
</tr>
<tr>
<td>beanReaderErrorHandlerType</td>
<td>String</td>
<td></td>
<td>To use a custom org.apache.camel.dataformat.beanio.BeanIOErrorHandler as error handler while parsing. Configure the fully qualified class name of the error handler. Notice the options ignoreUnidentifiedRecords, ignoreUnexpectedRecords, and ignoreInvalidRecords may not be in use when you use a custom error handler.</td>
</tr>
<tr>
<td>unmarshalSingleObject</td>
<td>false</td>
<td>Boolean</td>
<td>This option controls whether to unmarshal as a list of objects or as a single object only. The former is the default mode, and the latter is only intended in special use-cases where beanio maps the Camel message to a single POJO bean.</td>
</tr>
</tbody>
</table>

42.2. USAGE

An example of a mapping file is here.

42.2.1. Using Java DSL

To use the BeanIODataFormat you need to configure the data format with the mapping file, as well the name of the stream. In Java DSL this can be done as shown below. The streamName is "employeeFile".

Then we have two routes. The first route is for transforming CSV data into a List<Employee> Java objects. Which we then split, so the mock endpoint receives a message for each row.

The 2nd route is for the reverse operation, to transform a List<Employee> into a stream of CSV data.

The CSV data could for example be as below:

42.2.2. Using XML DSL

To use the BeanIO data format in XML, you need to configure it using the <beanio> XML tag as shown below. The routes is similar to the example above.

42.3. DEPENDENCIES

To use BeanIO in your Camel routes you need to add a dependency on camel-beanio which implements this data format.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-beanio</artifactId>
  <version>2.10.0</version>
</dependency>
```
CHAPTER 43. BEANSTALK COMPONENT

Available as of Camel version 2.15

camel-beanstalk project provides a Camel component for job retrieval and post-processing of Beanstalk jobs.

You can find the detailed explanation of Beanstalk job lifecycle at Beanstalk protocol.

43.1. DEPENDENCIES

Maven users need to add the following dependency to their pom.xml

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-beanstalk</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.15.0 or higher).

43.2. URI FORMAT

```
beanstalk://[host[:port]]/[tube]?[?options]
```

You may omit either `port` or both `host` and `port`: for the Beanstalk defaults to be used ("localhost" and 11300). If you omit `tube`, Beanstalk component will use the tube with name “default”.

When listening, you may probably want to watch for jobs from several tubes. Just separate them with plus sign, e.g.

```
beanstalk://localhost:11300/tube1+tube2
```

Tube name will be URL decoded, so if your tube names include special characters like + or ?, you need to URL-encode them appropriately, or use the RAW syntax, see more details here.

By the way, you cannot specify several tubes when you are writing jobs into Beanstalk.

43.3. BEANSTALK OPTIONS

The Beanstalk component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectionSettingsFactory</td>
<td>Custom ConnectionSettingsFactory. Specify which ConnectionSettingsFactory to use to make connections to Beanstalkd. Especially useful for unit testing without beanstalkd daemon (you can mock ConnectionSettings)</td>
<td></td>
<td>ConnectionSettingsFactory</td>
</tr>
</tbody>
</table>

### Name | Description | Default | Type
--- | --- | --- | ---
**resolveProperty Placeholders** *(advanced)* | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean

The Beanstalk endpoint is configured using URI syntax:

```
beanstalk:connectionSettings
```

with the following path and query parameters:

#### 43.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectionSettings</td>
<td>Connection settings host:port/tube</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 43.3.2. Query Parameters (26 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>command <em>(common)</em></td>
<td>put means to put the job into Beanstalk. Job body is specified in the Camel message body. Job ID will be returned in beanstalk:jobId message header. delete, release, touch or bury expect Job ID in the message header beanstalk:jobId. Result of the operation is returned in beanstalk.result message header kick expects the number of jobs to kick in the message body and returns the number of jobs actually kicked out in the message header beanstalk.result.</td>
<td></td>
<td>BeanstalkCommand</td>
</tr>
<tr>
<td>jobDelay <em>(common)</em></td>
<td>Job delay in seconds.</td>
<td>0</td>
<td>int</td>
</tr>
<tr>
<td>jobPriority <em>(common)</em></td>
<td>Job priority. (0 is the highest, see Beanstalk protocol)</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>jobTimeToRun <em>(common)</em></td>
<td>Job time to run in seconds. (when 0, the beanstalkd daemon raises it to 1 automatically, see Beanstalk protocol)</td>
<td>60</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------------</td>
</tr>
<tr>
<td><code>awaitJob</code></td>
<td>Whether to wait for job to complete before ack the job from beanstalk</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>bridgeErrorHandler</code></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onFailure</code></td>
<td>Command to use when processing failed.</td>
<td></td>
<td>BeanstalkCommand</td>
</tr>
<tr>
<td><code>sendEmptyMessageWhenIdle</code></td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>useBlockIO</code></td>
<td>Whether to use blockIO.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>exceptionHandler</code></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><code>exchangePattern</code></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>pollStrategy</code></td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td><code>synchronous</code></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>backoffErrorThreshold</code></td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>backoffIdleThreshold</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>backoffMultiplier</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>delay</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td></td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>scheduler</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumer</td>
</tr>
<tr>
<td>schedulerProperties</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>startTime</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLESEC</td>
<td>TimeUnit</td>
</tr>
</tbody>
</table>
Producer behavior is affected by the `command` parameter which tells what to do with the job, it can be `delete` or `bury`.

The consumer may delete the job immediately after reserving it or wait until Camel routes process it. While the first scenario is more like a “message queue”, the second is similar to “job queue”. This behavior is controlled by `consumer.awaitJob` parameter, which equals `true` by default (following Beanstalkd nature).

When synchronous, the consumer calls `delete` on successful job completion and calls `bury` on failure. You can choose which command to execute in the case of failure by specifying `consumer.onFailure` parameter in the URI. It can take values of `bury`, `delete` or `release`.

There is a boolean parameter `consumer.useBlockIO` which corresponds to the same parameter in JavaBeanstalkClient library. By default it is `true`.

Be careful when specifying `release`, as the failed job will immediately become available in the same tube and your consumer will try to acquire it again. You can `release` and specify `jobDelay` though.

The beanstalk consumer is a Scheduled Polling Consumer which means there is more options you can configure, such as how frequent the consumer should poll. For more details see Polling Consumer.

### 43.4. CONSUMER HEADERS

The consumer stores a number of job headers in the Exchange message:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>beanstalk.jobId</td>
<td>long</td>
<td>Job ID</td>
</tr>
<tr>
<td>beanstalk.tube</td>
<td>string</td>
<td>the name of the tube that contains this job</td>
</tr>
<tr>
<td>beanstalk.state</td>
<td>string</td>
<td>“ready” or “delayed” or “reserved” or “buried” (must be “reserved”)</td>
</tr>
<tr>
<td>beanstalk.priority</td>
<td>long</td>
<td>the priority value set</td>
</tr>
<tr>
<td>beanstalk.age</td>
<td>int</td>
<td>the time in seconds since the put command that created this job</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>beanstalk.time-left</td>
<td>int</td>
<td>the number of seconds left until the server puts this job into the ready queue</td>
</tr>
<tr>
<td>beanstalk.timeout</td>
<td>int</td>
<td>the number of times this job has timed out during a reservation</td>
</tr>
<tr>
<td>beanstalk.releases</td>
<td>int</td>
<td>the number of times a client has released this job from a reservation</td>
</tr>
<tr>
<td>beanstalk.buries</td>
<td>int</td>
<td>the number of times this job has been buried</td>
</tr>
<tr>
<td>beanstalk.kicks</td>
<td>int</td>
<td>the number of times this job has been kicked</td>
</tr>
</tbody>
</table>

### 43.5. EXAMPLES

This Camel component lets you both request the jobs for processing and supply them to Beanstalkd daemon. Our simple demo routes may look like

```java
from("beanstalk:testTube").
  log("Processing job #${property.beanstalk.jobId} with body ${in.body}").
  process(new Processor() {
    @Override
    public void process(Exchange exchange) {
      // try to make integer value out of body
      exchange.getIn().setBody( Integer.valueOf(exchange.getIn().getBody(classOf[String]) ) );
    }
  }).
  log("Parsed job #${property.beanstalk.jobId} to body ${in.body}");

from("timer:dig?period=30seconds").
  setBody(constant(10)).
  log("Kick ${in.body} buried/delayed tasks").
  to("beanstalk:testTube?command=kick");
```

In the first route we are listening for new jobs in tube "testTube". When they are arriving, we are trying to parse integer value from the message body. If done successful, we log it and this successful exchange completion makes Camel component to delete this job from Beanstalk automatically. Contrary, when we cannot parse the job data, the exchange failed and the Camel component buries it by default, so that it can be processed later or probably we are going to inspect failed jobs manually.

So the second route periodically requests Beanstalk to kick 10 jobs out of buried and/or delayed state to the normal queue.
43.6. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 44. BEAN VALIDATOR COMPONENT

Available as of Camel version 2.3

The Validator component performs bean validation of the message body using the Java Bean Validation API (JSR 303). Camel uses the reference implementation, which is Hibernate Validator.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bean-validator</artifactId>
  <version>x.y.z</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

44.1. URI FORMAT

```
bean-validator:label[?options]
```

or

```
bean-validator://label[?options]
```

Where label is an arbitrary text value describing the endpoint. You can append query options to the URI in the following format, ?option=value&option=value&...

44.2. URI OPTIONS

The Bean Validator component has no options.

The Bean Validator endpoint is configured using URI syntax:

```
bean-validator:label
```

with the following path and query parameters:

44.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Required Where label is an arbitrary text value describing the endpoint</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

44.2.2. Query Parameters (6 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>constraintValidatorFactory</td>
<td>To use a custom ConstraintValidatorFactory</td>
<td></td>
<td>ConstraintValidatorFactory</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>group</td>
<td>To use a custom validation group</td>
<td>javax.validation.groups.Default</td>
<td>String</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>messageInterpolator</td>
<td>To use a custom MessageInterpolator</td>
<td></td>
<td>MessageInterpolator</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>traversableResolver</td>
<td>To use a custom TraversableResolver</td>
<td></td>
<td>TraversableResolver</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>validationProviderResolver</td>
<td>To use a custom ValidationProviderResolver</td>
<td></td>
<td>ValidationProviderResolver</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 44.3. OSGI DEPLOYMENT

To use Hibernate Validator in the OSGi environment use dedicated `ValidationProviderResolver` implementation, just as `org.apache.camel.component.bean.validator.HibernateValidationProviderResolver`. The snippet below demonstrates this approach. Keep in mind that you can use `HibernateValidationProviderResolver` starting from the Camel 2.13.0.

**Using HibernateValidationProviderResolver**

```java
from("direct:test").
  to("bean-validator://ValidationProviderResolverTest?validationProviderResolver=#myValidationProviderResolver");

...

<bean id="myValidationProviderResolver" class="org.apache.camel.component.bean.validator.HibernateValidationProviderResolver"/>
```

If no custom `ValidationProviderResolver` is defined and the validator component has been deployed into the OSGi environment, the `HibernateValidationProviderResolver` will be automatically used.

### 44.4. EXAMPLE
Assumed we have a java bean with the following annotations

Car.java

```java
public class Car {

    @NotNull
    private String manufacturer;

    @NotNull
    @Size(min = 5, max = 14, groups = OptionalChecks.class)
    private String licensePlate;

    // getter and setter
}
```

and an interface definition for our custom validation group

OptionalChecks.java

```java
public interface OptionalChecks {
}
```

with the following Camel route, only the `@NotNull` constraints on the attributes manufacturer and licensePlate will be validated (Camel uses the default group `javax.validation.groups.Default`).

```camel
from("direct:start")
  .to("bean-validator://x")
  .to("mock:end")
```

If you want to check the constraints from the group `OptionalChecks`, you have to define the route like this

```camel
from("direct:start")
  .to("bean-validator://x?group=OptionalChecks")
  .to("mock:end")
```

If you want to check the constraints from both groups, you have to define a new interface first

AllChecks.java

```java
@GroupSequence({Default.class, OptionalChecks.class})
public interface AllChecks {
}
```

and then your route definition should looks like this

```camel
from("direct:start")
  .to("bean-validator://x?group=AllChecks")
  .to("mock:end")
```

And if you have to provide your own message interpolator, traversable resolver and constraint validator factory, you have to write a route like this
It’s also possible to describe your constraints as XML and not as Java annotations. In this case, you have to provide the file `META-INF/validation.xml` which could look like this:

```xml
<bean id="myMessageInterpolator" class="my.ConstraintValidatorFactory" />
<bean id="myTraversableResolver" class="my.TraversableResolver" />
<bean id="myConstraintValidatorFactory" class="my.ConstraintValidatorFactory" />

from("direct:start")
  .to("bean-validator://x?group=AllChecks&messageInterpolator=#myMessageInterpolator
    &traversableResolver=#myTraversableResolver&constraintValidatorFactory=#myConstraintValidatorFactory")
  .to("mock:end")
```

It’s also possible to describe your constraints as XML and not as Java annotations. In this case, you have to provide the file `META-INF/validation.xml` which could look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<validation-config
  xmlns="http://jboss.org/xml/ns/javax/validation/configuration"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://jboss.org/xml/ns/javax/validation/configuration">
  <default-provider>org.hibernate.validator.HibernateValidator</default-provider>
  <message-interpolator>org.hibernate.validator.engine.ResourceBundleMessageInterpolator</message-interpolator>
  <traversable-resolver>org.hibernate.validator.engine.resolver.DefaultTraversableResolver</traversable-resolver>
  <constraint-validator-factory>org.hibernate.validator.engine.ConstraintValidatorFactoryImpl</constraint-validator-factory>
  <constraint-mapping>/constraints-car.xml</constraint-mapping>
</validation-config>
```

and the `constraints-car.xml` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<constraint-mappings
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://jboss.org/xml/ns/javax/validation/mapping validation-mapping-1.0.xsd"
  xmlns="http://jboss.org/xml/ns/javax/validation/mapping">
  <default-package>org.apache.camel.component.bean.validator</default-package>

  <bean class="CarWithoutAnnotations" ignore-annotations="true">
    <field name="manufacturer">
      <constraint annotation="javax.validation.constraints.NotNull"/>
    </field>

    <field name="licensePlate">
      <constraint annotation="javax.validation.constraints.NotNull"/>
      <constraint annotation="javax.validation.constraints.Size">
        <groups>
          <value>org.apache.camel.component.bean.validator.OptionalChecks</value>
        </groups>
        <element name="min">5</element>
      </constraint>
    </field>
  </bean>
</constraint-mappings>
```
Here is the XML syntax for the example route definition where **OrderedChecks** can be [https://github.com/apache/camel/blob/master/components/camel-bean-validator/src/test/java/org/apache/camel/component/bean/validator/OrderedChecks.java](https://github.com/apache/camel/blob/master/components/camel-bean-validator/src/test/java/org/apache/camel/component/bean/validator/OrderedChecks.java)

Note that the body should include an instance of a class to validate.

```xml
<bean>
  <field name="max">14</field>
</bean>

< constraint-mappings >
  <constraint >
    <field/>
  </constraint>
</constraint-mappings>
```

CHAPTER 45. BINDING COMPONENT (DEPRECATED)

Available as of Camel version 2.11

In Camel terms a binding is a way of wrapping an Endpoint in a contract; such as a Data Format, a Content Enricher or validation step. Bindings are completely optional and you can choose to use them on any camel endpoint.

Bindings are inspired by the work of SwitchYard project adding service contracts to various technologies like Camel and many others. But rather than the SwitchYard approach of wrapping Camel in SCA, Camel Bindings provide a way of wrapping Camel endpoints with contracts inside the Camel framework itself; so you can use them easily inside any Camel route.

45.1. OPTIONS

The Binding component has no options.

The Binding endpoint is configured using URI syntax:

```
binding:bindingName:delegateUri
```

with the following path and query parameters:

45.1.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bindingName</td>
<td>Required Name of the binding to lookup in the Camel registry.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>delegateUri</td>
<td>Required Uri of the delegate endpoint.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

45.1.2. Query Parameters (4 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### 45.2. USING BINDINGS

A Binding is currently a bean which defines the contract (though we’ll hopefully add bindings to the Camel DSL).

There are a few approaches to defining a bound endpoint (i.e. an endpoint bound with a Binding).

### 45.3. USING THE BINDING URI

You can prefix any endpoint URI with `binding:nameOfBinding` where `nameOfBinding` is the name of the Binding bean in your registry.

```java
from("binding:jaxb:activemq:myQueue").to("binding:jaxb:activemq:anotherQueue")
```

Here we are using the "jaxb" binding which may, for example, use the JAXB Data Format to marshal and unmarshal messages.

### 45.4. USING A BINDINGCOMPONENT

There is a Component called BindingComponent which can be configured in your Registry by dependency injection which allows the creation of endpoints which are already bound to some binding.

For example if you registered a new component called "jsonmq" in your registry using code like this

```java
JacksonDataFormat format = new JacksonDataFormat(MyBean.class);
context.bind("jsonmq", new BindingComponent(new DataFormatBinding(format), "activemq:foo."));
```

Then you could use the endpoint as if it were any other endpoint.

```java
from("jsonmq:myQueue").to("jsonmq:anotherQueue")
```

which would be using the queues "foo.myQueue" and "foo.anotherQueue" and would use the given Jackson Data Format to marshal on and off the queue.
45.5. WHEN TO USE BINDINGS

If you only use an endpoint once in a single route; a binding may actually be more complex and more work than just using the ‘raw’ endpoint directly and using explicit marshalling and validation in the camel route as normal.

However bindings can help when you are composing many routes together; or using a single route as a ‘template’ that is configured input and output endpoints; bindings then provide a nice way to wrap up a contract and endpoint together.

Another good use case for bindings is when you are using many endpoints which use the same binding; rather than always having to mention a specific data format or validation rule, you can just use the BindingComponent to wrap the endpoints in the binding of your choice.

So bindings are a composition tool really; only use them when they make sense - the extra complexity may not be worth it unless you have lots of routes or endpoints.
CHAPTER 46. BINDY DATAFORMAT

Available as of Camel version 2.0

The goal of this component is to allow the parsing/binding of non-structured data (or to be more precise non-XML data) to/from Java Beans that have binding mappings defined with annotations. Using Bindy, you can bind data from sources such as:

- CSV records,
- Fixed-length records,
- FIX messages,
- or almost any other non-structured data

to one or many Plain Old Java Object (POJO). Bindy converts the data according to the type of the java property. POJOs can be linked together with one-to-many relationships available in some cases. Moreover, for data type like Date, Double, Float, Integer, Short, Long and BigDecimal, you can provide the pattern to apply during the formatting of the property.

For the BigDecimal numbers, you can also define the precision and the decimal or grouping separators.

<table>
<thead>
<tr>
<th>Type</th>
<th>Format Type</th>
<th>Pattern example</th>
<th>Link</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>DateFormat</td>
<td>dd-MM-yyyy</td>
<td><a href="http://java.sun.com/j2se/1.5.0/docs/api/java/text/SimpleDateFormat.html">http://java.sun.com/j2se/1.5.0/docs/api/java/text/SimpleDateFormat.html</a></td>
</tr>
<tr>
<td>Decimal*</td>
<td>DecimalFormat</td>
<td>..###</td>
<td><a href="http://java.sun.com/j2se/1.5.0/docs/api/java/text/DecimalFormat.html">http://java.sun.com/j2se/1.5.0/docs/api/java/text/DecimalFormat.html</a></td>
</tr>
</tbody>
</table>

Decimal* = Double, Integer, Float, Short, Long

*Format supported*

This first release only support comma separated values fields and key value pair fields (e.g.: FIX messages).

To work with camel-bindy, you must first define your model in a package (e.g. com.acme.model) and for each model class (e.g. Order, Client, Instrument, ...) add the required annotations (described hereafter) to the Class or field.

*Multiple models*

If you use multiple models, each model has to be placed in it’s own package to prevent unpredictable results.
From Camel 2.16 onwards this is no longer the case, as you can safely have multiple models in the same package, as you configure bindy using class names instead of package names now.

### 46.1. OPTIONS

The Bindy dataformat supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Bindy Type</td>
<td></td>
<td>Whether to use csv, fixed or key value pairs mode. The default value is either Csv or KeyValue depending on chosen dataformat.</td>
</tr>
<tr>
<td>classType</td>
<td>String</td>
<td></td>
<td>Name of model class to use.</td>
</tr>
<tr>
<td>locale</td>
<td>String</td>
<td></td>
<td>To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default.</td>
</tr>
<tr>
<td>unwrapSingleInstance</td>
<td>true</td>
<td>Boolean</td>
<td>When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a java.util.List.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc.</td>
</tr>
</tbody>
</table>

### 46.2. ANNOTATIONS

The annotations created allow to map different concept of your model to the POJO like:

- Type of record (csv, key value pair (e.g. FIX message), fixed length ...),
- Link (to link object in another object),
- DataField and their properties (int, type, ...),
- KeyValuePairField (for key = value format like we have in FIX financial messages),
- Section (to identify header, body and footer section),
- OneToMany,
- BindyConverter (since 2.18.0),
- FormatFactories (since 2.18.0)

This section will describe them:

### 46.3.1. CSVRECORD
The CsvRecord annotation is used to identify the root class of the model. It represents a record = a line of a CSV file and can be linked to several children model classes.

<table>
<thead>
<tr>
<th>Annotation name</th>
<th>Record type</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>CsvRecord</td>
<td>csv</td>
<td>Class</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>type</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>separator</td>
<td>string</td>
<td>mandatory - can be ‘,’ or ‘;’ or ‘anything’. This value is interpreted as a regular expression. If you want to use a sign which has a special meaning in regular expressions, e.g. the ‘</td>
</tr>
<tr>
<td>skipFirstLine</td>
<td>boolean</td>
<td>optional - default value = false - allow to skip the first line of the CSV file</td>
</tr>
<tr>
<td>crlf</td>
<td>string</td>
<td>optional - possible values = WINDOWS,UNIX,MAC, or custom; default value. WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s)</td>
</tr>
<tr>
<td>generateHeaderColumns</td>
<td>boolean</td>
<td>optional - default value = false - uses to generate the header columns of the CSV generates</td>
</tr>
<tr>
<td>autoSpanLine</td>
<td>boolean</td>
<td>[Camel 2.13/2.12.2]: optional - default value = false - if enabled then the last column is auto spanned to end of line, for example if its a comment, etc this allows the line to contain all characters, also the delimiter char.</td>
</tr>
<tr>
<td>isOrdered</td>
<td>boolean</td>
<td>optional - default value = false - allow to change the order of the fields when CSV is generated</td>
</tr>
<tr>
<td>quote</td>
<td>String</td>
<td>[Camel 2.8.3/2.9]: option - allow to specify a quote character of the fields when CSV is generated. This annotation is associated to the root class of the model and must be declared one time.</td>
</tr>
<tr>
<td>quoting</td>
<td>boolean</td>
<td><em>Camel 2.11</em>:optional - default value = false - Indicate if the values (and headers) must be quoted when marshaling when CSV is generated.</td>
</tr>
<tr>
<td>endWithLineBreak</td>
<td>boolean</td>
<td>[Camel 2.2]: optional - default value = true - Indicate if the CSV generated file should end with a line break.</td>
</tr>
</tbody>
</table>
case 1: separator = ','

The separator used to segregate the fields in the CSV record is ',':

10, J, Pauline, M, XD12345678, Fortis Dynamic 15/15, 2500, USD, 08-01-2009

```java
@CsvRecord( separator = ""," )
public Class Order {
    
}
```

case 2: separator = ';'

Compare to the previous case, the separator here is ';' instead of ',':

10; J; Pauline; M; XD12345678; Fortis Dynamic 15/15; 2500; USD; 08-01-2009

```java
@CsvRecord( separator = ";;" )
public Class Order {
    
}
```

case 3: separator = '|' 

Compare to the previous case, the separator here is '|' instead of ';':

```
10| J| Pauline| M| XD12345678| Fortis Dynamic 15/15| 2500| USD| 08-01-2009
```

```java
@CsvRecord( separator = "\|" )
public Class Order {
    
}
```

case 4: separator = "\",\"

Applies for Camel 2.8.2 or older

When the field to be parsed of the CSV record contains ',', ' or '; which is also used as separator, we would find another strategy to tell camel bindy how to handle this case. To define the field containing the data with a comma, you will use simple or double quotes as delimiter (e.g. '10', 'Street 10, NY', 'USA' or "10", "Street 10, NY", "USA").

Remark: In this case, the first and last character of the line which are a simple or double quotes will removed by bindy

```
"10","J","Pauline"," M","XD12345678","Fortis Dynamic 15,15" 2500","USD","08-01-2009"
```

```java
@CsvRecord( separator = "\",\" )
public Class Order {
    
```
From Camel 2.8.3/2.9 or never bindy will automatic detect if the record is enclosed with either single or double quotes and automatic remove those quotes when unmarshalling from CSV to Object. Therefore do not include the quotes in the separator, but simple do as below:

```
"10","J","Pauline"," M","XD12345678","Fortis Dynamic 15,15"
2500","USD","08-01-2009"
```

Notice that if you want to marshal from Object to CSV and use quotes, then you need to specify which quote character to use, using the `quote` attribute on the `@CsvRecord` as shown below:

```
@CsvRecord( separator = "," )
public class Order {
}
```

```
@CsvRecord( separator = ",", quote = "\"")
public class Order {
}
```

case 5 : separator & skipfirstline

The feature is interesting when the client wants to have in the first line of the file, the name of the data fields:

order id, client id, first name, last name, isin code, instrument name, quantity, currency, date

To inform bindy that this first line must be skipped during the parsing process, then we use the attribute:

```
@CsvRecord(separator = ",", skipFirstLine = true)
public class Order {
}
```

case 6 : generateHeaderColumns

To add at the first line of the CSV generated, the attribute `generateHeaderColumns` must be set to true in the annotation like this:

```
@CsvRecord( generateHeaderColumns = true )
public class Order {
}
```

As a result, Bindy during the unmarshaling process will generate CSV like this:

```
order id, client id, first name, last name, isin code, instrument name, quantity, currency, date
```

```
10, J, Pauline, M, XD12345678, Fortis Dynamic 15/15, 2500, USD,08-01-2009
```

case 7 : carriage return
If the platform where camel-bindy will run is not Windows but Macintosh or Unix, than you can change the crlf property like this. Three values are available: WINDOWS, UNIX or MAC.

```java
@CsvRecord(separator = ",", crlf="MAC")
public Class Order {
}
```

Additionally, if for some reason you need to add a different line ending character, you can opt to specify it using the crlf parameter. In the following example, we can end the line with a comma followed by the newline character:

```java
@CsvRecord(separator = ",", crlf="",\n")
public Class Order {
}
```

case 8 : isOrdered

Sometimes, the order to follow during the creation of the CSV record from the model is different from the order used during the parsing. Then, in this case, we can use the attribute isOrdered = true to indicate this in combination with attribute 'position' of the DataField annotation.

```java
@CsvRecord(isOrdered = true)
public Class Order {
    @DataField(pos = 1, position = 11)
    private int orderNr;
    @DataField(pos = 2, position = 10)
    private String clientNr;
}
```

Remark: pos is used to parse the file, stream while positions is used to generate the CSV.

### 46.4. 2. LINK

The link annotation will allow to link objects together.

<table>
<thead>
<tr>
<th>Annotation name</th>
<th>Record type</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link</td>
<td>all</td>
<td>Class &amp; Property</td>
</tr>
</tbody>
</table>
Only one-to-one relation is allowed.

e.g.: If the model class `Client` is linked to the `Order` class, then use annotation `Link` in the `Order` class like this:

**Property Link**

```java
@CsvRecord(separator = ",")
public class Order {
    @DataField(pos = 1)
    private int orderNr;

    @Link
    private Client client;
}
```

AND for the class `Client`:

**Class Link**

```java
@Link
public class Client {
}
```

### 46.5. 3. DATAFIELD

The `DataField` annotation defines the property of the field. Each datafield is identified by its position in the record, a type (string, int, date, ...) and optionally of a pattern.
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>type</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>int</td>
<td>mandatory - The <strong>input</strong> position of the field. digit number starting from 1 to ... - See the position parameter.</td>
</tr>
<tr>
<td>pattern</td>
<td>string</td>
<td>optional - default value = &quot;&quot; - will be used to format Decimal, Date,</td>
</tr>
<tr>
<td>length</td>
<td>int</td>
<td>optional - represents the length of the field for fixed length format</td>
</tr>
<tr>
<td>precision</td>
<td>int</td>
<td>optional - represents the precision to be used when the Decimal number will be formatted/parsed</td>
</tr>
<tr>
<td>pattern</td>
<td>string</td>
<td>optional - default value = &quot;&quot; - is used by the Java formatter (SimpleDateFormat by example) to format/validate data. If using pattern, then setting locale on bindy data format is recommended. Either set to a known locale such as &quot;us&quot; or use &quot;default&quot; to use platform default locale. Notice that &quot;default&quot; requires Camel 2.14/2.13.3/2.12.5.</td>
</tr>
<tr>
<td>position</td>
<td>int</td>
<td>optional - must be used when the position of the field in the CSV generated (output message) must be different compare to input position (pos). See the pos parameter.</td>
</tr>
<tr>
<td>required</td>
<td>boolean</td>
<td>optional - default value = &quot;false&quot;</td>
</tr>
<tr>
<td>trim</td>
<td>boolean</td>
<td>optional - default value = &quot;false&quot;</td>
</tr>
<tr>
<td>default Value</td>
<td>string</td>
<td>Camel 2.10: optional - default value = &quot;&quot; - defines the field’s default value when the respective CSV field is empty/not available</td>
</tr>
<tr>
<td>implied DecimalSeparator</td>
<td>boolean</td>
<td>Camel 2.11: optional - default value = &quot;false&quot; - Indicates if there is a decimal point implied at a specified location</td>
</tr>
<tr>
<td>length Pos</td>
<td>int</td>
<td>Camel 2.11: optional – can be used to identify a data field in a fixed-length record that defines the fixed length for this field</td>
</tr>
<tr>
<td>align</td>
<td>string</td>
<td>optional - default value = &quot;R&quot; - Align the text to the right or left within a fixed-length field. Use values ‘R’ or ‘L’</td>
</tr>
<tr>
<td>delimit er</td>
<td>string</td>
<td>Camel 2.11: optional – can be used to demarcate the end of a variable-length field within a fixed-length record</td>
</tr>
</tbody>
</table>

**case 1: pos**

This parameter/attribute represents the position of the field in the csv record
Position

As you can see in this example the position starts at '1' but continues at '5' in the class Order. The numbers from '2' to '4' are defined in the class Client (see here after).

Position continues in another model class

\begin{verbatim}
public class Client {
    @DataField(pos = 2)
    private String clientNr;
    @DataField(pos = 3)
    private String firstName;
    @DataField(pos = 4)
    private String lastName;
}
\end{verbatim}

case2: pattern

The pattern allows to enrich or validates the format of your data

Pattern

\begin{verbatim}
public class Order {
    @DataField(pos = 1)
    private int orderNr;
    @DataField(pos = 5)
    private String isinCode;
    @DataField(name = "Name", pos = 6)
    private String instrumentName;
    @DataField(pos = 7, precision = 2)
    private BigDecimal amount;
    @DataField(pos = 8)
    private String currency;
    // pattern used during parsing or when the date is created
\end{verbatim}
case 3: precision

The precision is helpful when you want to define the decimal part of your number

Precision

```java
@CsvRecord(separator = ",", isOrdered = true)
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @Link
    private Client client;

    @DataField(pos = 5)
    private String isinCode;

    @DataField(name = "Name", pos = 6)
    private String instrumentName;

    @DataField(pos = 7, precision = 2)
    private BigDecimal amount;

    @DataField(pos = 8)
    private String currency;

    @DataField(pos = 9, pattern = "dd-MM-yyyy")
    private Date orderDate;
}
```

case 4: Position is different in output

The position attribute will inform bindy how to place the field in the CSV record generated. By default, the position used corresponds to the position defined with the attribute 'pos'. If the position is different (that means that we have an asymmetric processus comparing marshaling from unmarshaling) than we can use 'position' to indicate this.

Here is an example

Position is different in output

```java
@CsvRecord(separator = ",", isOrdered = true)
public class Order {

    // Positions of the fields start from 1 and not from 0

    @DataField(pos = 1, position = 11)
    private int orderNr;

    @DataField(pos = 2, position = 10)
    private String clientNr;

    @DataField(pos = 3, position = 9)
    private String instrumentName;

    @DataField(pos = 4, position = 8)
    private String currency;

    @DataField(pos = 5, position = 7)
    private BigDecimal amount;

    @DataField(pos = 6, position = 6)
    private Date orderDate;
}
```
This attribute of the annotation @DataField must be used in combination with attribute isOrdered = true of the annotation @CsvRecord

case 5 : required

If a field is mandatory, simply use the attribute 'required' setted to true

Required

```java
@CsvRecord(separator = ",")
public class Order {
    @DataField(pos = 1)
    private int orderNr;
    @DataField(pos = 2, required = true)
    private String clientNr;
    @DataField(pos = 3, required = true)
    private String firstName;
    @DataField(pos = 4, required = true)
    private String lastName;
}
```

If this field is not present in the record, than an error will be raised by the parser with the following information:

Some fields are missing (optional or mandatory), line :

case 6 : trim

If a field has leading and/or trailing spaces which should be removed before they are processed, simply use the attribute 'trim' setted to true

Trim

```java
@CsvRecord(separator = ",")
public class Order {
    @DataField(pos = 1, trim = true)
    private int orderNr;
}
```
case 7: defaultValue

If a field is not defined then uses the value indicated by the defaultValue attribute

**Default value**

```java
@CsvRecord(separator = ",,"
public class Order {
    @DataField(pos = 1)
    private int orderNr;
    @DataField(pos = 2)
    private Integer clientNr;
    @DataField(pos = 3, required = true)
    private String firstName;
    @DataField(pos = 4, defaultValue = "Barin")
    private String lastName;
}
```

This attribute is only applicable to optional fields.

**46.6. 4. FIXEDLENGTHRECORD**

The FixedLengthRecord annotation is used to identified the root class of the model. It represents a record = a line of a file/message containing data fixed length formatted and can be linked to several children model classes. This format is a bit particular because data of a field can be aligned to the right or to the left. When the size of the data does not fill completely the length of the field, we can then add 'padd' characters.

<table>
<thead>
<tr>
<th>Annotation name</th>
<th>Record type</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>FixedLengthRecord</td>
<td>fixed</td>
<td>Class</td>
</tr>
<tr>
<td>Parameter name</td>
<td>type</td>
<td>Info</td>
</tr>
<tr>
<td>----------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>crlf</td>
<td>string</td>
<td>optional - possible values = WINDOWS, UNIX, MAC, or custom; default value. WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s). This option is used only during marshalling, whereas unmarshalling uses system default JDK provided line delimiter unless eol is customized</td>
</tr>
<tr>
<td>eol</td>
<td>string</td>
<td>optional - default=&quot;&quot; which is empty string. Character to be used to process considering end of line after each record while unmarshalling (optional - default = &quot;&quot; which help default JDK provided line delimiter to be used unless any other line delimiter provided). This option is used only during unmarshalling, where marshalling uses system default provided line delimiter as &quot;WINDOWS&quot; unless any other value is provided</td>
</tr>
<tr>
<td>paddin gChar</td>
<td>char</td>
<td>mandatory - default value = ' '</td>
</tr>
<tr>
<td>length</td>
<td>int</td>
<td>mandatory = size of the fixed length record</td>
</tr>
<tr>
<td>hasHeader</td>
<td>boolean</td>
<td><strong>Camel 2.11</strong> - optional - Indicates that the record(s) of this type may be preceded by a single header record at the beginning of the file / stream</td>
</tr>
<tr>
<td>hasFooter</td>
<td>boolean</td>
<td><strong>Camel 2.11</strong> - optional - Indicates that the record(s) of this type may be followed by a single footer record at the end of the file / stream</td>
</tr>
<tr>
<td>skipHeader</td>
<td>boolean</td>
<td><strong>Camel 2.11</strong> - optional - Configures the data format to skip marshalling / unmarshalling of the header record. Configure this parameter on the primary record (e.g., not the header or footer).</td>
</tr>
<tr>
<td>skipFooter</td>
<td>boolean</td>
<td><strong>Camel 2.11</strong> - optional - Configures the data format to skip marshalling / unmarshalling of the footer record. Configure this parameter on the primary record (e.g., not the header or footer).</td>
</tr>
<tr>
<td>isHeader</td>
<td>boolean</td>
<td><strong>Camel 2.11</strong> - optional - Identifies this FixedLengthRecord as a header record</td>
</tr>
<tr>
<td>isFooter</td>
<td>boolean</td>
<td><strong>Camel 2.11</strong> - optional - Identifies this FixedLengthRecords as a footer record</td>
</tr>
<tr>
<td>ignoreTrailingChars</td>
<td>boolean</td>
<td><strong>Camel 2.11.1</strong> - optional - Indicates that characters beyond the last mapped filed can be ignored when unmarshalling / parsing. This annotation is associated to the root class of the model and must be declared one time.</td>
</tr>
</tbody>
</table>

The hasHeader/hasFooter parameters are mutually exclusive with isHeader/isFooter. A record may not be both a header/footer and a primary fixed-length record.

**case 1: Simple fixed length record**

This simple example shows how to design the model to parse/format a fixed message
Fixed-simple

```java
@FixedLengthRecord(length=54, paddingChar=' ')
public static class Order {
    @DataField(pos = 1, length=2)
    private int orderNr;
    @DataField(pos = 3, length=2)
    private String clientNr;
    @DataField(pos = 5, length=7)
    private String firstName;
    @DataField(pos = 12, length=1, align="L")
    private String lastName;
    @DataField(pos = 13, length=4)
    private String instrumentCode;
    @DataField(pos = 17, length=10)
    private String instrumentNumber;
    @DataField(pos = 27, length=3)
    private String orderType;
    @DataField(pos = 30, length=5)
    private String instrumentType;
    @DataField(pos = 35, precision = 2, length=7)
    private BigDecimal amount;
    @DataField(pos = 42, length=3)
    private String currency;
    @DataField(pos = 45, length=10, pattern="dd-MM-yyyy")
    private Date orderDate;
}
```

case 2 : Fixed length record with alignment and padding

This more elaborated example show how to define the alignment for a field and how to assign a padding character which is ' ' here
case 3: Field padding

Sometimes, the default padding defined for record cannot be applied to the field as we have a number format where we would like to pad with '0' instead of '. In this case, you can use in the model the attribute paddingField to set this value.

```java
@DataField(pos = 3, length=2)
private String clientNr;

@DataField(pos = 5, length=9)
private String firstName;

@DataField(pos = 14, length=5, align="L")  // align text to the LEFT zone of the block
private String lastName;

@DataField(pos = 19, length=4)
private String instrumentCode;

@DataField(pos = 23, length=10)
private String instrumentNumber;

@DataField(pos = 33, length=3)
private String orderType;

@DataField(pos = 36, length=5)
private String instrumentType;

@DataField(pos = 41, precision = 2, length=7)
private BigDecimal amount;

@DataField(pos = 48, length=3)
private String currency;

@DataField(pos = 51, length=10, pattern = "dd-MM-yyyy")
private Date orderDate;
```

Fixed-padding-field

```java
@FixedLengthRecord(length = 65, paddingChar = ' ')
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 3, length = 2)
    private String clientNr;

    @DataField(pos = 5, length = 9)
    private String firstName;

    @DataField(pos = 14, length = 5, align = "L")
```
Fixed-length records sometimes have delimited content within the record. The firstName and lastName fields are delimited with the '^' character in the following example:

```
10A9Pauline^M^ISINXD12345678BUYShare000002500.45USD01-08-2009
```

```java
private String lastName;

@DataField(pos = 19, length = 4)
private String instrumentCode;

@DataField(pos = 23, length = 10)
private String instrumentNumber;

@DataField(pos = 33, length = 3)
private String orderType;

@DataField(pos = 36, length = 5)
private String instrumentType;

@DataField(pos = 41, precision = 2, length = 12, paddingChar = '0')
private BigDecimal amount;

@DataField(pos = 53, length = 3)
private String currency;

@DataField(pos = 56, length = 10, pattern = "dd-MM-yyyy")
private Date orderDate;
}
```

### Fixed-length record with delimiter

Fixed-length records sometimes have delimited content within the record. The firstName and lastName fields are delimited with the '^' character in the following example:

```
10A9Pauline^M^ISINXD12345678BUYShare000002500.45USD01-08-2009
```
As of Camel 2.11 the 'pos' value(s) in a fixed-length record may optionally be defined using ordinal, sequential values instead of precise column numbers.

**case 5 : Fixed length record with record-defined field length**

Occasionally a fixed-length record may contain a field that define the expected length of another field within the same record. In the following example the length of the instrumentNumber field value is defined by the value of instrumentNumberLen field in the record.

```
10A9Pauline^M^ISIN10XD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-delimited

```java
@FixedLengthRecord()
public static class Order {
    private int orderNr;
    private String clientNr;
    private String firstName;
    private String lastName;
    private String instrumentCode;
    private int instrumentNumberLen;
    private String instrumentNumber;
    private String orderType;
}
```
case 6: Fixed length record with header and footer

Bindy will discover fixed-length header and footer records that are configured as part of the model – provided that the annotated classes exist either in the same package as the primary @FixedLengthRecord class, or within one of the configured scan packages. The following text illustrates two fixed-length records that are bracketed by a header record and footer record.

```
101-08-2009
10A9 PaulineM ISINXD12345678BUYShare000002500.45USD01-08-2009
10A9 RichN ISINXD12345678BUYShare000002700.45USD01-08-2009
9000000002

Fixed-header-and-footer-main-class

@FixedLengthRecord(hasHeader = true, hasFooter = true)
public class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 2, length = 2)
    private String clientNr;

    @DataField(pos = 3, length = 9)
    private String firstName;

    @DataField(pos = 4, length = 5, align = "L")
    private String lastName;

    @DataField(pos = 5, length = 4)
    private String instrumentCode;

    @DataField(pos = 6, length = 10)
    private String instrumentNumber;

    @DataField(pos = 7, length = 3)
    private String orderType;

    @DataField(pos = 8, length = 5)
    private String instrumentType;

    @DataField(pos = 9, precision = 2, length = 12, paddingChar = '0')
```
private BigDecimal amount;

@DataField(pos = 10, length = 3)
private String currency;

@DataField(pos = 11, length = 10, pattern = "dd-MM-yyyy")
private Date orderDate;
}

@FixedLengthRecord(isHeader = true)
public class OrderHeader {
    @DataField(pos = 1, length = 1)
    private int recordType = 1;

    @DataField(pos = 2, length = 10, pattern = "dd-MM-yyyy")
    private Date recordDate;
}

@FixedLengthRecord(isFooter = true)
public class OrderFooter {
    @DataField(pos = 1, length = 1)
    private int recordType = 9;

    @DataField(pos = 2, length = 9, align = "R", paddingChar = '0')
    private int numberOfRecordsInTheFile;
}

@FixedLengthRecord(ignoreTrailingChars = true)
public static class Order {
    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 3, length = 2)
    private String clientNr;

    // any characters that appear beyond the last mapped field will be ignored
}

46.7. 5. MESSAGE
The Message annotation is used to identified the class of your model who will contain key value pairs fields. This kind of format is used mainly in Financial Exchange Protocol Messages (FIX). Nevertheless, this annotation can be used for any other format where data are identified by keys. The key pair values are separated each other by a separator which can be a special character like a tab delimiter (unicode representation: \u0009) or a start of heading (unicode representation: \u0001)

**“FIX information“**

More information about FIX can be found on this web site: [http://www.fixprotocol.org/](http://www.fixprotocol.org/). To work with FIX messages, the model must contain a Header and Trailer classes linked to the root message class which could be a Order class. This is not mandatory but will be very helpful when you will use camel-bindy in combination with camel-fix which is a Fix gateway based on quickFix project [http://www.quickfixj.org/](http://www.quickfixj.org/).

<table>
<thead>
<tr>
<th>Annotation name</th>
<th>Record type</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>key value pair</td>
<td>Class</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>type</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>pairSeparator</td>
<td>string</td>
<td>mandatory – can be ‘=’ or ‘;’ or ‘anything’</td>
</tr>
<tr>
<td>keyValuePairSeparator</td>
<td>string</td>
<td>mandatory – can be \u0001, \u0009, '#' or ‘anything’</td>
</tr>
<tr>
<td>crlf</td>
<td>string</td>
<td>optional – possible values = WINDOWS,UNIX,MAC, or custom; default value = WINDOWS – allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s)</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>optional – define the type of message (e.g. FIX, EMX, …)</td>
</tr>
<tr>
<td>version</td>
<td>string</td>
<td>optional – version of the message (e.g. 4.1)</td>
</tr>
<tr>
<td>isOrdered</td>
<td>boolean</td>
<td>optional – default value = false – allow to change the order of the fields when FIX message is generated. This annotation is associated to the message class of the model and must be declared one time.</td>
</tr>
</tbody>
</table>

case 1: separator = ‘\u0001’
The separator used to segregate the key value pair fields in a FIX message is the ASCII '01' character or in unicode format '\u0001'. This character must be escaped a second time to avoid a java runtime error. Here is an example:

```
8=FIX.4.1 9=20 34=1 35=0 49=INVMGR 56=BRKR 1=BE.CHM.001 11=CHM0001-01 22=4 ...
```

and how to use the annotation

**FIX - message**

```java
@Message(keyValuePairSeparator = "\=", pairSeparator = "\u0001", type="FIX", version="4.1")
public class Order {
}
```

*Look at test cases*

The ASCII character like tab, ... cannot be displayed in WIKI page. So, have a look to the test case of camel-bindy to see exactly how the FIX message looks like (src\test\data\fix\fix.txt) and the Order, Trailer, Header classes (src\test\java\org\apache\camel\dataformat\bindy\model\fix\simple\Order.java)

### 46.8. 6. KEYVALUEPAIRFIELD

The `KeyValuePairField` annotation defines the property of a key value pair field. Each `KeyValuePairField` is identified by a `tag` (= key) and its value associated, a `type` (string, int, date, ...), optionally a pattern and if the field is required

<table>
<thead>
<tr>
<th>Annotation name</th>
<th>Record type</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>KeyValuePairField</code></td>
<td><code>Key Value Pair - FIX</code></td>
<td>Property</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>type</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tag</code></td>
<td>int</td>
<td>mandatory - digit number identifying the field in the message - must be unique</td>
</tr>
<tr>
<td><code>pattern</code></td>
<td>string</td>
<td>optional - default value = &quot;&quot; - will be used to format Decimal, Date, ...</td>
</tr>
<tr>
<td><code>precision</code></td>
<td>int</td>
<td>optional - digit number - represents the precision to be used when the Decimal number will be formatted/parsed</td>
</tr>
<tr>
<td>Parameter name</td>
<td>type</td>
<td>Info</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>position</td>
<td>int</td>
<td>optional - must be used when the position of the key/tag in the FIX message must be different</td>
</tr>
<tr>
<td>required</td>
<td>boolean</td>
<td>optional - default value = &quot;false&quot;</td>
</tr>
<tr>
<td>implied DecimalSeparator</td>
<td>boolean</td>
<td>Camel 2.1: optional – default value = &quot;false&quot; – Indicates if there is a decimal point implied at a specified location</td>
</tr>
</tbody>
</table>

**case 1: tag**

This parameter represents the key of the field in the message

**FIX message - Tag**

```java
@Message(keyValuePairSeparator = "=", pairSeparator = "u0001", type="FIX", version="4.1")
public class Order {

    @Link Header header;

    @Link Trailer trailer;

    @KeyValuePairField(tag = 1) // Client reference
    private String Account;

    @KeyValuePairField(tag = 11) // Order reference
    private String ClOrdId;

    @KeyValuePairField(tag = 22) // Fund ID type (Sedol, ISIN, ...)
    private String IDSource;

    @KeyValuePairField(tag = 48) // Fund code
    private String SecurityId;

    @KeyValuePairField(tag = 54) // Movement type ( 1 = Buy, 2 = sell)
    private String Side;

    @KeyValuePairField(tag = 58) // Free text
    private String Text;
}
```

**case 2: Different position in output**

If the tags/keys that we will put in the FIX message must be sorted according to a predefine order, then use the attribute 'position' of the annotation @KeyValuePairField

**FIX message - Tag - sort**
In FIX message of fixed length records, it is common to have different sections in the representation of the information: header, body, and section. The purpose of the annotation @Section is to inform bindy about which class of the model represents the header (= section 1), body (= section 2) and footer (= section 3).

Only one attribute/parameter exists for this annotation.

<table>
<thead>
<tr>
<th>Annotation name</th>
<th>Record type</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section</td>
<td>FIX</td>
<td>Class</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>type</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>int</td>
<td>digit number identifying the section position</td>
</tr>
</tbody>
</table>

**case 1: Section**

Definition of the header section

**FIX message - Section - Header**

```java
@Section(number = 1)
public class Header {

    @KeyValuePairField(tag = 8, position = 1) // Message Header
    private String beginString;
}
```
The purpose of the annotation @OneToMany is to allow to work with a List<?> field defined a POJO class or from a record containing repetitive groups.

*Restrictions OneToMany*

Be careful, the one to many of bindy does not allow to handle repetitions defined on several levels of the hierarchy

The relation OneToMany ONLY WORKS in the following cases:

- Reading a FIX message containing repetitive groups (= group of tags/keys)
- Generating a CSV with repetitive data
case 1: Generating CSV with repetitive data

Here is the CSV output that we want:

| Claus, Ibsen, Camel in Action 1, 2010, 35 |
| Claus, Ibsen, Camel in Action 2, 2012, 35 |
| Claus, Ibsen, Camel in Action 3, 2013, 35 |
| Claus, Ibsen, Camel in Action 4, 2014, 35 |

Remark: the repetitive data concern the title of the book and its publication date while first, last name and age are common.

and the classes used to modeling this. The Author class contains a List of Book.

Generate CSV with repetitive data

```java
@CsvRecord(separator ="," ")
public class Author {

    @DataField(pos = 1)
    private String firstName;

    @DataField(pos = 2)
    private String lastName;

    @OneToMany
    private List<Book> books;

    @DataField(pos = 5)
    private String Age;
}

public class Book {

    @DataField(pos = 3)
    private String title;
```
Very simple isn’t it !!!

**case 2 : Reading FIX message containing group of tags/keys**

Here is the message that we would like to process in our model :

```
8=FIX 4.19=2034=135=049=INVMGR56=BRKR
1=BE.CHM.00111=CHM0001-0158=this is a camel - bindy test
22=448=BE000124567854=1
22=548=BE000987654354=2
22=648=BE000999999954=3
10=220
```

tags 22, 48 and 54 are repeated

and the code

**Reading FIX message containing group of tags/keys**

```java
public class Order {

    @Link Header header;
    @Link Trailer trailer;

    @KeyValuePairField(tag = 1) // Client reference
    private String account;

    @KeyValuePairField(tag = 11) // Order reference
    private String clOrdId;

    @KeyValuePairField(tag = 58) // Free text
    private String text;

    @OneToMany(mappedTo = "org.apache.camel.dataformat.bindy.model.fix.complex.onetomany.Security")
    List<Security> securities;
}
```

```java
public class Security {

    @KeyValuePairField(tag = 22) // Fund ID type (Sedol, ISIN, ...)
    private String idSource;

    @KeyValuePairField(tag = 48) // Fund code
    private String securityCode;

    @KeyValuePairField(tag = 54) // Movement type ( 1 = Buy, 2 = sell)
    private String side;
}
```
46.11. 9. BINDYCONVERTER

The purpose of the annotation @BindyConverter is define a converter to be used on field level. The provided class must implement the Format interface.

```java
public static class DataModel {
    @DataField(pos = 1, length = 10, trim = true)
    @BindyConverter(CustomConverter.class)
    public String field1;
}
```

```java
public static class CustomConverter implements Format<String> {
    @Override
    public String format(String object) throws Exception {
        return (new StringBuilder(object)).reverse().toString();
    }
    @Override
    public String parse(String string) throws Exception {
        return (new StringBuilder(string)).reverse().toString();
    }
}
```

46.12. 10. FORMATFACTORIES

The purpose of the annotation @FormatFactories is to define a set of converters at record-level. The provided classes must implement the FormatFactoryInterface interface.

```java
public static class OrderNumber {
    private int orderNr;
    public static OrderNumber ofString(String orderNumber) {
        OrderNumber result = new OrderNumber();
        result.orderNr = Integer.valueOf(orderNumber);
        return result;
    }
}
```

```java
public static class OrderNumberFormatFactory extends AbstractFormatFactory {
    {
        supportedClasses.add(OrderNumber.class);
    }
}
```
46.13. SUPPORTED DATATYPES

The DefaultFormatFactory makes formatting of the following datatype available by returning an instance of the interface FormatFactoryInterface based on the provided FormattingOptions:

- BigDecimal
- BigInteger
- Boolean
- Byte
- Character
- Date
- Double
- Enums
- Float
- Integer
- LocalDate (java 8, since 2.18.0)
- LocalDateTime (java 8, since 2.18.0)
- LocalTime (java 8, since 2.18.0)
- Long
- Short
- String
The DefaultFormatFactory can be overridden by providing an instance of FactoryRegistry in the registry in use (e.g. spring or JNDI).

### 46.14. USING THE JAVA DSL

The next step consists in instantiating the DataFormat `bindy` class associated with this record type and providing Java package name(s) as parameter.

For example the following uses the class `BindyCsvDataFormat` (who correspond to the class associated with the CSV record type) which is configured with `com.acme.model` package name to initialize the model objects configured in this package.

```java
// Camel 2.15 or older (configure by package name)
DataFormat bindy = new BindyCsvDataFormat("com.acme.model");

// Camel 2.16 onwards (configure by class name)
DataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);
```

#### 46.14.1. Setting locale

Bindy supports configuring the locale on the dataformat, such as

```java
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");

// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale("us");
```

Or to use the platform default locale then use "default" as the locale name. Notice this requires Camel 2.14/2.13.3/2.12.5.

```java
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");

// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale("default");
```

for older releases you can set it using Java code as shown

```java
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");

// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale(Locale.getDefault().getISO3Country());
```

### 46.14.2. Unmarshaling
Alternatively, you can use a named reference to a data format which can then be defined in your Registry e.g. your Spring XML file:

```java
from("file://inbox")
  .unmarshal("myBindyDataFormat")
  .to("direct:handleOrders");
```

The Camel route will pick-up files in the inbox directory, unmarshall CSV records into a collection of model objects and send the collection to the route referenced by 'handleOrders'.

The collection returned is a List of Map objects. Each Map within the list contains the model objects that were marshalled out of each line of the CSV. The reason behind this is that each line can correspond to more than one object. This can be confusing when you simply expect one object to be returned per line.

Each object can be retrieved using its class name.

```java
List<Map<String, Object>> unmarshaledModels = (List<Map<String, Object>>) exchange.getIn().getBody();

int modelCount = 0;
for (Map<String, Object> model : unmarshaledModels) {
  for (String className : model.keySet()) {
    Object obj = model.get(className);
    LOG.info("Count : " + modelCount + ", " + obj.toString());
  }
  modelCount++;
}
LOG.info("Total CSV records received by the csv bean : " + modelCount);
```

Assuming that you want to extract a single Order object from this map for processing in a route, you could use a combination of a Splitter and a Processor as per the following:

```java
from("file://inbox")
  .unmarshal(bindy)
  .split(body())
  .process(new Processor() {
    public void process(Exchange exchange) throws Exception {
      Message in = exchange.getIn();
      Map<String, Object> modelMap = (Map<String, Object>) in.getBody();
      in.setBody(modelMap.get(Order.class.getCanonicalName()));
    }
  })
  .to("direct:handleSingleOrder")
  .end();
```

Take care of the fact that Bindy uses CHARSET_NAME property or the CHARSET_NAME header as define in the Exchange interface to do a characterset conversion of the inputstream received for unmarshalling. In some producers (e.g. file-endpoint) you can define a characterset. The characterset...
conversion can already been done by this producer. Sometimes you need to remove this property or header from the exchange before sending it to the unmarshal. If you don’t remove it the conversion might be done twice which might lead to unwanted results.

```java
from("file://inbox?charset=Cp922")
    .removeProperty(Exchange.CHARSET_NAME)
    .unmarshal("myBindyDataFormat")
    .to("direct:handleOrders");
```

### 46.14.3. Marshaling

To generate CSV records from a collection of model objects, you create the following route:

```java
from("direct:handleOrders")
    .marshal(bindy)
    .to("file://outbox")
```

### 46.15. USING SPRING XML

This is really easy to use Spring as your favorite DSL language to declare the routes to be used for camel-bindy. The following example shows two routes where the first will pick-up records from files, unmarshal the content and bind it to their model. The result is then send to a pojo (doing nothing special) and place them into a queue.

The second route will extract the pojos from the queue and marshal the content to generate a file containing the csv record. The example above is for using Camel 2.16 onwards.

```xml
<beans xmlns="http://www.springframework.org/schema/beans"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans.xsd
    http://camel.apache.org/schema/spring
    http://camel.apache.org/schema/spring/camel-spring.xsd">

    <!-- Queuing engine - ActiveMq - work locally in mode virtual memory -->
    <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
        <property name="brokerURL" value="vm://localhost:61616"/>
    </bean>

    <camelContext xmlns="http://camel.apache.org/schema/spring">
        <dataFormats>
            <bindy id="bindyDataformat" type="Csv" classType="org.apache.camel.bindy.model.Order"/>
        </dataFormats>

        <route>
            <from uri="file://src/data/csv/?noop=true" />
            <unmarshal ref="bindyDataformat" />
            <to uri="bean:csv" />
            <to uri="activemq:queue:in" />
        </route>
    </camelContext>
</beans>
```
NOTE

Please verify that your model classes implements serializable otherwise the queue manager will raise an error

46.16. DEPENDENCIES

To use Bindy in your camel routes you need to add the a dependency on camel-bindy which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bindy</artifactId>
  <version>x.x.x</version>
</dependency>
```
CHAPTER 47. USING OSGI BLUEPRINT WITH CAMEL

A custom XML namespace for Blueprint has been created to let you leverage the nice XML dialect. Given Blueprint custom namespaces are not standardized yet, this namespace can only be used on the Apache Aries Blueprint implementation, which is the one used by Apache Karaf.

47.1. OVERVIEW

The XML schema is mostly the same as the one for Spring, so all the xml snippets throughout the documentation referring to Spring XML also apply to Blueprint routes.

Here is a very simple route definition using blueprint:

```xml
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0">
  <camelContext xmlns="http://camel.apache.org/schema/blueprint">
    <route>
      <from uri="timer:test"/>
      <to uri="log:test"/>
    </route>
  </camelContext>
</blueprint>
```

There are a few limitations at this point about the supported xml elements (compared to the Spring xml syntax):

- beanPostProcessor are specific to Spring and aren’t allowed

However, using blueprint when you deploy your applications in an OSGi environment has several advantages:

- when upgrading to a new camel version, you don’t have to change the namespace, as the correct version will be selected based on the camel packages that are imported by your bundle
- no startup ordering issue with respect to the custom namespaces and your bundles
- you can use Blueprint property placeholders

47.2. USING CAMEL-BLUEPRINT

To leverage camel-blueprint in OSGi, you only need the Aries Blueprint bundle and the camel-blueprint bundle, in addition to camel-core and its dependencies.

If you use Karaf, you can use the feature named camel-blueprint which will install all the required bundles.
CHAPTER 48. BONITA COMPONENT

Available as of Camel version 2.19

Used for communicating with a remote Bonita BPM process engine.

48.1. URI FORMAT

\[
\text{bonita://[operation]?[options]}
\]

Where \text{operation} is the specific action to perform on Bonita.

48.2. GENERAL OPTIONS

The Bonita component has no options.

The Bonita endpoint is configured using URI syntax:

\[
\text{bonita:operation}
\]

with the following path and query parameters:

48.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>Required Operation to use</td>
<td></td>
<td>BonitaOperation</td>
</tr>
</tbody>
</table>

48.2.2. Query Parameters (9 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>hostname (consumer)</td>
<td>Hostname where Bonita engine runs</td>
<td>localhost</td>
<td>String</td>
</tr>
<tr>
<td>port (consumer)</td>
<td>Port of the server hosting Bonita engine</td>
<td>8080</td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>processName (consumer)</td>
<td>Name of the process involved in the operation</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>password (security)</td>
<td>Password to authenticate to Bonita engine.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>username (security)</td>
<td>Username to authenticate to Bonita engine.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

48.3. BODY CONTENT

For the startCase operation, the input variables are retrieved from the body message. This one has to contain a Map<String,Serializable>.

48.4. EXAMPLES

The following example start a new case in Bonita:

```java
from("direct:start").to("bonita:startCase?
hostname=localhost&port=8080&processName=TestProcess&username=install&password=install")
```

48.5. DEPENDENCIES

To use Bonita in your Camel routes you need to add a dependency on camel-bonita, which implements the component.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bonita</artifactId>
</dependency>
```
<version>x.x.x</version>
</dependency>
CHAPTER 49. BOON DATAFORMAT

Available as of Camel version 2.16

Boon is a Data Format which uses the Boon JSON marshalling library to unmarshal an JSON payload into Java objects or to marshal Java objects into an JSON payload. Boon aims to be a simple and fast parser than other common parsers currently used.

49.1. OPTIONS

The Boon dataformat supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unmarshalTypeName</td>
<td>String</td>
<td></td>
<td>Class name of the java type to use when unmarshalling</td>
</tr>
<tr>
<td>useList</td>
<td>false</td>
<td>Boolean</td>
<td>To unmarshal to a List of Map or a List of Pojo.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

49.2. USING THE JAVA DSL

```
DataFormat boonDataFormat = new BoonDataFormat("com.acme.model.Person");

from("activemq:My.Queue")
    .unmarshal(boonDataFormat)
    .to("mqseries:Another.Queue");
```

49.3. USING BLUEPRINT XML

```
<bean id="boonDataFormat" class="org.apache.camel.component.boon.BoonDataFormat">
    <argument value="com.acme.model.Person"/>
</bean>

<camelContext id="camel" xmlns="http://camel.apache.org/schema/blueprint">
    <route>
        <from uri="activemq:My.Queue"/>
        <unmarshal ref="boonDataFormat"/>
        <to uri="mqseries:Another.Queue"/>
    </route>
</camelContext>
```
49.4. DEPENDENCIES

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-boon</artifactId>
  <version>x.x.x</version>
</dependency>
```
The Box component provides access to all of the Box.com APIs accessible using https://github.com/box/box-java-sdk. It allows producing messages to upload and download files, create, edit, and manage folders, etc. It also supports APIs that allow polling for updates to user accounts and even changes to enterprise accounts, etc.

Box.com requires the use of OAuth2.0 for all client application authentication. In order to use camel-box with your account, you’ll need to create a new application within Box.com at https://developer.box.com. The Box application’s client id and secret will allow access to Box APIs which require a current user. A user access token is generated and managed by the API for an end user.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-box</artifactId>
  <version>${camel-version}</version>
</dependency>
```

### 50.1. CONNECTION AUTHENTICATION TYPES

The Box component supports three different types of authenticated connections.

#### 50.1.1. Standard Authentication

**Standard Authentication** uses the **OAuth 2.0 three-legged authentication process** to authenticate its connections with Box.com. This type of authentication enables Box **managed users** and **external users** to access, edit, and save their Box content through the Box component.

#### 50.1.2. App Enterprise Authentication

**App Enterprise Authentication** uses the **OAuth 2.0 with JSON Web Tokens (JWT)** to authenticate its connections as a **Service Account** for a **Box Application**. This type of authentication enables a service account to access, edit, and save the Box content of its **Box Application** through the Box component.

#### 50.1.3. App User Authentication

**App User Authentication** uses the **OAuth 2.0 with JSON Web Tokens (JWT)** to authenticate its connections as an **App User** for a **Box Application**. This type of authentication enables app users to access, edit, and save their Box content in its **Box Application** through the Box component.

### 50.2. BOX OPTIONS

The Box component supports 2 options which are listed below.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td></td>
<td>BoxConfiguration</td>
</tr>
<tr>
<td>resolveProperty Placeholder</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Box endpoint is configured using URI syntax:

```
box:apiName/methodName
```

with the following path and query parameters:

### 50.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiName</td>
<td>Required What kind of operation to perform</td>
<td></td>
<td>BoxApiName</td>
</tr>
<tr>
<td>methodName</td>
<td>Required What sub operation to use for the selected operation</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 50.2.2. Query Parameters (20 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clientId</td>
<td>Box application client ID</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>enterpriseId</td>
<td>The enterprise ID to use for an App Enterprise.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>inBody</td>
<td>Sets the name of a parameter to be passed in the exchange In Body</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>userId</td>
<td>The user ID to use for an App User.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pick up incoming messages, or the like, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>httpParams (advanced)</td>
<td>Custom HTTP params for settings like proxy host</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>accessTokenCache (security)</td>
<td>Custom Access Token Cache for storing and retrieving access tokens.</td>
<td></td>
<td>IAccessTokenCache</td>
</tr>
<tr>
<td>clientSecret (security)</td>
<td>Box application client secret</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>encryptionAlgorithm (security)</td>
<td>The type of encryption algorithm for JWT. Supported Algorithms: RSA_SHA_256 RSA_SHA_384 RSA_SHA_512</td>
<td>RSA_SHA_256</td>
<td>EncryptionAlgorithm</td>
</tr>
<tr>
<td>maxCacheEntries (security)</td>
<td>The maximum number of access tokens in cache.</td>
<td>100</td>
<td>int</td>
</tr>
<tr>
<td>authenticationType (authentication)</td>
<td>The type of authentication for connection. Types of Authentication: STANDARD_AUTHENTICATION - OAuth 2.0 (3-legged) SERVER_AUTHENTICATION - OAuth 2.0 with JSON Web Tokens</td>
<td>APP_USER_AUTHENTICATION</td>
<td>String</td>
</tr>
<tr>
<td>privateKeyFile (security)</td>
<td>The private key for generating the JWT signature.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td>privateKeyPassword</td>
<td>The password for the private key.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>publicKeyId</td>
<td>The ID for public key for validating the JWT signature.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sslContextParameters</td>
<td>To configure security using SSLContextParameters.</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
<tr>
<td>userName</td>
<td>Box user name, MUST be provided</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>userPassword</td>
<td>Box user password, MUST be provided if authSecureStorage is not set, or returns null on first call</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 50.3. URI FORMAT

```
box:apiName/methodName
```

apiName can be one of:

- collaborations
- comments
- event-logs
- files
- folders
- groups
- events
- search
- tasks
- users

### 50.4. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.
Endpoint options that are not mandatory are denoted by \[\]. When there are no mandatory options for an endpoint, one of the set of \[\] options MUST be provided. Producer endpoints can also use a special option `inBody` that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format `CamelBox.<option>`. Note that the `inBody` option overrides message header, i.e. the endpoint option `inBody=option` would override a `CamelBox.option` header.

If a value is not provided for the option `defaultRequest` either in the endpoint URI or in a message header, it will be assumed to be `null`. Note that the `null` value will only be used if other options do not satisfy matching endpoints.

In case of Box API errors the endpoint will throw a `RuntimeCamelException` with a `com.box.sdk.BoxAPIException` derived exception cause.

### 50.4.1. Endpoint Prefix `collaborations`

For more information on Box collaborations see [https://developer.box.com/reference#collaboration-object](https://developer.box.com/reference#collaboration-object). The following endpoints can be invoked with the prefix `collaborations` as follows:

```
box:collaborations/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Short and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>addFolderCollaboration</td>
<td>add</td>
<td>folderId, collaborator, role</td>
<td>com.box.sdk.BoxCollaboration</td>
</tr>
<tr>
<td>addFolderCollaborationByEmail</td>
<td>addByEmail</td>
<td>folderId, email, role</td>
<td>com.box.sdk.BoxCollaboration</td>
</tr>
<tr>
<td>deleteCollaboration</td>
<td>delete</td>
<td>collaborationTokenId</td>
<td></td>
</tr>
<tr>
<td>getFolderCollaborations</td>
<td>collaborations</td>
<td>folderId</td>
<td>java.util.Collection</td>
</tr>
</tbody>
</table>
50.4.2. Endpoint Prefix comments

For more information on Box comments see https://developer.box.com/reference#comment-object. The following endpoints can be invoked with the prefix comments as follows:

```bash
box:comments/endpoint?[options]
```
## URI Options for collaborations

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>commentedId</td>
<td>String</td>
</tr>
<tr>
<td>fileId</td>
<td>String</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
</tr>
</tbody>
</table>

### 50.4.3. Endpoint Prefix events-logs

For more information on Box event logs see [https://developer.box.com/reference#events](https://developer.box.com/reference#events). The following endpoints can be invoked with the prefix `events` as follows:

```
box:event-logs/endpoint?[options]
```
### URI Options for event-logs

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>String</td>
</tr>
<tr>
<td>after</td>
<td>Date</td>
</tr>
<tr>
<td>before</td>
<td>Date</td>
</tr>
<tr>
<td>types</td>
<td>com.box.sdk.BoxEvent.Types[]</td>
</tr>
</tbody>
</table>

#### 50.4.4. Endpoint Prefix files

For more information on Box files see [https://developer.box.com/reference#file-object](https://developer.box.com/reference#file-object). The following endpoints can be invoked with the prefix `files` as follows.

`box:files/endpoint?[options]`

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>upload File</td>
<td>upload</td>
<td>parent FolderId, content, fileName, [created], [modified], [size], [listener]</td>
<td>com.box.sdk.BoxFile</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Shorthand Alias</td>
<td>Options</td>
<td>Result Body Type</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------</td>
<td>----------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>downloadFile</td>
<td>download</td>
<td>fileId, output, [range Start], [range End], [listener]</td>
<td>java.io.OutputStream</td>
</tr>
<tr>
<td>copyFile</td>
<td>copy</td>
<td>fileId, destinationFolderId, [newName]</td>
<td>com.box.sdk.BoxFile</td>
</tr>
<tr>
<td>moveFile</td>
<td>move</td>
<td>fileId, destinationFolderId, [newName]</td>
<td>com.box.sdk.BoxFile</td>
</tr>
<tr>
<td>renameFile</td>
<td>rename</td>
<td>fileId, newName</td>
<td>com.box.sdk.BoxFile</td>
</tr>
<tr>
<td>createFileSharedLink</td>
<td>link</td>
<td>fileId, access, [unshareDate], [permissions]</td>
<td>com.box.sdk.BoxSharedLink</td>
</tr>
<tr>
<td>deleteFile</td>
<td>delete</td>
<td>fileId</td>
<td></td>
</tr>
<tr>
<td>uploadNewFileVersion</td>
<td>upload Version</td>
<td>fileId, fileContent, [modified], [fileSize], [listener]</td>
<td>com.box.boxsdk.BoxFile</td>

### 50.4.5. Endpoint Prefix folders

For more information on Box folders see [https://developer.box.com/reference#folder-object](https://developer.box.com/reference#folder-object). The following endpoints can be invoked with the prefix `folders` as follows.

```text
box:folders/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>getRootFolder</td>
<td>root</td>
<td></td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>createFolder</td>
<td>create</td>
<td>parent, parentFolderId, folderName</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>createFolder</td>
<td>create</td>
<td>parent, parentFolderId, path</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>copyFolder</td>
<td>copy</td>
<td>folderId, destinationfolderId, [newName]</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>moveFolder</td>
<td>move</td>
<td>folderId, destinationFolderId, newName</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Short and Alias</td>
<td>Options</td>
<td>Result Body Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------</td>
<td>----------------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>rename Folder</td>
<td>rename</td>
<td>folderId, newFolderName</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>create Folder Shared Link</td>
<td>link</td>
<td>folderId, access, [unsharedDate], [permissions]</td>
<td>java.util.List</td>
</tr>
<tr>
<td>delete Folder</td>
<td>delete</td>
<td>folderId</td>
<td></td>
</tr>
<tr>
<td>getFolder</td>
<td>folder</td>
<td>path</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>

<td>info</td>
<td>folderId, fields</td>
<td>com.box.sdk.BoxFolder.Info</td>
</tr>
<tr>
<td>getFolderItems</td>
<td>items</td>
<td>folderId, offset, limit, fields</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
<tr>
<td>update FolderInfo</td>
<td>updateInfo</td>
<td>folderId, info</td>
<td>com.box.sdk.BoxFolder</td>
</tr>
</tbody>
</table>

**URI Options for folders**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String[]</td>
</tr>
<tr>
<td>folderId</td>
<td>String</td>
</tr>
<tr>
<td>offset</td>
<td>Long</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>limit</td>
<td>Long</td>
</tr>
<tr>
<td>fields</td>
<td>String[]</td>
</tr>
<tr>
<td>parentFolderId</td>
<td>String</td>
</tr>
<tr>
<td>folderName</td>
<td>String</td>
</tr>
<tr>
<td>destinationFolderId</td>
<td>String</td>
</tr>
<tr>
<td>newName</td>
<td>String</td>
</tr>
<tr>

<td>String</td>
</tr>
<tr>
<td>info</td>
<td>String</td>
</tr>
<tr>
<td>access</td>
<td>com.box.sdk.BoxSharedLink.Access</td>
</tr>
<tr>
<td>unshareDate</td>
<td>Date</td>
</tr>
<tr>
<td>permissions</td>
<td>com.box.sdk.BoxSharedLink.Permissions</td>
</tr>
</tbody>
</table>

### 50.4.6. Endpoint Prefix *groups*

For more information on Box groups see [https://developer.box.com/reference#group-object](https://developer.box.com/reference#group-object). The following endpoints can be invoked with the prefix *groups* as follows:

```
box:groups/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Short and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Endpoint</td>
<td>Shorthand and Alias</td>
<td>Option(s)</td>
<td>Result Body Type</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------</td>
<td>------------------------------------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td>create Group</td>
<td>create</td>
<td>name, [provenance, external</td>
<td>SyncId\text{entifier, description, invitabilityLevel, memberViewabilityLevel]</td>
</tr>
<tr>
<td>addGroupMembership</td>
<td>create Membership</td>
<td>group\text{id, userId, role}</td>
<td>com.box.sdk.BoxGroupMembership</td>
</tr>
<tr>
<td>delete Group</td>
<td>delete</td>
<td>group\text{id}</td>
<td></td>
</tr>
<tr>
<td>getAllGroups</td>
<td>groups</td>
<td></td>
<td>java.util.Collection</td>
</tr>
<tr>
<td>getGroupInfo</td>
<td>info</td>
<td>group\text{id}</td>
<td>com.box.sdk.BoxGroup\text{Info}</td>
</tr>
<tr>
<td>updateGroupInfo</td>
<td>updateInfo</td>
<td>group\text{id, groupId}</td>
<td>com.box.sdk.BoxGroup</td>
</tr>
<tr>
<td>addGroupMembership</td>
<td>addMembership</td>
<td>group\text{id, userId, role}</td>
<td>com.box.sdk.BoxGroupMembership</td>
</tr>
<tr>
<td>delete GroupMembership</td>
<td>delete Membership</td>
<td>group\text{MembershipId}</td>
<td></td>
</tr>
</tbody>
</table>
### Endpoint Prefix `search`

For more information on Box search API see [https://developer.box.com/reference#searching-for-content](https://developer.box.com/reference#searching-for-content). The following endpoints can be invoked with the prefix `search` as follows:

```
box:search/endpoint?[options]
```
### URI Options for search

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>folderId</td>
<td>String</td>
</tr>
<tr>
<td>query</td>
<td>String</td>
</tr>
</tbody>
</table>

#### 50.4.8. Endpoint Prefix tasks

For information on Box tasks see [https://developer.box.com/reference#task-object-1](https://developer.box.com/reference#task-object-1). The following endpoints can be invoked with the prefix **tasks** as follows:

```
box:tasks/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>addFileTask</td>
<td>add</td>
<td>fileId, action, dueAt, [message]</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>deleteTask</td>
<td>delete</td>
<td>taskId</td>
<td></td>
</tr>
<tr>
<td>getFileTasks</td>
<td>tasks</td>
<td>fileId</td>
<td>java.util.List</td>
</tr>
<tr>
<td>getTaskInfo</td>
<td>info</td>
<td>taskId</td>
<td>com.box.sdk.BoxTask.Info</td>
</tr>
<tr>
<td>updateTaskInfo</td>
<td>updateInfo</td>
<td>taskld, info</td>
<td>com.box.sdk.BoxTask</td>
</tr>
</tbody>
</table>
### Endpoint | Short and Alias | Options | Result Body Type
--- | --- | --- | ---
addAssignmentToTask | addAssignment | taskId, assignTo | com.box.sdk.BoxTask

deleteTaskAssignment | delete Assignment | taskAssignmentId |

getTaskAssignments | assignments | taskId | java.util.List

getTaskAssignmentInfo | assignmentInfo | taskAssignmentId | com.box.sdk.BoxTaskAssignment.Info

### URI Options for tasks

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileId</td>
<td>String</td>
</tr>
<tr>
<td>action</td>
<td>com.box.sdk.BoxTask.Action</td>
</tr>
<tr>
<td>dueAt</td>
<td>Date</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
</tr>
<tr>
<td>taskId</td>
<td>String</td>
</tr>
<tr>
<td>info</td>
<td>com.box.sdk.BoxTask.Info</td>
</tr>
<tr>
<td>assignTo</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>taskAssignmentId</td>
<td>String</td>
</tr>
</tbody>
</table>
50.4.9. Endpoint Prefix *users*

For information on Box users see [https://developer.box.com/reference#user-object](https://developer.box.com/reference#user-object). The following endpoints can be invoked with the prefix *users* as follows:

```
box:users/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>getCurrentUser</td>
<td>current User</td>
<td></td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>getAllEnterpriseOrExternalUsers</td>
<td>users</td>
<td>filterTerm, [fields]</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>createAppUser</td>
<td>create</td>
<td>name, [params]</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>createEnterpriseUser</td>
<td>create</td>
<td>login, name, [params]</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>deleteUser</td>
<td>delete</td>
<td>userId, notifyUser, force</td>
<td></td>
</tr>
<tr>
<td>getUserEmailAlias</td>
<td>emailAlias</td>
<td>userId</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>deleteUserEmailAlias</td>
<td>emailAlias</td>
<td>userId, emailAlias</td>
<td>java.util.List</td>
</tr>
<tr>
<td>getUserInfo</td>
<td>info</td>
<td>userId</td>
<td>com.box.sdk.BoxUser.Info</td>
</tr>
<tr>
<td>updateUserInfo</td>
<td>updateInfo</td>
<td>userId, info</td>
<td>com.box.sdk.BoxUser</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Shorthand and Alias</td>
<td>Option(s)</td>
<td>Result Body Type</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------</td>
<td>----------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>moveFolderToUser</td>
<td>-</td>
<td>userId, source UserId</td>
<td>com.box.sdk.BoxFolder.Info</td>
</tr>
</tbody>
</table>

**URI Options for users**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultRequest</td>
<td>com.box.restclientv2.requestsbase.BoxDefaultRequestObject</td>
</tr>
<tr>
<td>emailAliasRequest</td>
<td>com.box.boxjav-libv2.requests.requestobjects.BoxEmailAliasRequestObject</td>
</tr>
<tr>
<td>emailId</td>
<td>String</td>
</tr>
<tr>
<td>filterTerm</td>
<td>String</td>
</tr>
<tr>
<td>folderId</td>
<td>String</td>
</tr>
<tr>
<td>simpleUserRequest</td>
<td>com.box.boxjav-libv2.requests.requestobjects.BoxSimpleUserRequestObject</td>
</tr>
<tr>
<td>userDeleteRequest</td>
<td>com.box.boxjav-libv2.requests.requestobjects.BoxUserDeleteRequestObject</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
</tr>
<tr>
<td>userRequest</td>
<td>com.box.boxjav-libv2.requests.requestobjects.BoxUserRequestObject</td>
</tr>
<tr>
<td>userUpdateLoginReq</td>
<td>com.box.boxjav-libv2.requests.requestobjects.BoxUserUpdateLoginRequestObject</td>
</tr>
</tbody>
</table>

### 50.5. CONSUMER ENDPOINTS:

For more information on Box events see [https://developer.box.com/reference#events](https://developer.box.com/reference#events).
For more information on Box events see https://developer.box.com/reference#events. Consumer endpoints can only use the endpoint prefix `events` as shown in the example next.

```java
box:events/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand and Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>events</td>
<td>[startingPosition]</td>
<td>com.box.sdk.BoxEvent</td>
<td></td>
</tr>
</tbody>
</table>

URI Options for `events`

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>startingPosition</td>
<td>Long</td>
</tr>
</tbody>
</table>

### 50.6. MESSAGE HEADER

Any of the options can be provided in a message header for producer endpoints with `CamelBox` prefix.

### 50.7. MESSAGE BODY

All result message bodies utilize objects provided by the Box Java SDK. Producer endpoints can specify the option name for incoming message body in the `inBody` endpoint parameter.

### 50.8. SAMPLES

The following route uploads new files to the user’s root folder:

```java
from("file:...")
  .to("box://files/upload/inBody=fileUploadRequest");
```

The following route polls user’s account for updates:

```java
from("box://events/listen?startingPosition=-1")
  .to("bean:blah");
```

The following route uses a producer with dynamic header options. The `fileId` property has the Box file id and the `output` property has the output stream of the file contents, so they are assigned to the `CamelBox.fileId` header and `CamelBox.output` header respectively as follows:

```java
from("direct:foo")
  .setHeader("CamelBox.fileId", header("fileId"))
  .setHeader("CamelBox.output", header("output"))
```
.to("box://files/download")
.to("file://...");
CHAPTER 51. BRAINTREE COMPONENT

Available as of Camel version 2.17

The Braintree component provides access to Braintree Payments through their Java SDK. All client applications need API credential in order to process payments. In order to use camel-braintree with your account, you’ll need to create a new Sandbox or Production account.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-braintree</artifactId>
  <version>${camel-version}</version>
</dependency>
```

51.1. BRAINTREE OPTIONS

The Braintree component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td></td>
<td>BraintreeConfiguration</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholder</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>apiName</td>
<td>Required What kind of operation to perform</td>
<td></td>
<td>BraintreeApiName</td>
</tr>
<tr>
<td>methodName</td>
<td>What sub operation to use for the selected operation</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

The Braintree endpoint is configured using URI syntax:

```
braintree:apiName/methodName
```

with the following path and query parameters:

51.1.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiName</td>
<td>Required What kind of operation to perform</td>
<td></td>
<td>BraintreeApiName</td>
</tr>
<tr>
<td>methodName</td>
<td>What sub operation to use for the selected operation</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
## 51.1.2. Query Parameters (14 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>environment</code></td>
<td>The environment Either SANDBOX or PRODUCTION</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>inBody</code></td>
<td>Sets the name of a parameter to be passed in the exchange In Body</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>merchantId</code></td>
<td>The merchant id provided by Braintree.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>privateKey</code></td>
<td>The private key provided by Braintree.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>publicKey</code></td>
<td>The public key provided by Braintree.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>bridgeErrorHandler</code></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>exceptionHandler</code></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><code>exchangePattern</code></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>accessToken</code></td>
<td>The access token granted by a merchant to another in order to process transactions on their behalf. Used in place of environment, merchant id, public key and private key fields.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>httpReadTimeout</code></td>
<td>Set read timeout for http calls.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td><code>synchronous</code></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td>httpLogLevel</td>
<td>Set logging level for http calls, see java.util.logging.Level</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyHost</td>
<td>The proxy host</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort</td>
<td>The proxy port</td>
<td></td>
<td>Integer</td>
</tr>
</tbody>
</table>

### 51.2. URI FORMAT

```
braintree://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:
- addOn
- address
- clientToken
- creditCardverification
- customer
- discount
- merchantAccount
- paymentmethod
- paymentmethodNonce
- plan
- settlementBatchSummary
- subscription
- transaction
- webhookNotification

### 51.3. BRAINTREECOMPONENT
The Braintree Component can be configured with the options below. These options can be provided using the component’s bean property `configuration` of type `org.apache.camel.component.braintree.BraintreeConfiguration`.

<table>
<thead>
<tr>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>environment</td>
<td>String</td>
<td>Value that specifies where requests should be directed – sandbox or production</td>
</tr>
<tr>
<td>merchantId</td>
<td>String</td>
<td>A unique identifier for your gateway account, which is different than your merchant account ID</td>
</tr>
<tr>
<td>publicKey</td>
<td>String</td>
<td>User-specific public identifier</td>
</tr>
<tr>
<td>privateKey</td>
<td>String</td>
<td>User-specific secure identifier that should not be shared – even with us!</td>
</tr>
<tr>
<td>accessToken</td>
<td>String</td>
<td>Token granted to a merchant using Braintree Auth allowing them to process transactions on another’s behalf. Used in place of the environment, merchantId, publicKey and privateKey options.</td>
</tr>
</tbody>
</table>

All the options above are provided by Braintree Payments

### 51.4. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by `[]`. When there are no mandatory options for an endpoint, one of the set of `[]` options MUST be provided. Producer endpoints can also use a special option `inBody` that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format `CamelBraintree.<option>`. Note that the `inBody` option overrides message header, i.e. the endpoint option `inBody=option` would override a `CamelBraintree.option` header.

For more information on the endpoints and options see Braintree references at [https://developers.braintreepayments.com/reference/overview](https://developers.braintreepayments.com/reference/overview)

### 51.4.1. Endpoint prefix `addOn`
The following endpoints can be invoked with the prefix `addOn` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td></td>
<td></td>
<td>List&lt;com.braintreegateway.Addon&gt;</td>
</tr>
</tbody>
</table>

51.4.2. Endpoint prefix `address`  
The following endpoints can be invoked with the prefix `address` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td></td>
<td>customerId, request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Address&gt;</td>
</tr>
<tr>
<td>delete</td>
<td></td>
<td>customerId, id</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Address&gt;</td>
</tr>
<tr>
<td>find</td>
<td></td>
<td>customerId, id</td>
<td>com.braintreegateway.Address</td>
</tr>
<tr>
<td>update</td>
<td></td>
<td>customerId, id, request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Address&gt;</td>
</tr>
</tbody>
</table>

**URI Options for address**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>customerId</td>
<td>String</td>
</tr>
<tr>
<td>request</td>
<td>com.braintreegateway.AddressRequest</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
</tr>
</tbody>
</table>

51.4.3. Endpoint prefix `clientToken`
The following endpoints can be invoked with the prefix `clientId` as follows:

### braintree://clientId/endpoint?{options}

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>generate</td>
<td>request</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

**URI Options for clientId**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>com.braintreegateway.ClientTokenRequest</td>
</tr>
</tbody>
</table>

#### 51.4.4. Endpoint prefix `creditCardVerification`

The following endpoints can be invoked with the prefix `creditCardVerification` as follows:

### braintree://creditCardVerification/endpoint?{options}

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>find</td>
<td>id</td>
<td></td>
<td>com.braintreegateway.CreditCardVerification</td>
</tr>
<tr>
<td>search</td>
<td>query</td>
<td></td>
<td>com.braintreegateway.ResourceCollection&lt;com.braintreegateway.CreditCardVerification&gt;</td>
</tr>
</tbody>
</table>

**URI Options for creditCardVerification**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
</tr>
<tr>
<td>query</td>
<td>com.braintreegateway.CreditCardVerificationSearchRequest</td>
</tr>
</tbody>
</table>

#### 51.4.5. Endpoint prefix `customer`

The following endpoints can be invoked with the prefix `customer` as follows:
### braintree://customer/endpoint?[options]

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>create</td>
<td></td>
<td>request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Customer&gt;</td>
</tr>
<tr>
<td>delete</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Customer&gt;</td>
</tr>
<tr>
<td>find</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Customer</td>
</tr>
</tbody>
</table>

**URI Options for customer**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
</tr>
<tr>
<td>request</td>
<td>com.braintreegateway.CustomerRequest</td>
</tr>
<tr>
<td>query</td>
<td>com.braintreegateway.CustomerSearchRequest</td>
</tr>
</tbody>
</table>

**51.4.6. Endpoint prefix discount**

The following endpoints can be invoked with the prefix `discount` as follows:

### braintree://discount/endpoint
<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td></td>
<td></td>
<td>List&lt;com.braintreegateway.Discount&gt;</td>
</tr>
</tbody>
</table>

51.4.7. Endpoint prefix `merchantAccount`

The following endpoints can be invoked with the prefix `merchantAccount` as follows:

```
braintree://merchantAccount/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>request</td>
<td>request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.MerchantAccount&gt;</td>
</tr>
<tr>
<td>createForCurrency</td>
<td>currencyRequest</td>
<td>currencyRequest</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.MerchantAccount&gt;</td>
</tr>
<tr>
<td>find</td>
<td>id</td>
<td>id</td>
<td>com.braintreegateway.MerchantAccount</td>
</tr>
<tr>
<td>update</td>
<td>id, request</td>
<td>id, request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.MerchantAccount&gt;</td>
</tr>
</tbody>
</table>

URI Options for `merchantAccount`

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
</tr>
<tr>
<td>request</td>
<td>com.braintreegateway.MerchantAccountRequest</td>
</tr>
<tr>
<td>currencyRequest</td>
<td>com.braintreegateway.MerchantAccountCreateForCurrencyRequest</td>
</tr>
</tbody>
</table>

51.4.8. Endpoint prefix `paymentMethod`
The following endpoints can be invoked with the prefix `paymentMethod` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>request</td>
<td></td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.PaymentMethod&gt;</td>
</tr>
<tr>
<td>delete</td>
<td>token, deleteRequest</td>
<td></td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.PaymentMethod&gt;</td>
</tr>
<tr>
<td>find</td>
<td>token</td>
<td></td>
<td>com.braintreegateway.PaymentMethod</td>
</tr>
<tr>
<td>update</td>
<td>token, request</td>
<td></td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.PaymentMethod&gt;</td>
</tr>
</tbody>
</table>

**URI Options for paymentMethod**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>token</td>
<td>String</td>
</tr>
<tr>
<td>request</td>
<td>com.braintreegateway.PaymentMethodRequest</td>
</tr>
<tr>
<td>deleteRequest</td>
<td>com.braintreegateway.PaymentMethodDeleteRequest</td>
</tr>
</tbody>
</table>

**51.4.9. Endpoint prefix paymentMethodNonce**

The following endpoints can be invoked with the prefix `paymentMethodNonce` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>paymentMethodToken</td>
<td></td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.PaymentMethodNonce&gt;</td>
</tr>
</tbody>
</table>
### 51.4.10. Endpoint prefix `plan`

The following endpoints can be invoked with the prefix `plan` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td></td>
<td></td>
<td>List&lt;com.braintreegateway.Plan&gt;</td>
</tr>
</tbody>
</table>

#### braintree://plan/endpoint

### 51.4.11. Endpoint prefix `settlementBatchSummary`

The following endpoints can be invoked with the prefix `settlementBatchSummary` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>generate</td>
<td></td>
<td>request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.SettlementBatchSummary&gt;</td>
</tr>
</tbody>
</table>

#### braintree://settlementBatchSummary/endpoint?[options]

### URI Options for `paymentMethodNonce`

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>paymentMethodToken</td>
<td>String</td>
</tr>
<tr>
<td>paymentMethodNonce</td>
<td>String</td>
</tr>
</tbody>
</table>

### URI Options for `paymentMethodNonce`
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>settlementDate</td>
<td>Calendar</td>
</tr>
<tr>
<td>groupByCustomField</td>
<td>String</td>
</tr>
</tbody>
</table>

### 51.4.12. Endpoint prefix `subscription`

The following endpoints can be invoked with the prefix `subscription` as follows:

```markdown
<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancel</td>
<td>id</td>
<td></td>
<td><code>com.braintreegateway.Result&lt;com.braintreegateway.Subscription&gt;</code></td>
</tr>
<tr>
<td>create</td>
<td>request</td>
<td></td>
<td><code>com.braintreegateway.Result&lt;com.braintreegateway.Subscription&gt;</code></td>
</tr>
<tr>
<td>delete</td>
<td>customerId, id</td>
<td></td>
<td><code>com.braintreegateway.Result&lt;com.braintreegateway.Subscription&gt;</code></td>
</tr>
<tr>
<td>find</td>
<td>id</td>
<td></td>
<td><code>com.braintreegateway.Subscription</code></td>
</tr>
<tr>
<td>retryCharge</td>
<td>subscriptionId, amount</td>
<td></td>
<td><code>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</code></td>
</tr>
<tr>
<td>search</td>
<td>searchRequest</td>
<td></td>
<td><code>com.braintreegateway.ResourceCollection&lt;com.braintreegateway.Subscription&gt;</code></td>
</tr>
<tr>
<td>update</td>
<td>id, request</td>
<td></td>
<td><code>com.braintreegateway.Result&lt;com.braintreegateway.Subscription&gt;</code></td>
</tr>
</tbody>
</table>
```

**URI Options for `subscription`**
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
</tr>
<tr>
<td>request</td>
<td>com.braintreegateway.SubscriptionRequest</td>
</tr>
<tr>
<td>customerId</td>
<td>String</td>
</tr>
<tr>
<td>subscriptionId</td>
<td>String</td>
</tr>
<tr>
<td>amount</td>
<td>BigDecimal</td>
</tr>
<tr>
<td>searchRequest</td>
<td>com.braintreegateway.SubscriptionSearchRequest</td>
</tr>
</tbody>
</table>

51.4.13. Endpoint prefix `transaction`

The following endpoints can be invoked with the prefix `transaction` as follows:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancelRelease</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>cloneTransaction</td>
<td></td>
<td>id, cloneRequest</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>credit</td>
<td></td>
<td>request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>find</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Transaction</td>
</tr>
<tr>
<td>holdInEscrow</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Shorthand Alias</td>
<td>Options</td>
<td>Result Body Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------</td>
<td>------------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>releaseFromEscrow</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>refund</td>
<td></td>
<td>id, amount, refundRequest</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>sale</td>
<td></td>
<td>request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>submitForPartialSettlement</td>
<td></td>
<td>id, amount</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>submitForSettlement</td>
<td></td>
<td>id, amount, request</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
<tr>
<td>voidTransaction</td>
<td></td>
<td>id</td>
<td>com.braintreegateway.Result&lt;com.braintreegateway.Transaction&gt;</td>
</tr>
</tbody>
</table>

**URI Options for transaction**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
</tr>
<tr>
<td>request</td>
<td>com.braintreegateway.TransactionCloneRequest</td>
</tr>
<tr>
<td>cloneRequest</td>
<td>com.braintreegateway.TransactionCloneRequest</td>
</tr>
<tr>
<td>refundRequest</td>
<td>com.braintreegateway.TransactionRefundRequest</td>
</tr>
<tr>
<td>amount</td>
<td>BigDecimal</td>
</tr>
<tr>
<td>query</td>
<td>com.braintreegateway.TransactionSearchRequest</td>
</tr>
</tbody>
</table>

51.4.14. Endpoint prefix `webhookNotification`
The following endpoints can be invoked with the prefix `webhookNotification` as follows:

```java
braintree://webhookNotification/endpoint?[options]
```

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Shorthand Alias</th>
<th>Options</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>parse</td>
<td></td>
<td>signature, payload</td>
<td>com.braintreegateway.WebhookNotification</td>
</tr>
<tr>
<td>verify</td>
<td></td>
<td>challenge</td>
<td>String</td>
</tr>
</tbody>
</table>

**URI Options for `webhookNotification`**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>signature</td>
<td>String</td>
</tr>
<tr>
<td>payload</td>
<td>String</td>
</tr>
<tr>
<td>challenge</td>
<td>String</td>
</tr>
</tbody>
</table>

**51.5. CONSUMER ENDPOINTS**

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use `Scheduled Poll Consumer Options` with a `consumer` prefix to schedule endpoint invocation. By default Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange. To change this behavior use the property `consumer.splitResults=true` to return a single exchange for the entire list or array.

**51.6. MESSAGE HEADERS**

Any URI option can be provided in a message header for producer endpoints with a `CamelBraintree` prefix.

**51.7. MESSAGE BODY**

All result message bodies utilize objects provided by the Braintree Java SDK. Producer endpoints can specify the option name for incoming message body in the `inBody` endpoint parameter.

**51.8. EXAMPLES**
CHAPTER 51. BRAINTREE COMPONENT

**Blueprint**

```xml
<?xml version="1.0"?>
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
    xsi:schemaLocation=""
        http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0
        http://aries.apache.org/schemas/blueprint-cm/blueprint-cm-1.0.0.xsd
        http://www.osgi.org/xmlns/blueprint/v1.0.0
        https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd

    <cm:property-placeholder id="placeholder" persistent-id="camel.braintree">
        </cm:property-placeholder>

    <bean id="braintree" class="org.apache.camel.component.braintree.BraintreeComponent">
        <property name="configuration">
            <bean class="org.apache.camel.component.braintree.BraintreeConfiguration">
                <property name="environment" value="${environment}"/>
                <property name="merchantId" value="${merchantId}"/>
                <property name="publicKey" value="${publicKey}"/>
                <property name="privateKey" value="${privateKey}"/>
            </bean>
        </property>
    </bean>

    <camelContext trace="true" xmlns="http://camel.apache.org/schema/blueprint" id="braintree-example-context">
        <route id="braintree-example-route">
            <from url="direct:generateClientToken"/>
            <to uri="braintree://clientToken/generate"/>
            <to uri="stream:out"/>
        </route>
    </camelContext>
</blueprint>
```

51.9. SEE ALSO

* Configuring Camel * Component * Endpoint * Getting Started
CHAPTER 52. BROWSE COMPONENT

Available as of Camel version 1.3

The Browse component provides a simple BrowsableEndpoint which can be useful for testing, visualisation tools or debugging. The exchanges sent to the endpoint are all available to be browsed.

52.1. URI FORMAT

```
browse:someName[?options]
```

Where `someName` can be any string to uniquely identify the endpoint.

52.2. OPTIONS

The Browse component has no options.

The Browse endpoint is configured using URI syntax:

```
browse:name
```

with the following path and query parameters:

52.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required A name which can be any string to uniquely identify the endpoint</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

52.2.2. Query Parameters (4 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### ExceptionHandler

To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.

### exchangePattern

Sets the default exchange pattern when creating an exchange.

### synchronous

Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

### 52.3. SAMPLE

In the route below, we insert a `browse` component to be able to browse the Exchanges that are passing through:

```java
from("activemq:order.in").to("browse:orderReceived").to("bean:processOrder");
```

We can now inspect the received exchanges from within the Java code:

```java
private CamelContext context;

public void inspectRecievedOrders() {
    BrowsableEndpoint browse = context.getEndpoint("browse:orderReceived", BrowsableEndpoint.class);
    List<Exchange> exchanges = browse.getExchanges();

    // then we can inspect the list of received exchanges from Java
    for (Exchange exchange : exchanges) {
        String payload = exchange.getIn().getBody();
        // do something with payload
    }
}
```

### 52.4. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 53. EHCACHE COMPONENT (DEPRECATED)

Available as of Camel version 2.1

The cache component enables you to perform caching operations using EHCache as the Cache Implementation. The cache itself is created on demand or if a cache of that name already exists then it is simply utilized with its original settings.

This component supports producer and event based consumer endpoints.

The Cache consumer is an event based consumer and can be used to listen and respond to specific cache activities. If you need to perform selections from a pre-existing cache, use the processors defined for the cache component.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cache</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

53.1. URI FORMAT

cache://cacheName[?options]

You can append query options to the URI in the following format, ?option=value&option=#beanRef&…

53.2. OPTIONS

The EHCache component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheManagerFactory</td>
<td>To use the given CacheManagerFactory for creating the CacheManager. By default the DefaultCacheManagerFactory is used.</td>
<td></td>
<td>CacheManagerFactory</td>
</tr>
<tr>
<td>configuration</td>
<td>Sets the Cache configuration</td>
<td></td>
<td>CacheConfiguration</td>
</tr>
<tr>
<td>configurationFile</td>
<td>Sets the location of the ehcache.xml file to load from classpath or file system. By default the file is loaded from classpath:ehcache.xml</td>
<td>classpath:ehcache.xml</td>
<td>String</td>
</tr>
</tbody>
</table>
Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

```
cache:cacheName
```

with the following path and query parameters:

### 53.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required Name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 53.2.2. Query Parameters (19 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>diskExpireThreadInterval Seconds</td>
<td>The number of seconds between runs of the disk expiry thread.</td>
<td></td>
<td>long</td>
</tr>
<tr>
<td>diskPersistent</td>
<td>Whether the disk store persists between restarts of the application.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>diskStorePath</td>
<td>Deprecated This parameter is ignored. CacheManager sets it using setter injection.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>eternal</td>
<td>Sets whether elements are eternal. If eternal, timeouts are ignored and the element never expires.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>key</td>
<td>The default key to use. If a key is provided in the message header, then the key from the header takes precedence.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>maxElementsInMemory</td>
<td>The number of elements that may be stored in the defined cache in memory.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>memoryStoreEvictionPolicy</td>
<td>Which eviction strategy to use when maximum number of elements in memory is reached. The strategy defines which elements to be removed. LRU - Lest Recently Used LFU - Lest Frequently Used FIFO - First In First Out</td>
<td>LFU</td>
<td>MemoryStoreEviction Policy</td>
</tr>
<tr>
<td>objectCache</td>
<td>Whether to turn on allowing to store non serializable objects in the cache. If this option is enabled then overflow to disk cannot be enabled as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>operation</td>
<td>The default cache operation to use. If an operation in the message header, then the operation from the header takes precedence.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>overflowToDisk</td>
<td>Specifies whether cache may overflow to disk</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeToIdleSeconds</td>
<td>The maximum amount of time between accesses before an element expires</td>
<td>300</td>
<td>long</td>
</tr>
<tr>
<td>timeToLiveSeconds</td>
<td>The maximum time between creation time and when an element expires. Is used only if the element is not eternal</td>
<td>300</td>
<td>long</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>cacheLoaderRegistry</td>
<td>To configure cache loader using the CacheLoaderRegistry</td>
<td></td>
<td>CacheLoaderRegistry</td>
</tr>
</tbody>
</table>
### 53.3. SENDING/RECEIVING MESSAGES TO/FROM THE CACHE

#### 53.3.1. Message Headers up to Camel 2.7

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE_OPERATION</td>
<td>The operation to be performed on the cache. Valid options are * GET * CHECK * ADD * UPDATE * DELETE * DELETEALL. GET and CHECK requires Camel 2.3 onwards.</td>
</tr>
<tr>
<td>CACHE_KEY</td>
<td>The cache key used to store the Message in the cache. The cache key is optional if the CACHE_OPERATION is DELETEALL</td>
</tr>
</tbody>
</table>

#### 53.3.2. Message Headers Camel 2.8+

Header changes in Camel 2.8

The header names and supported values have changed to be prefixed with 'CamelCache' and use mixed case. This makes them easier to identify and keep separate from other headers. The CacheConstants variable names remain unchanged, just their values have been changed. Also, these headers are now removed from the exchange after the cache operation is performed.

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelCacheOperation</td>
<td>The operation to be performed on the cache. The valid options are * CamelCacheGet * CamelCacheCheck * CamelCacheAdd * CamelCacheUpdate * CamelCacheDelete * CamelCacheDeleteAll</td>
</tr>
<tr>
<td>CamelCacheKey</td>
<td>The cache key used to store the Message in the cache. The cache key is optional if the CamelCacheOperation is CamelCacheDeleteAll</td>
</tr>
</tbody>
</table>
The **CamelCacheAdd** and **CamelCacheUpdate** operations support additional headers:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel Cache TimeToLive</td>
<td>Integer</td>
<td>Camel 2.11: Time to live in seconds.</td>
</tr>
<tr>
<td>Camel Cache TimeToIdle</td>
<td>Integer</td>
<td>Camel 2.11: Time to idle in seconds.</td>
</tr>
<tr>
<td>Camel Cache Eternal</td>
<td>Boolean</td>
<td>Camel 2.11: Whether the content is eternal.</td>
</tr>
</tbody>
</table>

### 53.3.3. Cache Producer

Sending data to the cache involves the ability to direct payloads in exchanges to be stored in a pre-existing or created-on-demand cache. The mechanics of doing this involve:

- setting the Message Exchange Headers shown above.
- ensuring that the Message Exchange Body contains the message directed to the cache

### 53.3.4. Cache Consumer

Receiving data from the cache involves the ability of the CacheConsumer to listen on a pre-existing or created-on-demand Cache using an event Listener and receive automatic notifications when any cache activity take place (i.e. CamelCacheGet/CamelCacheUpdate/CamelCacheDelete/CamelCacheDeleteAll). Upon such an activity taking place:

- an exchange containing Message Exchange Headers and a Message Exchange Body containing the just added/updated payload is placed and sent.
- in case of a CamelCacheDeleteAll operation, the Message Exchange Header CamelCacheKey and the Message Exchange Body are not populated.

### 53.3.5. Cache Processors

There are a set of nice processors with the ability to perform cache lookups and selectively replace payload content at the

- **body**
- **token**
- **xpath level**
53.4. CACHE USAGE SAMPLES

53.4.1. Example 1: Configuring the cache

```java
from("cache://MyApplicationCache" +
   "?maxElementsInMemory=1000" +
   "&memoryStoreEvictionPolicy=" +
   "MemoryStoreEvictionPolicy.LFU" +
   "&overflowToDisk=true" +
   "&eternal=true" +
   "&timeToLiveSeconds=300" +
   "&timeToIdleSeconds=true" +
   "&diskPersistent=true" +
   "&diskExpiryThreadIntervalSeconds=300")
```

53.4.2. Example 2: Adding keys to the cache

```java
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                        constant(CacheConstants.CACHE_OPERATION_ADD))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

53.4.3. Example 2: Updating existing keys in a cache

```java
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                        constant(CacheConstants.CACHE_OPERATION_UPDATE))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

53.4.4. Example 3: Deleting existing keys in a cache

```java
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                        constant(CacheConstants.CACHE_DELETE))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```
53.4.5. Example 4: Deleting all existing keys in a cache

```java
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_DELETEALL))
            .to("cache://TestCache1");
    }
};
```

53.4.6. Example 5: Notifying any changes registering in a Cache to Processors and other Producers

```java
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("cache://TestCache1")
            .process(new Processor() {
                public void process(Exchange exchange) throws Exception {
                    String operation = (String) exchange.getIn().getHeader(CacheConstants.CACHE_OPERATION);
                    String key = (String) exchange.getIn().getHeader(CacheConstants.CACHE_KEY);
                    Object body = exchange.getIn().getBody();
                    // Do something
                }
            });
    }
};
```

53.4.7. Example 6: Using Processors to selectively replace payload with cache values

```java
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        //Message Body Replacer
        from("cache://TestCache1")
            .filter(header(CacheConstants.CACHE_KEY).isEqualTo("greeting"))
            .process(new CacheBasedMessageBodyReplacer("cache://TestCache1","farewell"))
            .to("direct:next");

        //Message Token replacer
        from("cache://TestCache1")
            .filter(header(CacheConstants.CACHE_KEY).isEqualTo("quote"))
            .process(new CacheBasedTokenReplacer("cache://TestCache1","novel","#novel#"))
            .process(new CacheBasedTokenReplacer("cache://TestCache1","author","#author#"))
            .process(new CacheBasedTokenReplacer("cache://TestCache1","number","#number#"))
            .to("direct:next");

        //Message XPath replacer
        from("cache://TestCache1")
            .filter(header(CacheConstants.CACHE_KEY).isEqualTo("XML_FRAGMENT"))
            .process(new CacheBasedXPathReplacer("cache://TestCache1","book1","/books/book1"))
            .process (new CacheBasedXPathReplacer("cache://TestCache1","book2","/books/book2"))
    }
};
```
53.4.8. Example 7: Getting an entry from the Cache

```java
from("direct:start")
    // Prepare headers
    .setHeader(CacheConstants.CACHE_OPERATION, constant(CacheConstants.CACHE_OPERATION_GET))
    .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
    .to("cache://TestCache1")
    // Check if entry was not found
    .choice().when(header(CacheConstants.CACHE_ELEMENT_WAS_FOUND).isNull()).
        // If not found, get the payload and put it to cache
        .to("cxf:bean:someHeavyweightOperation")
        .setHeader(CacheConstants.CACHE_OPERATION, constant(CacheConstants.CACHE_OPERATION_ADD))
        .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
        .to("cache://TestCache1")
    .end()
    .to("direct:nextPhase");
```

53.4.9. Example 8: Checking for an entry in the Cache

Note: The CHECK command tests existence of an entry in the cache but doesn’t place a message in the body.

```java
from("direct:start")
    // Prepare headers
    .setHeader(CacheConstants.CACHE_OPERATION, constant(CacheConstants.CACHE_OPERATION_CHECK))
    .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
    .to("cache://TestCache1")
    // Check if entry was not found
    .choice().when(header(CacheConstants.CACHE_ELEMENT_WAS_FOUND).isNull()).
        // If not found, get the payload and put it to cache
        .to("cxf:bean:someHeavyweightOperation")
        .setHeader(CacheConstants.CACHE_OPERATION, constant(CacheConstants.CACHE_OPERATION_ADD))
        .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
        .to("cache://TestCache1")
    .end();
```

53.5. MANAGEMENT OF EHCache

EHCache has its own statistics and management from JMX.

Here’s a snippet on how to expose them via JMX in a Spring application context:

```xml
<bean id="ehCacheManagementService" class="net.sf.ehcache.management.ManagementService"
    init-method="init" lazy-init="false">
    <constructor-arg>
```

431
Of course you can do the same thing in straight Java:

```xml
<bean class="net.sf.ehcache.CacheManager" factory-method="getInstance"/>
<constructor-arg>
  <bean class="org.springframework.jmx.support.JmxUtils" factory-method="locateMBeanServer"/>
</constructor-arg>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
</bean>
```

You can get cache hits, misses, in-memory hits, disk hits, size stats this way. You can also change CacheConfiguration parameters on the fly.

### 53.6. CACHE REPLICATION CAMEL 2.8

The Camel Cache component is able to distribute a cache across server nodes using several different replication mechanisms including: RMI, JGroups, JMS and Cache Server.

There are two different ways to make it work:

1. You can configure `ehcache.xml` manually

   OR

2. You can configure these three options:

   - cacheManagerFactory
   - eventListenerRegistry
   - cacheLoaderRegistry

Configuring Camel Cache replication using the first option is a bit of hard work as you have to configure all caches separately. So in a situation when the all names of caches are not known, using `ehcache.xml` is not a good idea.

The second option is much better when you want to use many different caches as you do not need to define options per cache. This is because replication options are set per `CacheManager` and per `CacheEndpoint`. Also it is the only way when cache names are not know at the development phase.

**Note:** It might be useful to read the [EHCache manual](#) to get a better understanding of the Camel Cache replication mechanism.

#### 53.6.1. Example: JMS cache replication

JMS replication is the most powerful and secured replication method. Used together with Camel Cache replication makes it also rather simple. An example is available on a separate page.
CHAPTER 54. CAFFEINE CACHE COMPONENT

Available as of Camel version 2.20

The caffeine-cache component enables you to perform caching operations using The simple cache from Caffeine.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-caffeine</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

54.1. URI FORMAT

caffeine-cache://cacheName[?options]

You can append query options to the URI in the following format, ?option=value&option=#beanRef&...

54.2. OPTIONS

The Caffeine Cache component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>Sets the global component configuration</td>
<td></td>
<td>CaffeineConfig</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Caffeine Cache endpoint is configured using URI syntax:

caffeine-cache:cacheName

with the following path and query parameters:

54.2.1. Path Parameters (1 parameters):
### 54.2.2. Query Parameters (19 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required the cache name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>createCacheIfNotExist</td>
<td>Configure if a cache need to be created if it does exist or can’t be pre-configured.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>action</td>
<td>To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>cache</td>
<td>To configure the default an already instantiated cache to be used</td>
<td></td>
<td>Cache</td>
</tr>
<tr>
<td>cacheLoader</td>
<td>To configure a CacheLoader in case of a LoadCache use</td>
<td></td>
<td>CacheLoader</td>
</tr>
<tr>
<td>evictionType</td>
<td>Set the eviction Type for this cache</td>
<td></td>
<td>EvictionType</td>
</tr>
<tr>
<td>expireAfterAccessTime</td>
<td>Set the expire After Access Time in case of time based Eviction (in seconds)</td>
<td>300</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------</td>
</tr>
<tr>
<td>expireAfterWrite Time</td>
<td>Set the expire After Access Write in case of time based Eviction (in seconds)</td>
<td>300</td>
<td>int</td>
</tr>
<tr>
<td>initialCapacity</td>
<td>Set the initial Capacity for the cache</td>
<td>10000</td>
<td>int</td>
</tr>
<tr>
<td>key</td>
<td>To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>maximumSize</td>
<td>Set the maximum size for the cache</td>
<td>10000</td>
<td>int</td>
</tr>
<tr>
<td>removalListener</td>
<td>Set a specific removal Listener for the cache</td>
<td></td>
<td>RemovalListener</td>
</tr>
<tr>
<td>statsCounter</td>
<td>Set a specific Stats Counter for the cache stats</td>
<td></td>
<td>StatsCounter</td>
</tr>
<tr>
<td>statsEnabled</td>
<td>To enable stats on the cache</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>keyType</td>
<td>The cache key type, default java.lang.Object</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>valueType</td>
<td>The cache value type, default java.lang.Object</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
CHAPTER 55. CAFFEINE LOADCACHE COMPONENT

Available as of Camel version 2.20

The caffeine-loadcache component enables you to perform caching operations using The Load cache from Caffeine.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-caffeine</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

55.1. URI FORMAT

caffeine-loadcache://cacheName?[options]

You can append query options to the URI in the following format, ?
option=value?option=#beanRef&...

55.2. OPTIONS

The Caffeine LoadCache component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Sets the global component configuration</td>
<td></td>
<td>CaffeineConfigu</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td>ration</td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Caffeine LoadCache endpoint is configured using URI syntax:

```
caffeine-loadcache:cacheName
```

with the following path and query parameters:

55.2.1. Path Parameters (1 parameters):
55.2.2. Query Parameters (19 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required the cache name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>createCacheIfNotExist</td>
<td>Configure if a cache need to be created if it does exist or can’t be pre-configured.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>action</td>
<td>To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>cache</td>
<td>To configure the default an already instantiated cache to be used</td>
<td></td>
<td>Cache</td>
</tr>
<tr>
<td>cacheLoader</td>
<td>To configure a CacheLoader in case of a LoadCache use</td>
<td></td>
<td>CacheLoader</td>
</tr>
<tr>
<td>evictionType</td>
<td>Set the eviction Type for this cache</td>
<td>SIZE_BASED</td>
<td>EvictionType</td>
</tr>
<tr>
<td>expireAfterAccessTime</td>
<td>Set the expire After Access Time in case of time based Eviction (in seconds)</td>
<td>300</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>expireAfterWriteTime (producer)</td>
<td>Set the expire After Access Write in case of time based Eviction (in seconds)</td>
<td>300</td>
<td>int</td>
</tr>
<tr>
<td>initialCapacity (producer)</td>
<td>Set the initial Capacity for the cache</td>
<td>10000</td>
<td>int</td>
</tr>
<tr>
<td>key (producer)</td>
<td>To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>maximumSize (producer)</td>
<td>Set the maximum size for the cache</td>
<td>10000</td>
<td>int</td>
</tr>
<tr>
<td>removalListener (producer)</td>
<td>Set a specific removal Listener for the cache</td>
<td></td>
<td>RemovalListener</td>
</tr>
<tr>
<td>statsCounter (producer)</td>
<td>Set a specific Stats Counter for the cache stats</td>
<td></td>
<td>StatsCounter</td>
</tr>
<tr>
<td>statsEnabled (producer)</td>
<td>To enable stats on the cache</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>keyType (advanced)</td>

</table>
CHAPTER 56. CASTOR DATAFORMAT (DEPRECATED)

Available as of Camel version 2.1

Castor is a Data Format which uses the Castor XML library to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

As usually you can use either Java DSL or Spring XML to work with Castor Data Format.

56.1. USING THE JAVA DSL

For example the following uses a named DataFormat of Castor which uses default Castor data binding features.

```java
CastorDataFormat castor = new CastorDataFormat();
from("activemq:My.Queue").unmarshal(castor).
to("mqseries:Another.Queue");
```

If you prefer to use a named reference to a data format which can then be defined in your Registry such as via your Spring XML file, e.g.

```java
from("activemq:My.Queue").unmarshal("mycasterType").
to("mqseries:Another.Queue");
```

If you want to override default mapping schema by providing a mapping file you can set it as follows.

```java
CastorDataFormat castor = new CastorDataFormat();
caster.setMappingFile("mapping.xml");
```

Also if you want to have more control on Castor Marshaller and Unmarshaller you can access them as below.

```java
caster.getMarshaller();
caster.getUnmarshaller();
```

56.2. USING SPRING XML

The following example shows how to use Castor to unmarshal using Spring configuring the castor data type

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <unmarshal>
      <castor validation="true" />
    </unmarshal>
  </route>
</camelContext>
```
This example shows how to configure the data type just once and reuse it on multiple routes. You have to set the `<castor>` element directly in `<camelContext>`.

```xml
<camelContext>
    <camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
        <dataFormats>
            <castor id="myCastor"/>
        </dataFormats>

        <route>
            <from uri="direct:start"/>
            <marshal ref="myCastor"/>
            <to uri="direct:marshalled"/>
        </route>

        <route>
            <from uri="direct:marshalled"/>
            <unmarshal ref="myCastor"/>
            <to uri="mock:result"/>
        </route>
    </camelContext>
</camelContext>
```

### 56.3. OPTIONS

The Castor dataformat supports 9 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mappingFile</td>
<td>String</td>
<td></td>
<td>Path to a Castor mapping file to load from the classpath.</td>
</tr>
<tr>
<td>whitelistEnabled</td>
<td>true</td>
<td>Boolean</td>
<td>Define if Whitelist feature is enabled or not.</td>
</tr>
<tr>
<td>allowedUnmarshalledObjects</td>
<td>String</td>
<td></td>
<td>Define the allowed objects to be unmarshalled. You can specify the FQN class name of allowed objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by <code>link org.apache.camel.util.EndpointHelper#matchPattern(String, String)</code>. Denied objects takes precedence over allowed objects.</td>
</tr>
<tr>
<td>deniedUnmarshalledObjects</td>
<td>String</td>
<td></td>
<td>Define the denied objects to be unmarshalled. You can specify the FQN class name of denied objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by <code>link org.apache.camel.util.EndpointHelper#matchPattern(String, String)</code>. Denied objects takes precedence over allowed objects.</td>
</tr>
<tr>
<td>Name</td>
<td>Default</td>
<td>Java Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>validation</td>
<td>true</td>
<td>Boolean</td>
<td>Whether validation is turned on or off. Is by default true.</td>
</tr>
<tr>
<td>encoding</td>
<td>UTF-8</td>
<td>String</td>
<td>Encoding to use when marshalling an Object to XML. Is by default UTF-8</td>
</tr>
<tr>
<td>packages</td>
<td>String</td>
<td>[]</td>
<td>Add additional packages to Castor XmlContext</td>
</tr>
<tr>
<td>classes</td>
<td>String</td>
<td>[]</td>
<td>Add additional class names to Castor XmlContext</td>
</tr>
<tr>
<td>contentTypeHead</td>
<td>er</td>
<td>false</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

### 56.4. DEPENDENCIES

To use Castor in your camel routes you need to add the a dependency on `camel-castor` which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-castor</artifactId>
  <version>x.x.x</version>
</dependency>
```
CHAPTER 57. CAMEL CDI

The Camel CDI component provides auto-configuration for Apache Camel using CDI as dependency injection framework based on convention-over-configuration. It auto-detects Camel routes available in the application and provides beans for common Camel primitives like Endpoint, FluentProducerTemplate, ProducerTemplate or TypeConverter. It implements standard Camel bean integration so that Camel annotations like @Consume, @Produce and @PropertyInject can be used seamlessly in CDI beans. Besides, it bridges Camel events (e.g. RouteAddedEvent, CamelContextStartedEvent, ExchangeCompletedEvent, ...) as CDI events and provides a CDI events endpoint that can be used to consume / produce CDI events from / to Camel routes.

While the Camel CDI component is available as of Camel 2.10, it’s been rewritten in Camel 2.17 to better fit into the CDI programming model. Hence some of the features like the Camel events to CDI events bridge and the CDI events endpoint only apply starting Camel 2.17.

More details on how to test Camel CDI applications are available in Camel CDI testing.

CAUTION

camel-cdi is deprecated in OSGi and not supported. Use OSGi Blueprint if using Camel with OSGi.

57.1. AUTO-CONFIGURED CAMEL CONTEXT

Camel CDI automatically deploys and configures a CamelContext bean. That CamelContext bean is automatically instantiated, configured and started (resp. stopped) when the CDI container initializes (resp. shuts down). It can be injected in the application, e.g.:

```java
@Inject
CamelContext context;
```

That default CamelContext bean is qualified with the built-in @Default qualifier, is scoped @ApplicationScoped and is of type DefaultCamelContext.

Note that this bean can be customized programmatically and other Camel context beans can be deployed in the application as well.

57.2. AUTO-DETECTING CAMEL ROUTES

Camel CDI automatically collects all the RoutesBuilder beans in the application, instantiates and add them to the CamelContext bean instance when the CDI container initializes. For example, adding a Camel route is as simple as declaring a class, e.g.:

```java
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("jms:invoices").to("file:/invoices");
    }
}
```

Note that you can declare as many RoutesBuilder beans as you want. Besides, RouteContainer beans are also automatically collected, instantiated and added to the CamelContext bean instance managed by Camel CDI when the container initializes.
Available as of Camel 2.19

In some situations, it may be necessary to disable the auto-configuration of the RouteBuilder and RouteContainer beans. That can be achieved by observing for the CdiCamelConfiguration event, e.g.:

```java
static void configuration(@Observes CdiCamelConfiguration configuration) {
    configuration.autoConfigureRoutes(false);
}
```

Similarly, it is possible to deactivate the automatic starting of the configured CamelContext beans, e.g.:

```java
static void configuration(@Observes CdiCamelConfiguration configuration) {
    configuration.autoStartContexts(false);
}
```

### 57.3. AUTO-CONFIGURED CAMEL PRIMITIVES

Camel CDI provides beans for common Camel primitives that can be injected in any CDI beans, e.g.:

```java
@Inject
@Uri("direct:inbound")
ProducerTemplate producerTemplate;

@Inject
@Uri("direct:inbound")
FluentProducerTemplate fluentProducerTemplate;

@Inject
MockEndpoint outbound; // URI defaults to the member name, i.e. mock:outbound

@Inject
@Uri("direct:inbound")
Endpoint endpoint;

@Inject
TypeConverter converter;
```

### 57.4. CAMEL CONTEXT CONFIGURATION

If you just want to change the name of the default CamelContext bean, you can used the @ContextName qualifier provided by Camel CDI, e.g.:

```java
@ContextName("camel-context")
class MyRouteBean extends RouteBuilder {
    @Override
    public void configure() {
        from("jms:invoices").to("file:/invoices");
    }
}
```
Else, if more customization is needed, any CamelContext class can be used to declare a custom Camel context bean. Then, the @PostConstruct and @PreDestroy lifecycle callbacks can be done to do the customization, e.g.:

```java
@ApplicationScoped
class CustomCamelContext extends DefaultCamelContext {

    @PostConstruct
    void customize() {
        // Set the Camel context name
        setName("custom");
        // Disable JMX
        disableJMX();
    }

    @PreDestroy
    void cleanUp() {
        // ...
    }
}
```

Producer and disposer methods can also be used as well to customize the Camel context bean, e.g.:

```java
class CamelContextFactory {

    @Produces
    @ApplicationScoped
    CamelContext customize() {
        DefaultCamelContext context = new DefaultCamelContext();
        context.setName("custom");
        return context;
    }

    void cleanUp(@Disposes CamelContext context) {
        // ...
    }
}
```

Similarly, producer fields can be used, e.g.:

```java
@Produces
@ApplicationScoped
CamelContext context = new CustomCamelContext();

class CustomCamelContext extends DefaultCamelContext {

    CustomCamelContext() {
        setName("custom");
    }
}
```

This pattern can be used for example to avoid having the Camel context routes started automatically when the container initializes by calling the setAutoStartup method, e.g.:

```java
@ApplicationScoped
```
Any number of `CamelContext` beans can actually be declared in the application as documented above. In that case, the CDI qualifiers declared on these `CamelContext` beans are used to bind the Camel routes and other Camel primitives to the corresponding Camel contexts. From example, if the following beans get declared:

```java
class ManualStartupCamelContext extends DefaultCamelContext {
    @PostConstruct
    void manual() {
        setAutoStartup(false);
    }
}
```

```java
@ApplicationScoped
@ContextName("foo")
class FooCamelContext extends DefaultCamelContext {
}
```

```java
@ApplicationScoped
@BarContextQualifier
class BarCamelContext extends DefaultCamelContext {
}
```

```java
@ContextName("foo")
class RouteAddedToFooCamelContext extends RouteBuilder {
    @Override
    public void configure() {
        // ...
    }
}
```

```java
@BarContextQualifier
class RouteAddedToBarCamelContext extends RouteBuilder {
    @Override
    public void configure() {
        // ...
    }
}
```

```java
@ContextName("baz")
class RouteAddedToBazCamelContext extends RouteBuilder {
    @Override
    public void configure() {
        // ...
    }
}
```

```java
@MyOtherQualifier
class RouteNotAddedToAnyCamelContext extends RouteBuilder {
    
```
The RoutesBuilder beans qualified with @ContextName are automatically added to the corresponding CamelContext beans by Camel CDI. If no such CamelContext bean exists, it gets automatically created, as for the RouteAddedToBazCamelContext bean. Note this only happens for the @ContextName qualifier provided by Camel CDI. Hence the RouteNotAddedToAnyCamelContext bean qualified with the user-defined @MyOtherQualifier qualifier does not get added to any Camel contexts. That may be useful, for example, for Camel routes that may be required to be added later during the application execution.

**NOTE**

Since Camel version 2.17.0, Camel CDI is capable of managing any kind of CamelContext beans (e.g. DefaultCamelContext). In previous versions, it is only capable of managing beans of type CdiCamelContext so it is required to extend it.

The CDI qualifiers declared on the CamelContext beans are also used to bind the corresponding Camel primitives, e.g.:

```java
@Inject
@ContextName("foo")
@Uri("direct:inbound")
ProducerTemplate producerTemplate;

@Inject
@ContextName("foo")
@Uri("direct:inbound")
FluentProducerTemplate fluentProducerTemplate;

@Inject
@BarContextQualifier
MockEndpoint outbound; // URI defaults to the member name, i.e. mock:outbound

@Inject
@ContextName("baz")
@Uri("direct:inbound")
Endpoint endpoint;
```

### 57.6. CONFIGURATION PROPERTIES

To configure the sourcing of the configuration properties used by Camel to resolve properties placeholders, you can declare a PropertiesComponent bean qualified with @Named("properties"), e.g.:

```java
@Produces
@ApplicationScoped
@Named("properties")
PropertiesComponent propertiesComponent() {
    Properties properties = new Properties();
    properties.put("property", "value");
```
If you want to use DeltaSpike configuration mechanism you can declare the following `PropertiesComponent` bean:

```java
@Produces
@ApplicationScoped
@Named("properties")
PropertiesComponent properties(PropertiesParser parser) {
    PropertiesComponent component = new PropertiesComponent();
    component.setPropertiesParser(parser);
    return component;
}
```

// PropertiesParser bean that uses DeltaSpike to resolve properties
static class DeltaSpikeParser extends DefaultPropertiesParser {
    @Override
    public String parseProperty(String key, String value, Properties properties) {
        return ConfigResolver.getPropertyValue(key);
    }
}
```

You can see the `camel-example-cdi-properties` example for a working example of a Camel CDI application using DeltaSpike configuration mechanism.

### 57.7. AUTO-CONFIGURED TYPE CONVERTERS

CDI beans annotated with the `@Converter` annotation are automatically registered into the deployed Camel contexts, e.g.:

```java
@Converter
public class MyTypeConverter {
    @Converter
    public Output convert(Input input) {
        //...
    }
}
```

Note that CDI injection is supported within the type converters.

### 57.8. CAMEL BEAN INTEGRATION

#### 57.8.1. Camel annotations

As part of the Camel bean integration, Camel comes with a set of annotations that are seamlessly supported by Camel CDI. So you can use any of these annotations in your CDI beans, e.g.:
<table>
<thead>
<tr>
<th>Camel annotation</th>
<th>CDI equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configuration property</strong></td>
<td>If using DeltaSpike configuration mechanism:</td>
</tr>
<tr>
<td>@PropertyInject(&quot;key&quot;) String value;</td>
<td>@Inject @ConfigProperty(name = &quot;key&quot;) String value;</td>
</tr>
<tr>
<td>See configuration properties for more details.</td>
<td></td>
</tr>
<tr>
<td><strong>Producer template injection (default Camel context)</strong></td>
<td></td>
</tr>
<tr>
<td>@Produce(uri = &quot;mock:outbound&quot;) ProducerTemplate producer;</td>
<td>@Produce(uri = &quot;direct:outbound&quot;) ProducerTemplate producer;</td>
</tr>
<tr>
<td>@Produce(uri = &quot;mock:outbound&quot;) FluentProducerTemplate producer;</td>
<td>@Produce(uri = &quot;direct:outbound&quot;) FluentProducerTemplate producer;</td>
</tr>
<tr>
<td><strong>Endpoint injection (default Camel context)</strong></td>
<td></td>
</tr>
<tr>
<td>@EndpointInject(uri = &quot;direct:inbound&quot;) Endpoint endpoint;</td>
<td>@Inject @Uri(&quot;direct:inbound&quot;) Endpoint endpoint;</td>
</tr>
<tr>
<td><strong>Endpoint injection (Camel context by name)</strong></td>
<td></td>
</tr>
<tr>
<td>@EndpointInject(uri = &quot;direct:inbound&quot;, context = &quot;foo&quot;) Endpoint contextEndpoint;</td>
<td>@Inject @ContextName(&quot;foo&quot;) @Uri(&quot;direct:inbound&quot;) Endpoint contextEndpoint;</td>
</tr>
<tr>
<td><strong>Bean injection (by type)</strong></td>
<td></td>
</tr>
<tr>
<td>@BeanInject MyBean bean;</td>
<td>@Inject MyBean bean;</td>
</tr>
<tr>
<td><strong>Bean injection (by name)</strong></td>
<td></td>
</tr>
<tr>
<td>@BeanInject(&quot;foo&quot;) MyBean bean;</td>
<td>@Inject @Named(&quot;foo&quot;) MyBean bean;</td>
</tr>
<tr>
<td><strong>POJO consuming</strong></td>
<td></td>
</tr>
<tr>
<td>@Consume(uri = &quot;seda:inbound&quot;) void consume(@Body String body) { //... }</td>
<td></td>
</tr>
</tbody>
</table>

57.8.2. Bean component
You can refer to CDI beans, either by type or name, from the Camel DSL, e.g. with the Java Camel DSL:

```java
class MyBean {
    //...
}
from("direct:inbound").bean(MyBean.class);
```

Or to lookup a CDI bean by name from the Java DSL:

```java
@Named("foo")
class MyNamedBean {
    //...
}
from("direct:inbound").bean("foo");
```

### 57.8.3. Referring beans from Endpoint URIs

When configuring endpoints using the URI syntax you can refer to beans in the Registry using the `#` notation. If the URI parameter value starts with a `#` sign then Camel CDI will lookup for a bean of the given type by name, e.g.:

```java
from("jms:queue:{{destination}}?transacted=true&transactionManager=#jtaTransactionManager").to("...");
```

Having the following CDI bean qualified with `@Named("jtaTransactionManager")`:

```java
@Produces
@Named("jtaTransactionManager")
PlatformTransactionManager createTransactionManager(TransactionManager transactionManager, UserTransaction userTransaction) {
    JtaTransactionManager jtaTransactionManager = new JtaTransactionManager();
    jtaTransactionManager.setUserTransaction(userTransaction);
    jtaTransactionManager.setTransactionManager(transactionManager);
    jtaTransactionManager.afterPropertiesSet();
    return jtaTransactionManager;
}
```

## 57.9. CAMEL EVENTS TO CDI EVENTS

Available as of Camel 2.17

Camel provides a set of management events that can be subscribed to for listening to Camel context, service, route and exchange events. Camel CDI seamlessly translates these Camel events into CDI events that can be observed using CDI observer methods, e.g.:

```java
void onContextStarting(@Observes CamelContextStartingEvent event) {
    // Called before the default Camel context is about to start
}
```
As of Camel 2.18, it is possible to observe events for a particular route (RouteAddedEvent, RouteStartedEvent, RouteStoppedEvent and RouteRemovedEvent) should it have an explicit defined, e.g.:

```java
from("...").routeId("foo").to("...");

void onRouteStarted(@Observes @Named("foo") RouteStartedEvent event) {
    // Called after the route "foo" has started
}
```

When multiple Camel contexts exist in the CDI container, the Camel context bean qualifiers, like @ContextName, can be used to refine the observer method resolution to a particular Camel context as specified in observer resolution, e.g.:

```java
void onRouteStarted(@Observes @ContextName("foo") RouteStartedEvent event) {
    // Called after the route 'event.getRoute()' for the Camel context 'foo' has started
}
void onContextStarted(@Observes @Manual CamelContextStartedEvent event) {
    // Called after the the Camel context qualified with '@Manual' has started
}
```

Similarly, the @Default qualifier can be used to observe Camel events for the default Camel context if multiples contexts exist, e.g.:

```java
void onExchangeCompleted(@Observes @Default ExchangeCompletedEvent event) {
    // Called after the exchange 'event.getExchange()' processing has completed
}
```

In that example, if no qualifier is specified, the @Any qualifier is implicitly assumed, so that corresponding events for all the Camel contexts get received.

Note that the support for Camel events translation into CDI events is only activated if observer methods listening for Camel events are detected in the deployment, and that per Camel context.

## 57.10. CDI EVENTS ENDPOINT

**Available as of Camel 2.17**

The CDI event endpoint bridges the CDI events with the Camel routes so that CDI events can be seamlessly observed / consumed (resp. produced / fired) from Camel consumers (resp. by Camel producers).

The CdiEventEndpoint<T> bean provided by Camel CDI can be used to observe / consume CDI events whose event type is T, for example:

```java
@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from(cdiEventEndpoint).log("CDI event received: ${body}");
```

This is equivalent to writing:

```java
@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from(cdiEventEndpoint).log("CDI event received: "$body");
```
Conversely, the `CdiEventEndpoint<T>` bean can be used to produce / fire CDI events whose event type is `T`, for example:

```java
@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from("direct:event").to(cdiEventEndpoint).log("CDI event sent: ${body}");
```

This is equivalent to writing:

```java
@Inject
Event<String> event;

from("direct:event").process(new Processor() {
    @Override
    public void process(Exchange exchange) {
        event.fire(exchange.getIn().getBody(String.class));
    }
}).log("CDI event sent: ${body}");
```

Or using a Java 8 lambda expression:

```java
@Inject
Event<String> event;

from("direct:event")
    .process(exchange -> event.fire(exchange.getIn().getBody(String.class)))
    .log("CDI event sent: ${body}");
```

The type variable `T` (resp. the qualifiers) of a particular `CdiEventEndpoint<T>` injection point are automatically translated into the parameterized event type (resp. into the event qualifiers) e.g.:

```java
@Inject
@FooQualifier
CdiEventEndpoint<List<String>> cdiEventEndpoint;

from("direct:event").to(cdiEventEndpoint);

void observeCdiEvents(@Observes @FooQualifier List<String> event) {
    logger.info("CDI event: ", event);
}
```

When multiple Camel contexts exist in the CDI container, the Camel context bean qualifiers, like `@ContextName`, can be used to qualify the `CdiEventEndpoint<T>` injection points, e.g.:
Note that the CDI event Camel endpoint dynamically adds an observer method for each unique combination of event type and event qualifiers and solely relies on the container typesafe observer resolution, which leads to an implementation as efficient as possible.

Besides, as the impedance between the typesafe nature of CDI and the dynamic nature of the Camel component model is quite high, it is not possible to create an instance of the CDI event Camel endpoint via URIs. Indeed, the URI format for the CDI event component is:

```
@ImportResource
class MyBean {
    ...
}
```

But more fundamentally, that would prevent efficient binding between the endpoint instances and the observer methods as the CDI container doesn’t have any ways of discovering the Camel context model during the deployment phase.

### 57.11. CAMEL XML CONFIGURATION IMPORT

Available as of Camel 2.18

While CDI favors a typesafe dependency injection mechanism, it may be useful to reuse existing Camel XML configuration files into a Camel CDI application. In other use cases, it might be handy to rely on the Camel XML DSL to configure its Camel context(s).

You can use the `@ImportResource` annotation that’s provided by Camel CDI on any CDI beans and Camel CDI will automatically load the Camel XML configuration at the specified locations, e.g.:

```
@ImportResource("camel-context.xml")
class MyBean {
    ...
}
```

Camel CDI will load the resources at the specified locations from the classpath (other protocols may be added in the future).

Every CamelContext elements and other Camel primitives from the imported resources are automatically deployed as CDI beans during the container bootstrap so that they benefit from the auto-configuration provided by Camel CDI and become available for injection at runtime. If such an element
has an explicit id attribute set, the corresponding CDI bean is qualified with the @Named qualifier, e.g., given the following Camel XML configuration:

```xml
<camelContext id="foo">
  <endpoint id="bar" url="seda:inbound">
    <property key="queue" value="#queue"/>
    <property key="concurrentConsumers" value="10"/>
  </endpoint>
</camelContext>
```

The corresponding CDI beans are automatically deployed and can be injected, e.g.:

```java
@Named("bar")
Endpoint endpoint;
```

Note that the CamelContext beans are automatically qualified with both the @Named and @ContextName qualifiers. If the imported CamelContext element doesn’t have an id attribute, the corresponding bean is deployed with the built-in @Default qualifier.

Conversely, CDI beans deployed in the application can be referred to from the Camel XML configuration, usually using the ref attribute, e.g., given the following bean declared:

```java
@Produces
@Named("baz")
Processor processor = exchange -> exchange.getIn().setHeader("qux", "quux");
```

A reference to that bean can be declared in the imported Camel XML configuration, e.g.:

```xml
<camelContext id="foo">
  <route>
    <from url="..."/>
    <process ref="baz"/>
  </route>
</camelContext>
```

### 57.12. TRANSACTION SUPPORT

**Available as of Camel 2.19**

Camel CDI provides support for Camel transactional client using JTA.

That support is optional hence you need to have JTA in your application classpath, e.g., by explicitly add JTA as a dependency when using Maven:

```xml
<dependency>
  <groupId>javax.transaction</groupId>
  <artifactId>javax.transaction-api</artifactId>
  <scope>runtime</scope>
</dependency>
```
You’ll have to have your application deployed in a JTA capable container or provide a standalone JTA implementation.

**CAUTION**

Note that, for the time being, the transaction manager is looked up as JNDI resource with the `java:/TransactionManager` key.

More flexible strategies will be added in the future to support a wider range of deployment scenarios.

### 57.12.1. Transaction policies

Camel CDI provides implementation for the typically supported Camel `TransactedPolicy` as CDI beans.

It is possible to have these policies looked up by name using the transacted EIP, e.g.:

```java
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("activemq:queue:foo")
            .transacted("PROPAGATION_REQUIRED")
            .bean("transformer")
            .to("jpa:my.application.entity.Bar")
            .log("${body.id} inserted");
    }
}
```

This would be equivalent to:

```java
class MyRouteBean extends RouteBuilder {

    @Inject
    @Named("PROPAGATION_REQUIRED")
    Policy required;

    @Override
    public void configure() {
        from("activemq:queue:foo")
            .policy(required)
            .bean("transformer")
            .to("jpa:my.application.entity.Bar")
            .log("${body.id} inserted");
    }
}
```

The list of supported transaction policy names is:

- `PROPAGATION_NEVER`,
- `PROPAGATION_NOT_SUPPORTED`,
- `PROPAGATION_SUPPORTED`,
- `PROPAGATION_REQUIRED`,
- `PROPAGATION_MANDATORY`,
• PROPAGATION_REQUIRES_NEW,
• PROPAGATION_NESTED,
• PROPAGATION_MANDATORY.

57.12.2. Transactional error handler
Camel CDI provides a transactional error handler that extends the redelivery error handler, forces a rollback whenever an exception occurs and creates a new transaction for each redelivery.

Camel CDI provides the CdiRouteBuilder class that exposes the transactionErrorHandler helper method to enable quick access to the configuration, e.g.:

```java
class MyRouteBean extends CdiRouteBuilder {
    @Override
    public void configure() {
        errorHandler(transactionErrorHandler()
            .setTransactionPolicy("PROPAGATION_SUPPORTS")
            .maximumRedeliveries(5)
            .maximumRedeliveryDelay(5000)
            .collisionAvoidancePercent(10)
            .backOffMultiplier(1.5));
    }
}
```

57.13. AUTO-CONFIGURED OSGI INTEGRATION
Available as of Camel 2.17

The Camel context beans are automatically adapted by Camel CDI so that they are registered as OSGi services and the various resolvers (like ComponentResolver and DataFormatResolver) integrate with the OSGi registry. That means that the Karaf Camel commands can be used to operate the Camel contexts auto-configured by Camel CDI, e.g.:

```
karaf@root()> camel:context-list
Context  Status  Total #  Failed #  Inflight #  Uptime
-------  ------  -------  --------  ----------  -----
camel-cdi  Started  1       0         0      1 minute
```

See the camel-example-cdi-osgi example for a working example of the Camel CDI OSGi integration.

57.14. LAZY INJECTION / PROGRAMMATIC LOOKUP
While the CDI programmatic model favors a typesafe resolution mechanism that occurs at application initialization time, it is possible to perform dynamic / lazy injection later during the application execution using the programmatic lookup mechanism.

Camel CDI provides for convenience the annotation literals corresponding to the CDI qualifiers that you can use for standard injection of Camel primitives. These annotation literals can be used in conjunction with the javax.enterprise.inject.Instance interface which is the CDI entry point to perform lazy injection / programmatic lookup.
For example, you can use the provided annotation literal for the `@Uri` qualifier to lazily lookup for Camel primitives, e.g. for `ProducerTemplate` beans:

```java
@Any
@Inject
Instance<ProducerTemplate> producers;

ProducerTemplate inbound = producers
  .select(Uri.Literal.of("direct:inbound"))
  .get();
```

Or for `Endpoint` beans, e.g.:

```java
@Any
@Inject
Instance<Endpoint> endpoints;

MockEndpoint outbound = endpoints
  .select(MockEndpoint.class, Uri.Literal.of("mock:outbound"))
  .get();
```

Similarly, you can use the provided annotation literal for the `@ContextName` qualifier to lazily lookup for `CamelContext` beans, e.g.:

```java
@Any
@Inject
Instance<CamelContext> contexts;

CamelContext context = contexts
  .select(ContextName.Literal.of("foo"))
  .get();
```

You can also refined the selection based on the Camel context type, e.g.:

```java
@Any
@Inject
Instance<CamelContext> contexts;

// Refine the selection by type
Instance<DefaultCamelContext> context = contexts.select(DefaultCamelContext.class);

// Check if such a bean exists then retrieve a reference
if (!context.isUnsatisfied())
    context.get();
```

Or even iterate over a selection of Camel contexts, e.g.:

```java
@Any
@Inject
Instance<CamelContext> contexts;

for (CamelContext context : contexts)
    context.setUseBreadcrumb(true);
```
57.15. MAVEN ARCHETYPE

Among the available Camel Maven archetypes, you can use the provided camel-archetype-cdi to generate a Camel CDI Maven project, e.g.:

```bash
mvn archetype:generate -DarchetypeGroupId=org.apache.camel.archetypes -DarchetypeArtifactId=camel-archetype-cdi
```

57.16. SUPPORTED CONTAINERS

The Camel CDI component is compatible with any CDI 1.0, CDI 1.1 and CDI 1.2 compliant runtime. It’s been successfully tested against the following runtimes:

<table>
<thead>
<tr>
<th>Container</th>
<th>Version</th>
<th>Runtime</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weld SE</td>
<td>1.1.28.Final</td>
<td>CDI 1.0 / Java SE 7</td>
</tr>
<tr>
<td>OpenWebBeans</td>
<td>1.2.7</td>
<td>CDI 1.0 / Java SE 7</td>
</tr>
<tr>
<td>Weld SE</td>
<td>2.4.2.Final</td>
<td>CDI 1.2 / Java SE 7</td>
</tr>
<tr>
<td>OpenWebBeans</td>
<td>1.7.2</td>
<td>CDI 1.2 / Java SE 7</td>
</tr>
<tr>
<td>WildFly</td>
<td>8.2.1.Final</td>
<td>CDI 1.2 / Java EE 7</td>
</tr>
<tr>
<td>WildFly</td>
<td>9.0.1.Final</td>
<td>CDI 1.2 / Java EE 7</td>
</tr>
<tr>
<td>WildFly</td>
<td>10.1.0.Final</td>
<td>CDI 1.2 / Java EE 7</td>
</tr>
</tbody>
</table>

57.17. EXAMPLES

The following examples are available in the examples directory of the Camel project:

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>camel-example-cdi</td>
<td>Illustrates how to work with Camel using CDI to configure components, endpoints and beans</td>
</tr>
<tr>
<td>camel-example-cdi-kubernetes</td>
<td>Illustrates the integration between Camel, CDI and Kubernetes</td>
</tr>
<tr>
<td>camel-example-cdi-metrics</td>
<td>Illustrates the integration between Camel, Dropwizard Metrics and CDI</td>
</tr>
<tr>
<td>camel-example-cdi-properties</td>
<td>Illustrates the integration between Camel, DeltaSpike and CDI for configuration properties</td>
</tr>
<tr>
<td>Example</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>camel-example-cdi-osgi</td>
<td>A CDI application using the SJMS component that can be executed inside an OSGi container using PAX CDI</td>
</tr>
<tr>
<td>camel-example-cdi-rest-servlet</td>
<td>Illustrates the Camel REST DSL being used in a Web application that uses CDI as dependency injection framework</td>
</tr>
<tr>
<td>camel-example-cdi-test</td>
<td>Demonstrates the testing features that are provided as part of the integration between Camel and CDI</td>
</tr>
<tr>
<td>camel-example-cdi-xml</td>
<td>Illustrates the use of Camel XML configuration files into a Camel CDI application</td>
</tr>
<tr>
<td>camel-example-swagger-cdi</td>
<td>An example using REST DSL and Swagger Java with CDI</td>
</tr>
<tr>
<td>camel-example-widget-gadget-cdi</td>
<td>The Widget and Gadget use-case from the EIP book implemented in Java with CDI dependency Injection</td>
</tr>
</tbody>
</table>

### 57.19. CAMEL CDI FOR EAR DEPLOYMENTS ON {WILDFLY-CAMEL}

Camel CDI EAR deployments on {wildfly-camel} have some differences in class and resource loading behaviour, compared to standard WAR or JAR deployments.

{wildfly} bootstraps Weld using the EAR deployment ClassLoader. {wildfly} also mandates that only a single CDI extension is created and shared by all EAR sub-deployments.

This results in the ‘Auto-configured’ CDI Camel Context using the EAR deployment ClassLoader to dynamically load classes and resources. By default, this ClassLoader does not have access to resources within EAR sub-deployments.

For EAR deployments, it is recommended that usage of the ‘Auto-configured’ CDI Camel Context is avoided and that RouteBuilder classes are annotated with @ContextName, or that a CamelContext is created via the @ImportResource annotation or through CDI producer methods and fields. This helps {wildfly-camel} to determine the correct ClassLoader to use with Camel.
CHAPTER 58. CHRONICLE ENGINE COMPONENT

Available as of Camel version 2.18

The camel chronicle-engine component let you leverage the power of OpenHFT’s Chronicle-Engine

58.1. URI FORMAT

chronicle-engine:addresses/path[?options]

58.2. URI OPTIONS

The Chronicle Engine component has no options.

The Chronicle Engine endpoint is configured using URI syntax:

chronicle-engine:addresses/path

with the following path and query parameters:

58.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>addresses</td>
<td><strong>Required</strong> Engine addresses. Multiple addresses can be separated by comma.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>path</td>
<td><strong>Required</strong> Engine path</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

58.2.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>The default action to perform, valid values are: - PUBLISH - PPUBLISH_AND_INDEX - PPUT - PGET_AND_PUT - PPUT_ALL - PPUT_IF_ABSENT - PGET - PGET_AND_REMOVE - PREMOVE - PIS_EMPTY - PSIZE</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>clusterName</td>
<td>Cluster name for queue</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>filteredMapEvents</td>
<td>A comma separated list of Map event type to filer, valid values are: INSERT, UPDATE, REMOVE.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td>persistent</td>
<td>Enable/disable data persistence</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>subscribeMapEvents</td>
<td>Set if consumer should subscribe to Map events, default true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>subscribeTopicEvents</td>
<td>Set if consumer should subscribe to TopicEvents, default false.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>subscribeTopologicalEvents</td>
<td>Set if consumer should subscribe to TopologicalEvents, default false.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>wireType</td>
<td>The Wire type to use, default to binary wire.</td>
<td>BINARY</td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td>mean any exceptions occurred while the consumer is trying to pickup</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>incoming messages, or the likes, will now be processed as a message and</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>handled by the routing Error Handler. By default the consumer will use the</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>logged at WARN or ERROR level and ignored.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td></td>
<td>bridgeErrorHandler is enabled then this options is not in use. By default</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>the consumer will deal with exceptions, that will be logged at WARN or</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>ERROR level and ignored.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td>allowed to use asynchronous processing (if supported).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The **chunk** component allows for processing a message using a **Chunk** template. This can be ideal when using Templating to generate responses for requests.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-chunk</artifactId>
  <version>x.x.x</version>
</dependency>
```

### 59.1. URI FORMAT

```
chunk:templateName[?options]
```

Where **templateName** is the classpath-local URI of the template to invoke.

You can append query options to the URI in the following format, **?option=value&option=value&...**

### 59.2. OPTIONS

The **Chunk** component has no options.

The **Chunk** endpoint is configured using URI syntax:

```
chunk:resourceUri
```

with the following path and query parameters:

#### 59.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceUri</td>
<td><strong>Required</strong> Path to the resource. You can prefix with: classpath, file, http, ref, or bean. classpath, file and http loads the resource using these protocols (classpath is default). ref will lookup the resource in the registry. bean will call a method on a bean to be used as the resource. For bean you can specify the method name after dot, eg bean:myBean.myMethod.</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

#### 59.2.2. Query Parameters (7 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentCache</td>
<td>Sets whether to use resource content cache or not</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>encoding</td>
<td>Define the encoding of the body</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>extension</td>
<td>Define the file extension of the template</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>themeFolder</td>
<td>Define the themes folder to scan</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>themeLayer</td>
<td>Define the theme layer to elaborate</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>themeSubfolder</td>
<td>Define the themes subfolder to scan</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

Chunk component will look for a specific template in themes folder with extensions .chtml or .cxml. If you need to specify a different folder or extensions, you will need to use the specific options listed above.

### 59.3. CHUNK CONTEXT

Camel will provide exchange information in the Chunk context (just a Map). The `Exchange` is transferred as:

<table>
<thead>
<tr>
<th>key</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>exchange</td>
<td>The Exchange itself.</td>
</tr>
<tr>
<td>exchange.properties</td>
<td>The Exchange properties.</td>
</tr>
<tr>
<td>headers</td>
<td>The headers of the In message.</td>
</tr>
<tr>
<td>camelContext</td>
<td>The Camel Context.</td>
</tr>
<tr>
<td>request</td>
<td>The In message.</td>
</tr>
</tbody>
</table>
### 59.4. DYNAMIC TEMPLATES

Camel provides two headers by which you can define a different resource location for a template or the template content itself. If any of these headers is set then Camel uses this over the endpoint configured resource. This allows you to provide a dynamic template at runtime.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Support Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChunkConstants.CHUNK_RESOURCE_URI</td>
<td>String</td>
<td>A URI for the template resource to use instead of the endpoint configured.</td>
<td></td>
</tr>
<tr>
<td>ChunkConstants.CHUNK_TEMPLATE</td>
<td>String</td>
<td>The template to use instead of the endpoint configured.</td>
<td></td>
</tr>
</tbody>
</table>

### 59.5. SAMPLES

For example you could use something like:

```java
from("activemq:My.Queue").
to("chunk:template");
```

To use a Chunk template to formulate a response for a message for InOut message exchanges (where there is a `JMSReplyTo` header).
If you want to use InOnly and consume the message and send it to another destination you could use:

```java
from("activemq:My.Queue").
to("chunk:template").
to("activemq:Another.Queue");
```

It’s possible to specify what template the component should use dynamically via a header, so for example:

```java
from("direct:in").
setHeader(ChunkConstants.CHUNK_RESOURCE_URI).constant("template").
to("chunk:dummy");
```

An example of Chunk component options use:

```java
from("direct:in").
to("chunk:file_example?themeFolder=template&themeSubfolder=subfolder&extension=chunk");
```

In this example Chunk component will look for the file `file_example.chunk` in the folder `template/subfolder`.

### 59.6. THE EMAIL SAMPLE

In this sample we want to use Chunk templating for an order confirmation email. The email template is laid out in Chunk as:

```plaintext
Dear {$headers.lastName}, {$headers.firstName}

Thanks for the order of {$headers.item}.

Regards Camel Riders Bookstore
{$body}
```

### 59.7. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 60. CLASS COMPONENT

Available as of Camel version 2.4

The class: component binds beans to Camel message exchanges. It works in the same way as the Bean component but instead of looking up beans from a Registry it creates the bean based on the class name.

60.1. URI FORMAT

```
class:className[?options]
```

Where className is the fully qualified class name to create and use as bean.

60.2. OPTIONS

The Class component has no options.

The Class endpoint is configured using URI syntax:

```
class:beanName
```

with the following path and query parameters:

60.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>beanName</td>
<td>Required Sets the name of the bean to invoke</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

60.2.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>method (producer)</td>
<td>Sets the name of the method to invoke on the bean</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>cache (advanced)</td>
<td>If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>multiParameterArray (advanced)</td>
<td>Deprecated How to treat the parameters which are passed from the message body; if it is true, the message body should be an array of parameters. Note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### 60.4. Setting Properties on the Created Instance

In the endpoint uri you can specify properties to set on the created instance, for example if it has a `setPrefix` method:

```java
// Camel 2.17 onwards
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?bean.prefix=Bye")
  .to("mock:result");

// Camel 2.16 and older
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?prefix=Bye")
  .to("mock:result");
```

And you can also use the `#` syntax to refer to properties to be looked up in the Registry.

```java
// Camel 2.17 onwards
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?bean.cool=#foo")
  .to("mock:result");

// Camel 2.16 and older
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?cool=#foo")
  .to("mock:result");
```
Which will lookup a bean from the Registry with the id `foo` and invoke the `setCool` method on the created instance of the `MyPrefixBean` class.

TIP: See more details at the `Bean` component as the `class` component works in much the same way.

- Endpoint
- Getting Started
- `Bean`
- `Bean Binding`
- `Bean Integration`
CHAPTER 61. CMIS COMPONENT

Available as of Camel version 2.11

The cmis component uses the Apache Chemistry client API and allows you to add/read nodes to/from a CMIS compliant content repositories.

61.1. URI FORMAT

   cmis://cmisServerUrl[?options]

You can append query options to the URI in the following format, ?options=value&option2=value&...

61.2. CMIS OPTIONS

The CMIS component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>sessionFacadeFactory</td>
<td>To use a custom CMISSessionFacadeFactory to create the CMISSessionFacade instances</td>
<td></td>
<td>CMISSessionFacade</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The CMIS endpoint is configured using URI syntax:

   cmis:cmisUrl

with the following path and query parameters:

61.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmsUrl</td>
<td>Required URL to the cmis repository</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

61.2.2. Query Parameters (13 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>pageSize</td>
<td>Number of nodes to retrieve per page</td>
<td>100</td>
<td>int</td>
</tr>
<tr>
<td>readContent</td>
<td>If set to true, the content of document node will be retrieved in addition to the properties</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>readCount</td>
<td>Max number of nodes to read</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>repositoryId</td>
<td>The Id of the repository to use. If not specified the first available repository is used</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>query</td>
<td>The cmis query to execute against the repository. If not specified, the consumer will retrieve every node from the content repository by iterating the content tree recursively</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>queryMode</td>
<td>If true, will execute the cmis query from the message body and return result, otherwise will create a node in the cmis repository</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sessionFacadeFactory</td>
<td>To use a custom CMISSessionFacadeFactory to create the CMISSessionFacade instances</td>
<td></td>
<td>CMISSessionFacadeFactory</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>password (security)</td>
<td>Password for the cmis repository</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>username (security)</td>
<td>Username for the cmis repository</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 61.3. USAGE

#### 61.3.1. Message headers evaluated by the producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel CMISFolderPath</td>
<td>/</td>
<td>The current folder to use during the execution. If not specified will use the root folder</td>
</tr>
<tr>
<td>Camel CMISRetrieveContent</td>
<td>false</td>
<td>In queryMode this header will force the producer to retrieve the content of document nodes.</td>
</tr>
<tr>
<td>Camel CMISReadSize</td>
<td>0</td>
<td>Max number of nodes to read.</td>
</tr>
<tr>
<td>cmis: path</td>
<td>null</td>
<td>If CamelCMISFolderPath is not set, will try to find out the path of the node from this cmis property and it is name</td>
</tr>
<tr>
<td>cmis: name</td>
<td>null</td>
<td>If CamelCMISFolderPath is not set, will try to find out the path of the node from this cmis property and it is path</td>
</tr>
<tr>
<td>cmis: object TypeId</td>
<td>null</td>
<td>The type of the node</td>
</tr>
<tr>
<td>cmis: contentTypeMimeType</td>
<td>null</td>
<td>The mimetype to set for a document</td>
</tr>
</tbody>
</table>
61.3.2. Message headers set during querying Producer operation

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelCMISResultCount</td>
<td>Integer</td>
<td>Number of nodes returned from the query.</td>
</tr>
</tbody>
</table>

The message body will contain a list of maps, where each entry in the map is cmis property and its value. If CamelCMISRetrieveContent header is set to true, one additional entry in the map with key CamelCMISContent will contain ByteArrayInputStream of the document type of nodes.

61.4. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cmis</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.11 or higher).

61.5. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 62. CM SMS GATEWAY COMPONENT

Available as of Camel version 2.18

Camel-Cm-Sms is an Apache Camel component for the [CM SMS Gateway](https://www.cmtelecom.com).

It allows to integrate CM SMS API in an application as a camel component.

You must have a valid account. More information are available at CM Telecom.

```
cm-sms://sgw01.cm.nl/gateway.ashx?
defaultFrom=DefaultSender&defaultMaxNumberOfParts=8&productToken=xxxxx
```

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cm-sms</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

### 62.1. OPTIONS

The CM SMS Gateway component has no options.

The CM SMS Gateway endpoint is configured using URI syntax:

```
cm-sms:host
```

with the following path and query parameters:

#### 62.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Required SMS Provider HOST with scheme</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 62.1.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultFrom</td>
<td>This is the sender name. The maximum length is 11 characters.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td>defaultMaxNumberOfParts (producer)</td>
<td>If it is a multipart message forces the max number. Message can be truncated. Technically the gateway will first check if a message is larger than 160 characters, if so, the message will be cut into multiple 153 characters parts limited by these parameters.</td>
<td>8</td>
<td>int</td>
</tr>
<tr>
<td>productToken (producer)</td>
<td>Required The unique token to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>testConnectionOnStartup (producer)</td>
<td>Whether to test the connection to the SMS Gateway on startup</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 62.2. SAMPLE

You can try [this project](#) to see how camel-cm-sms can be integrated in a camel route.
CHAPTER 63. COAP COMPONENT

Available as of Camel version 2.16

Camel-CoAP is an Apache Camel component that allows you to work with CoAP, a lightweight REST-type protocol for machine-to-machine operation. CoAP, Constrained Application Protocol is a specialized web transfer protocol for use with constrained nodes and constrained networks and it is based on RFC 7252.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-coap</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

63.1. OPTIONS

The CoAP component has no options.

The CoAP endpoint is configured using URI syntax:

```text
coap:uri
```

with the following path and query parameters:

63.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>The URI for the CoAP endpoint</td>
<td></td>
<td>URI</td>
</tr>
</tbody>
</table>

63.1.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### 63.2. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelCoapMethod</td>
<td>String</td>
<td>The request method that the CoAP producer should use when calling the target CoAP server URI. Valid options are DELETE, GET, PING, POST &amp; PUT.</td>
</tr>
<tr>
<td>CamelCoapResponseCode</td>
<td>String</td>
<td>The CoAP response code sent by the external server. See RFC 7252 for details of what each code means.</td>
</tr>
<tr>
<td>CamelCoapUri</td>
<td>String</td>
<td>The URI of a CoAP server to call. Will override any existing URI configured directly on the endpoint.</td>
</tr>
</tbody>
</table>

#### 63.2.1. Configuring the CoAP producer request method

The following rules determine which request method the CoAP producer will use to invoke the target URI:

1. The value of the **CamelCoapMethod** header

2. **GET** if a query string is provided on the target CoAP server URI.
3. **POST** if the message exchange body is not null.

4. **GET** otherwise.
CHAPTER 64. CONSTANT LANGUAGE

Available as of Camel version 1.5

The Constant Expression Language is really just a way to specify constant strings as a type of expression.

![NOTE]
This is a fixed constant value that is only set once during starting up the route, do not use this if you want dynamic values during routing.

64.1. CONSTANT OPTIONS

The Constant language supports 1 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trim</td>
<td>true</td>
<td>Boolean</td>
<td>Whether to trim the value to remove leading and trailing whitespaces and line breaks</td>
</tr>
</tbody>
</table>

64.2. EXAMPLE USAGE

The setHeader element of the Spring DSL can utilize a constant expression like:

```xml
<route>
  <from uri="seda:a"/>
  <setHeader headerName="theHeader">
    <constant>the value</constant>
  </setHeader>
  <to uri="mock:b"/>
</route>
```

in this case, the Message coming from the seda:a Endpoint will have 'theHeader' header set to the constant value 'the value'.

And the same example using Java DSL:

```java
from("seda:a")
  .setHeader("theHeader", constant("the value"))
  .to("mock:b");
```

64.3. DEPENDENCIES

The Constant language is part of camel-core.
CHAPTER 65. COMETD COMPONENT

Available as of Camel version 2.0

The `cometd:` component is a transport for working with the jetty implementation of the cometd/bayeux protocol. Using this component in combination with the dojo toolkit library it’s possible to push Camel messages directly into the browser using an AJAX based mechanism.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cometd</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

65.1. URI FORMAT

`cometd://host:port/channelName[?options]`

The `channelName` represents a topic that can be subscribed to by the Camel endpoints.

65.2. EXAMPLES

```
cometd://localhost:8080/service/mychannel
cometds://localhost:8443/service/mychannel
```

where `cometds:` represents an SSL configured endpoint.

65.3. OPTIONS

The CometD component supports 8 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sslKeyPassword</code> (security)</td>
<td>The password for the keystore when using SSL.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>sslPassword</code> (security)</td>
<td>The password when using SSL.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>sslKeystore</code> (security)</td>
<td>The path to the keystore.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>securityPolicy</code> (security)</td>
<td>To use a custom configured SecurityPolicy to control authorization</td>
<td></td>
<td>SecurityPolicy</td>
</tr>
</tbody>
</table>
To use a list of custom BayeuxServer.Extension that allows modifying incoming and outgoing requests.

To configure security using SSLContextParameters

Enable usage of global SSL context parameters.

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

The CometD endpoint is configured using URI syntax:

```
cometd:host:port/channelName
```

with the following path and query parameters:

### 65.3.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Required Hostname</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>Required Host port number</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>channelName</td>
<td>Required The channelName represents a topic that can be subscribed to by the Camel endpoints.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 65.3.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowedOrigins</td>
<td>The origins domain that support to cross, if the crosssOriginFilterOn is true</td>
<td>*</td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>baseResource</td>
<td>The root directory for the web resources or classpath. Use the protocol file: or classpath: depending if you want that the component loads the resource from file system or classpath. Classpath is required for OSGI deployment where the resources are packaged in the jar.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>crossOriginFilterOn</td>
<td>If true, the server will support for cross-domain filtering</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>filterPath</td>
<td>The filterPath will be used by the CrossOriginFilter, if the crossOriginFilterOn is true</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>interval</td>
<td>The client side poll timeout in milliseconds. How long a client will wait between reconnects</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>jsonCommented</td>
<td>If true, the server will accept JSON wrapped in a comment and will generate JSON wrapped in a comment. This is a defence against Ajax Hijacking.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>logLevel</td>
<td>Logging level. 0=none, 1=info, 2=debug.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>maxInterval</td>
<td>The max client side poll timeout in milliseconds. A client will be removed if a connection is not received in this time.</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>multiFrameInterval</td>
<td>The client side poll timeout, if multiple connections are detected from the same browser.</td>
<td>1500</td>
<td>int</td>
</tr>
<tr>
<td>timeout</td>
<td>The server side poll timeout in milliseconds. This is how long the server will hold a reconnect request before responding.</td>
<td>240000</td>
<td>int</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sessionHeadersEnabled</td>
<td>Whether to include the server session headers in the Camel message when creating a Camel Message for incoming requests.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>disconnectSession (producer)</td>
<td>Whether to disconnect local sessions after publishing a message to its channel. Disconnecting local session is needed as they are not swept by default by CometD, and therefore you can run out of memory.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

You can append query options to the URI in the following format, `?option=value&option=value&…`

Here is some examples on How to pass the parameters

For file (for webapp resources located in the Web Application directory → cometd://localhost:8080?resourceBase=file./webapp
For classpath (when by example the web resources are packaged inside the webapp folder → cometd://localhost:8080?resourceBase=classpath:webapp

### 65.4. AUTHENTICATION

Available as of Camel 2.8

You can configure custom SecurityPolicy and Extension's to the `CometdComponent` which allows you to use authentication as documented here

### 65.5. SETTING UP SSL FOR COMETD COMPONENT

#### 65.5.1. Using the JSSE Configuration Utility

As of Camel 2.9, the Cometd component supports SSL/TLS configuration through the Camel JSSE Configuration Utility. This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the Cometd component. You need to configure SSL on the CometdComponent.

Programmatic configuration of the component

```java
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
```
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

TrustManagersParameters tmp = new TrustManagersParameters();
tmp.setKeyStore(ksp);

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);
scp.setTrustManagers(tmp);

CometdComponent commetdComponent = getContext().getComponent("cometds", CometdComponent.class);
commetdComponent.setSslContextParameters(scp);

Spring DSL based configuration of endpoint

...<camel:sslContextParameters
    id="sslContextParameters">
    <camel:keyManagers
        keyPassword="keyPassword">
        <camel:keyStore
            resource="/users/home/server/keystore.jks"
            password="keystorePassword"/>
    </camel:keyManagers>
    <camel:trustManagers>
        <camel:keyStore
            resource="/users/home/server/keystore.jks"
            password="keystorePassword"/>
    </camel:keyManagers>
</camel:sslContextParameters>...

<bean id="cometd" class="org.apache.camel.component.cometd.CometdComponent">
    <property name="sslContextParameters" ref="sslContextParameters"/>
</bean>

...<to uri="cometds://127.0.0.1:443/service/test?baseResource=file:/target/test-classes/webapp&timeout=240000&interval=0&maxInterval=30000&multiFrameInterval=1500&jsonCom mented=true&logLevel=2"/>...
CHAPTER 66. CONSUL COMPONENT

Available as of Camel version 2.18

The Consul component is a component for integrating your application with Consul.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-consul</artifactId>
  <version>${camel-version}</version>
</dependency>
```

66.1. URI FORMAT

```
consul://domain?[options]
```

You can append query options to the URI in the following format:

```
?option=value&option=value&...
```

66.2. OPTIONS

The Consul component supports 9 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>url (common)</td>
<td>The Consul agent URL</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>datacenter (common)</td>
<td>The data center</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sslContextParameters (common)</td>
<td>SSL configuration using an org.apache.camel.util.jsse.SSLContextParameters instance.</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
<tr>
<td>useGlobalSslContextParameters (security)</td>
<td>Enable usage of global SSL context parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>aclToken (common)</td>
<td>Sets the ACL token to be used with Consul</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>userName (common)</td>
<td>Sets the username to be used for basic authentication</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
The Consul endpoint is configured using URI syntax:

```
consul:apiEndpoint
```

with the following path and query parameters:

### 66.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiEndpoint</td>
<td><strong>Required</strong> The API endpoint</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 66.2.2. Query Parameters (4 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bridgeErrorHandler</code> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>exceptionHandler</code> (consumer)</td>
<td>To let the consumer use a customExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
</tbody>
</table>
### 66.3. HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel Consul Action</td>
<td>String</td>
<td>The Producer action</td>
</tr>
<tr>
<td>Camel Consul Key</td>
<td>String</td>
<td>The Key on which the action should applied</td>
</tr>
<tr>
<td>Camel Consul EventId</td>
<td>String</td>
<td>The event id (consumer only)</td>
</tr>
<tr>
<td>Camel Consul EventName</td>
<td>String</td>
<td>The event name (consumer only)</td>
</tr>
<tr>
<td>Camel Consul EventLTime</td>
<td>Long</td>
<td>The event LTime</td>
</tr>
<tr>
<td>Camel Consul NodeFilter</td>
<td>String</td>
<td>The Node filter</td>
</tr>
<tr>
<td>Camel Consul TagFilter</td>
<td>String</td>
<td>The tag filter</td>
</tr>
</tbody>
</table>

**Name**
- exchangePattern
- synchronous

**Description**
- Sets the exchange pattern when the consumer creates an exchange.
- Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

**Default**
- false

**Type**
- ExchangePattern
- boolean
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel Consul Session Filter</td>
<td>String</td>
<td>The session filter</td>
</tr>
<tr>
<td>Camel Consul Version</td>
<td>int</td>
<td>The data version</td>
</tr>
<tr>
<td>Camel Consul Flags</td>
<td>Long</td>
<td>Flags associated with a value</td>
</tr>
<tr>
<td>Camel Consul CreateIndex</td>
<td>Long</td>
<td>The internal index value that represents when the entry was created</td>
</tr>
<tr>
<td>Camel Consul LockIndex</td>
<td>Long</td>
<td>The number of times this key has successfully been acquired in a lock</td>
</tr>
<tr>
<td>Camel Consul ModifyIndex</td>
<td>Long</td>
<td>The last index that modified this key</td>
</tr>
<tr>
<td>Camel Consul Options</td>
<td>Object</td>
<td>Options associated to the request</td>
</tr>
<tr>
<td>Camel Consul Result</td>
<td>boolean</td>
<td>true if the response has a result</td>
</tr>
<tr>
<td>Camel Consul Session</td>
<td>String</td>
<td>The session id</td>
</tr>
<tr>
<td>Camel Consul ValueAsString</td>
<td>boolean</td>
<td>To transform values retrieved from Consul i.e. on KV endpoint to string.</td>
</tr>
</tbody>
</table>
CHAPTER 67. CONTROL BUS COMPONENT

Available as of Camel version 2.11

The Control Bus from the EIP patterns allows for the integration system to be monitored and managed from within the framework.

Use a Control Bus to manage an enterprise integration system. The Control Bus uses the same messaging mechanism used by the application data, but uses separate channels to transmit data that is relevant to the management of components involved in the message flow.

In Camel you can manage and monitor using JMX, or by using a Java API from the CamelContext, or from the org.apache.camel.api.management package, or use the event notifier which has an example here.

From Camel 2.11 onwards we have introduced a new ControlBus Component that allows you to send messages to a control bus Endpoint that reacts accordingly.

67.1. CONTROLBUS COMPONENT

Available as of Camel 2.11

The controlbus: component provides easy management of Camel applications based on the Control Bus EIP pattern. For example, by sending a message to an Endpoint you can control the lifecycle of routes, or gather performance statistics.

```
controlbus:command[?options]
```

Where command can be any string to identify which type of command to use.

67.2. COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route</td>
<td>To control routes using the routeld and action parameter.</td>
</tr>
</tbody>
</table>
### 67.3. OPTIONS

The Control Bus component has no options.

The Control Bus endpoint is configured using URI syntax:

```
controlbus:command:language
```

with the following path and query parameters:

#### 67.3.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td><strong>Required</strong> Command can be either route or language</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>language</td>
<td>Allows you to specify the name of a Language to use for evaluating the message body. If there is any result from the evaluation, then the result is put in the message body.</td>
<td></td>
<td>Language</td>
</tr>
</tbody>
</table>

#### 67.3.2. Query Parameters (6 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>To denote an action that can be either: start, stop, or status. To either start or stop a route, or to get the status of the route as output in the message body. You can use suspend and resume from Camel 2.11.1 onwards to either suspend or resume a route. And from Camel 2.11.1 onwards you can use stats to get performance statics returned in XML format; the routeld option can be used to define which route to get the performance stats for, if routeld is not defined, then you get statistics for the entire CamelContext. The restart action will restart the route.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### 67.4. USING ROUTE COMMAND

The route command allows you to do common tasks on a given route very easily, for example to start a route, you can send an empty message to this endpoint:

```java
template.sendBody("controlbus:route?routeId=foo&action=start", null);
```

To get the status of the route, you can do:

```java
String status = template.requestBody("controlbus:route?routeId=foo&action=status", null, String.class);
```

### 67.5. GETTING PERFORMANCE STATISTICS

Available as of Camel 2.11.1

This requires JMX to be enabled (is by default) then you can get the performance statics per route, or for the CamelContext. For example to get the statics for a route named foo, we can do:

```java
String xml = template.requestBody("controlbus:route?routeId=foo&action=stats", null, String.class);
```

The returned statics is in XML format. Its the same data you can get from JMX with the `dumpRouteStatsAsXml` operation on the `ManagedRouteMBean`.

To get statics for the entire CamelContext you just omit the `routeId` parameter as shown below:

```java
String xml = template.requestBody("controlbus:route?routeId=foo&action=stats", null, String.class);
```
67.6. USING SIMPLE LANGUAGE

You can use the **Simple** language with the control bus, for example to stop a specific route, you can send a message to the "**controlbus:language:simple**" endpoint containing the following message:

```
template.sendBody("controlbus:language:simple", "${camelContext.stopRoute('myRoute')}";
```

As this is a void operation, no result is returned. However, if you want the route status you can do:

```
String status = template.requestBody("controlbus:language:simple", "${camelContext.getRouteStatus('myRoute')}", String.class);
```

It’s easier to use the **route** command to control lifecycle of routes. The **language** command allows you to execute a language script that has stronger powers such as **Groovy** or to some extend the **Simple** language.

For example to shutdown Camel itself you can do:

```
template.sendBody("controlbus:language:simple?async=true", "${camelContext.stop()}");
```

We use **async=true** to stop Camel asynchronously as otherwise we would be trying to stop Camel while it was in-flight processing the message we sent to the control bus component.

**TIP**

You can also use other languages such as **Groovy**, etc.
CHAPTER 68. COUCHBASE COMPONENT

Available as of Camel version 2.19

The couchbase: component allows you to treat CouchBase instances as a producer or consumer of messages.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-couchbase</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

### 68.1. URI FORMAT

couchbase:url

### 68.2. OPTIONS

The Couchbase component has no options.

The Couchbase endpoint is configured using URI syntax:

```
couchbase:protocol:hostname:port
```

with the following path and query parameters:

#### 68.2.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol</td>
<td>Required The protocol to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>hostname</td>
<td>Required The hostname to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>The port number to use</td>
<td>8091</td>
<td>int</td>
</tr>
</tbody>
</table>

#### 68.2.2. Query Parameters (47 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bucket (common)</td>
<td>The bucket to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td><strong>key</strong> (common)</td>
<td>The key to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>consumerProcessEdStrategy</strong> (consumer)</td>
<td>Define the consumer Processed strategy to use</td>
<td>none</td>
<td>String</td>
</tr>
<tr>
<td><strong>descending</strong> (consumer)</td>
<td>Define if this operation is descending or not</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>designDocumentName</strong> (consumer)</td>
<td>The design document name to use</td>
<td>beer</td>
<td>String</td>
</tr>
<tr>
<td><strong>limit</strong> (consumer)</td>
<td>The output limit to use</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td><strong>rangeEndKey</strong> (consumer)</td>
<td>Define a range for the end key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>rangeStartKey</strong> (consumer)</td>
<td>Define a range for the start key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>sendEmptyMessageWhenIdle</strong> (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>skip</strong> (consumer)</td>
<td>Define the skip to use</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td><strong>viewName</strong> (consumer)</td>
<td>The view name to use</td>
<td>brewe_y_beers</td>
<td>String</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong> (consumer)</td>
<td>To let the consumer use a customExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>autoStartIdForInserts (producer)</td>
<td>Define if we want an autostart Id when we are doing an insert operation.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>operation (producer)</td>
<td>The operation to do</td>
<td>CCB_PUT</td>
<td>String</td>
</tr>
<tr>
<td>persistTo (producer)</td>
<td>Where to persist the data</td>
<td>0</td>
<td>int</td>
</tr>
<tr>
<td>producerRetryAttempts (producer)</td>
<td>Define the number of retry attempts</td>
<td>2</td>
<td>int</td>
</tr>
<tr>
<td>producerRetryPause (producer)</td>
<td>Define the retry pause between different attempts</td>
<td>5000</td>
<td>int</td>
</tr>
<tr>
<td>replicateTo (producer)</td>
<td>Where to replicate the data</td>
<td>0</td>
<td>int</td>
</tr>
<tr>
<td>startingIdForInsertsFrom (producer)</td>
<td>Define the starting Id where we are doing an insert operation</td>
<td></td>
<td>long</td>
</tr>
<tr>
<td>additionalHosts (advanced)</td>
<td>The additional hosts</td>
<td></td>
<td>String</td>
</tr>
<tr>

</table>
CHAPTER 69. COUCHDB COMPONENT

Available as of Camel version 2.11

The **couchdb:** component allows you to treat CouchDB instances as a producer or consumer of messages. Using the lightweight LightCouch API, this camel component has the following features:

- As a consumer, monitors couch changesets for inserts, updates and deletes and publishes these as messages into camel routes.
- As a producer, can save, update and from Camel 2.18 delete (by using CouchDbMethod with DELETE value) documents into couch.
- Can support as many endpoints as required, eg for multiple databases across multiple instances.
- Ability to have events trigger for only deletes, only inserts/updates or all (default).
- Headers set for sequenceld, document revision, document id, and HTTP method type.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-couchdb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

### 69.1. URI FORMAT

```
couchdb:http://hostname[:port]/database?[options]
```

Where **hostname** is the hostname of the running couchdb instance. Port is optional and if not specified then defaults to 5984.

### 69.2. OPTIONS

The CouchDB component has no options.

The CouchDB endpoint is configured using URI syntax:

```
couchdb:protocol:hostname:port/database
```

with the following path and query parameters:

### 69.2.1. Path Parameters (4 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol</td>
<td><strong>Required</strong> The protocol to use for communicating with the database.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------</td>
<td>--------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>hostname</td>
<td>Required Hostname of the running couchdb instance</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>Port number for the running couchdb instance</td>
<td>5984</td>
<td>int</td>
</tr>
<tr>
<td>database</td>
<td>Required Name of the database to use</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 69.2.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>createDatabase</td>
<td>Creates the database if it does not already exist</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>deletes</td>
<td>Document deletes are published as events</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>heartbeat</td>
<td>How often to send an empty message to keep socket alive in millis</td>
<td>30000</td>
<td>long</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>since</td>
<td>Start tracking changes immediately after the given update sequence. The default, null, will start monitoring from the latest sequence.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>style</td>
<td>Specifies how many revisions are returned in the changes array. The default, main_only, will only return the current winning revision; all_docs will return all leaf revisions (including conflicts and deleted former conflicts.)</td>
<td>main_only</td>
<td>String</td>
</tr>
<tr>
<td>updates</td>
<td>Document inserts/updates are published as events</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### ExceptionHandler (consumer)

To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.

### exchangePattern (consumer)

Sets the exchange pattern when the consumer creates an exchange.

### synchronous (advanced)

Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

### password (security)

Password for authenticated databases

### username (security)

Username in case of authenticated databases

### 69.3. HEADERS

The following headers are set on exchanges during message transport.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CouchDbDatabase</strong></td>
<td>the database the message came from</td>
</tr>
<tr>
<td><strong>CouchDbSeq</strong></td>
<td>the couchdb changeset sequence number of the update / delete message</td>
</tr>
<tr>
<td><strong>CouchDbId</strong></td>
<td>the couchdb document id</td>
</tr>
<tr>
<td><strong>CouchDbRev</strong></td>
<td>the couchdb document revision</td>
</tr>
<tr>
<td><strong>CouchDbMethod</strong></td>
<td>the method (delete / update)</td>
</tr>
</tbody>
</table>

Headers are set by the consumer once the message is received. The producer will also set the headers for downstream processors once the insert/update has taken place. Any headers set prior to the producer are ignored. That means for example, if you set CouchDbId as a header, it will not be used as the id for insertion, the id of the document will still be used.

### 69.4. MESSAGE BODY
The component will use the message body as the document to be inserted. If the body is an instance of String, then it will be marshalled into a GSON object before insert. This means that the string must be valid JSON or the insert / update will fail. If the body is an instance of a com.google.gson.JsonElement then it will be inserted as is. Otherwise the producer will throw an exception of unsupported body type.

69.5. SAMPLES

For example if you wish to consume all inserts, updates and deletes from a CouchDB instance running locally, on port 9999 then you could use the following:

```java
from("couchdb:http://localhost:9999").process(someProcessor);
```

If you were only interested in deletes, then you could use the following

```java
from("couchdb:http://localhost:9999?updates=false").process(someProcessor);
```

If you wanted to insert a message as a document, then the body of the exchange is used

```java
from("someProducingEndpoint").process(someProcessor).to("couchdb:http://localhost:9999")
```
CHAPTER 70. CASSANDRA CQL COMPONENT

Available as of Camel version 2.15

Apache Cassandra is an open source NoSQL database designed to handle large amounts on commodity hardware. Like Amazon’s DynamoDB, Cassandra has a peer-to-peer and master-less architecture to avoid single point of failure and garanty high availability. Like Google’s BigTable, Cassandra data is structured using column families which can be accessed through the Thrift RPC API or a SQL-like API called CQL.

This component aims at integrating Cassandra 2.0+ using the CQL3 API (not the Thrift API). It’s based on Cassandra Java Driver provided by DataStax.

Maven users will need to add the following dependency to their pom.xml:

```
pom.xml

<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cassandraql</artifactId>
  <version>x.y.z</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

70.1. URI FORMAT

The endpoint can initiate the Cassandra connection or use an existing one.

<table>
<thead>
<tr>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cql:localhost/keyspace</td>
<td>Single host, default port, usual for testing</td>
</tr>
<tr>
<td>cql:host1,host2/keyspace</td>
<td>Multi host, default port</td>
</tr>
<tr>
<td>cql:host1,host2:9042/keyspace</td>
<td>Multi host, custom port</td>
</tr>
<tr>
<td>cql:host1,host2</td>
<td>Default port and keyspace</td>
</tr>
<tr>
<td>cql:bean:sessionRef</td>
<td>Provided Session reference</td>
</tr>
<tr>
<td>cql:bean:clusterRef/keyspace</td>
<td>Provided Cluster reference</td>
</tr>
</tbody>
</table>

To fine tune the Cassandra connection (SSL options, pooling options, load balancing policy, retry policy, reconnection policy...), create your own Cluster instance and give it to the Camel endpoint.

70.2. CASSANDRA OPTIONS

The Cassandra CQL component has no options.

The Cassandra CQL endpoint is configured using URI syntax:
cql:beanRef:hosts:port/keyspace

with the following path and query parameters:

### 70.2.1. Path Parameters (4 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>beanRef</td>
<td>beanRef is defined using bean:id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>hosts</td>
<td>Hostname(s) cassandra server(s). Multiple hosts can be separated by comma.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>Port number of cassandra server(s)</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>keyspace</td>
<td>Keyspace to use</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 70.2.2. Query Parameters (29 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster (common)</td>
<td>To use the Cluster instance (you would normally not use this option)</td>
<td></td>
<td>Cluster</td>
</tr>
<tr>
<td>clusterName (common)</td>
<td>Cluster name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>consistencyLevel (common)</td>
<td>Consistency level to use</td>
<td></td>
<td>ConsistencyLevel</td>
</tr>
<tr>
<td>cql (common)</td>
<td>CQL query to perform. Can be overridden with the message header with key CamelCqlQuery.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>loadBalancingPolicy (common)</td>
<td>To use a specific LoadBalancingPolicy</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>password (common)</td>
<td>Password for session authentication</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>prepareStatements (common)</td>
<td>Whether to use PreparedStatements or regular Statements</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>resultSetConversionStrategy (common)</td>
<td>To use a custom class that implements logic for converting ResultSet into message body ALL, ONE, LIMIT_10, LIMIT_100...</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------------</td>
</tr>
<tr>
<td>session (common)</td>
<td>To use the Session instance (you would normally not use this option)</td>
<td></td>
<td>Session</td>
</tr>
<tr>
<td>username (common)</td>
<td>Username for session authentication</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>backoffIdleThreshold (scheduler)</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>backoffMultiplier</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>delay</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td></td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>scheduler</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumerScheduler</td>
</tr>
<tr>
<td>schedulerProperties</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>startScheduler</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLISECONDS</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

70.3. MESSAGES
70.3.1. Incoming Message

The Camel Cassandra endpoint expects a bunch of simple objects (Object or Object[] or Collection<Object>) which will be bound to the CQL statement as query parameters. If message body is null or empty, then CQL query will be executed without binding parameters.

Headers:

- CamelCqlQuery (optional, String or RegularStatement): CQL query either as a plain String or built using the QueryBuilder.

70.3.2. Outgoing Message

The Camel Cassandra endpoint produces one or many a Cassandra Row objects depending on the resultSetConversionStrategy:

- List<Row> if resultSetConversionStrategy is ALL or LIMIT_[0-9]+.
- Single `Row` if resultSetConversionStrategy is ONE.
- Anything else, if resultSetConversionStrategy is a custom implementation of the ResultSetConversionStrategy.

70.4. REPOSITORIES

Cassandra can be used to store message keys or messages for the idempotent and aggregation EIP.

Cassandra might not be the best tool for queuing use cases yet, read Cassandra anti-patterns queues and queue like datasets. It’s advised to use LeveledCompaction and a small GC grace setting for these tables to allow tombstoned rows to be removed quickly.

70.5. IDEMPOTENT REPOSITORY

The NamedCassandraIdempotentRepository stores messages keys in a Cassandra table like this:

```
CREATE TABLE CAMEL_IDEMPOTENT ( 
  NAME varchar,  -- Repository name
  KEY varchar,  -- Message key
  PRIMARY KEY (NAME, KEY)
) WITH compaction = {class:'LeveledCompactionStrategy'}
AND gc_grace_seconds = 86400;
```

This repository implementation uses lightweight transactions (also known as Compare and Set) and requires Cassandra 2.0.7+.

Alternatively, the CassandraIdempotentRepository does not have a NAME column and can be extended to use a different data model.
### 70.6. AGGREGATION REPOSITORY

The `NamedCassandraAggregationRepository` stores exchanges by correlation key in a Cassandra table like this:

**CAMEL_AGGREGATION.cql**

```cql
CREATE TABLE CAMEL_AGGREGATION (  
  NAME varchar, -- Repository name  
  KEY varchar, -- Correlation id  
  EXCHANGE_ID varchar, -- Exchange id  
  EXCHANGE blob, -- Serialized exchange  
  PRIMARY KEY (NAME, KEY)  
) WITH compaction = {class:'LeveledCompactionStrategy'}  
AND gc_grace_seconds = 86400;
```

Alternatively, the `CassandraAggregationRepository` does not have a `NAME` column and can be extended to use a different data model.
<table>
<thead>
<tr>
<th>Option</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exchangeColumn</td>
<td>EXCHANGE</td>
<td>Exchange content column</td>
</tr>
<tr>
<td>name</td>
<td></td>
<td>Repository name, value used for NAME column</td>
</tr>
<tr>
<td>ttl</td>
<td></td>
<td>Exchange time to live</td>
</tr>
<tr>
<td>writeConsistencyLevel</td>
<td></td>
<td>Consistency level used to insert/delete exchange: ANY, ONE, TWO, QUORUM, LOCAL_QUORUM...</td>
</tr>
<tr>
<td>readConsistencyLevel</td>
<td></td>
<td>Consistency level used to read/check exchange: ONE, TWO, QUORUM, LOCAL_QUORUM...</td>
</tr>
</tbody>
</table>
CHAPTER 71. CRYPTO (JCE) COMPONENT

Available as of Camel version 2.3

With Camel cryptographic endpoints and Java’s Cryptographic extension it is easy to create Digital Signatures for Exchanges. Camel provides a pair of flexible endpoints which get used in concert to create a signature for an exchange in one part of the exchange’s workflow and then verify the signature in a later part of the workflow.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

71.1. INTRODUCTION

Digital signatures make use of Asymmetric Cryptographic techniques to sign messages. From a (very) high level, the algorithms use pairs of complimentary keys with the special property that data encrypted with one key can only be decrypted with the other. One, the private key, is closely guarded and used to 'sign' the message while the other, public key, is shared around to anyone interested in verifying the signed messages. Messages are signed by using the private key to encrypting a digest of the message. This encrypted digest is transmitted along with the message. On the other side the verifier recalculates the message digest and uses the public key to decrypt the digest in the signature. If both digests match the verifier knows only the holder of the private key could have created the signature.

Camel uses the Signature service from the Java Cryptographic Extension to do all the heavy cryptographic lifting required to create exchange signatures. The following are some excellent resources for explaining the mechanics of Cryptography, Message digests and Digital Signatures and how to leverage them with the JCE.

- Bruce Schneier’s Applied Cryptography
- Beginning Cryptography with Java by David Hook
- The ever insightful Wikipedia Digital_signatures

71.2. URI FORMAT

As mentioned Camel provides a pair of crypto endpoints to create and verify signatures

- `crypto:sign:name[?options]`
- `crypto:verify:name[?options]`

- `crypto:sign` creates the signature and stores it in the Header keyed by the constant `org.apache.camel.component.crypto.DigitalSignatureConstants.SIGNATURE`, i.e. "CamelDigitalSignature".
- `crypto:verify` will read in the contents of this header and do the verification calculation.

In order to correctly function, the sign and verify process needs a pair of keys to be shared, signing
requiring a **PrivateKey** and verifying a **PublicKey** (or a **Certificate** containing one). Using the JCE it is very simple to generate these key pairs but it is usually most secure to use a KeyStore to house and share your keys. The DSL is very flexible about how keys are supplied and provides a number of mechanisms.

Note a **crypto:sign** endpoint is typically defined in one route and the complimentary **crypto:verify** in another, though for simplicity in the examples they appear one after the other. It goes without saying that both signing and verifying should be configured identically.

### 71.3. OPTIONS

The Crypto (JCE) component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>To use the shared DigitalSignatureConfiguration as configuration</td>
<td></td>
<td>DigitalSignature Configuration</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Crypto (JCE) endpoint is configured using URI syntax:

```
crypto:cryptoOperation:name
```

with the following path and query parameters:

#### 71.3.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cryptoOperation</td>
<td>Required Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. crypto:sign sets sign as the operation.</td>
<td></td>
<td>CryptoOperation</td>
</tr>
<tr>
<td>name</td>
<td>Required The logical name of this operation.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 71.3.2. Query Parameters (19 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>algorithm</td>
<td>Sets the JCE name of the Algorithm that should be used for the signer.</td>
<td>SHA1W ithDSA</td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>alias (producer)</td>
<td>Sets the alias used to query the KeyStore for keys and link java.security.cert.Certificate Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header link org.apache.camel.component.crypto.DigitalSignatureConstantsKEYSTORE_ALIAS</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>certificateName (producer)</td>
<td>Sets the reference name for a PrivateKey that can be found in the registry.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>keystore (producer)</td>
<td>Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used.</td>
<td></td>
<td>KeyStore</td>
</tr>
<tr>
<td>keystoreName (producer)</td>
<td>Sets the reference name for a Keystore that can be found in the registry.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>privateKey (producer)</td>
<td>Set the PrivateKey that should be used to sign the exchange</td>
<td></td>
<td>PrivateKey</td>
</tr>
<tr>
<td>privateKeyName (producer)</td>
<td>Sets the reference name for a PrivateKey that can be found in the registry.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>provider (producer)</td>
<td>Set the id of the security provider that provides the configured Signature algorithm.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>publicKeyName (producer)</td>
<td>references that should be resolved when the context changes</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>secureRandomName (producer)</td>
<td>Sets the reference name for a SecureRandom that can be found in the registry.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>signatureHeader Name (producer)</td>
<td>Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature'</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bufferSize (advanced)</td>
<td>Set the size of the buffer used to read in the Exchange payload data.</td>
<td>2048</td>
<td>Integer</td>
</tr>
<tr>
<td>certificate (advanced)</td>
<td>Set the Certificate that should be used to verify the signature in the exchange based on its payload.</td>
<td></td>
<td>Certificate</td>
</tr>
</tbody>
</table>
## Name | Description | Default | Type
--- | --- | --- | ---
**clearHeaders**<br>(advanced) | Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset. | true | boolean

**keyStoreParameters**<br>(advanced) | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | KeyStoreParameters | 

**publicKey**<br>(advanced) | Set the PublicKey that should be used to verify the signature in the exchange. | PublicKey | 

**secureRandom**<br>(advanced) | Set the SecureRandom used to initialize the Signature service | SecureRandom | 

**synchronous**<br>(advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean

**password**<br>(security) | Sets the password used to access an aliased PrivateKey in the KeyStore. | String | 

### 71.4. USING

#### 71.4.1. Raw keys

The most basic way to way to sign and verify an exchange is with a KeyPair as follows.

The same can be achieved with the Spring XML Extensions using references to keys

#### 71.4.2. KeyStores and Aliases.

The JCE provides a very versatile keystore concept for housing pairs of private keys and certificates, keeping them encrypted and password protected. They can be retrieved by applying an alias to the retrieval APIs. There are a number of ways to get keys and Certificates into a keystore, most often this is done with the external 'keytool' application. This is a good example of using keytool to create a KeyStore with a self signed Cert and Private key.

The examples use a Keystore with a key and cert aliased by 'bob'. The password for the keystore and the key is 'letmein'
The following shows how to use a Keystore via the Fluent builders, it also shows how to load and initialize the keystore.

Again in Spring a ref is used to lookup an actual keystore instance.

71.4.3. Changing JCE Provider and Algorithm

Changing the Signature algorithm or the Security provider is a simple matter of specifying their names. You will need to also use Keys that are compatible with the algorithm you choose.

or

71.4.4. Changing the Signature Message Header

It may be desirable to change the message header used to store the signature. A different header name can be specified in the route definition as follows

or

71.4.5. Changing the buffersize

In case you need to update the size of the buffer...

or

71.4.6. Supplying Keys dynamically.

When using a Recipient list or similar EIP the recipient of an exchange can vary dynamically. Using the same key across all recipients may be neither feasible nor desirable. It would be useful to be able to specify signature keys dynamically on a per-exchange basis. The exchange could then be dynamically enriched with the key of its target recipient prior to signing. To facilitate this the signature mechanisms allow for keys to be supplied dynamically via the message headers below

- Exchange.SIGNATURE_PRIVATE_KEY, "CamelSignaturePrivateKey"
- Exchange.SIGNATURE_PUBLIC_KEY_OR_CERT, "CamelSignaturePublicKeyOrCert"

or

Even better would be to dynamically supply a keystore alias. Again the alias can be supplied in a message header

- Exchange.KEYSTORE_ALIAS, "CamelSignatureKeyStoreAlias"

or

The header would be set as follows

```java
Exchange unsigned = getMandatoryEndpoint("direct:alias-sign").createExchange();
unsigned.getIn().setBody(payload);
unsigned.getIn().setHeader(DigitalSignatureConstants.KEYSTORE_ALIAS, "bob");
unsigned.getIn().setHeader(DigitalSignatureConstants.KEYSTORE_PASSWORD, "letmein".toCharArray());
template.send("direct:alias-sign", unsigned);
Exchange signed = getMandatoryEndpoint("direct:alias-sign").createExchange();
```
signed.getIn().copyFrom(unsigned.getOut());
signed.getIn().setHeader(KEYSTORE_ALIAS, "bob");
template.send("direct:alias-verify", signed);

- Getting Started
CHAPTER 72. CRYPTO CMS COMPONENT

Available as of Camel version 2.20

Cryptographic Message Syntax (CMS) is a well established standard for signing and encrypting messages. The Apache Crypto CMS component supports the following parts of this standard: * Content Type "Enveloped Data" with Key Transport (asymmetric key), * Content Type "Signed Data". You can create CMS Enveloped Data instances, decrypt CMS Enveloped Data instances, create CMS Signed Data instances, and validate CMS Signed Data instances.

The component uses the Bouncy Castle libraries bcprov-jdk15on and bcpkix-jdk15on.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto-cms</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

We recommend to register the Bouncy Castle security provider in your application before you call an endpoint of this component:

```java
Security.addProvider(new BouncyCastleProvider());
```

If the Bouncy Castle security provider is not registered then the Crypto CMS component will register the provider.

72.1. OPTIONS

The Crypto CMS component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>signedDataVerifier Configuration</td>
<td>To configure the shared SignedDataVerifierConfiguration, which determines the uri parameters for the verify operation.</td>
<td></td>
<td>SignedDataVerifier Configuration</td>
</tr>
<tr>
<td>envelopedDataDecryptor Configuration</td>
<td>To configure the shared EnvelopedDataDecryptorConfiguration, which determines the uri parameters for the decrypt operation.</td>
<td></td>
<td>EnvelopedDataDecryptor Configuration</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Crypto CMS endpoint is configured using URI syntax:
crypto-cms:cryptoOperation:name

with the following path and query parameters:

72.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cryptoOperation</td>
<td>Required Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. crypto-cms:sign sets sign as the operation. Possible values: sign, verify, encrypt, or decrypt.</td>
<td></td>
<td>CryptoOperation</td>
</tr>
<tr>
<td>name</td>
<td>Required The name part in the URI can be chosen by the user to distinguish between different signer/verifier/encryptor/decryptor endpoints within the camel context.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

72.1.2. Query Parameters (15 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyStore (common)</td>
<td>Keystore which contains signer private keys, verifier public keys, encryptor public keys, decryptor private keys depending on the operation. Use either this parameter or the parameter 'keyStoreParameters'.</td>
<td></td>
<td>KeyStore</td>
</tr>
<tr>
<td>keyStoreParameters (common)</td>
<td>Keystore containing signer private keys, verifier public keys, encryptor public keys, decryptor private keys depending on the operation. Use either this parameter or the parameter 'keystore'.</td>
<td></td>
<td>KeyStoreParameters</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>password (decrypt)</td>
<td>Sets the password of the private keys. It is assumed that all private keys in the keystore have the same password. If not set then it is assumed that the password of the private keys is given by the keystore password given in the KeyStoreParameters.</td>
<td></td>
<td>Char[]</td>
</tr>
<tr>
<td>fromBase64 (decrypt_verify)</td>
<td>If true then the CMS message is base 64 encoded and must be decoded during the processing. Default value is false.</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td><code>contentEncryptionAlgorithm</code> (encrypt)</td>
<td>Encryption algorithm, for example DESede/CBC/PKCS5Padding. Further possible values: DESede/CBC/PKCS5Padding, AES/CBC/PKCS5Padding, Camellia/CBC/PKCS5Padding, CAST5/CBC/PKCS5Padding.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>originatorInformationProvider</code> (encrypt)</td>
<td>Provider for the originator info. See <a href="https://tools.ietf.org/html/rfc5652section-6.1">https://tools.ietf.org/html/rfc5652section-6.1</a>. The default value is null.</td>
<td></td>
<td>OriginatorInformationProvider</td>
</tr>
<tr>
<td><code>recipient</code> (encrypt)</td>
<td>Recipient Info: reference to a bean which implements the interface org.apache.camel.component.crypto.cms.api.TransRecipientInfo</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td><code>secretKeyLength</code> (encrypt)</td>
<td>Key length for the secret symmetric key used for the content encryption. Only used if the specified content-encryption algorithm allows keys of different sizes. If contentEncryptionAlgorithm=AES/CBC/PKCS5Padding or Camellia/CBC/PKCS5Padding then 128; if contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding then 192, 128; if strong encryption is enabled then for AES/CBC/PKCS5Padding and Camellia/CBC/PKCS5Padding also the key lengths 192 and 256 are possible.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><code>unprotectedAttributesGeneratorProvider</code> (encrypt)</td>
<td>Provider of the generator for the unprotected attributes. The default value is null which means no unprotected attribute is added to the Enveloped Data object. See <a href="https://tools.ietf.org/html/rfc5652section-6.1">https://tools.ietf.org/html/rfc5652section-6.1</a>.</td>
<td></td>
<td>AttributesGeneratorProvider</td>
</tr>
<tr>
<td><code>toBase64</code> (encrypt_sign)</td>
<td>Indicates whether the Signed Data or Enveloped Data instance shall be base 64 encoded. Default value is false.</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td><code>includeContent</code> (sign)</td>
<td>Indicates whether the signed content should be included into the Signed Data instance. If false then a detached Signed Data instance is created in the header CamelCryptoCmsSignedData.</td>
<td>true</td>
<td>Boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>signer (sign)</td>
<td>Signer information: reference to a bean which implements org.apache.camel.component.crypto.cms.api.SignerInfo</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>signedDataHeaderBase64 (verify)</td>
<td>Indicates whether the value in the header CamelCryptoCmsSignedData is base64 encoded. Default value is false. Only relevant for detached signatures. In the detached signature case, the header contains the Signed Data object.</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>verifySignaturesOfAllSigners (verify)</td>
<td>If true then the signatures of all signers contained in the Signed Data object are verified. If false then only one signature whose signer info matches with one of the specified certificates is verified. Default value is true.</td>
<td>true</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

### 72.2. ENVELOPED DATA

Note, that a `crypto-cms:encrypt` endpoint is typically defined in one route and the complimentary `crypto-cms:decrypt` in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create an Enveloped Data message and how you can decrypt an Enveloped Data message.

**Basic Example in Java DSL**

```java
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private key if not specified in the crypto-cms:decrypt endpoint

DefaultKeyTransRecipientInfo recipient1 = new DefaultKeyTransRecipientInfo();
recipient1.setCertificateAlias("rsa"); // alias of the public key used for the encryption
recipient1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("recipient1", recipient1); // register recipient info in the registry

from("direct:start")
    .to("crypto-cms:encrypt://testencryt?toBase64=true&recipient=#recipient1&contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding&secretKeyLength=128")
```

Red Hat Fuse 7.2 Apache Camel Component Reference

516
Basic Example in Spring XML

```xml
<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="./keystore/keystore.jceks"
    password="some_password" type="JCEKS"/>

<bean id="recipient1"
    class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1"/>
    <property name="certificateAlias" value="rsa"/>
</bean>
```

Two Recipients in Java DSL

```java
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo;
...

KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the crypto-cms:decrypt endpoint

DefaultKeyTransRecipientInfo recipient1 = new DefaultKeyTransRecipientInfo();
recipient1.setCertificateAlias("rsa"); // alias of the public key used for the encryption
recipient1.setKeyStoreParameters(keystore);

DefaultKeyTransRecipientInfo recipient2 = new DefaultKeyTransRecipientInfo();
recipient2.setCertificateAlias("dsa");
recipient2.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("recipient1", recipient1); // register recipient info in the registry
from("direct:start")
    .to("crypto-cms:encrypt://testencrypt?
    toBase64=true&recipient=#recipient1&recipient=#recipient2&contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding&secretKeyLength=128")
    // the decryptor will automatically choose one of the two private keys depending which one is in the
decryptor keystore
```

import fromBase64=true&keyStoreParameters=#keyStoreParameters1
    .to("mock:result");
Note, that a `crypto-cms:sign` endpoint is typically defined in one route and the complimentary `crypto-cms:verify` in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create a Signed Data message and how you can validate a Signed Data message.

**Basic Example in Java DSL**

```java
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...

KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("./keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType, signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
```

### 72.3. SIGNED DATA

Note, that a `crypto-cms:sign` endpoint is typically defined in one route and the complimentary `crypto-cms:verify` in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create a Signed Data message and how you can validate a Signed Data message.

**Basic Example in Java DSL**

```java
.import org.apache.camel.util.jsse.KeyStoreParameters;
.import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...

KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("./keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType, signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
```
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry

from("direct:start")
.to("crypto-cms:sign://testsign?signer=#signer1&includeContent=true&toBase64=true")
.to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters1&fromBase64=true")
.to("mock:result");

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;

KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType, contentEncoding, and creationTime;
Example with two Signers in Spring XML

singingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

DefaultSignerInfo signerInfo2 = new DefaultSignerInfo();
signerInfo2.setIncludeCertificates(true);
signerInfo2.setSignatureAlgorithm("SHA256withDSA");
signerInfo2.setPrivateKeyAlias("dsa");
signerInfo2.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry
simpleReg.put("signer2", signerInfo2); //register signer info in the registry

from("direct:start")
    .to("crypto-cms:sign://testsign?signer=#signer1&signer=#signer2&includeContent=true")
    .to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters")
    .to("mock:result");

Example with two Signers in Spring XML

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="./keystore/keystore.jceks"
    password="some_password" type="JCEKS"/>
<bean id="signer1"
    class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1"/>
    <property name="privateKeyAlias" value="rsa"/>
    <property name="signatureAlgorithm" value="SHA256withRSA"/>
    <property name="includeCertificates" value="true"/>
    <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
be used for accessing the private key -->
    <property name="password" value="private_key_pw"/>
</bean>

<bean id="signer2"
    class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1"/>
    <property name="privateKeyAlias" value="dsa"/>
    <property name="signatureAlgorithm" value="SHA256withDSA"/>
    <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
be used for accessing the private key -->
    <property name="password" value="private_key_pw2"/>
</bean>

...
Detached Signature Example in Java DSL

```java
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private key if not specified in the signerInfo1 bean

// Signer Information, by default the following signed attributes are included: contentType, signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsing attribute is included. // If you want to add your own signed attributes or unsing attributes, see methods DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator. DefaultSignerInfo signerInfo1 = new DefaultSignerInfo(); signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("signer1", signerInfo1); // register signer info in the registry

from("direct:start")
// with the option includeContent=false the SignedData object without the signed text will be written into the header "CamelCryptoCmsSignedData"
.to("crypto-cms:sign://testsigh?signer=#signer1&includeContent=false&toBase64=true")
// the verifier reads the Signed Data object form the header CamelCryptoCmsSignedData and assumes that the signed content is in the message body
.to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters1&signedDataHeaderBase64=true")
.to("mock:result");
```

Detached Signature Example in Spring XML

```xml
<keyStoreParameters xmlns="http://camel.apache.org/schema/spring" id="keyStoreParameters1" resource="/keystore/keystore.jceks" password="some_password" type="JCEKS" />
<bean id="signer1" class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="privateKeyAlias" value="rsa" />
  <property name="signatureAlgorithm" value="SHA256withRSA" />
  <property name="includeCertificates" value="true" />
```
<route>
  <from uri="direct:start" />
  <!-- with the option includeContent=false the SignedData object without the signed text will be
  written into the header "CamelCryptoCmsSignedData" -->
  <to uri="crypto-cms:sign://testsing?
  signer=#signer1&includeContent=false&toBase64=true" />
  <!-- the verifier reads the SignedData object form the header CamelCryptoCmsSignedData and assumes
  that the signed content is in the message body -->
  <to uri="crypto-cms:verify://testverify?
  keyStoreParameters=#keyStoreParameters1&signedDataHeaderBase64=true" />
  <to uri="mock:result" />
</route>
CHAPTER 73. CRYPTO (JAVA CRYPTOGRAPHIC EXTENSION) DATAFORMAT

Available as of Camel version 2.3

The Crypto Data Format integrates the Java Cryptographic Extension into Camel, allowing simple and flexible encryption and decryption of messages using Camel’s familiar marshall and unmarshall formatting mechanism. It assumes marshalling to mean encryption to cyphertext and unmarshalling to mean decryption back to the original plaintext. This data format implements only symmetric (shared-key) encryption and decryption.

73.1. CRYPTODATAFORMAT OPTIONS

The Crypto (Java Cryptographic Extension) dataformat supports 10 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>algorithm</td>
<td>DES/CBC/PKCS5Padding</td>
<td>String</td>
<td>The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding.</td>
</tr>
<tr>
<td>cryptoProvider</td>
<td></td>
<td>String</td>
<td>The name of the JCE Security Provider that should be used.</td>
</tr>
<tr>
<td>keyRef</td>
<td></td>
<td>String</td>
<td>Refers to the secret key to lookup from the register to use.</td>
</tr>
<tr>
<td>initVectorRef</td>
<td></td>
<td>String</td>
<td>Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher.</td>
</tr>
<tr>
<td>algorithmParameterRef</td>
<td></td>
<td>String</td>
<td>A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a java.security.spec.AlgorithmParameterSpec type.</td>
</tr>
<tr>
<td>buffersize</td>
<td></td>
<td>Integer</td>
<td>The size of the buffer used in the signature process.</td>
</tr>
<tr>
<td>macAlgorithm</td>
<td>HmacSHA1</td>
<td>String</td>
<td>The JCE algorithm name indicating the Message Authentication algorithm.</td>
</tr>
<tr>
<td>shouldAppendHMAC</td>
<td>false</td>
<td>Boolean</td>
<td>Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data.</td>
</tr>
<tr>
<td>inline</td>
<td>false</td>
<td>Boolean</td>
<td>Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false.</td>
</tr>
</tbody>
</table>
### 73.2. BASIC USAGE

At its most basic all that is required to encrypt/decrypt an exchange is a shared secret key. If one or more instances of the Crypto data format are configured with this key the format can be used to encrypt the payload in one route (or part of one) and decrypted in another. For example, using the Java DSL as follows:

```java
KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());

from("direct:basic-encryption")
 .marshal(cryptoFormat)
 .to("mock:encrypted")
 .unmarshal(cryptoFormat)
 .to("mock:unencrypted");
```

In Spring the dataformat is configured first and then used in routes

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <crypto id="basic" algorithm="DES" keyRef="desKey" />
  </dataFormats>
  ...
  <route>
    <from uri="direct:basic-encryption" />
    <marshal ref="basic" />
    <to uri="mock:encrypted" />
    <unmarshal ref="basic" />
    <to uri="mock:unencrypted" />
  </route>
</camelContext>
```

### 73.3. SPECIFYING THE ENCRYPTION ALGORITHM

Changing the algorithm is a matter of supplying the JCE algorithm name. If you change the algorithm you will need to use a compatible key.

```java
KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
cryptoFormat.setMacAlgorithm("HmacMD5");
```
A list of the available algorithms in Java 7 is available via the Java Cryptography Architecture Standard Algorithm Name Documentation.

### 73.4. SPECIFYING AN INITIALIZATION VECTOR

Some crypto algorithms, particularly block algorithms, require configuration with an initial block of data known as an Initialization Vector. In the JCE this is passed as an AlgorithmParameterSpec when the Cipher is initialized. To use such a vector with the CryptoDataFormat you can configure it with a byte[] containing the required data e.g.

```java
KeyGenerator generator = KeyGenerator.getInstance("DES");
byte[] initializationVector = new byte[] {0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07};

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", generator.generateKey());
cryptoFormat.setInitializationVector(initializationVector);
```

or with spring, suppling a reference to a byte[]

```xml
<crypto id="init-vector" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey" initVectorRef="initializationVector"/>
```

The same vector is required in both the encryption and decryption phases. As it is not necessary to keep the IV a secret, the DataFormat allows for it to be inlined into the encrypted data and subsequently read out in the decryption phase to initialize the Cipher. To inline the IV set the /oinline flag.

```java
KeyGenerator generator = KeyGenerator.getInstance("DES");
byte[] initializationVector = new byte[] {0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07};
SecretKey key = generator.generateKey();

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", key);
cryptoFormat.setInitializationVector(initializationVector);
cryptoFormat.setShouldInlineInitializationVector(true);

CryptoDataFormat decryptFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", key);
decryptFormat.setShouldInlineInitializationVector(true);
```

```java
from("direct:inline")
.marshall(cryptoFormat)
.to("mock:encrypted")
.unmarshall(decryptFormat)
.to("mock:unencrypted");
```
or with spring.

```xml
<crypto id="inline" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey"
initVectorRef="initializationVector"
inline="true" />
<crypto id="inline-decrypt" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey" inline="true" />
```

For more information of the use of Initialization Vectors, consult

### 73.5. HASHED MESSAGE AUTHENTICATION CODES (HMAC)

To avoid attacks against the encrypted data while it is in transit the CryptoDataFormat can also calculate a Message Authentication Code for the encrypted exchange contents based on a configurable MAC algorithm. The calculated HMAC is appended to the stream after encryption. It is separated from the stream in the decryption phase. The MAC is recalculated and verified against the transmitted version to insure nothing was tampered with in transit. For more information on Message Authentication Codes see [http://en.wikipedia.org/wiki/HMAC](http://en.wikipedia.org/wiki/HMAC)

```java
KeyGenerator generator = KeyGenerator.getInstance("DES");
CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
```

or with spring.

```xml
<crypto id="hmac" algorithm="DES" keyRef="desKey" shouldAppendHMAC="true" />
```

By default the HMAC is calculated using the HmacSHA1 mac algorithm though this can be easily changed by supplying a different algorithm name. See here for how to check what algorithms are available through the configured security providers

```java
KeyGenerator generator = KeyGenerator.getInstance("DES");
CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
cryptoFormat.setMacAlgorithm("HmacMD5");
```

or with spring.

```xml
<crypto id="hmac-algorithm" algorithm="DES" keyRef="desKey" shouldAppendHMAC="true" />
```
or with spring.

```xml
    <crypto id="hmac-algorithm" algorithm="DES" keyRef="desKey" macAlgorithm="HmacMD5" shouldAppendHMAC="true"/>
```

### 73.6. SUPPLYING KEYS DYNAMICALLY

When using a Recipient list or similar EIP the recipient of an exchange can vary dynamically. Using the same key across all recipients may neither be feasible or desirable. It would be useful to be able to specify keys dynamically on a per exchange basis. The exchange could then be dynamically enriched with the key of its target recipient before being processed by the data format. To facilitate this the DataFormat allow for keys to be supplied dynamically via the message headers below

- CryptoDataFormat.KEY "CamelCryptoKey"

```java
CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", null);
/**
 * Note: the header containing the key should be cleared after
 * marshalling to stop it from leaking by accident and
 * potentially being compromised. The processor version below is
 * arguably better as the key is left in the header when you use
 * the DSL leaks the fact that camel encryption was used.
 */
from("direct:key-in-header-encrypt")
    .marshal(cryptoFormat)
    .removeHeader(CryptoDataFormat.KEY)
    .to("mock:encrypted");

from("direct:key-in-header-decrypt").unmarshal(cryptoFormat).process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().getHeaders().remove(CryptoDataFormat.KEY);
        exchange.getOut().copyFrom(exchange.getIn());
    }
}).to("mock:unencrypted");
```

or with spring.

```xml
    <crypto id="nokey" algorithm="DES"/>
```

### 73.7. DEPENDENCIES

To use the Crypto dataformat in your camel routes you need to add the following dependency to your pom.

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-crypto</artifactId>
    <version>x.x.x</version>
</dependency>
```

<!-- use the same version as your Camel core version -->

### 73.8. SEE ALSO
• Data Format

• http://www.bouncycastle.org/java.html
CHAPTER 74. CSV DATAFORMAT

Available as of Camel version 1.3

The CSV Data Format uses Apache Commons CSV to handle CSV payloads (Comma Separated Values) such as those exported/imported by Excel.

74.1. OPTIONS

The CSV dataformat supports 28 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatRef</td>
<td>String</td>
<td>String</td>
<td>The reference format to use, it will be updated with the other format options, the default value is CSVFormat.DEFAULT</td>
</tr>
<tr>
<td>formatName</td>
<td>String</td>
<td>String</td>
<td>The name of the format to use, the default value is CSVFormat.DEFAULT</td>
</tr>
<tr>
<td>commentMarkerDisabled</td>
<td>false</td>
<td>Boolean</td>
<td>Disables the comment marker of the reference format.</td>
</tr>
<tr>
<td>commentMarker</td>
<td>String</td>
<td>String</td>
<td>Sets the comment marker of the reference format.</td>
</tr>
<tr>
<td>delimiter</td>
<td>String</td>
<td>String</td>
<td>Sets the delimiter to use. The default value is , (comma)</td>
</tr>
<tr>
<td>escapeDisabled</td>
<td>false</td>
<td>Boolean</td>
<td>Use for disabling using escape character</td>
</tr>
<tr>
<td>escape</td>
<td>String</td>
<td>String</td>
<td>Sets the escape character to use</td>
</tr>
<tr>
<td>headerDisabled</td>
<td>false</td>
<td>Boolean</td>
<td>Use for disabling headers</td>
</tr>
<tr>
<td>header</td>
<td>List</td>
<td>List</td>
<td>To configure the CSV headers</td>
</tr>
<tr>
<td>allowMissingColumnNames</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to allow missing column names.</td>
</tr>
<tr>
<td>ignoreEmptyLines</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to ignore empty lines</td>
</tr>
<tr>
<td>ignoreSurroundingSpaces</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to ignore surrounding spaces</td>
</tr>
<tr>
<td>nullStringDisabled</td>
<td>false</td>
<td>Boolean</td>
<td>Used to disable null strings</td>
</tr>
<tr>
<td>Name</td>
<td>Default</td>
<td>Java Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>nullString</td>
<td></td>
<td>String</td>
<td>Sets the null string</td>
</tr>
<tr>
<td>quoteDisabled</td>
<td>false</td>
<td>Boolean</td>
<td>Used to disable quotes</td>
</tr>
<tr>
<td>quote</td>
<td></td>
<td>String</td>
<td>Sets the quote which by default is</td>
</tr>
<tr>
<td>recordSeparatorDisabled</td>
<td></td>
<td>String</td>
<td>Used for disabling record separator</td>
</tr>
<tr>
<td>recordSeparator</td>
<td></td>
<td>String</td>
<td>Sets the record separator (aka new line) which by default is new line characters (CRLF)</td>
</tr>
<tr>
<td>skipHeaderRecord</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to skip the header record in the output</td>
</tr>
<tr>
<td>quoteMode</td>
<td></td>
<td>String</td>
<td>Sets the quote mode</td>
</tr>
<tr>
<td>ignoreHeaderCase</td>
<td>false</td>
<td>Boolean</td>
<td>Sets whether or not to ignore case when accessing header names.</td>
</tr>
<tr>
<td>trim</td>
<td>false</td>
<td>Boolean</td>
<td>Sets whether or not to trim leading and trailing blanks.</td>
</tr>
<tr>
<td>trailingDelimiter</td>
<td>false</td>
<td>Boolean</td>
<td>Sets whether or not to add a trailing delimiter.</td>
</tr>
<tr>
<td>lazyLoad</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the unmarshalling should produce an iterator that reads the lines on the fly or if all the lines must be read at one.</td>
</tr>
<tr>
<td>useMaps</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the unmarshalling should produce maps (HashMap) for the lines values instead of lists. It requires to have header (either defined or collected).</td>
</tr>
<tr>
<td>useOrderedMaps</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the unmarshalling should produce ordered maps (LinkedHashMap) for the lines values instead of lists. It requires to have header (either defined or collected).</td>
</tr>
<tr>
<td>recordConverterRef</td>
<td></td>
<td>String</td>
<td>Refers to a custom CsvRecordConverter to lookup from the registry to use.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>
74.2. MARSHALLING A MAP TO CSV

The component allows you to marshal a Java Map (or any other message type that can be converted in a Map) into a CSV payload.

Considering the following body

```java
Map<String, Object> body = new LinkedHashMap<>();
body.put("foo", "abc");
body.put("bar", 123);
```

and this Java route definition

```java
from("direct:start")
.marshall().csv()
.to("mock:result");
```

or this XML route definition

```xml
<route>
  <from uri="direct:start" />
  <marshal>
    <csv />
  </marshal>
  <to uri="mock:result" />
</route>
```

then it will produce

```
abc,123
```

74.3. UNMARSHALLING A CSV MESSAGE INTO A JAVA LIST

Unmarshalling will transform a CSV message into a Java List with CSV file lines (containing another List with all the field values).

An example: we have a CSV file with names of persons, their IQ and their current activity.

```
Jack Dalton, 115, mad at Averell
Joe Dalton, 105, calming Joe
William Dalton, 105, keeping Joe from killing Averell
Averell Dalton, 80, playing with Rantanplan
Lucky Luke, 120, capturing the Daltons
```

We can now use the CSV component to unmarshal this file:

```java
from("file:src/test/resources/?fileName=daltons.csv&noop=true")
.unmarshal().csv()
.to("mock:daltons");
```

The resulting message will contain a `List<List<String>>` like...
If you have multiple rows of data you want to be marshalled into CSV format you can now store the message payload as a `List<Map<String, Object>>` object where the list contains a Map for each row.

### 74.5. FILE POLLER OF CSV, THEN UNMARSHALING

Given a bean which can handle the incoming data...

**MyCsvHandler.java**

```java
public void doHandleCsvData(List<List<String>> csvData)
{
    // do magic here
}
```

Your route then looks as follows

```xml
<route>
    <!-- poll every 10 seconds -->
    <from uri="file:///some/path/to/pickup/csvfiles?delete=true&amp;consumer.delay=10000" />
    <unmarshal><csv /></unmarshal>
    <to uri="bean:myCsvHandler?method=doHandleCsvData" />
</route>
```

### 74.6. MARSHALING WITH A PIPE AS DELIMITER

Considering the following body

```java
Map<String, Object> body = new LinkedHashMap<>();
body.put("foo", "abc");
body.put("bar", 123);
```

and this Java route definition

```java
// Camel version < 2.15
CsvDataFormat oldCSV = new CsvDataFormat();
oldCSV.setDelimiter("|");
from("direct:start")
    .marshal(oldCSV)
    .to("mock:result")

// Camel version >= 2.15
```
or this XML route definition

```xml
<route>
  <from uri="direct:start" />
  <marshal>
    <csv delimiter="|" />
  </marshal>
  <to uri="mock:result" />
</route>
```

then it will produce

```
abc|123
```

Using autogenColumns, configRef and strategyRef attributes inside XML # DSL

**Available as of Camel 2.9.2 / 2.10 and deleted for Camel 2.15**

You can customize the CSV Data Format to make use of your own `CSVConfig` and/or `CSVStrategy`. Also note that the default value of the `autogenColumns` option is true. The following example should illustrate this customization.

```xml
<route>
  <from uri="direct:start" />
  <marshal>
    <!-- make use of a strategy other than the default one which is 'org.apache.commons.csv.CSVStrategy.DEFAULT_STRATEGY' -->
    <csv autogenColumns="false" delimiter="|" configRef="csvConfig" strategyRef="excelStrategy" />
  </marshal>
  <convertBodyTo type="java.lang.String" />
  <to uri="mock:result" />
</route>
```

```xml
<bean id="csvConfig" class="org.apache.commons.csv.writer.CSVConfig">
  <property name="fields">
    <list>
      <bean class="org.apache.commons.csv.writer.CSVField">
        <property name="name" value="orderId" />
      </bean>
      <bean class="org.apache.commons.csv.writer.CSVField">
        <property name="name" value="amount" />
      </bean>
    </list>
  </property>
</bean>
```

```xml
<bean id="excelStrategy" class="org.springframework.beans.factory.config.FieldRetrievingFactoryBean">
  <property name="staticField" value="org.apache.commons.csv.CSVStrategy.EXCEL_STRATEGY" />
</bean>
```
74.7. USING SKIPFIRSTLINE OPTION WHILE UNMARSHALING

Available as of Camel 2.10 and deleted for Camel 2.15

You can instruct the CSV Data Format to skip the first line which contains the CSV headers. Using the Spring/XML DSL:

```
<route>
  <from uri="direct:start" />
  <unmarshal>
    <csv skipFirstLine="true" />
  </unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsv" />
</route>
```

Or the Java DSL:

```java
CsvDataFormat csv = new CsvDataFormat();
csv.setSkipFirstLine(true);
from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");
```

74.8. UNMARSHALING WITH A PIPE AS DELIMITER

Using the Spring/XML DSL:

```
<route>
  <from uri="direct:start" />
  <unmarshal>
    <csv delimiter="|" />
  </unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsv" />
</route>
```

Or the Java DSL:

```java
CsvDataFormat csv = new CsvDataFormat();
CSVStrategy strategy = CSVStrategy.DEFAULT_STRATEGY;
strategy.setDelimiter('|');
csv.setStrategy(strategy);
from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");
```
CsvDataFormat csv = new CsvDataFormat();
CSVConfig csvConfig = new CSVConfig();
csvConfig.setDelimiter(";");
csv.setConfig(csvConfig);

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

Issue in CSVConfig

It looks like that

CSVConfig csvConfig = new CSVConfig();
csvConfig.setDelimiter(";");

...doesn’t work. You have to set the delimiter as a String!

74.9. DEPENDENCIES

To use CSV in your Camel routes you need to add a dependency on camel-csv, which implements this data format.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-csv</artifactId>
  <version>x.x.x</version>
</dependency>
```
CHAPTER 75. CXF

CXF COMPONENT

The `cxf:` component provides integration with Apache CXF for connecting to JAX-WS services hosted in CXF.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cxf</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

**NOTE**

If you want to learn about CXF dependencies, see the `WHICH-JARS` text file.

**NOTE**

When using CXF in streaming modes (see DataFormat option), then also read about Stream caching.

CAMEL ON EAP DEPLOYMENT

This component is supported by the Camel on EAP (Wildfly Camel) framework, which offers a simplified deployment model on the Red Hat JBoss Enterprise Application Platform (JBoss EAP) container.

The CXF component integrates with the JBoss EAP `webservices` subsystem that also uses Apache CXF. For more information, see JAX-WS.

**NOTE**

At present, the Camel on EAP subsystem does not support CXF or Restlet consumers. However, it is possible to mimic CXF consumer behaviour, using the CamelProxy.

URI FORMAT

```
cxf:bean:cxfEndpoint[?options]
```

Where `cxfEndpoint` represents a bean ID that references a bean in the Spring bean registry. With this URI format, most of the endpoint details are specified in the bean definition.

```
cxf://someAddress[?options]
```

Where `someAddress` specifies the CXF endpoint’s address. With this URI format, most of the endpoint details are specified using options.

For either style above, you can append options to the URI as follows:
cxf:bean:cxfEndpoint?wsdlURL=wsdl/hello_world.wsdl&dataFormat=PAYLOAD

## OPTIONS

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wsdlURL</code></td>
<td>No</td>
<td>The location of the WSDL. WSDL is obtained from endpoint address by default. For example: <code>file://local/wsdl/hello.wsdl</code> or <code>wsdl/hello.wsdl</code></td>
</tr>
<tr>
<td><code>serviceClass</code></td>
<td>Yes</td>
<td>The name of the SEI (Service Endpoint Interface) class. This class can have, but does not require, JSR181 annotations. <strong>Since 2.0</strong>, this option is only required by POJO mode. If the <code>wsdlURL</code> option is provided, <code>serviceClass</code> is not required for PAYLOAD and MESSAGE mode. When <code>wsdlURL</code> option is used without <code>serviceClass</code>, the <code>serviceName</code> and <code>portName</code> (endpointName for Spring configuration) options <strong>MUST</strong> be provided. Since 2.0, it is possible to use <code>#</code> notation to reference a <code>serviceClass</code> object instance from the registry. <strong>Please be advised that the referenced object cannot be a Proxy (Spring AOP Proxy is OK) as it relies on <code>Object.getClass().getName()</code> method for non Spring AOP Proxy.</strong> Since 2.8, it is possible to omit both <code>wsdlURL</code> and <code>serviceClass</code> options for PAYLOAD and MESSAGE mode. When they are omitted, arbitrary XML elements can be put in CxfPayload’s body in PAYLOAD mode to facilitate CXF Dispatch Mode. For example: <code>org.apache.camel.Hello</code></td>
</tr>
<tr>
<td><strong>serviceName</strong></td>
<td>Only if more than one <em>serviceName</em> present in WSDL</td>
<td>The service name this service is implementing, it maps to the <code>wsdl:service@name</code>. For example: <code>http://org.apache.camel]ServiceName</code></td>
</tr>
<tr>
<td><strong>endpointName</strong></td>
<td>Only if more than one <em>portName</em> under the <em>serviceName</em> is present, and it is required for camel-cxf consumer since camel 2.2</td>
<td>The port name this service is implementing, it maps to the <code>wsdl:port@name</code>. For example: <code>http://org.apache.camel]PortName</code></td>
</tr>
<tr>
<td><strong>dataFormat</strong></td>
<td>No</td>
<td>Which message data format the CXF endpoint supports. Possible values are: <strong>POJO</strong> (default), <strong>PAYLOAD</strong>, <strong>MESSAGE</strong></td>
</tr>
<tr>
<td><strong>relayHeaders</strong></td>
<td>No</td>
<td>Please see the Description of relayHeaders option section for this option. Should a CXF endpoint relay headers along the route. Currently only available when <em>dataFormat=POJO</em>default: trueExample: true, false</td>
</tr>
<tr>
<td><strong>wrapped</strong></td>
<td>No</td>
<td>Which kind of operation the CXF endpoint producer will invoke. Possible values are: <strong>true</strong>, <strong>false</strong> (default)</td>
</tr>
<tr>
<td><strong>wrappedStyle</strong></td>
<td>No</td>
<td>Since 2.5.0 The WSDL style that describes how parameters are represented in the SOAP body. If the value is <strong>false</strong>, CXF will chose the document-literal unwrapped style, If the value is <strong>true</strong>, CXF will chose the document-literal wrapped style</td>
</tr>
<tr>
<td><strong>setDefaultBus</strong></td>
<td>No</td>
<td>Deprecated: Specifies whether or not to use the default CXF bus for this endpoint. Possible values are: <strong>true</strong>, <strong>false</strong> (default). This option is deprecated and you should use <code>defaultBus</code> from Camel 2.16 onwards.</td>
</tr>
<tr>
<td>Option</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>defaultBus</td>
<td>No</td>
<td>Deprecated: Specifies whether or not to use the default CXF bus for this endpoint. Possible values are: true, false (default). This option is deprecated and you should use <code>defaultBus</code> from Camel 2.16 onwards.</td>
</tr>
<tr>
<td>bus</td>
<td>No</td>
<td>Use <code>#</code> notation to reference a bus object from the registry — for example, <code>bus=#busName</code>. The referenced object must be an instance of <code>org.apache.cxf.Bus</code>. By default, uses the default bus created by CXF Bus Factory.</td>
</tr>
<tr>
<td>cxfBinding</td>
<td>No</td>
<td>Use <code>#</code> notation to reference a CXF binding object from the registry — for example, <code>cxfBinding=#bindingName</code>. The referenced object must be an instance of <code>org.apache.camel.component.cxf.CxfBinding</code>.</td>
</tr>
<tr>
<td>headerFilterStrategy</td>
<td>No</td>
<td>Use <code>#</code> notation to reference a header filter strategy object from the registry — for example, <code>headerFilterStrategy=#strategyName</code>. The referenced object must be an instance of <code>org.apache.camel.spi.HeaderFilterStrategy</code>.</td>
</tr>
<tr>
<td>loggingFeatureEnabled</td>
<td>No</td>
<td>New in 2.3, this option enables CXF Logging Feature which writes inbound and outbound SOAP messages to log. Possible values are: true, false (default).</td>
</tr>
<tr>
<td>defaultOperationName</td>
<td>No</td>
<td>New in 2.4, this option will set the default <code>operationName</code> that will be used by the <code>CxfProducer</code> that invokes the remote service. For example: <code>defaultOperationName=greetMe</code>.</td>
</tr>
<tr>
<td>Property Name</td>
<td>New/Existing</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>defaultOperationNamespace</td>
<td>No</td>
<td>New in 2.4, this option will set the default operationNamespace that will be used by the CxfProducer which invokes the remote service. For example: defaultOperationNamespace=<a href="http://apache.org/hello_world_soap_http">http://apache.org/hello_world_soap_http</a></td>
</tr>
<tr>
<td>synchronous</td>
<td>No</td>
<td>New in 2.5, this option will let CXF endpoint decide to use sync or async API to do the underlying work. The default value is false, which means camel-cxf endpoint will try to use async API by default.</td>
</tr>
<tr>
<td>publishedEndpointUrl</td>
<td>No</td>
<td>New in 2.5, this option overrides the endpoint URL that appears in the published WSDL that is accessed using the service address URL plus ?wsdl. For example: publishedEndpointUrl=<a href="http://example.com/service">http://example.com/service</a></td>
</tr>
<tr>
<td>properties.propName</td>
<td>No</td>
<td>Camel 2.8: Allows you to set custom CXF properties in the endpoint URI. For example, setting properties.mtom-enabled=true to enable MTOM. To make sure that CXF does not switch the thread when starting the invocation, you can set properties.org.apache.cxf.interceptor.OneWayProcessorInterceptor.USE_ORIGINAL_THREAD=true.</td>
</tr>
<tr>
<td>allowStreaming</td>
<td>No</td>
<td>New in 2.8.2. This option controls whether the CXF component, when running in PAYLOAD mode (see below), will DOM parse the incoming messages into DOM Elements or keep the payload as a javax.xml.transform.Source object that would allow streaming in some cases.</td>
</tr>
<tr>
<td><strong>skipFaultLogging</strong></td>
<td>No</td>
<td>New in 2.11. This option controls whether the PhaseInterceptorChain skips logging the Fault that it catches.</td>
</tr>
<tr>
<td>----------------------</td>
<td>----</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>cxfEndpointConfigurer</strong></th>
<th>No</th>
<th>New in <strong>Camel 2.11</strong>. This option could apply the implementation of <code>org.apache.camel.component.cxf.CxfEndpointConfigurer</code> which supports to configure the CXF endpoint in programmatic way. Since <strong>Camel 2.15.0</strong>, user can configure the CXF server and client by implementing <code>configure{Server,Client}</code> method of <code>CxfEndpointConfigurer</code>.</th>
</tr>
</thead>
</table>

**Client} method of `CxfEndpointConfigurer`.**

<table>
<thead>
<tr>
<th><strong>username</strong></th>
<th>No</th>
</tr>
</thead>
</table>

New in **Camel 2.12.3** This option is used to set the basic authentication information of username for the CXF client.

<table>
<thead>
<tr>
<th><strong>password</strong></th>
<th>No</th>
</tr>
</thead>
</table>

New in **Camel 2.12.3** This option is used to set the basic authentication information of password for the CXF client.

<table>
<thead>
<tr>
<th><strong>continuationTimeout</strong></th>
<th>No</th>
</tr>
</thead>
</table>

The **serviceName** and **portName** are **QNames**, so if you provide them be sure to prefix them with their **{namespace}** as shown in the examples above.

## THE DESCRIPTIONS OF THE DATAFORMATS

<table>
<thead>
<tr>
<th>DataFormat</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>POJO</strong></td>
<td>POJOs (plain old Java objects) are the Java parameters to the method being invoked on the target server. Both Protocol and Logical JAX-WS handlers are supported.</td>
</tr>
<tr>
<td><strong>PAYLOAD</strong></td>
<td><strong>PAYLOAD</strong> is the message payload (the contents of the <code>soap:body</code>) after message configuration in the CXF endpoint is applied. Only Protocol JAX-WS handler is supported. Logical JAX-WS handler is not supported.</td>
</tr>
</tbody>
</table>
MESSAGE

MESSAGE is the raw message that is received from the transport layer. It is not suppose to touch or change Stream, some of the CXF interceptors will be removed if you are using this kind of DataFormat so you can’t see any soap headers after the camel-cxf consumer and JAX-WS handler is not supported.

CXF_MESSAGE

New in Camel 2.8.2, CXF_MESSAGE allows for invoking the full capabilities of CXF interceptors by converting the message from the transport layer into a raw SOAP message.

You can determine the data format mode of an exchange by retrieving the exchange property, CamelCXFDataFormat. The exchange key constant is defined in org.apache.camel.component.cxf.CxfConstants.DATA_FORMAT_PROPERTY.

CONFIGURING THE CXF ENDPOINTS WITH APACHE ARIES BLUEPRINT.

Since Camel 2.8, there is support for using Aries blueprint dependency injection for your CXF endpoints. The schema is very similar to the Spring schema, so the transition is fairly transparent.

For example:

```xml
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
   xmlns:camel-cxf="http://camel.apache.org/schema/blueprint/cxf"
   xmlns:cxfcore="http://cxf.apache.org/blueprint/core"
   xsi:schemaLocation="http://www.osgi.org/xmlns/blueprint/v1.0.0
   https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

  <camel-cxf:cxfEndpoint id="routerEndpoint"
    address="http://localhost:9001/router"
    serviceClass="org.apache.servicemix.examples.cxf.HelloWorld">
    <camel-cxf:properties>
      <entry key="dataFormat" value="MESSAGE"/>
    </camel-cxf:properties>
  </camel-cxf:cxfEndpoint>

  <camel-cxf:cxfEndpoint id="serviceEndpoint"
    address="http://localhost:9000/SoapContext/SoapPort"
    serviceClass="org.apache.servicemix.examples.cxf.HelloWorld">
  </camel-cxf:cxfEndpoint>

</camelContext xmlns="http://camel.apache.org/schema/blueprint">
```

<route>
  <from uri="routerEndpoint"/>
  <to uri="log:request"/>
</route>

Currently the endpoint element is the first supported CXF namespace handler.

You can also use the bean references just as in spring

```xml
<camelContext xmlns="http://camel.apache.org/schema/blueprint">
  <routeBuilder ref="reportIncidentRoutes"/>
</camelContext>
```

### HOW TO ENABLE CXF’S LOGGINGOUTINTERCEPTOR IN MESSAGE MODE

CXF’s `LoggingOutInterceptor` outputs outbound message that goes on the wire to logging system (Java.util.logging). Since the `LoggingOutInterceptor` is in `PRE_STREAM` phase (but `PRE_STREAM` phase is removed in `MESSAGE` mode), you have to configure `LoggingOutInterceptor` to be run during the `WRITE` phase. The following is an example.

```xml
<bean id="loggingOutInterceptor" class="org.apache.cxf.interceptor.LoggingOutInterceptor">
  <!-- it really should have been user-prestream but CXF does have such phase! -->
  <constructor-arg value="target/write"/>
</bean>
```

```xml
<cxf:outInterceptors>
  <ref bean="loggingOutInterceptor"/>
</cxf:outInterceptors>
```
DESCRIPTION OF RELAYHEADERS OPTION

There are in-band and out-of-band on-the-wire headers from the perspective of a JAXWS WSDL-first developer.

The in-band headers are headers that are explicitly defined as part of the WSDL binding contract for an endpoint such as SOAP headers.

The out-of-band headers are headers that are serialized over the wire, but are not explicitly part of the WSDL binding contract.

Headers relaying/filtering is bi-directional.

When a route has a CXF endpoint and the developer needs to have on-the-wire headers, such as SOAP headers, be relayed along the route to be consumed say by another JAXWS endpoint, then relayHeaders should be set to true, which is the default value.

AVAILABLE ONLY IN POJO MODE

The relayHeaders=true setting expresses an intent to relay the headers. The actual decision on whether a given header is relayed is delegated to a pluggable instance that implements the MessageHeadersRelay interface. A concrete implementation of MessageHeadersRelay will be consulted to decide if a header needs to be relayed or not. There is already an implementation of SoapMessageHeadersRelay which binds itself to well-known SOAP name spaces. Currently only out-of-band headers are filtered, and in-band headers will always be relayed when relayHeaders=true. If there is a header on the wire, whose name space is unknown to the runtime, then a fall back DefaultMessageHeadersRelay will be used, which simply allows all headers to be relayed.

The relayHeaders=false setting asserts that all headers, in-band and out-of-band, will be dropped.

You can plugin your own MessageHeadersRelay implementations overriding or adding additional ones to the list of relays. In order to override a preloaded relay instance just make sure that your MessageHeadersRelay implementation services the same name spaces as the one you looking to override. Also note, that the overriding relay has to service all of the name spaces as the one you looking to override, or else a runtime exception on route start up will be thrown as this would introduce an ambiguity in name spaces to relay instance mappings.

```xml
<cxf:cxfEndpoint ...
  <cxf:properties>
    <entry key="org.apache.camel.cxf.message.headers.relays">
      <list>
        <ref bean="customHeadersRelay"/>
      </list>
    </entry>
  </cxf:properties>
</cxf:cxfEndpoint>
```
Take a look at the tests that show how you’d be able to relay/drop headers here:

CHANGES SINCE RELEASE 2.0

- **POJO** and **PAYLOAD** modes are supported. In **POJO** mode, only out-of-band message headers are available for filtering as the in-band headers have been processed and removed from the header list by CXF. The in-band headers are incorporated into the **MessageContentList** in **POJO** mode. The **camel-cxf** component does make any attempt to remove the in-band headers from the **MessageContentList**. If filtering of in-band headers is required, please use **PAYLOAD** mode or plug in a (pretty straightforward) CXF interceptor/JAXWS Handler to the CXF endpoint.

- The Message Header Relay mechanism has been merged into **CxfHeaderFilterStrategy**. The **relayHeaders** option, its semantics, and default value remain the same, but it is a property of **CxfHeaderFilterStrategy**. Here is an example of configuring it:

  ```xml
  <bean id="dropAllMessageHeadersStrategy" class="org.apache.camel.component.cxf.common.header.CxfHeaderFilterStrategy">

  <!-- Set relayHeaders to false to drop all SOAP headers -->
  <property name="relayHeaders" value="false"/>

  </bean>
  
  Then, your endpoint can reference the **CxfHeaderFilterStrategy**.

  ```xml
  <route>
    <from uri="cxf:bean:routerNoRelayEndpoint?
    headerFilterStrategy=#dropAllMessageHeadersStrategy"/>
    <to uri="cxf:bean:serviceNoRelayEndpoint?
    headerFilterStrategy=#dropAllMessageHeadersStrategy"/>
  </route>
  ```

- The **MessageHeadersRelay** interface has changed slightly and has been renamed to **MessageHeaderFilter**. It is a property of **CxfHeaderFilterStrategy**. Here is an example of configuring user defined Message Header Filters:

  ```xml
  <bean id="customMessageFilterStrategy" class="org.apache.camel.component.cxf.common.header.CxfHeaderFilterStrategy">
    <property name="messageHeaderFilters">
      <list>
        <!-- SoapMessageHeaderFilter is the built in filter. It can be removed by omitting it. -->
        <bean class="org.apache.camel.component.cxf.soap.headers.CustomHeaderFilter"/>

      </list>
    </property>
    </bean>
  
  <!-- Add custom filter here -->
  <bean class="org.apache.camel.component.cxf.soap.headers.CustomHeaderFilter"/>
  ```
• Other than relayHeaders, there are new properties that can be configured in CxfHeaderFilterStrategy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>type</th>
<th>Required?</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>relayHeaders</td>
<td>All message headers will be processed by Message Header Filters</td>
<td>boolean</td>
<td>No</td>
<td>true (1.6.1 behavior)</td>
</tr>
<tr>
<td>relayAllMessageHeaders</td>
<td>All message headers will be propagated (without processing by Message Header Filters)</td>
<td>boolean</td>
<td>No</td>
<td>false (1.6.1 behavior)</td>
</tr>
<tr>
<td>allowFilterNameSpaceClash</td>
<td>If two filters overlap in activation namespace, the property control how it should be handled. If the value is true, last one wins. If the value is false, it will throw an exception</td>
<td>boolean</td>
<td>No</td>
<td>false (1.6.1 behavior)</td>
</tr>
</tbody>
</table>

**CONFIGURE THE CXF ENDPOINTS WITH SPRING**

You can configure the CXF endpoint with the Spring configuration file shown below, and you can also embed the endpoint into the camelContext tags. When you are invoking the service endpoint, you can set the operationName and operationNamespace headers to explicitly state which operation you are calling.

**NOTE** In Camel 2.x we change to use [http://camel.apache.org/schema/cxf](http://camel.apache.org/schema/cxf) as the CXF endpoint’s target namespace.

```xml
<beans xmlns="http://www.springframework.org/schema/beans"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xmlns:cxf="http://camel.apache.org/schema/cxf"
      xsi:schemaLocation="http://www.springframework.org/schema/beans
                          http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
```
NOTE

In Apache Camel 2.x, the [http://activemq.apache.org/camel/schema/cxfEndpoint](http://activemq.apache.org/camel/schema/cxfEndpoint) namespace was changed to [http://camel.apache.org/schema/cxf](http://camel.apache.org/schema/cxf).

Be sure to include the JAX-WS `schemaLocation` attribute specified on the root beans element. This allows CXF to validate the file and is required. Also note the namespace declarations at the end of the `<cxf:cxfEndpoint/>` tag—these are required because the combined `{namespace}localName` syntax is presently not supported for this tag's attribute values.

The `cxf:cxfEndpoint` element supports many additional attributes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PortName</strong></td>
<td>The endpoint name this service is implementing, it maps to the <code>wsdl:port@name</code>. In the format of <code>ns:PORT_NAME</code> where <code>ns</code> is a namespace prefix valid at this scope.</td>
</tr>
<tr>
<td><strong>serviceName</strong></td>
<td>The service name this service is implementing, it maps to the <code>wsdl:service@name</code>. In the format of <code>ns:SERVICE_NAME</code> where <code>ns</code> is a namespace prefix valid at this scope.</td>
</tr>
<tr>
<td><strong>wsdlURL</strong></td>
<td>The location of the WSDL. Can be on the classpath, file system, or be hosted remotely.</td>
</tr>
<tr>
<td><strong>bindingId</strong></td>
<td>The <code>bindingId</code> for the service model to use.</td>
</tr>
<tr>
<td><strong>address</strong></td>
<td>The service publish address.</td>
</tr>
<tr>
<td><strong>bus</strong></td>
<td>The bus name that will be used in the JAX-WS endpoint.</td>
</tr>
<tr>
<td><strong>serviceClass</strong></td>
<td>The class name of the SEI (Service Endpoint Interface) class which could have JSR181 annotation or not.</td>
</tr>
</tbody>
</table>

It also supports many child elements:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>cxf:inInterceptors</strong></td>
<td>The incoming interceptors for this endpoint. A list of <code>&lt;bean&gt;</code> or <code>&lt;ref&gt;</code>.</td>
</tr>
<tr>
<td><strong>cxf:inFaultInterceptors</strong></td>
<td>The incoming fault interceptors for this endpoint. A list of <code>&lt;bean&gt;</code> or <code>&lt;ref&gt;</code>.</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>cxf:outInterceptors</strong></td>
<td>The outgoing interceptors for this endpoint. A list of <code>&lt;bean&gt;</code> or <code>&lt;ref&gt;</code>.</td>
</tr>
<tr>
<td><strong>cxf:outFaultInterceptors</strong></td>
<td>The outgoing fault interceptors for this endpoint. A list of <code>&lt;bean&gt;</code> or <code>&lt;ref&gt;</code>.</td>
</tr>
<tr>
<td><strong>cxf:properties</strong></td>
<td>A properties map which should be supplied to the JAX-WS endpoint. See below.</td>
</tr>
<tr>
<td><strong>cxf:handlers</strong></td>
<td>A JAX-WS handler list which should be supplied to the JAX-WS endpoint. See below.</td>
</tr>
<tr>
<td><strong>cxf:dataBinding</strong></td>
<td>You can specify the which <strong>DataBinding</strong> will be use in the endpoint. This can be supplied using the Spring <code>&lt;bean class=&quot;MyDataBinding&quot;/&gt;</code> syntax.</td>
</tr>
<tr>
<td><strong>cxf:binding</strong></td>
<td>You can specify the <strong>BindingFactory</strong> for this endpoint to use. This can be supplied using the Spring <code>&lt;bean class=&quot;MyBindingFactory&quot;/&gt;</code> syntax.</td>
</tr>
<tr>
<td><strong>cxf:features</strong></td>
<td>The features that hold the interceptors for this endpoint. A list of <code>&lt;bean&gt;</code>s or <code>&lt;ref&gt;</code>s</td>
</tr>
<tr>
<td><strong>cxf:schemaLocations</strong></td>
<td>The schema locations for endpoint to use. A list of <code>&lt;schemaLocation&gt;</code>s</td>
</tr>
<tr>
<td><strong>cxf:serviceFactory</strong></td>
<td>The service factory for this endpoint to use. This can be supplied using the Spring <code>&lt;bean class=&quot;MyServiceFactory&quot;/&gt;</code> syntax</td>
</tr>
</tbody>
</table>

You can find more advanced examples which show how to provide interceptors, properties and handlers here: [http://cwiki.apache.org/CXF20DOC/jax-ws-configuration.html](http://cwiki.apache.org/CXF20DOC/jax-ws-configuration.html)
NOTE

You can use CXF:properties to set the CXF endpoint’s `dataFormat` and `setDefaultBus` properties from a Spring configuration file, as follows:

```xml
<cxf:cxfEndpoint id="testEndpoint" address="http://localhost:9000/router"
  serviceClass="org.apache.camel.component.cxf.HelloService"
  endpointName="s:PortName"
  serviceName="s:ServiceName"
  xmlns:s="http://www.example.com/test">
  <cxf:properties>
    <entry key="dataFormat" value="MESSAGE"/>
    <entry key="setDefaultBus" value="true"/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

HOW TO MAKE THE CAMEL-CXF COMPONENT USE LOG4J INSTEAD OF JAVA.UTIL.LOGGING

CXF’s default logger is `java.util.logging`. If you want to change it to `log4j`, proceed as follows. Create a file, in the classpath, named `META-INF/cxf/org.apache.cxf.logger`. This file should contain the fully-qualified name of the class, `org.apache.cxf.common.logging.Log4jLogger`, with no comments, on a single line.

HOW TO LET CAMEL-CXF RESPONSE MESSAGE WITH XML START DOCUMENT

If you are using some SOAP client such as PHP, you will get this kind of error, because CXF doesn’t add the XML start document `<?xml version="1.0" encoding="utf-8"?>`.

Error:sendSms: SoapFault exception: [Client] looks like we got no XML document in [...]

To resolved this issue, you just need to tell StaxOutInterceptor to write the XML start document for you.

```java
public class WriteXmlDeclarationInterceptor extends AbstractPhaseInterceptor<SoapMessage> {
  public WriteXmlDeclarationInterceptor() {
    super(Phase.PRE_STREAM);
    addBefore(StaxOutInterceptor.class.getName());
  }

  public void handleMessage(SoapMessage message) throws Fault {
    message.put("org.apache.cxf.stax.force-start-document", Boolean.TRUE);
  }
}
```

You can add a custom interceptor like this and configure it into your `camel-cxf` endpoint:

```xml
<cxf:cxfEndpoint id="routerEndpoint"
  address="http://localhost:${CXFTestSupport.port2}/CXFGreeterRouterTest/CamelContext/RouterPort"
  serviceClass="org.apache.hello_world_soap_http.GreeterImpl"
  skipFaultLogging="true">
</cxf:cxfEndpoint>
```
<cxf:outInterceptors>
  <!-- This interceptor will force the CXF server send the XML start document to client -->
  <bean class="org.apache.camel.component.cxf.WriteXmlDeclarationInterceptor"/>
</cxf:outInterceptors>

<cxf:properties>
  <!-- Set the publishedEndpointUrl which could override the service address from generated WSDL as you want -->
  <entry key="publishedEndpointUrl" value="http://www.simple.com/services/test"/>
</cxf:properties>
</cxf:cxfEndpoint>

Or adding a message header for it like this if you are using Camel 2.4.

```
// set up the response context which force start document
Map<String, Object> map = new HashMap<String, Object>();
map.put("org.apache.cxf.stax.force-start-document", Boolean.TRUE);
exchange.getOut().setHeader(Client.RESPONSE_CONTEXT, map);
```

**HOW TO CONSUME A MESSAGE FROM A CAMEL-CXF ENDPOINT IN POJO DATA FORMAT**

The camel-cxf endpoint consumer POJO data format is based on the cxf invoker, so the message header has a property with the name of CxfConstants.OPERATION_NAME and the message body is a list of the SEI method parameters.

```java
public class PersonProcessor implements Processor {
    private static final transient Logger LOG = LoggerFactory.getLogger(PersonProcessor.class);

    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        LOG.info("processing exchange in camel");

        BindingOperationInfo boi = (BindingOperationInfo)exchange.getProperty(BindingOperationInfo.class.toString());
        if (boi != null) {
            LOG.info("boi.isUnwrapped" + boi.isUnwrapped());
        }

        // Get the parameters list which element is the holder.
        MessageContentsList msgList = (MessageContentsList)exchange.getIn().getBody();
        Holder<String> personId = (Holder<String>)msgList.get(0);
        Holder<String> ssn = (Holder<String>)msgList.get(1);
        Holder<String> name = (Holder<String>)msgList.get(2);

        if (personId.value == null || personId.value.length() == 0) {
            LOG.info("person id 123, so throwing exception");
            // Try to throw out the soap fault message
            org.apache.camel.wsdl_first.types.UnknownPersonFault personFault =
                    new org.apache.camel.wsdl_first.types.UnknownPersonFault();
            personFault.setPersonId("");
            org.apache.camel.wsdl_first.UnknownPersonFault fault =
                    new org.apache.camel.wsdl_first.UnknownPersonFault("Get the null value of person name",
                            personFault);
            // Since camel has its own exception handler framework, we can't throw the exception to
```
trigger it

// We just set the fault message in the exchange for camel-cxf component handling and return
exchange.getOut().setFault(true);
exchange.getOut().setBody(fault);
return;
}

name.value = "Bonjour";
ssn.value = "123";
LOG.info("setting Bonjour as the response");
// Set the response message, first element is the return value of the operation,
// the others are the holders of method parameters
exchange.getOut().setBody(new Object[] {null, personId, ssn, name});

HOW TO PREPARE THE MESSAGE FOR THE CAMEL-CXF ENDPOINT IN POJO DATA FORMAT

The camel-cxf endpoint producer is based on the cxf client API. First you need to specify the operation
name in the message header, then add the method parameters to a list, and initialize the message with
this parameter list. The response message's body is a messageContentsList, you can get the result
from that list.

If you don't specify the operation name in the message header, CxfProducer will try to use the
defaultOperationName from CxfEndpoint. If there is no defaultOperationName set on CxfEndpoint,
it will pick up the first operation name from the operation list.

If you want to get the object array from the message body, you can get the body using
message.getBody(Object[].class), as follows:

Exchange senderExchange = new DefaultExchange(context, ExchangePattern.InOut);
final List<String> params = new ArrayList<String>();
// Prepare the request message for the camel-cxf procedure
params.add(TEST_MESSAGE);
senderExchange.getIn().setBody(params);
senderExchange.getIn().setHeader(CxfConstants.OPERATION_NAME, ECHO_OPERATION);

Exchange exchange = template.send("direct:EndpointA", senderExchange);

org.apache.camel.Message out = exchange.getOut();
// The response message's body is an MessageContentsList which first element is the return value of
// the operation,
// If there are some holder parameters, the holder parameter will be filled in the reset of List.
// The result will be extract from the MessageContentsList with the String class type
MessageContentsList result = (MessageContentsList)out.getBody();
LOG.info("Received output text: " + result.get(0));
Map<String, Object> responseContext = CastUtils.cast((Map<?, ?>)>out.getHeader(Client.RESPONSE_CONTEXT));
assertNotNull(responseContext);
assertEquals("We should get the response context here", "UTF-8",
responseContext.get(org.apache.cxf.message.Message.ENCODING));
assertEquals("Reply body on Camel is wrong", "echo " + TEST_MESSAGE, result.get(0));
HOW TO DEAL WITH THE MESSAGE FOR A CAMEL-CXF ENDPOINT IN PAYLOAD DATA FORMAT

In Apache Camel 2.0, `CxfMessage.getBody()` will return an `org.apache.camel.component.cxf.CxfPayload` object, which has getters for SOAP message headers and Body elements. This change enables decoupling the native CXF message from the Apache Camel message.

```java
protected RouteBuilder createRouteBuilder() {
    return new RouteBuilder() {
        public void configure() {
            from(SIMPLE_ENDPOINT_URI + "&dataFormat=PAYLOAD").to("log:info").process(new Processor() {
                @SuppressWarnings("unchecked")
                public void process(final Exchange exchange) throws Exception {
                    CxfPayload<SoapHeader> requestPayload = exchange.getIn().getBody(CxfPayload.class);
                    List<Source> inElements = requestPayload.getBodySources();
                    List<Source> outElements = new ArrayList<Source>();
                    // You can use a customer toStringConverter to turn a CxfPayload message into String as you want
                    String request = exchange.getIn().getBody(String.class);
                    XmlConverter converter = new XmlConverter();
                    String documentString = ECHO_RESPONSE;
                    Element in = new XmlConverter().toDOMElement(inElements.get(0));
                    // Just check the element namespace
                    if (!in.getNamespaceURI().equals(ELEMENT_NAMESPACE)) {
                        throw new IllegalArgumentException("Wrong element namespace");
                    }
                    if (in.getLocalName().equals("echoBoolean")) {
                        documentString = ECHO_BOOLEAN_RESPONSE;
                        checkRequest("ECHO_BOOLEAN_REQUEST", request);
                    } else {
                        documentString = ECHO_RESPONSE;
                        checkRequest("ECHO_REQUEST", request);
                    }
                    Document outDocument = converter.toDOMDocument(documentString);
                    outElements.add(new DOMSource(outDocument.getDocumentElement()));
                    // set the payload header with null
                    CxfPayload<SoapHeader> responsePayload = new CxfPayload<SoapHeader>({null,
                        outElements, null});
                    exchange.getOut().setBody(responsePayload);
                }
            });
        }
    };
}
```

HOW TO GET AND SET SOAP HEADERS IN POJO MODE

**POJO** means that the data format is a list of Java objects when the CXF endpoint produces or consumes Camel exchanges. Even though Apache Camel exposes the message body as POJOs in this mode, the CXF component still provides access to read and write SOAP headers. However, since CXF
interceptors remove in-band SOAP headers from the header list after they have been processed, only out-of-band SOAP headers are available in POJO mode.

The following example illustrates how to get/set SOAP headers. Suppose we have a route that forwards from one CXF endpoint to another. That is, SOAP Client \(\rightarrow\) Apache Camel \(\rightarrow\) CXF service. We can attach two processors to obtain/insert SOAP headers at (1) before request goes out to the CXF service and (2) before response comes back to the SOAP Client. Processor (1) and (2) in this example are InsertRequestOutHeaderProcessor and InsertResponseOutHeaderProcessor. Our route looks like this:

```xml
<route>
  <from uri="cxf:bean:routerRelayEndpointWithInsertion"/>
  <process ref="InsertRequestOutHeaderProcessor"/>
  <to uri="cxf:bean:serviceRelayEndpointWithInsertion"/>
  <process ref="InsertResponseOutHeaderProcessor"/>
</route>
```

In 2.x SOAP headers are propagated to and from Apache Camel Message headers. The Apache Camel message header name is `org.apache.cxf.headers.Header.list`, which is a constant defined in CXF (`org.apache.cxf.headers.Header.HEADER_LIST`). The header value is a `List<SoapHeader>` object (`org.apache.cxf.binding.soap.SoapHeader`). The following snippet is the `InsertResponseOutHeaderProcessor` (that inserts a new SOAP header in the response message). The way to access SOAP headers in both `InsertResponseOutHeaderProcessor` and `InsertRequestOutHeaderProcessor` are actually the same. The only difference between the two processors is setting the direction of the inserted SOAP header.

```java
class InsertResponseOutHeaderProcessor implements Processor {
    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        List<SoapHeader> soapHeaders = CastUtils.cast((List<?>)exchange.getIn().getHeader(Header.HEADER_LIST));
        if (soapHeaders == null) {
            // we just create a new soap headers in case the header is null
            soapHeaders = new ArrayList<SoapHeader>();
        }

        // Insert a new header
        String xml = "<?xml version="1.0" encoding="utf-8"?>
            <outofbandHeader xmlns="http://cxf.apache.org/outofband/Header" hdrAttribute="testHdrAttribute" xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/" soap:mustUnderstand="1">" + "<name>New_testOobHeader</name><value>New_testOobHeaderValue</value>" + "</outofbandHeader>";
        SoapHeader newHeader = new SoapHeader(soapHeaders.get(0).getName(),
                DOMUtils.readXml(new StringReader(xml)).getDocumentElement());
        // make sure direction is OUT since it is a response message.
        newHeader.setDirection(Direction.DIRECTION_OUT);
        soapHeaders.add(newHeader);
    }
}
```
HOW TO GET AND SET SOAP HEADERS IN PAYLOAD MODE

We have already shown how to access SOAP message (CxfPayload object) in PAYLOAD mode (see the section called “How to deal with the message for a camel-cxf endpoint in PAYLOAD data format”).

Once you obtain a CxfPayload object, you can invoke the CxfPayload.getHeaders() method that returns a List of DOM Elements (SOAP headers).

```java
from(getRouterEndpointURI()).process(new Processor() {
    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        CxfPayload<SoapHeader> payload = exchange.getIn().getBody(CxfPayload.class);
        List<Source> elements = payload.getBodySources();
        assertNotNull("We should get the elements here", elements);
        assertEquals("Get the wrong elements size", 1, elements.size());

        Element el = new XmlConverter().toDOMElement(elements.get(0));
        elements.set(0, new DOMSource(el));
        assertEquals("Get the wrong namespace URI", "http://camel.apache.org/pizza/types",
                     el.getNamespaceURI());

        List<SoapHeader> headers = payload.getHeaders();
        assertNotNull("We should get the headers here", headers);
        assertEquals("Get the wrong headers size", headers.size(), 1);
        assertEquals("Get the wrong namespace URI",
                     ((Element)(headers.get(0).getObject())).getNamespaceURI(),
                     "http://camel.apache.org/pizza/types");
    }
})
.to(getServiceEndpointURI());
```

Since Camel 2.16.0, you can use the same approach as described in the section called “How to get and set SOAP headers in POJO mode” to set or get the SOAP headers. You can now use the org.apache.cxf.headers.Header.list header to get and set a list of SOAP headers. This means that if you have a route that forwards from one Camel CXF endpoint to another (SOAP Client → Camel → CXF service), the SOAP headers sent by the SOAP client are now also forwarded to the CXF service. If you do not want the headers to be forwarded, remove them from the org.apache.cxf.headers.Header.list Camel header.

SOAP HEADERS ARE NOT AVAILABLE IN MESSAGE MODE

SOAP headers are not available in MESSAGE mode as SOAP processing is skipped.

HOW TO THROW A SOAP FAULT FROM APACHE CAMEL

If you are using a CXF endpoint to consume the SOAP request, you may need to throw the SOAP Fault from the camel context. Basically, you can use the throwFault DSL to do that; it works for POJO, PAYLOAD and MESSAGE data format. You can define the soap fault like this:

```java
SOAP_FAULT = new SoapFault(EXCEPTION_MESSAGE, SoapFault.FAULT_CODE_CLIENT);
Element detail = SOAP_FAULT.getOrCreateDetail();
Document doc = detail.getOwnerDocument();
```
Text tn = doc.createTextNode(DETAIL_TEXT);
detail.appendChild(tn);

Then throw it as you like:

from(routerEndpointURI).setFaultBody(constant(SOAP_FAULT));

If your CXF endpoint is working in the MESSAGE data format, you could set the the SOAP Fault message in the message body and set the response code in the message header.

from(routerEndpointURI).process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        Message out = exchange.getOut();
        // Set the message body with the
        out.setBody(this.getClass().getResourceAsStream("SoapFaultMessage.xml");
        // Set the response code here
        out.setHeader(org.apache.cxf.message.Message.RESPONSE_CODE, new Integer(500));
    }
});

The same is true for the POJO data format. You can set the SOAP Fault on the Out body and also indicate it’s a fault by calling Message.setFault(true), as follows:

from("direct:start").onException(SoapFault.class).maximumRedeliveries(0).handled(true)
    .process(new Processor() {
        public void process(Exchange exchange) throws Exception {
            SoapFault fault = exchange
                .getProperty(Exchange.EXCEPTION_CAUGHT, SoapFault.class);
            exchange.getOut().setFault(true);
            exchange.getOut().setBody(fault);
        }
    }).end().to(serviceURI);

HOW TO PROPAGATE A CXF ENDPOINT’S REQUEST AND RESPONSE CONTEXT

cxf client API provides a way to invoke the operation with request and response context. If you are using a CXF endpoint producer to invoke the external Web service, you can set the request context and get the response context with the following code:

CxfExchange exchange = (CxfExchange)template.send(getJaxwsEndpointUri(), new Processor() {
    public void process(final Exchange exchange) {
        final List<String> params = new ArrayList<String>();
        params.add(TEST_MESSAGE);
        // Set the request context to the inMessage
        Map<String, Object> requestContext = new HashMap<String, Object>();
        requestContext.put(BindingProvider.ENDPOINT_ADDRESS_PROPERTY, JAXWS_SERVER_ADDRESS);
        exchange.getIn().setBody(params);
exchange.getIn().setHeader(Client.REQUEST_CONTEXT, requestContext);
exchange.getIn().setHeader(CxfConstants.OPERATION_NAME, GREET_ME_OPERATION);
}
org.apache.camel.Message out = exchange.getOut();
// The output is an object array, the first element of the array is the return value
Object[] output = out.getBody(Object[].class);
LOG.info("Received output text: " + output[0]);
// Get the response context form outMessage
Map<String, Object> responseContext = CastUtils.cast((Map)out.getHeader(Client.RESPONSE_CONTEXT));
assertNotNull(responseContext);
assertEquals("Get the wrong wsdl operation name", "
{http://apache.org/hello_world_soap_http}greetMe",
responseContext.get("javax.xml.ws.wsdl.operation").toString());

ATTACHMENT SUPPORT

POJO Mode: Both SOAP with Attachment and MTOM are supported (see example in Payload Mode for enabling MTOM). However, SOAP with Attachment is not tested. Since attachments are marshalled and unmarshalled into POJOs, users typically do not need to deal with the attachment themself. Attachments are propagated to Camel message’s attachments since 2.1. So, it is possible to retrieve attachments by Camel Message API

DataHandler Message.getAttachment(String id)

Payload Mode: MTOM is supported since 2.1. Attachments can be retrieved by Camel Message APIs mentioned above. SOAP with Attachment is not supported as there is no SOAP processing in this mode.

To enable MTOM, set the CXF endpoint property "mtom_enabled" to true. (I believe you can only do it with Spring.)

You can produce a Camel message with attachment to send to a CXF endpoint in Payload mode.

Exchange exchange = context.createProducerTemplate().send("direct:testEndpoint", new
public void process(Exchange exchange) throws Exception {
    exchange.setPattern(ExchangePattern.InOut);
    List&lt;Source&gt; elements = new ArrayList&lt;Source&gt;();
    elements.add(new DOMSource(DOMUtils.readXml(new
    StringReader(MtomTestHelper.REQ_MESSAGE)).getDocumentElement()));
    CxfPayload&lt;SoapHeader&gt; body = new CxfPayload&lt;SoapHeader&gt;(
        elements, null);
    exchange.getIn().setBody(body);
    exchange.getIn().addAttachment(MtomTestHelper.REQ_PHOTO_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.REQ_PHOTO_DATA,
            "application/octet-stream")));
    exchange.getIn().addAttachment(MtomTestHelper.REQ_IMAGE_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.requestJpeg, "image/jpeg")));
}

// process response
CxfPayload&lt;SoapHeader&gt; out = exchange.getOut().getBody(CxfPayload.class);
Assert.assertEquals(1, out.getBody().size());

Map&lt;String, String&gt; ns = new HashMap&lt;String, String&gt;();
ns.put("ns", MtomTestHelper.SERVICE_TYPES_NS);
ns.put("xop", MtomTestHelper.XOP_NS);
XPathUtils xu = new XPathUtils(ns);
Element oute = new XmlConverter().toDOMElement(out.getBody().get(0));
Element ele = (Element)xu.getValue("//ns:DetailResponse/ns:photo/xop:Include", oute,
    XPathConstants.NODE);
String photoid = ele.getAttribute("href").substring(4); // skip "cid:"

ele = (Element)xu.getValue("//ns:DetailResponse/ns:image/xop:Include", oute,
    XPathConstants.NODE);
String imageld = ele.getAttribute("href").substring(4); // skip "cid:"

DataHandler dr = exchange.getOut().getAttachment(photoid);
Assert.assertEquals("application/octet-stream", dr.getContentType());
MtomTestHelper.assertEquals(MtomTestHelper.RESP_PHOTO_DATA,
    IOUtils.readBytesFromStream(dr.getInputStream()));

dr = exchange.getOut().getAttachment(imageld);
Assert.assertEquals("image/jpeg", dr.getContentType());

BufferedImage image = ImageIO.read(dr.getInputStream());
Assert.assertEquals(560, image.getWidth());
Assert.assertEquals(300, image.getHeight());
}

You can also consume a Camel message received from a CXF endpoint in Payload mode.

public static class MyProcessor implements Processor {
@SuppressWarnings("unchecked")
public void process(Exchange exchange) throws Exception {
    CxfPayload<SoapHeader> in = exchange.getIn().getBody(CxfPayload.class);

    // verify request
    assertEquals(1, in.getBody().size());

    Map<String, String> ns = new HashMap<String, String>();
    ns.put("ns", MtomTestHelper.SERVICE_TYPES_NS);
    ns.put("xop", MtomTestHelper.XOP_NS);
    XPathUtils xu = new XPathUtils(ns);
    Element body = new XmlConverter().toDOMElement(in.getBody().get(0));
    Element ele = (Element)xu.getValue("//ns:Detail/ns:photo/xop:Include", body,
    XPathConstants.NODE);
    String photoId = ele.getAttribute("href").substring(4); // skip "cid:"
    assertEquals(MtomTestHelper.REQ_PHOTO_CID, photoId);
    ele = (Element)xu.getValue("//ns:Detail/ns:image/xop:Include", body,
    XPathConstants.NODE);
    String imageld = ele.getAttribute("href").substring(4); // skip "cid:"
    assertEquals(MtomTestHelper.REQ_IMAGE_CID, imageld);

    DataHandler dr = exchange.getIn().getAttachment(photoId);
    assertEquals("application/octet-stream", dr.getContentType());
    MtomTestHelper.assertEquals(MtomTestHelper.REQ_PHOTO_DATA,
    IOUtils.readBytesFromStream(dr.getInputStream()));
    dr = exchange.getIn().getAttachment(imageId);
    assertEquals("image/jpeg", dr.getContentType());
    MtomTestHelper.assertEquals(MtomTestHelper.requestJpeg,
    IOUtils.readBytesFromStream(dr.getInputStream()));

    // create response
    List<Source> elements = new ArrayList<Source>();
    elements.add(new DOMSource(DOMUtils.readXml(new
    StringReader(MtomTestHelper.RESP_MESSAGE)).getDocumentElement()));
    CxfPayload<SoapHeader> sbody = new CxfPayload<SoapHeader>(new
    ArrayList<SoapHeader>(),
    elements, null);
    exchange.getOut().setBody(sbody);
    exchange.getOut().addAttachment(MtomTestHelper.RESP_PHOTO_CID,
    new DataHandler(new ByteArrayDataSource(MtomTestHelper.RESP_PHOTO_DATA,
    "application/octet-stream")));
    exchange.getOut().addAttachment(MtomTestHelper.RESP_IMAGE_CID,
    new DataHandler(new ByteArrayDataSource(MtomTestHelper.responseJpeg, "image/jpeg")));
}

Message Mode: Attachments are not supported as it does not process the message at all.

CXF_MESSAGE Mode: MTOM is supported, and Attachments can be retrieved by Camel Message APIs mentioned above. Note that when receiving a multipart (that is, MTOM) message the default
SOAPMessage to String converter will provide the complete multi-part payload on the body. If you require just the SOAP XML as a String, you can set the message body with message.getSOAPPart(), and Camel convert can do the rest of work for you.

HOW TO PROPAGATE STACK TRACE INFORMATION

It is possible to configure a CXF endpoint so that, when a Java exception is thrown on the server side, the stack trace for the exception is marshalled into a fault message and returned to the client. To enable this feature, set the dataFormat to PAYLOAD and set the faultStackTraceEnabled property to true in the cxfEndpoint element, as follows:

```xml
<cf:cxfEndpoint id="router" address="http://localhost:9002/TestMessage"
    wsdlURL="ship.wsdl"
    endpointName="s:TestSoapEndpoint"
    serviceName="s:TestService"
    xmlns:s="http://test">
    <cxf:properties>
        <!-- enable sending the stack trace back to client; the default value is false-->
        <entry key="faultStackTraceEnabled" value="true" />
        <!-- enable to send the stack trace back to client, the default value is false-->
        <entry key="dataFormat" value="PAYLOAD" />
    </cxf:properties>
</cf:cxfEndpoint>
```

For security reasons, the stack trace does not include the causing exception (that is, the part of a stack trace that follows Caused by). If you want to include the causing exception in the stack trace, set the exceptionMessageCauseEnabled property to true in the cxfEndpoint element, as follows:

```xml
<cf:cxfEndpoint id="router" address="http://localhost:9002/TestMessage"
    wsdlURL="ship.wsdl"
    endpointName="s:TestSoapEndpoint"
    serviceName="s:TestService"
    xmlns:s="http://test">
    <cxf:properties>
        <!-- enable to show the cause exception message and the default value is false -->
        <entry key="exceptionMessageCauseEnabled" value="true" />
        <!-- enable to send the stack trace back to client, the default value is false-->
        <entry key="faultStackTraceEnabled" value="true" />
        <entry key="dataFormat" value="PAYLOAD" />
    </cxf:properties>
</cf:cxfEndpoint>
```

**WARNING**

You should only enable the exceptionMessageCauseEnabled flag for testing and diagnostic purposes. It is normal practice for servers to conceal the original cause of an exception to make it harder for hostile users to probe the server.

STREAMING SUPPORT IN PAYLOAD MODE
In 2.8.2, the camel-cxf component now supports streaming of incoming messages when using PAYLOAD mode. Previously, the incoming messages would have been completely DOM parsed. For large messages, this is time consuming and uses a significant amount of memory. Starting in 2.8.2, the incoming messages can remain as a javax.xml.transform.Source while being routed and, if nothing modifies the payload, can then be directly streamed out to the target destination. For common "simple proxy" use cases (example: from("cxf:...").to("cxf:")), this can provide very significant performance increases as well as significantly lowered memory requirements.

However, there are cases where streaming may not be appropriate or desired. Due to the streaming nature, invalid incoming XML may not be caught until later in the processing chain. Also, certain actions may require the message to be DOM parsed anyway (like WS-Security or message tracing and such) in which case the advantages of the streaming is limited. At this point, there are two ways to control the streaming:

- Endpoint property: you can add "allowStreaming=false" as an endpoint property to turn the streaming on/off.
- Component property: the CxfComponent object also has an allowStreaming property that can set the default for endpoints created from that component.
- Global system property: you can add a system property of "org.apache.camel.component.cxf.streaming" to "false" to turn if off. That sets the global default, but setting the endpoint property above will override this value for that endpoint.

USING THE GENERIC CXF DISPATCH MODE

From 2.8.0, the camel-cxf component supports the generic CXF dispatch mode that can transport messages of arbitrary structures (i.e., not bound to a specific XML schema). To use this mode, you simply omit specifying the wsdlURL and serviceClass attributes of the CXF endpoint.

```
<cxf:cxfEndpoint id="testEndpoint" address="http://localhost:9000/SoapContext/SoapAnyPort">
  <cxf:properties>
    <entry key="dataFormat" value="PAYLOAD"/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

It is noted that the default CXF dispatch client does not send a specific SOAPAction header. Therefore, when the target service requires a specific SOAPAction value, it is supplied in the Camel header using the key SOAPAction (case-insensitive).

75.1. CXF CONSUMERS ON {WILDFLY}

The configuration of camel-cxf consumers on {wildfly} is different to that of standalone Camel. Producer endpoints work as per normal.

On {wildfly}, camel-cxf consumers leverage the default Undertow HTTP server provided by the container. The server is defined within the undertow subsystem configuration. Here's an excerpt of the default configuration from standalone.xml:

```
<subsystem xmlns="urn:jboss:domain:undertow:4.0">
  <buffer-cache name="default"/>
  <server name="default-server">
    <http-listener name="default" socket-binding="http" redirect-socket="https" enable-http2="true" />
    <https-listener name="https" socket-binding="https" security-realm="ApplicationRealm" enable-http2="true" />
  </server>
</subsystem>
```
In this instance, Undertow is configured to listen on interfaces / ports specified by the http and https socket-binding. By default this is port 8080 for http and 8443 for https.

For example, if you configure an endpoint consumer using different host or port combinations, a warning will appear within the server log file. For example the following host & port configurations would be ignored:

```xml
<org.wildfly.extension.camel> (pool-2-thread-1) Ignoring configured host: http://somehost:1234/path/to/resource
```

However, the consumer is still available on the default host & port localhost:8080 or localhost:8443.

**NOTE**

Applications which use camel-cxf consumers **must** be packaged as a WAR. In previous {wildfly-camel} releases, other types of archive such as JAR were permitted, but this is no longer supported.

### 75.1.1. Configuring alternative ports

If alternative ports are to be accepted, then these must be configured via the {wildfly} subsystem configuration. This is explained in the server documentation:

https://access.redhat.com/documentation/en-us/red_hat_jboss_enterprise_application_platform/7.1/html/configuration_guide/configuring_the_web_server_undertow

### 75.1.2. Configuring SSL

To configure SSL, refer to the {wildfly} SSL configuration guide:

### 75.1.3. Configuring security with Elytron
{wildfly-camel} supports securing camel-cxf consumer endpoints with the Elytron security framework.

### 75.1.3.1. Configuring a security domain

To secure a {wildfly-camel} application with Elytron, an application security domain needs to be referenced within WEB-INF/jboss-web.xml of your WAR deployment:

```
<jboss-web>
  <security-domain>my-application-security-domain</security-domain>
</jboss-web>
```

The `<security-domain>` configuration references the name of an `<application-security-domain>` defined by the Undertow subsystem. For example, the Undertow subsystem `<application-security-domain>` is configured within the {wildfly} server standalone.xml configuration file as follows:

```
<subsystem xmlns="urn:jboss:domain:undertow:6.0">
  ...
  <application-security-domains>
    <application-security-domain name="my-application-security-domain" http-authentication-factory="application-http-authentication"/>
  </application-security-domains>
</subsystem>
```

The `<http-authentication-factory>` application-http-authentication is defined within the Elytron subsystem. application-http-authentication is available by default in both the standalone.xml and standalone-full.xml server configuration files. For example:

```
<subsystem xmlns="urn:wildfly:elytron:1.2">
  ...
  <http>
    ...
    <http-authentication-factory name="application-http-authentication" http-server-mechanism-factory="global" security-domain="ApplicationDomain">
      <mechanism-configuration>
        <mechanism mechanism-name="BASIC">
          <mechanism-realm realm-name="Application Realm"/>
        </mechanism>
        <mechanism mechanism-name="FORM"/>
      </mechanism-configuration>
    </http-authentication-factory>
  </http>
  ...
</subsystem>
```

The `<http-authentication-factory>` named application-http-authentication, holds a reference to a Elytron security domain called ApplicationDomain.

For more information on how to configure the Elytron subsystem, refer to the Elytron documentation.

### 75.1.3.2. Configuring security constraints, authentication methods and security roles
Security constraints, authentication methods and security roles for camel-cxf consumer endpoints can be configured within your WAR deployment WEB-INF/web.xml. For example, to configure BASIC Authentication:

```
<web-app>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>secure</web-resource-name>
      <url-pattern>/webservices/*</url-pattern>
    </web-resource-collection>
    <auth-constraint>
      <role-name>my-role</role-name>
    </auth-constraint>
  </security-constraint>
  <security-role>
    <description>The role that is required to log in to /webservices/*</description>
    <role-name>my-role</role-name>
  </security-role>
  <login-config>
    <auth-method>BASIC</auth-method>
    <realm-name>my-realm</realm-name>
  </login-config>
</web-app>
```

Note that the `<url-pattern>` defined by the Servlet Specification is relative to the context path of the web application. If your application is packaged as `my-app.war`, {wildfly} will make it accessible under the context path `/my-app` and the `<url-patternpattern>` `/webservices/*` will be applied to paths relative to `/my-app`.

For example, requests against `http://my-server/my-app/webservices/my-endpoint` will match the `/webservices/*` pattern, while `http://my-server/webservices/my-endpoint` will not match.

This is important because {wildfly-camel} allows the creation of camel-cxf endpoint consumers whose base path is outside of the host web application context path. For example, it is possible to create a camel-cxf consumer for `http://my-server/webservices/my-endpoint` inside `my-app.war`.

In order to define security constraints for such out-of-context endpoints, {wildfly-camel} supports a custom, **non-standard** `<url-pattern>` convention where prefixing the pattern with three forward slashes `///` will be interpreted as absolute to server host name. For example, to secure `http://my-server/webservices/my-endpoint` inside `my-app.war`, you would add the following configuration to `web.xml`:

```
<web-app>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>secure</web-resource-name>
      <url-pattern>///webservices/*</url-pattern>
    </web-resource-collection>
    <auth-constraint>
      <role-name>my-role</role-name>
    </auth-constraint>
  </security-constraint>
  <security-role>
    <description>The role that is required to log in to /webservices/*</description>
    <role-name>my-role</role-name>
  </security-role>
</web-app>
```
<login-config>
  <auth-method>BASIC</auth-method>
  <realm-name>my-realm</realm-name>
</login-config>
</web-app>
CHAPTER 76. CXF-RS COMPONENT

Available as of Camel version 2.0

The `cxfrs:` component provides integration with Apache CXF for connecting to JAX-RS 1.1 and 2.0 services hosted in CXF.

When using CXF as a consumer, the CXF Bean Component allows you to factor out how message payloads are received from their processing as a RESTful or SOAP web service. This has the potential of using a multitude of transports to consume web services. The bean component’s configuration is also simpler and provides the fastest method to implement web services using Camel and CXF.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-cxf</artifactId>
    <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

76.1. URI FORMAT

`cxfrs://address?options`

Where `address` represents the CXF endpoint’s address

`cxfrs:bean:rsEndpoint`

Where `rsEndpoint` represents the spring bean’s name which presents the CXFRS client or server

For either style above, you can append options to the URI as follows:

`cxfrs:bean:cxfEndpoint?resourceClasses=org.apache.camel.rs.Example`

76.2. OPTIONS

The CXF-RS component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>useGlobalSslContext Parameters</code> (security)</td>
<td>Enable usage of global SSL context parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>headerFilterStrategy</code> (filter)</td>
<td>To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The CXF-RS endpoint is configured using URI syntax:

```
cxfrs:beanId:address
```

with the following path and query parameters:

### 76.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>beanId</td>
<td>To lookup an existing configured CxfRsEndpoint. Must used bean: as prefix.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>address</td>
<td>The service publish address.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 76.2.2. Query Parameters (29 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>features (common)</td>
<td>Set the feature list to the CxfRs endpoint.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>loggingFeatureEnabled (common)</td>
<td>This option enables CXF Logging Feature which writes inbound and outbound REST messages to log.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>loggingSizeLimit (common)</td>
<td>To limit the total size of number of bytes the logger will output when logging feature has been enabled.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>modelRef (common)</td>
<td>This option is used to specify the model file which is useful for the resource class without annotation. When using this option, then the service class can be omitted, to emulate document-only endpoints</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>providers (common)</td>
<td>Set custom JAX-RS provider(s) list to the CxfRs endpoint. You can specify a string with a list of providers to lookup in the registry separated by comma.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>resourceClasses</td>
<td>The resource classes which you want to export as REST service. Multiple classes can be separated by comma.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>schemaLocations</td>
<td>Sets the locations of the schema(s) which can be used to validate the incoming XML or JAXB-driven JSON.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>skipFaultLogging</td>
<td>This option controls whether the PhaseInterceptorChain skips logging the Fault that it catches.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bindingStyle</td>
<td>Sets how requests and responses will be mapped to/from Camel. Two values are possible: SimpleConsumer: This binding style processes request parameters, multipart, etc. and maps them to IN headers, IN attachments and to the message body. It aims to eliminate low-level processing of org.apache.cxf.message.MessageContentsList. It also also adds more flexibility and simplicity to the response mapping. Only available for consumers. Default: The default style. For consumers this passes on a MessageContentsList to the route, requiring low-level processing in the route. This is the traditional binding style, which simply dumps the org.apache.cxf.message.MessageContentsList coming in from the CXF stack onto the IN message body. The user is then responsible for processing it according to the contract defined by the JAX-RS method signature. Custom: allows you to specify a custom binding through the binding option.</td>
<td>Default</td>
<td>BindingStyle</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>

</tr>
</tbody>
</table>

You can also configure the CXF REST endpoint through the spring configuration. Since there are lots of difference between the CXF REST client and CXF REST Server, we provide different configuration for them. Please check out the schema file and CXF JAX-RS documentation for more information.

### 76.3. HOW TO CONFIGURE THE REST ENDPOINT IN CAMEL

In camel-cxf schema file, there are two elements for the REST endpoint definition. cxf:rsServer for REST consumer, cxf:rsClient for REST producer.

You can find a Camel REST service route configuration example here.

### 76.4. HOW TO OVERRIDE THE CXF PRODUCER ADDRESS FROM MESSAGE HEADER

The camel-cxfrs producer supports to override the services address by setting the message with the key of "CamelDestinationOverrideUrl".
76.5. CONSUMING A REST REQUEST - SIMPLE BINDING STYLE

Available as of Camel 2.11

The Default binding style is rather low-level, requiring the user to manually process the MessageContentsList object coming into the route. Thus, it tightly couples the route logic with the method signature and parameter indices of the JAX-RS operation. Somewhat inelegant, difficult and error-prone.

In contrast, the SimpleConsumer binding style performs the following mappings, in order to make the request data more accessible to you within the Camel Message:

- JAX-RS Parameters (@HeaderParam, @QueryParam, etc.) are injected as IN message headers. The header name matches the value of the annotation.
- The request entity (POJO or other type) becomes the IN message body. If a single entity cannot be identified in the JAX-RS method signature, it falls back to the original MessageContentsList.
- Binary @Multipart body parts become IN message attachments, supporting DataHandler, InputStream, DataSource and CXF’s Attachment class.
- Non-binary @Multipart body parts are mapped as IN message headers. The header name matches the Body Part name.

Additionally, the following rules apply to the Response mapping:

- If the message body type is different to javax.ws.rs.core.Response (user-built response), a new Response is created and the message body is set as the entity (so long it’s not null). The response status code is taken from the Exchange.HTTP_RESPONSE_CODE header, or defaults to 200 OK if not present.
- If the message body type is equal to javax.ws.rs.core.Response, it means that the user has built a custom response, and therefore it is respected and it becomes the final response.
- In all cases, Camel headers permitted by custom or default HeaderFilterStrategy are added to the HTTP response.

76.5.1. Enabling the Simple Binding Style

This binding style can be activated by setting the bindingStyle parameter in the consumer endpoint to value SimpleConsumer:

```java
from("cxfrs:bean:rsServer?bindingStyle=SimpleConsumer")
 .to("log:TEST?showAll=true");
```

76.5.2. Examples of request binding with different method signatures

Below is a list of method signatures along with the expected result from the Simple binding.
public Response doAction(BusinessObject request);
Request payload is placed in IN message body, replacing the original MessageContentsList.

public Response doAction(BusinessObject request, @HeaderParam("abcd") String abcd,
@QueryParam("defg") String defg); Request payload placed in IN message body, replacing the original MessageContentsList. Both request params mapped as IN message headers with names abcd and defg.

public Response doAction(@HeaderParam("abcd") String abcd, @QueryParam("defg") String defg); Both request params mapped as IN message headers with names abcd and defg. The original MessageContentsList is preserved, even though it only contains the 2 parameters.

public Response doAction(@Multipart(value="body1") BusinessObject request,
@Multipart(value="body2") BusinessObject request2); The first parameter is transferred as a header with name body1, and the second one is mapped as header body2. The original MessageContentsList is preserved as the IN message body.

public Response doAction(InputStream abcd); The InputStream is unwrapped from the MessageContentsList and preserved as the IN message body.

public Response doAction(DataHandler abcd); The DataHandler is unwrapped from the MessageContentsList and preserved as the IN message body.

76.5.3. More examples of the Simple Binding Style

Given a JAX-RS resource class with this method:

```java
@POST @Path("/customers/{type}")
public Response newCustomer(Customer customer, @PathParam("type") String type,
@QueryParam("active") @DefaultValue("true") boolean active) {
    return null;
}
```

Serviced by the following route:

```java
from("cxfrs:bean:rsServer?bindingStyle=SimpleConsumer")
    .recipientList(simple("direct:${header.operationName}"));
from("direct:newCustomer")
    .log("Request: type=${header.type}, active=${header.active}, customerData=${body}");
```

The following HTTP request with XML payload (given that the Customer DTO is JAXB-annotated):

POST /customers/gold?active=true

Payload:

```xml
<Customer>
    <fullName>Raul Kripalani</fullName>
    <country>Spain</country>
    <project>Apache Camel</project>
</Customer>
```

Will print the message:

Request: type=gold, active=true, customerData=<Customer.toString() representation>
For more examples on how to process requests and write responses can be found [here](#).

### 76.6. CONSUMING A REST REQUEST - DEFAULT BINDING STYLE

The [CXF JAXRS front end](#) implements the [JAX-RS (JSR-311)](http://xmlns.jcp.org/jsr/311) API, so we can export the resources classes as a REST service. And we leverage the [CXF Invoker API](#) to turn a REST request into a normal Java object method invocation.

Unlike the [Camel Restlet](#) component, you don’t need to specify the URI template within your endpoint, CXF takes care of the REST request URI to resource class method mapping according to the JSR-311 specification. All you need to do in Camel is delegate this method request to a right processor or endpoint.

Here is an example of a CXFRS route...

And the corresponding resource class used to configure the endpoint...

INFO:*Note about resource classes*

By default, JAX-RS resource classes are only used to configure JAX-RS properties. Methods will not be executed during routing of messages to the endpoint. Instead, it is the responsibility of the route to do all processing.

Note that starting from Camel 2.15 it is also sufficient to provide an interface only as opposed to a no-op service implementation class for the default mode.

Starting from Camel 2.15, if a `performInvocation` option is enabled, the service implementation will be invoked first, the response will be set on the Camel exchange and the route execution will continue as usual. This can be useful for integrating the existing JAX-RS implementations into Camel routes and for post-processing JAX-RS Responses in custom processors.

### 76.7. HOW TO INVOKE THE REST SERVICE THROUGH CAMEL-CXFRS PRODUCER

The [CXF JAXRS front end](#) implements a proxy-based client API, with this API you can invoke the remote REST service through a proxy. The `camel-cxfrs` producer is based on this proxy API.

You just need to specify the operation name in the message header and prepare the parameter in the message body, the camel-cxfrs producer will generate right REST request for you.

Here is an example:

The [CXF JAXRS front end](#) also provides a http centric client API. You can also invoke this API from `camel-cxfrs` producer. You need to specify the HTTP_PATH and the HTTP_METHOD and let the producer use the http centric client API by using the URI option `httpClientAPI` or by setting the message header `CxFConstants.CAMEL_CXF_RS_USING_HTTP_API`. You can turn the response object to the type class specified with the message header `CxFConstants.CAMEL_CXF_RS_RESPONSE_CLASS`.

From Camel 2.1, we also support to specify the query parameters from cxfrs URI for the CXFRS http centric client.

To support the Dynamical routing, you can override the URI's query parameters by using the `CxFConstants.CAMEL_CXF_RS_QUERY_MAP` header to set the parameter map for it.
76.8. WHAT'S THE CAMEL TRANSPORT FOR CXF

In CXF you offer or consume a webservice by defining its address. The first part of the address specifies the protocol to use. For example address="http://localhost:9000" in an endpoint configuration means your service will be offered using the http protocol on port 9000 of localhost. When you integrate Camel Transport into CXF you get a new transport "camel". So you can specify address="camel://direct:MyEndpointName" to bind the CXF service address to a camel direct endpoint.

Technically speaking Camel transport for CXF is a component which implements the CXF transport API with the Camel core library. This allows you to easily use Camel’s routing engine and integration patterns support together with your CXF services.

76.9. INTEGRATE CAMEL INTO CXF TRANSPORT LAYER

To include the Camel Tranport into your CXF bus you use the CamelTransportFactory. You can do this in Java as well as in Spring.

76.9.1. Setting up the Camel Transport in Spring

You can use the following snippet in your applicationcontext if you want to configure anything special. If you only want to activate the camel transport you do not have to do anything in your application context. As soon as you include the camel-cxf-transport jar (or camel-cxf.jar if your camel version is less than 2.7.x) in your app, cxf will scan the jar and load a CamelTransportFactory for you.

```xml
<bean class="org.apache.camel.component.cxf.transport.CamelTransportFactory">
  <property name="bus" ref="cxf" />
  <property name="camelContext" ref="camelContext" />
  <property name="checkException" value="true" />
  <property name="transportIds">
    <list>
      <value>http://cxf.apache.org/transports/camel</value>
    </list>
  </property>
</bean>
```

76.9.2. Integrating the Camel Transport in a programmatic way

Camel transport provides a setContext method that you could use to set the Camel context into the transport factory. If you want this factory take effect, you need to register the factory into the CXF bus. Here is a full example for you.

```java
import org.apache.cxf.Bus;
import org.apache.cxf.BusFactory;
import org.apache.cxf.transport.ConduitInitiatorManager;
import org.apache.cxf.transport.DestinationFactoryManager;
...```
76.10. CONFIGURE THE DESTINATION AND CONDUIT WITH SPRING

76.10.1. Namespace

The elements used to configure an Camel transport endpoint are defined in the namespace
http://cxf.apache.org/transports/camel. It is commonly referred to using the prefix camel. In order to
use the Camel transport configuration elements, you will need to add the lines shown below to the beans
element of your endpoint’s configuration file. In addition, you will need to add the configuration
elements’ namespace to the xsi:schemaLocation attribute.

Adding the Configuration Namespace

```xml
<beans ...>
  xmlns:camel="http://cxf.apache.org/transports/camel"
  ...>
  xsi:schemaLocation="...
  http://cxf.apache.org/transports/camel
  http://cxf.apache.org/transports/camel.xsd
  ...">

76.10.2. The destination element

You configure an Camel transport server endpoint using the camel:destination element and its
children. The camel:destination element takes a single attribute, name, that specifies the WSDL port
element that corresponds to the endpoint. The value for the name attribute takes the form
portQName`..camel-destination`. The example below shows the camel:destination element that would
be used to add configuration for an endpoint that was specified by the WSDL fragment <port
binding="widgetSOAPBinding" name="widgetSOAPPort"> if the endpoint’s target namespace was
http://widgets.widgetvendor.net.

camel:destination Element

...
The camel:destination element for Spring has a number of child elements that specify configuration information. They are described below.

Element
Description

**camel-spring:camelContext**
You can specify the camel context in the camel destination

**camel:camelContextRef**
The camel context id which you want inject into the camel destination

### 76.10.3. The conduit element

You configure a Camel transport client using the camel:conduit element and its children. The camel:conduit element takes a single attribute, name, that specifies the WSDL port element that corresponds to the endpoint. The value for the name attribute takes the form `portQName`.camel-conduit`. For example, the code below shows the camel:conduit element that would be used to add configuration for an endpoint that was specified by the WSDL fragment `<port binding="widgetSOAPBinding" name="widgetSOAPPort">` if the endpoint’s target namespace was `http://widgets.widgetvendor.net`.

http-conf:conduit Element

```
  <camelContext id="context" xmlns="http://activemq.apache.org/camel/schema/spring">
    <route>
      <from uri="direct:EndpointC" />
      <to uri="direct:EndpointD" />
    </route>
  </camelContext>
</camel:destination>
```

```
<!-- new added feature since Camel 2.11.x
<camel:destination name="[http://widgets/widgetvendor.net]widgetSOAPPort.camel-destination" camelContextId="context" />
```

```
  <camelContext id="context" xmlns="http://activemq.apache.org/camel/schema/spring">
    <route>
      <from uri="direct:EndpointC" />
      <to uri="direct:EndpointD" />
    </route>
  </camelContext>
</camel:destination>
```

```
<camel:destination name="[http://widgets/widgetvendor.net]widgetSOAPPort.camel-destination">
  <camelContext id="context" xmlns="http://activemq.apache.org/camel/schema/spring">
    <route>
      <from uri="direct:EndpointC" />
      <to uri="direct:EndpointD" />
    </route>
  </camelContext>
</camel:destination>
```

```
<!-- new added feature since Camel 2.11.x
<camel:destination name="[http://widgets/widgetvendor.net]widgetSOAPPort.camel-destination" camelContextId="context" />
```

```
<camel:destination name="[http://widgets/widgetvendor.net]widgetSOAPPort.camel-destination">
  <camelContext id="context" xmlns="http://activemq.apache.org/camel/schema/spring">
    <route>
      <from uri="direct:EndpointC" />
      <to uri="direct:EndpointD" />
    </route>
  </camelContext>
</camel:destination>
```

```
<!-- new added feature since Camel 2.11.x
<camel:destination name="[http://widgets/widgetvendor.net]widgetSOAPPort.camel-destination"
```
The **camel:conduit** element has a number of child elements that specify configuration information. They are described below.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>camel-spring:camelContext</strong></td>
<td>You can specify the camel context in the camel conduit</td>
</tr>
<tr>
<td><strong>camel:camelContextRef</strong></td>
<td>The camel context id which you want inject into the camel conduit</td>
</tr>
</tbody>
</table>

### 76.11. Configure the Destination and Conduit with Blueprint

From [Camel 2.11.x](https://cxf.apache.org/), Camel Transport supports to be configured with Blueprint.

If you are using blueprint, you should use the namespace [http://cxf.apache.org/transports/camel/blueprint](http://cxf.apache.org/transports/camel/blueprint) and import the schema like the blow.

**Adding the Configuration Namespace for blueprint**

```xml
<beans ...
    xmlns:camel="http://cxf.apache.org/transports/camel/blueprint"
    ...>
    <camel:conduit id="*.camel-conduit" camelContextId="camel1" />
    <camel:destination id="*.camel-destination" camelContextId="camel1" />
</beans>
```

In blueprint **camel:conduit camel:destination** only has one camelContextId attribute, they doesn’t support to specify the camel context in the camel destination.

### 76.12. Example Using Camel as a Load Balancer for CXF

This example shows how to use the camel load balancing feature in CXF. You need to load the configuration file in CXF and publish the endpoints on the address "camel://direct:EndpointA" and "camel://direct:EndpointB"
76.13. COMPLETE HOWTO AND EXAMPLE FOR ATTACHING CAMEL TO CXF

Better JMS Transport for CXF Web service using Apache Camel
CHAPTER 77. DATA FORMAT COMPONENT

Available as of Camel version 2.12

The dataformat: component allows to use Data Format as a Camel Component.

77.1. URI FORMAT

dataformat:name:(marshal|unmarshal)[?options]

Where name is the name of the Data Format. And then followed by the operation which must either be marshal or unmarshal. The options is used for configuring the Data Format in use. See the Data Format documentation for which options it support.

77.2. DATAFORMAT OPTIONS

The Data Format component has no options.

The Data Format endpoint is configured using URI syntax:

dataformat:name:operation

with the following path and query parameters:

77.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required Name of data format</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>operation</td>
<td>Operation to use either marshal or unmarshal</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

77.2.2. Query Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

77.3. SAMPLES

For example to use the JAXB Data Format we can do as follows:
from("activemq:My.Queue").
to("dataformat:jaxb:unmarshal?contextPath=com.acme.model").
to("mqseries:Another.Queue");

And in XML DSL you do:

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="activemq:My.Queue"/>
    <to uri="dataformat:jaxb:unmarshal?contextPath=com.acme.model"/>
    <to uri="mqseries:Another.Queue"/>
  </route>
</camelContext>
```
CHAPTER 78. DATASET COMPONENT

Available as of Camel version 1.3

Testing of distributed and asynchronous processing is notoriously difficult. The Mock, Test and DataSet endpoints work great with the Camel Testing Framework to simplify your unit and integration testing using Enterprise Integration Patterns and Camel's large range of Components together with the powerful Bean Integration.

The DataSet component provides a mechanism to easily perform load & soak testing of your system. It works by allowing you to create DataSet instances both as a source of messages and as a way to assert that the data set is received.

Camel will use the throughput logger when sending dataset’s.

78.1. URI FORMAT

dataset:name[?options]

Where name is used to find the DataSet instance in the Registry

Camel ships with a support implementation of org.apache.camel.component.dataset.DataSet, the org.apache.camel.component.dataset.DataSetSupport class, that can be used as a base for implementing your own DataSet. Camel also ships with some implementations that can be used for testing: org.apache.camel.component.dataset.SimpleDataSet, org.apache.camel.component.dataset.ListDataSet and org.apache.camel.component.dataset.FileDataSet, all of which extend DataSetSupport.

78.2. OPTIONS

The Dataset component has no options.

The Dataset endpoint is configured using URI syntax:

dataset:name

with the following path and query parameters:

78.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required Name of DataSet to lookup in the registry</td>
<td></td>
<td>DataSet</td>
</tr>
</tbody>
</table>

78.2.2. Query Parameters (19 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSetIndex</td>
<td>Controls the behaviour of the CamelDataSetIndex header. For Consumers: - off = the header will not be set - strict/lenient = the header will be set For Producers: - off = the header value will not be verified, and will not be set if it is not present - strict = the header value must be present and will be verified - lenient = the header value will be verified if it is present, and will be set if it is not present</td>
<td>lenient</td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay</td>
<td>Time period in millis to wait before starting sending messages.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>minRate</td>
<td>Wait until the DataSet contains at least this number of messages</td>
<td>0</td>
<td>int</td>
</tr>
<tr>
<td>preloadSize</td>
<td>Sets how many messages should be preloaded (sent) before the route completes its initialization</td>
<td>0</td>
<td>long</td>
</tr>
<tr>
<td>produceDelay</td>
<td>Allows a delay to be specified which causes a delay when a message is sent by the consumer (to simulate slow processing)</td>
<td>3</td>
<td>long</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the default exchange pattern when creating an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------</td>
<td>-------</td>
</tr>
<tr>
<td>assertPeriod (producer)</td>
<td>Sets a grace period after which the mock endpoint will re-assert to ensure the preliminary assertion is still valid. This is used for example to assert that exactly a number of messages arrives. For example if link expectedMessageCount(int) was set to 5, then the assertion is satisfied when 5 or more message arrives. To ensure that exactly 5 messages arrives, then you would need to wait a little period to ensure no further message arrives. This is what you can use this link setAssertPeriod(long) method for. By default this period is disabled.</td>
<td>0</td>
<td>long</td>
</tr>
<tr>
<td>consumeDelay (producer)</td>
<td>Allows a delay to be specified which causes a delay when a message is consumed by the producer (to simulate slow processing)</td>
<td>0</td>
<td>long</td>
</tr>
<tr>
<td>expectedCount (producer)</td>
<td>Specifies the expected number of message exchanges that should be received by this endpoint. Beware: If you want to expect that 0 messages, then take extra care, as 0 matches when the tests starts, so you need to set a assert period time to let the test run for a while to make sure there are still no messages arrived; for that use link setAssertPeriod(long). An alternative is to use NotifyBuilder, and use the notifier to know when Camel is done routing some messages, before you call the link assertIsSatisfied() method on the mocks. This allows you to not use a fixed assert period, to speedup testing times. If you want to assert that exactly n\text{th} message arrives to this mock endpoint, then see also the link setAssertPeriod(long) method for further details.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>reportGroup (producer)</td>
<td>A number that is used to turn on throughput logging based on groups of the size.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>resultMinimumWaitTime (producer)</td>
<td>Sets the minimum expected amount of time (in millis) the link assertIsSatisfied() will wait on a latch until it is satisfied</td>
<td>0</td>
<td>long</td>
</tr>
<tr>
<td>resultWaitTime (producer)</td>
<td>Sets the maximum amount of time (in millis) the link assertIsSatisfied() will wait on a latch until it is satisfied</td>
<td>0</td>
<td>long</td>
</tr>
</tbody>
</table>
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>retainFirst</td>
<td>Specifies to only retain the first n’th number of received Exchanges. This is used when testing with big data, to reduce memory consumption by not storing copies of every Exchange this mock endpoint receives. Important: When using this limitation, then the link <code>getReceivedCounter()</code> will still return the actual number of received Exchanges. For example if we have received 5000 Exchanges, and have configured to only retain the first 10 Exchanges, then the link <code>getReceivedCounter()</code> will still return 5000 but there is only the first 10 Exchanges in the link <code>getExchanges()</code> and link <code>getReceivedExchanges()</code> methods. When using this method, then some of the other expectation methods is not supported, for example the link <code>expectedBodiesReceived(Object...)</code> sets a expectation on the first number of bodies received. You can configure both link <code>setRetainFirst(int)</code> and link <code>setRetainLast(int)</code> methods, to limit both the first and last received.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>retainLast</td>
<td>Specifies to only retain the last n’th number of received Exchanges. This is used when testing with big data, to reduce memory consumption by not storing copies of every Exchange this mock endpoint receives. Important: When using this limitation, then the link <code>getReceivedCounter()</code> will still return the actual number of received Exchanges. For example if we have received 5000 Exchanges, and have configured to only retain the last 20 Exchanges, then the link <code>getReceivedCounter()</code> will still return 5000 but there is only the last 20 Exchanges in the link <code>getExchanges()</code> and link <code>getReceivedExchanges()</code> methods. When using this method, then some of the other expectation methods is not supported, for example the link <code>expectedBodiesReceived(Object...)</code> sets a expectation on the first number of bodies received. You can configure both link <code>setRetainFirst(int)</code> and link <code>setRetainLast(int)</code> methods, to limit both the first and last received.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>sleepForEmptyTest</td>
<td>Allows a sleep to be specified to wait to check that this endpoint really is empty when link <code>expectedMessageCount(int)</code> is called with zero</td>
<td>0</td>
<td>long</td>
</tr>
<tr>
<td>copyOnExchange</td>
<td>Sets whether to make a deep copy of the incoming Exchange when received at this mock endpoint. Is by default true.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>
You can append query options to the URI in the following format, ?option=value&option=value&…

### 78.3. CONFIGURING DATASET

Camel will lookup in the Registry for a bean implementing the DataSet interface. So you can register your own DataSet as:

```xml
<bean id="myDataSet" class="com.mycompany.MyDataSet">
  <property name="size" value="100"/>
</bean>
```

### 78.4. EXAMPLE

For example, to test that a set of messages are sent to a queue and then consumed from the queue without losing any messages:

```java
// send the dataset to a queue
from("dataset:foo").to("activemq:SomeQueue");

// now lets test that the messages are consumed correctly
from("activemq:SomeQueue").to("dataset:foo");
```

The above would look in the Registry to find the `foo` DataSet instance which is used to create the messages.

Then you create a DataSet implementation, such as using the `SimpleDataSet` as described below, configuring things like how big the data set is and what the messages look like etc.

### 78.5. DATASETSUPPORT (ABSTRACT CLASS)

The DataSetSupport abstract class is a nice starting point for new DataSets, and provides some useful features to derived classes.

#### 78.5.1. Properties on DataSetSupport

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultHeaders</td>
<td>Map&lt;String, Object&gt;</td>
<td>null</td>
<td>Specifies the default message body. For SimpleDataSet it is a constant payload; though if you want to create custom payloads per message, create your own derivation of <code>DataSetSupport</code>.</td>
</tr>
</tbody>
</table>
### 78.6. SIMPLEDATASET

The SimpleDataSet extends DataSetSupport, and adds a default body.

#### 78.6.1. Additional Properties on SimpleDataSet

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultBody</td>
<td>Object</td>
<td><code>&lt;hello&gt;world!&lt;/hello&gt;</code></td>
<td>Specifies the default message body. By default, the SimpleDataSet produces the same constant payload for each exchange. If you want to customize the payload for each exchange, create a Camel Processor and configure the SimpleDataSet to use it by setting the outputTransformer property.</td>
</tr>
</tbody>
</table>

### 78.7. LISTDATASET

Available since Camel 2.17

The List`DataSet` extends DataSetSupport, and adds a list of default bodies.

#### 78.7.1. Additional Properties on ListDataSet

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultBodies</td>
<td>List&lt;Object&gt;</td>
<td><code>empty LinkedList&lt;Object&gt;</code></td>
<td>Specifies the default message body. By default, the ListDataSet selects a constant payload from the list of defaultBodies using the CamelDataSetIndex. If you want to customize the payload, create a Camel Processor and configure the ListDataSet to use it by setting the outputTransformer property.</td>
</tr>
</tbody>
</table>
### size

**Type:** long  
**Default:** the size of the default Bodies list  
**Description:** Specifies how many messages to send/consume. This value can be different from the size of the `defaultBodies` list. If the value is less than the size of the `defaultBodies` list, some of the list elements will not be used. If the value is greater than the size of the `defaultBodies` list, the payload for the exchange will be selected using the modulus of the `CamelDataSetIndex` and the size of the `defaultBodies` list (i.e. `CamelDataSetIndex % defaultBodies.size()`)

---

#### 78.8. FILEDATASET

**Available since Camel 2.17**

The `FileDataSet` extends `ListDataSet`, and adds support for loading the bodies from a file.

#### 78.8.1. Additional Properties on FileDataSet

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sourceFile</code></td>
<td>File</td>
<td>null</td>
<td>Specifies the source file for payloads</td>
</tr>
<tr>
<td><code>delimiter</code></td>
<td>String</td>
<td>\z</td>
<td>Specifies the delimiter pattern used by a <code>java.util.Scanner</code> to split the file into multiple payloads.</td>
</tr>
</tbody>
</table>
CHAPTER 79. DIGITALOCEAN COMPONENT

Available as of Camel version 2.19

The DigitalOcean component allows you to manage Droplets and resources within the DigitalOcean cloud with Camel by encapsulating [digitalocean-api-java](https://www.digitalocean.com/community/projects/api-client-in-java). All of the functionality that you are familiar with in the DigitalOcean control panel is also available through this Camel component.

79.1. PREREQUISITES

You must have a valid DigitalOcean account and a valid OAuth token. You can generate an OAuth token by visiting the [Apps & API](https://cloud.digitalocean.com/settings/applications) section of the DigitalOcean control panel for your account.

79.2. URI FORMAT

The DigitalOcean Component uses the following URI format:

```
digitalocean://endpoint?[options]
```

where `endpoint` is a DigitalOcean resource type.

Example: to list your droplets:

```
digitalocean://droplets?operation=list&oAuthToken=XXXXXX&page=1&perPage=10
```

The DigitalOcean component only supports producer endpoints so you cannot use this component at the beginning of a route to listen to messages in a channel.

79.3. OPTIONS

The DigitalOcean component has no options.

The DigitalOcean endpoint is configured using URI syntax:

```
digitalocean:operation
```

with the following path and query parameters:

79.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>The operation to perform to the given resource.</td>
<td></td>
<td>DigitalOceanOperations</td>
</tr>
</tbody>
</table>

79.3.2. Query Parameters (10 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>page (producer)</td>
<td>Use for pagination. Force the page number.</td>
<td>1</td>
<td>Integer</td>
</tr>
<tr>
<td>perPage (producer)</td>
<td>Use for pagination. Set the number of item per request. The maximum number of results per page is 200.</td>
<td>25</td>
<td>Integer</td>
</tr>
<tr>
<td>resource (producer)</td>
<td>Required The DigitalOcean resource type on which perform the operation.</td>
<td></td>
<td>DigitalOceanResources</td>
</tr>
<tr>
<td>digitalOceanClient (advanced)</td>
<td>To use a existing configured DigitalOceanClient as client</td>
<td></td>
<td>DigitalOceanClient</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>httpProxyHost (proxy)</td>
<td>Set a proxy host if needed</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>httpProxyPassword (proxy)</td>
<td>Set a proxy password if needed</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>httpProxyPort (proxy)</td>
<td>Set a proxy port if needed</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>httpProxyUser (proxy)</td>
<td>Set a proxy host if needed</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>oAuthToken (security)</td>
<td>DigitalOcean OAuth Token</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

You have to provide an operation value for each endpoint, with the operation URI option or the CamelDigitalOceanOperation message header.

All operation values are defined in DigitalOceanOperations enumeration.

All header names used by the component are defined in DigitalOceanHeaders enumeration.

79.4. MESSAGE BODY RESULT

All message bodies returned are using objects provided by the digitalocean-api-java library.

79.5. API RATE LIMITS

DigitalOcean REST API encapsulated by camel-digitalocean component is subjected to API Rate Limiting. You can find the per method limits in the [API Rate Limits documentation](https://developers.digitalocean.com/documentation/v2/#rate-limit).
### 79.6. ACCOUNT ENDPOINT

<table>
<thead>
<tr>
<th>operation</th>
<th>Description</th>
<th>Headers</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>get</td>
<td>get account info</td>
<td></td>
<td>com.myjeeva.digitalocean.pojo.Account</td>
</tr>
</tbody>
</table>

### 79.7. BLOCKSTORAGES ENDPOINT

<table>
<thead>
<tr>
<th>operation</th>
<th>Description</th>
<th>Headers</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>get</td>
<td>show information about a Block Storage volume by name</td>
<td>CamelDigitalOceanId Integer, CamelDigitalOceanName String, CamelDigitalOceanRegion String</td>
<td>com.myjeeva.digitalocean.pojo.Volume</td>
</tr>
<tr>
<td>list</td>
<td>list all of the Block Storage volumes available on your account</td>
<td>CamelDigitalOceanId Integer</td>
<td>List&lt;com.myjeeva.digitalocean.pojo.Volume&gt;</td>
</tr>
<tr>
<td>listSnapshots</td>
<td>retrieve the snapshots that have been created from a volume</td>
<td>CamelDigitalOceanId Integer</td>
<td>List&lt;com.myjeeva.digitalocean.pojo.Snapshot&gt;</td>
</tr>
</tbody>
</table>

### 79.8. DROPLETS ENDPOINT

<table>
<thead>
<tr>
<th>operation</th>
<th>Description</th>
<th>Headers</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>list all Droplets in your account</td>
<td>CamelDigitalOceanId Integer</td>
<td>List&lt;com.myjeeva.digitalocean.pojo.Droplet&gt;</td>
</tr>
<tr>
<td>create</td>
<td>create a new Droplet</td>
<td>CamelDigitalOceanName String, CamelDigitalOceanDropletImage String, CamelDigitalOceanRegion String</td>
<td>com.myjeeva.digitalocean.pojo.Droplet</td>
</tr>
<tr>
<td>create</td>
<td>create multiple Droplets</td>
<td>CamelDigitalOceanNames List&lt;String&gt;</td>
<td>List&lt;com.myjeeva.digitalocean.pojo.Droplet&gt;</td>
</tr>
<tr>
<td>operation</td>
<td>Description</td>
<td>Headers</td>
<td>Result</td>
</tr>
</tbody>
</table>

79.9. IMAGES ENDPOINT
CamelDigitalOceanId Integer | CamelDigitalOceanRegion String | com.myjeeva.digitalocean.pojo.Action | convert | convert an image, for example, a backup to a snapshot | CamelDigitalOceanId Integer | com.myjeeva.digitalocean.pojo.Action |

79.10. SNAPSHOTS ENDPOINT

| operation | Description | Headers | Result | | list | list all of the snapshots available on your account | CamelDigitalOceanType DigitalOceanSnapshotTypes | List<com.myjeeva.digitalocean.pojo.Snapshot> | | get | retrieve information about a snapshot | CamelDigitalOceanId Integer | com.myjeeva.digitalocean.pojo.Snapshot | | delete | delete an snapshot | CamelDigitalOceanId Integer | com.myjeeva.digitalocean.pojo.Delete |

79.11. KEYS ENDPOINT

79.12. REGIONS ENDPOINT

| operation | Description | Headers | Result | | list | list all of the regions that are available | | List<com.myjeeva.digitalocean.pojo.Region> |

79.13. SIZES ENDPOINT

| operation | Description | Headers | Result | | list | list all of the sizes that are available | | List<com.myjeeva.digitalocean.pojo.Size> |

79.14. FLOATING IPS ENDPOINT

### 79.15. TAGS ENDPOINT

<table>
<thead>
<tr>
<th>operation</th>
<th>Description</th>
<th>Headers</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>list all of your tags</td>
<td></td>
<td>List&lt;com.myjeeva.digitalocean.pojo.Tag&gt;</td>
</tr>
<tr>
<td>create</td>
<td>create a Tag</td>
<td>CamelDigitalOceanName String</td>
<td>com.myjeeva.digitalocean.pojo.Tag</td>
</tr>
<tr>
<td>get</td>
<td>retrieve an individual tag</td>
<td>CamelDigitalOceanName String</td>
<td>com.myjeeva.digitalocean.pojo.Tag</td>
</tr>
<tr>
<td>delete</td>
<td>delete a tag</td>
<td>CamelDigitalOceanName String</td>
<td>com.myjeeva.digitalocean.pojo.Delete</td>
</tr>
<tr>
<td>update</td>
<td>update a tag</td>
<td>CamelDigitalOceanName String &lt;br&gt;<code>CamelDigitalOceanNewName</code> String</td>
<td>com.myjeeva.digitalocean.pojo.Tag</td>
</tr>
</tbody>
</table>

### 79.16. EXAMPLES

**Get your account info**

```xml
from("direct:getAccountInfo")
  .setHeader(DigitalOceanConstants.OPERATION, constant(DigitalOceanOperations.get))
  .to("digitalocean:account?oAuthToken=XXXXXX")
```

**Create a droplet**

```xml
from("direct:createDroplet")
  .setHeader(DigitalOceanConstants.OPERATION, constant("create"))
  .setHeader(DigitalOceanHeaders.NAME, constant("myDroplet"))
  .setHeader(DigitalOceanHeaders.REGION, constant("fra1"))
  .setHeader(DigitalOceanHeaders.DROPLET_IMAGE, constant("ubuntu-14-04-x64"))
  .setHeader(DigitalOceanHeaders.DROPLET_SIZE, constant("512mb"))
  .to("digitalocean:droplet?oAuthToken=XXXXXX")
```

**List all your droplets**

```xml
from("direct:getDroplets")
  .setHeader(DigitalOceanConstants.OPERATION, constant("list"))
  .to("digitalocean:droplets?oAuthToken=XXXXXX")
```

**Retrieve information for the Droplet (dropletId = 34772987)**

```xml
from("direct:getDroplet")
  .setHeader(DigitalOceanConstants.OPERATION, constant("get"))
  .setHeader(DigitalOceanConstants.ID, 34772987)
  .to("digitalocean:droplet?oAuthToken=XXXXXX")
```

**Shutdown information for the Droplet (dropletId = 34772987)**

```xml
from("direct:shutdown")
  .setHeader(DigitalOceanConstants.ID, 34772987)
  .to("digitalocean:droplet?operation=shutdown&oAuthToken=XXXXXX")
```
CHAPTER 80. DIRECT COMPONENT

Available as of Camel version 1.0

The direct: component provides direct, synchronous invocation of any consumers when a producer sends a message exchange. This endpoint can be used to connect existing routes in the same camel context.

TIP

Asynchronous: The SEDA component provides asynchronous invocation of any consumers when a producer sends a message exchange.

TIP

Connection to other camel contexts: The VM component provides connections between Camel contexts as long they run in the same JVM.

80.1. URI FORMAT

| direct:someName[?options] |

Where someName can be any string to uniquely identify the endpoint

80.2. OPTIONS

The Direct component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>block (producer)</td>
<td>If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeout (producer)</td>
<td>The timeout value to use if block is enabled.</td>
<td>30000</td>
<td>long</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Direct endpoint is configured using URI syntax:

| direct:name |

with the following path and query parameters:

80.2.1. Path Parameters (1 parameters):
### Name | Description | Default | Type
---|---|---|---
name | Required Name of direct endpoint | | String

#### 80.2.2. Query Parameters (7 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the default exchange pattern when creating an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>block (producer)</td>
<td>If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>failIfNoConsumers (producer)</td>
<td>Whether the producer should fail by throwing an exception, when sending to a DIRECT endpoint with no active consumers.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>timeout (producer)</td>
<td>The timeout value to use if block is enabled.</td>
<td>30000</td>
<td>long</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

#### 80.3. SAMPLES

In the route below we use the direct component to link the two routes together:

```java
from("activemq:queue:order.in")
```
And the sample using spring DSL:

```java
.to("bean:orderServer?method=validate")
.to("direct:processOrder");
from("direct:processOrder")
.to("bean:orderService?method=process")
.to("activemq:queue:order.out");
```

See also samples from the SEDA component, how they can be used together.

### 80.4. SEE ALSO

- SEDA
- VM
CHAPTER 81. DIRECT VM COMPONENT

Available as of Camel version 2.10

The direct-vm: component provides direct, synchronous invocation of any consumers in the JVM when a producer sends a message exchange. This endpoint can be used to connect existing routes in the same camel context, as well from other camel contexts in the same JVM.

This component differs from the Direct component in that Direct-VM supports communication across CamelContext instances - so you can use this mechanism to communicate across web applications (provided that camel-core.jar is on the system/boot classpath).

At runtime you can swap in new consumers, by stopping the existing consumer(s) and start new consumers. But at any given time there can be at most only one active consumer for a given endpoint.

This component allows also to connect routes deployed in different OSGI Bundles as you can see here after. Even if they are running in different bundles, the camel routes will use the same thread. That authorises to develop applications using Transactions - Tx.

81.1. URI FORMAT

```
direct-vm:someName
```

Where someName can be any string to uniquely identify the endpoint

81.2. OPTIONS

The Direct VM component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

81.1. URI FORMAT

direct-vm:someName

Where someName can be any string to uniquely identify the endpoint

81.2. OPTIONS

The Direct VM component supports 5 options which are listed below.
If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.

The timeout value to use if block is enabled.

Sets a HeaderFilterStrategy that will only be applied on producer endpoints (on both directions: request and response). Default value: none.

Whether to propagate or not properties from the producer side to the consumer side, and vice versa. Default value: true.

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

The Direct VM endpoint is configured using URI syntax:

direct-vm:name

with the following path and query parameters:

### 81.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required Name of direct-vm endpoint</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 81.2.2. Query Parameters (9 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern</strong></td>
<td>Sets the default exchange pattern when creating an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><strong>block</strong></td>
<td>If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>failIfNoConsumers</strong></td>
<td>Whether the producer should fail by throwing an exception, when sending to a Direct-VM endpoint with no active consumers.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>timeout</strong></td>
<td>The timeout value to use if block is enabled.</td>
<td>30000</td>
<td>long</td>
</tr>
<tr>
<td><strong>headerFilterStrategy</strong></td>
<td>Sets a HeaderFilterStrategy that will only be applied on producer endpoints (on both directions: request and response). Default value: none.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td><strong>propagateProperties</strong></td>
<td>Whether to propagate or not properties from the producer side to the consumer side, and vice versa. Default value: true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>synchronous</strong></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 81.3. SAMPLES

In the route below we use the direct component to link the two routes together:

-
And now in another CamelContext, such as another OSGi bundle:

from("direct-vm:processOrder")
    .to("bean:orderService?method=validate")
    .to("direct-vm:processOrder");

And the sample using spring DSL:

    <route>
    <from uri="activemq:queue:order.in"/>
    <to uri="bean:orderService?method=validate"/>
    <to uri="direct-vm:processOrder"/>
    </route>

    <route>
    <from uri="direct-vm:processOrder"/>
    <to uri="bean:orderService?method=process"/>
    <to uri="activemq:queue:order.out"/>
    </route>

- Direct
- SEDA
- VM
CHAPTER 82. DISRUPTOR COMPONENT

Available as of Camel version 2.12

The disruptor: component provides asynchronous SEDA behavior much as the standard SEDA Component, but utilizes a Disruptor instead of a BlockingQueue utilized by the standard SEDA. Alternatively, a 

disruptor-vm: endpoint is supported by this component, providing an alternative to the standard VM. As with the SEDA component, buffers of the disruptor: endpoints are only visible within a single CamelContext and no support is provided for persistence or recovery. The buffers of the disruptor-vm: endpoints also provide support for communication across CamelContexts instances so you can use this mechanism to communicate across web applications (provided that camel-disruptor.jar is on the system/boot classpath).

The main advantage of choosing to use the Disruptor Component over the SEDA or the VM Component is performance in use cases where there is high contention between producer(s) and/or multicasted or concurrent Consumers. In those cases, significant increases of throughput and reduction of latency has been observed. Performance in scenarios without contention is comparable to the SEDA and VM Components.

The Disruptor is implemented with the intention of mimicking the behaviour and options of the SEDA and VM Components as much as possible. The main differences with the them are the following:

- The buffer used is always bounded in size (default 1024 exchanges).
- As a the buffer is always bounded, the default behaviour for the Disruptor is to block while the buffer is full instead of throwing an exception. This default behaviour may be configured on the component (see options).
- The Disruptor endpoints don’t implement theBrowsableEndpoint interface. As such, the exchange currently in the Disruptor can’t be retrieved, only the amount of exchanges.
- The Disruptor requires its consumers (multicasted or otherwise) to be statically configured. Adding or removing consumers on the fly requires complete flushing of all pending exchanges in the Disruptor.
- As a result of the reconfiguration: Data sent over a Disruptor is directly processed and ‘gone’ if there is at least one consumer, late joiners only get new exchanges published after they’ve joined.
- The pollTimeout option is not supported by the Disruptor Component.
- When a producer blocks on a full Disruptor, it does not respond to thread interrupts.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-disruptor</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

82.1. URI FORMAT
disruptor:someName[?options]

or

disruptor-vm:someName[?options]

Where `someName` can be any string that uniquely identifies the endpoint within the current CamelContext (or across contexts in case of `disruptor-vm`).

You can append query options to the URI in the following format:

```
?option=value?option=value&...
```

## 82.2. OPTIONS

All the following options are valid for both the `disruptor:` and `disruptor-vm:` components.

The Disruptor component supports 8 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultConcurrent Consumers</td>
<td>To configure the default number of concurrent consumers</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>defaultMultiple Consumers</td>
<td>To configure the default value for multiple consumers</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>defaultProducerType</td>
<td>To configure the default value for DisruptorProducerType The default value is Multi.</td>
<td>Multi</td>
<td>DisruptorProducerType</td>
</tr>
<tr>
<td>defaultWaitStrategy</td>
<td>To configure the default value for DisruptorWaitStrategy The default value is Blocking.</td>
<td>Blocking</td>
<td>DisruptorWaitStrategy</td>
</tr>
<tr>
<td>defaultBlockWhenFull</td>
<td>To configure the default value for block when full The default value is true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>queueSize</td>
<td>Deprecated To configure the ring buffer size</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>bufferSize</td>
<td>To configure the ring buffer size</td>
<td>1024</td>
<td>int</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>
The Disruptor endpoint is configured using URI syntax:

```
/disruptor:name
```

with the following path and query parameters:

### 82.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required Name of queue</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 82.2.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>size (common)</td>
<td>The maximum capacity of the Disruptors ringbuffer will be effectively increased to the nearest power of two. Notice: Mind if you use this option, then its the first endpoint being created with the queue name, that determines the size. To make sure all endpoints use same size, then configure the size option on all of them, or the first endpoint being created.</td>
<td>1024</td>
<td>int</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrentConsumers (consumer)</td>
<td>Number of concurrent threads processing exchanges.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>multipleConsumers (consumer)</td>
<td>Specifies whether multiple consumers are allowed. If enabled, you can use Disruptor for Publish-Subscribe messaging. That is, you can send a message to the queue and have each consumer receive a copy of the message. When enabled, this option should be specified on every consumer endpoint.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>waitStrategy (consumer)</td>
<td>Defines the strategy used by consumer threads to wait on new exchanges to be published. The options allowed are: Blocking, Sleeping, BusySpin and Yielding.</td>
<td>Blocking</td>
<td>DisruptorWaitStrategy</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>blockWhenFull</td>
<td>Whether a thread that sends messages to a full Disruptor will block until the ringbuffer’s capacity is no longer exhausted. By default, the calling thread will block and wait until the message can be accepted. By disabling this option, an exception will be thrown stating that the queue is full.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>producerType</td>
<td>Defines the producers allowed on the Disruptor. The options allowed are: Multi to allow multiple producers and Single to enable certain optimizations only allowed when one concurrent producer (on one thread or otherwise synchronized) is active.</td>
<td>Multi</td>
<td>DisruptorProducerType</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout (in milliseconds) before a producer will stop waiting for an asynchronous task to complete. You can disable timeout by using 0 or a negative value.</td>
<td>30000</td>
<td>long</td>
</tr>
<tr>
<td>waitForTaskToCo-</td>
<td>Option to specify whether the caller should wait for the async task to complete or not before continuing. The following three options are supported: Always, Never or IfReplyExpected. The first two values are self-explanatory. The last value, IfReplyExpected, will only wait if the message is Request Reply based.</td>
<td>IfReply</td>
<td>WaitForTaskToComplete</td>
</tr>
<tr>
<td>mplete</td>
<td></td>
<td>Expected</td>
<td></td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 82.3. WAIT STRATEGIES

The wait strategy effects the type of waiting performed by the consumer threads that are currently waiting for the next exchange to be published. The following strategies can be chosen:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Advice</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blocking</td>
<td>Blocking strategy that uses a lock and condition variable for Consumers waiting on a barrier.</td>
<td>This strategy can be used when throughput and low-latency are not as important as CPU resource.</td>
</tr>
</tbody>
</table>
### 82.4. USE OF REQUEST REPLY

The Disruptor component supports using Request Reply, where the caller will wait for the Async route to complete. For instance:

```java
from("mina:tcp://0.0.0.0:9876?textline=true&sync=true").to("disruptor:input");
from("disruptor:input").to("bean:processInput").to("bean:createResponse");
```

In the route above, we have a TCP listener on port 9876 that accepts incoming requests. The request is routed to the `disruptor:input` buffer. As it is a Request Reply message, we wait for the response. When the consumer on the `disruptor:input` buffer is complete, it copies the response to the original message response.

### 82.5. CONCURRENT CONSUMERS

By default, the Disruptor endpoint uses a single consumer thread, but you can configure it to use concurrent consumer threads. So instead of thread pools you can use:

```java
from("disruptor:stageName?concurrentConsumers=5").process(...)
```

As for the difference between the two, note a thread pool can increase/shrink dynamically at runtime depending on load, whereas the number of concurrent consumers is always fixed and supported by the Disruptor internally so performance will be higher.

### 82.6. THREAD POOLS

Be aware that adding a thread pool to a Disruptor endpoint by doing something like:

```java
from("disruptor:stageName").thread(5).process(...)
```

Can wind up with adding a normal BlockingQueue to be used in conjunction with the Disruptor, effectively negating part of the performance gains achieved by using the Disruptor. Instead, it is advised to directly configure number of threads that process messages on a Disruptor endpoint using the concurrentConsumers option.
82.7. SAMPLE
In the route below we use the Disruptor to send the request to this async queue to be able to send a fire-and-forget message for further processing in another thread, and return a constant reply in this thread to the original caller.

```java
public void configure() throws Exception {
    from("direct:start")
        // send it to the disruptor that is async
        .to("disruptor:next")
        // return a constant response
        .transform(constant("OK"));

    from("disruptor:next").to("mock:result");
}
```

Here we send a Hello World message and expects the reply to be OK.

```java
Object out = template.requestBody("direct:start", "Hello World");
assertEquals("OK", out);
```

The "Hello World" message will be consumed from the Disruptor from another thread for further processing. Since this is from a unit test, it will be sent to a mock endpoint where we can do assertions in the unit test.

82.8. USING MULTIPLECONSUMERS
In this example we have defined two consumers and registered them as spring beans.

```xml
<bean id="consumer1" class="org.apache.camel.spring.example.FooEventConsumer"/>
<bean id="consumer2" class="org.apache.camel.spring.example.AnotherFooEventConsumer"/>
<camelContext xmlns="http://camel.apache.org/schema/spring">
    <!-- define a shared endpoint which the consumers can refer to instead of using url -->
    <endpoint id="foo" uri="disruptor:foo?multipleConsumers=true"/>
</camelContext>
```

Since we have specified multipleConsumers=true on the Disruptor foo endpoint we can have those two or more consumers receive their own copy of the message as a kind of pub-sub style messaging. As the beans are part of an unit test they simply send the message to a mock endpoint, but notice how we can use @Consume to consume from the Disruptor.

```java
public class FooEventConsumer {
    @EndpointInject(uri = "mock:result")
    private ProducerTemplate destination;

    @Consume(ref = "foo")
    public void doSomething(String body) {
        destination.sendBody("foo" + body);
    }
}
```
82.9. EXTRACTING DISRUPTOR INFORMATION

If needed, information such as buffer size, etc. can be obtained without using JMX in this fashion:

```java
DisruptorEndpoint disruptor = context.getEndpoint("disruptor:xxxx");
int size = disruptor.getBufferSize();
```
CHAPTER 83. DNS COMPONENT

Available as of Camel version 2.7

This is an additional component for Camel to run DNS queries, using DNSJava. The component is a thin layer on top of DNSJava. The component offers the following operations:

- ip, to resolve a domain by its ip
- lookup, to lookup information about the domain
- dig, to run DNS queries

INFO:*Requires SUN JVM* The DNSJava library requires running on the SUN JVM. If you use Apache ServiceMix or Apache Karaf, you’ll need to adjust the etc/jre.properties file, to add sun.net.spi.nameservice to the list of Java platform packages exported. The server will need restarting before this change takes effect.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dns</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

83.1. URI FORMAT

The URI scheme for a DNS component is as follows

```text
dns://operation[?options]
```

This component only supports producers.

83.2. OPTIONS

The DNS component has no options.

The DNS endpoint is configured using URI syntax:

```text
dns:dnsType
```

with the following path and query parameters:

83.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dnsType</td>
<td>Required The type of the lookup.</td>
<td></td>
<td>DnsType</td>
</tr>
</tbody>
</table>
83.2.2. Query Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td>allowed to use asynchronous processing (if supported).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

83.3. HEADERS

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Operations</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dns.domain</td>
<td>String</td>
<td>ip</td>
<td>The domain name. Mandatory.</td>
</tr>
<tr>
<td>dns.name</td>
<td>String</td>
<td>lookup</td>
<td>The name to lookup. Mandatory.</td>
</tr>
<tr>
<td>dns.type</td>
<td>lookup</td>
<td>dig</td>
<td>The type of the lookup. Should match the values of org.xbill.dns.Type. Optional.</td>
</tr>
<tr>
<td>dns.class</td>
<td>lookup</td>
<td>dig</td>
<td>The DNS class of the lookup. Should match the values of org.xbill.dns.DClass. Optional.</td>
</tr>
<tr>
<td>dns.query</td>
<td>String</td>
<td>dig</td>
<td>The query itself. Mandatory.</td>
</tr>
<tr>
<td>dns.server</td>
<td>String</td>
<td>dig</td>
<td>The server in particular for the query. If none is given, the default one specified by the OS will be used. Optional.</td>
</tr>
</tbody>
</table>

83.4. EXAMPLES

83.4.1. IP lookup

```xml
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:ip"/>
</route>
```

This looks up a domain's IP. For example, www.example.com resolves to 192.0.32.10. The IP address to lookup must be provided in the header with key "dns.domain".

83.4.2. DNS lookup

```xml
<route id="IPCheck">
  <from uri="direct:start"/>
</route>
```
This returns a set of DNS records associated with a domain. The name to lookup must be provided in the header with key "dns.name".

83.4.3. DNS Dig

Dig is a Unix command-line utility to run DNS queries.

The query must be provided in the header with key "dns.query".

83.5. DNS ACTIVATION POLICY

DnsActivationPolicy can be used to dynamically start and stop routes based on dns state.

If you have instances of the same component running in different regions you can configure a route in each region to activate only if dns is pointing to its region.

i.e. You may have an instance in NYC and an instance in SFO. You would configure a service CNAME service.example.com to point to nyc-service.example.com to bring NYC instance up and SFO instance down. When you change the CNAME service.example.com to point to sfo-service.example.com – nyc instance would stop its routes and sfo will bring its routes up. This allows you to switch regions without restarting actual components.

```xml
<bean id="dnsActivationPolicy" class="org.apache.camel.component.dns.policy.DnsActivationPolicy">
    <property name="hostname" value="service.example.com"/>
    <property name="resolvesTo" value="nyc-service.example.com"/>
    <property name="ttl" value="60000"/>
</bean>

<route id="routeId" autoStartup="false" routePolicyRef="dnsActivationPolicy">
    <!-- route configuration here -->
</route>
```
CHAPTER 84. DOCKER COMPONENT

Available as of Camel version 2.15

Camel component for communicating with Docker.

The Docker Camel component leverages the docker-java via the Docker Remote API.

84.1. URI FORMAT

```
docker://[operation]?[options]
```

Where `operation` is the specific action to perform on Docker.

84.2. GENERAL OPTIONS

The Docker component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared docker configuration</td>
<td></td>
<td>DockerConfiguration</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Docker endpoint is configured using URI syntax:

```
docker:operation
```

with the following path and query parameters:

84.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>Required Which operation to use</td>
<td></td>
<td>DockerOperation</td>
</tr>
</tbody>
</table>

84.2.2. Query Parameters (20 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>email (common)</td>
<td>Email address associated with the user</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>host (common)</td>
<td><strong>Required</strong> Docker host</td>
<td>localhost</td>
<td>String</td>
</tr>
<tr>
<td>port (common)</td>
<td><strong>Required</strong> Docker port</td>
<td>2375</td>
<td>Integer</td>
</tr>
<tr>
<td>requestTimeout (common)</td>
<td>Request timeout for response (in seconds)</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td>ExchangePattern</td>
<td></td>
</tr>
<tr>
<td>cmdExecFactory (advanced)</td>
<td>The fully qualified class name of the DockerCmdExecFactory implementation to use</td>
<td>com.git.hub.dockerjava.netty.NettyDockerCmdExecFactory</td>
<td>String</td>
</tr>
<tr>
<td>followRedirectFilter (advanced)</td>
<td>Whether to follow redirect filter</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>loggingFilter (advanced)</td>
<td>Whether to use logging filter</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>maxPerRouteConnections (advanced)</td>
<td>Maximum route connections</td>
<td>100</td>
<td>Integer</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
--- | --- | --- | ---
maxTotalConnections (advanced) | Maximum total connections | 100 | Integer
serverAddress (advanced) | Server address for docker registry. | https://index.docker.io/v1/ | String
socket (advanced) | Socket connection mode | true | boolean
synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean
certPath (security) | Location containing the SSL certificate chain | | String
password (security) | Password to authenticate with | | String
secure (security) | Use HTTPS communication | false | boolean
tlsVerify (security) | Check TLS | false | boolean
username (security) | User name to authenticate with | | String

### 84.3. HEADER STRATEGY

All URI option can be passed as Header properties. Values found in a message header take precedence over URI parameters. A header property takes the form of a URI option prefixed with `CamelDocker` as shown below:

<table>
<thead>
<tr>
<th>URI Option</th>
<th>Header Property</th>
</tr>
</thead>
</table>
containerId | CamelDockerContainerId |

### 84.4. EXAMPLES

The following example consumes events from Docker:

```
from("docker://events?host=192.168.59.103&port=2375").to("log:event");
```
The following example queries Docker for system wide information

```java
from("docker://info?host=192.168.59.103&port=2375").to("log:info");
```

84.5. DEPENDENCIES

To use Docker in your Camel routes you need to add a dependency on camel-docker, which implements the component.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-docker</artifactId>
    <version>x.x.x</version>
</dependency>
```
CHAPTER 85. DOZER COMPONENT

Available as of Camel version 2.15

The dozer: component provides the ability to map between Java beans using the Dozer mapping framework since Camel 2.15.0. Camel also supports the ability to trigger Dozer mappings as a type converter. The primary differences between using a Dozer endpoint and a Dozer converter are:

- The ability to manage Dozer mapping configuration on a per-endpoint basis vs. global configuration via the converter registry.
- A Dozer endpoint can be configured to marshal/unmarshal input and output data using Camel data formats to support a single, any-to-any transformation endpoint
- The Dozer component allows for fine-grained integration and extension of Dozer to support additional functionality (e.g. mapping literal values, using expressions for mappings, etc.).

In order to use the Dozer component, Maven users will need to add the following dependency to their pom.xml:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-dozer</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

85.1. URI FORMAT

The Dozer component only supports producer endpoints.

```
/dozer:endpointId[?options]
```

Where endpointId is a name used to uniquely identify the Dozer endpoint configuration.

An example Dozer endpoint URI:

```
from("direct:orderInput").
to("dozer:transformOrder?mappingFile=orderMapping.xml&targetModel=example.XYZOrder").
to("direct:orderOutput");
```

85.2. OPTIONS

The Dozer component has no options.

The Dozer endpoint is configured using URI syntax:

```
dozer:name
```

with the following path and query parameters:

85.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required A human readable name of the mapping.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

**85.2.2. Query Parameters (7 parameters):**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>mappingConfiguration (producer)</td>
<td>The name of a DozerBeanMapperConfiguration bean in the Camel registry which should be used for configuring the Dozer mapping. This is an alternative to the mappingFile option that can be used for fine-grained control over how Dozer is configured. Remember to use a prefix in the value to indicate that the bean is in the Camel registry (e.g. myDozerConfig).</td>
<td></td>
<td>DozerBeanMapperConfiguration</td>
</tr>
<tr>
<td>mappingFile (producer)</td>
<td>The location of a Dozer configuration file. The file is loaded from the classpath by default, but you can use file:, classpath:, or http: to load the configuration from a specific location.</td>
<td>dozerBeanMapping.xml</td>
<td>String</td>
</tr>
<tr>
<td>marshalId (producer)</td>
<td>The id of a dataFormat defined within the Camel Context to use for marshalling the mapping output to a non-Java type.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sourceModel (producer)</td>
<td>Fully-qualified class name for the source type used in the mapping. If specified, the input to the mapping is converted to the specified type before being mapped with Dozer.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>targetModel (producer)</td>
<td>Required Fully-qualified class name for the target type used in the mapping.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>unmarshalId (producer)</td>
<td>The id of a dataFormat defined within the Camel Context to use for unmarshalling the mapping input from a non-Java type.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

**85.3. USING DATA FORMATS WITH DOZER**

Dozer does not support non-Java sources and targets for mappings, so it cannot, for example, map an XML document to a Java object on its own. Luckily, Camel has extensive support for marshalling between Java and a wide variety of formats using data formats. The Dozer component takes advantage of this support by allowing you to specify that input and output data should be passed through a data
format prior to processing via Dozer. You can always do this on your own outside the call to Dozer, but supporting it directly in the Dozer component allows you to use a single endpoints to configure any-to-any transformation within Camel.

As an example, let’s say you wanted to map between an XML data structure and a JSON data structure using the Dozer component. If you had the following data formats defined in a Camel Context:

```
<dataFormats>
  <json library="Jackson" id="myjson"/>
  <jaxb contextPath="org.example" id="myjaxb"/>
</dataFormats>
```

You could then configure a Dozer endpoint to unmarshal the input XML using a JAXB data format and marshal the mapping output using Jackson.

```
<endpoint uri="dozer:xml2json?marshalId=myjson&amp;unmarshalId=myjaxb&amp;targetModel=org.example.Order"/>
```

### 85.4. CONFIGURING DOZER

All Dozer endpoints require a Dozer mapping configuration file which defines mappings between source and target objects. The component will default to a location of META-INF/dozerBeanMapping.xml if the mappingFile or mappingConfiguration options are not specified on an endpoint. If you need to supply multiple mapping configuration files for a single endpoint or specify additional configuration options (e.g. event listeners, custom converters, etc.), then you can use an instance of `org.apache.camel.converter.dozer.DozerBeanMapperConfiguration`.

```
<bean id="mapper" class="org.apache.camel.converter.dozer.DozerBeanMapperConfiguration">
  <property name="mappingFiles">
    <list>
      <value>mapping1.xml</value>
      <value>mapping2.xml</value>
    </list>
  </property>
</bean>
```

### 85.5. MAPPING EXTENSIONS

The Dozer component implements a number of extensions to the Dozer mapping framework as custom converters. These converters implement mapping functions that are not supported directly by Dozer itself.

#### 85.5.1. Variable Mappings

Variable mappings allow you to map the value of a variable definition within a Dozer configuration into a target field instead of using the value of a source field. This is equivalent to constant mapping in other mapping frameworks, where you can assign a literal value to a target field. To use a variable mapping, simply define a variable within your mapping configuration and then map from the VariableMapper class into your target field of choice:

```
<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping"/>
```
85.5.2. Custom Mappings

Custom mappings allow you to define your own logic for how a source field is mapped to a target field. They are similar in function to Dozer customer converters, with two notable differences:

- You can have multiple converter methods in a single class with custom mappings.
- There is no requirement to implement a Dozer-specific interface with custom mappings.

A custom mapping is declared by using the built-in '_customMapping' converter in your mapping configuration. The parameter to this converter has the following syntax:

`[class-name][.method-name]`

Method name is optional - the Dozer component will search for a method that matches the input and output types required for a mapping. An example custom mapping and configuration are provided below.

```java
public class CustomMapper {
    // All customer ids must be wrapped in "[]"
    public Object mapCustomer(String customerId) {
        return "[" + customerId + "]";
    }
}
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
<configuration>
    <variables>
        <variable name="CUST_ID">ACME-SALES</variable>
    </variables>
</configuration>
<mapping>
    <class-a>org.apache.camel.component.dozer.VariableMapper</class-a>
    <class-b>org.example.Order</class-b>
    <field custom-converter-id="_variableMapping" custom-converter-param="${CUST_ID}" />
    <a>literal</a>
    <b>custId</b>
</mapping>
</mappings>
```
85.5.3. Expression Mappings

Expression mappings allow you to use the powerful language capabilities of Camel to evaluate an expression and assign the result to a target field in a mapping. Any language that Camel supports can be used in an expression mapping. Basic examples of expressions include the ability to map a Camel message header or exchange property to a target field or to concatenate multiple source fields into a target field. The syntax of a mapping expression is:

```
[language]:[expression]
```

An example of mapping a message header into a target field:

```xml
<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
 http://dozermapper.github.io/schema/bean-mapping.xsd">
  <mapping>
    <class-a>org.apache.camel.component.dozer.ExpressionMapper</class-a>
    <class-b>org.example.B</class-b>
    <field custom-converter-id="_expressionMapping" custom-converter-param="simple:${header.customerNumber}"
       expression="a">
      custId"b>
    </field>
  </mapping>
</mappings>
```

Note that any properties within your expression must be escaped with "\" to prevent an error when Dozer attempts to resolve variable values defined using the EL.
CHAPTER 86. DRILL COMPONENT

Available as of Camel version 2.19

The **drill** component gives you the ability to querying to Apache Drill Cluster

Drill is an Apache open-source SQL query engine for Big Data exploration. Drill is designed from the ground up to support high-performance analysis on the semi-structured and rapidly evolving data coming from modern Big Data applications, while still providing the familiarity and ecosystem of ANSI SQL, the industry-standard query language.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-drill</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

### 86.1. URI FORMAT

`drill://host[?options]`

You can append query options to the URI in the following format, `?option=value&option=value&…`

### 86.2. DRILL PRODUCER

The producer execute query using `CamelDrillQuery` header and put results into body.

### 86.3. OPTIONS

The Drill component has no options.

The Drill endpoint is configured using URI syntax:

`drill:host`

with the following path and query parameters:

#### 86.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Required ZooKeeper host name or IP address. Use local instead of a host name or IP address to connect to the local Drillbit</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 86.3.2. Query Parameters (5 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Drill directory in ZooKeeper</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>ZooKeeper port number</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 86.4. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 87. DROPBOX COMPONENT

Available as of Camel version 2.14

The dropbox: component allows you to treat Dropbox remote folders as a producer or consumer of messages. Using the Dropbox Java Core API (reference version for this component is 1.7.x), this camel component has the following features:

- As a consumer, download files and search files by queries
- As a producer, download files, move files between remote directories, delete files/dir, upload files and search files by queries

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dropbox</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

87.1. URI FORMAT

```
dropbox://[operation]?[options]
```

Where operation is the specific action (typically is a CRUD action) to perform on Dropbox remote folder.

87.2. OPERATIONS

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>del</td>
<td>deletes files or directories on Dropbox</td>
</tr>
<tr>
<td>get</td>
<td>download files from Dropbox</td>
</tr>
<tr>
<td>move</td>
<td>move files from folders on Dropbox</td>
</tr>
<tr>
<td>put</td>
<td>upload files on Dropbox</td>
</tr>
<tr>
<td>search</td>
<td>search files on Dropbox based on string queries</td>
</tr>
</tbody>
</table>

Operations require additional options to work, some are mandatory for the specific operation.

87.3. OPTIONS

In order to work with Dropbox API you need to obtain an accessToken and a clientIdentifier. You can refer to the Dropbox documentation that explains how to get them.
The Dropbox component has no options.

The Dropbox endpoint is configured using URI syntax:

```
dropbox:operation
```

with the following path and query parameters:

### 87.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>Required The specific action (typically is a CRUD action) to perform on Dropbox remote folder.</td>
<td></td>
<td>DropboxOperation</td>
</tr>
</tbody>
</table>

### 87.3.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessToken</td>
<td>Required The access token to make API requests for a specific Dropbox user</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>client</td>
<td>To use an existing DbxClient instance as DropBox client.</td>
<td></td>
<td>DbxClientV2</td>
</tr>
<tr>
<td>clientIdentifier</td>
<td>Name of the app registered to make API requests</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>localPath</td>
<td>Optional folder or file to upload on Dropbox from the local filesystem. If this option has not been configured then the message body is used as the content to upload.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>newRemotePath</td>
<td>Destination file or folder</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>query</td>
<td>A space-separated list of sub-strings to search for. A file matches only if it contains all the sub-strings. If this option is not set, all files will be matched.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>remotePath</td>
<td>Original file or folder to move</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
Which mode to upload. in case of add the new file will be renamed if a file with the same name already exists on Dropbox. in case of force if a file with the same name already exists on Dropbox, this will be overwritten.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>uploadMode (common)</td>
<td>Which mode to upload. in case of add the new file will be renamed if a file with the same name already exists on Dropbox. in case of force if a file with the same name already exists on Dropbox, this will be overwritten.</td>
<td></td>
<td>DropboxUploadMode</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

87.4. DEL OPERATION

Delete files on Dropbox.

Works only as Camel producer.

Below are listed the options for this operation:

<table>
<thead>
<tr>
<th>Property</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remotePath</td>
<td>true</td>
<td>Folder or file to delete on Dropbox</td>
</tr>
</tbody>
</table>

87.4.1. Samples

```java
from("direct:start")
.to("dropbox://del?accessToken=XXX&clientIdentifier=XXX&remotePath=/root/folder1")
.to("mock:result");
```
87.4.2. Result Message Headers

The following headers are set on message result:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETED_PATH</td>
<td>name of the path deleted on dropbox</td>
</tr>
</tbody>
</table>

87.4.3. Result Message Body

The following objects are set on message body result:

<table>
<thead>
<tr>
<th>Object type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>name of the path deleted on dropbox</td>
</tr>
</tbody>
</table>

87.5. GET (DOWNLOAD) OPERATION

Download files from Dropbox.

Works as Camel producer or Camel consumer.

Below are listed the options for this operation:

<table>
<thead>
<tr>
<th>Property</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remotePath</td>
<td>true</td>
<td>Folder or file to download from Dropbox</td>
</tr>
</tbody>
</table>

87.5.1. Samples

from("direct:start")
  .to("dropbox://get?accessToken=XXX&clientIdentifier=XXX&remotePath=/root/folder1/file1.tar.gz")
  .to("file:///home/kermit/?fileName=file1.tar.gz");

from("direct:start")
  .to("dropbox://get?accessToken=XXX&clientIdentifier=XXX&remotePath=/root/folder1")
  .to("mock:result");

from("dropbox://get?accessToken=XXX&clientIdentifier=XXX&remotePath=/root/folder1")
  .to("file:///home/kermit/");

87.5.2. Result Message Headers

The following headers are set on message result:
### 87.5.3. Result Message Body

The following objects are set on message body result:

<table>
<thead>
<tr>
<th>Object type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ByteArrayOutputStream</td>
<td>in case of single file download, stream representing the file downloaded</td>
</tr>
<tr>
<td>Map&lt;String, ByteArrayOutputStream&gt;</td>
<td>in case of multiple files download, a map with as key the path of the remote file downloaded and as value the stream representing the file downloaded</td>
</tr>
</tbody>
</table>

### 87.6. MOVE OPERATION

Move files on Dropbox between one folder to another.

Works only as Camel producer.

Below are listed the options for this operation:

<table>
<thead>
<tr>
<th>Property</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remotePath</td>
<td>true</td>
<td>Original file or folder to move</td>
</tr>
<tr>
<td>newRemotePath</td>
<td>true</td>
<td>Destination file or folder</td>
</tr>
</tbody>
</table>

#### 87.6.1. Samples

```java
from("direct:start")
  .to("dropbox://move?
    accessToken=XXX&clientIdentifier=XXX&remotePath=/root/folder1&newRemotePath=/rootfolder2")
  .to("mock:result");
```

#### 87.6.2. Result Message Headers

The following headers are set on message result:
### 87.6.3. Result Message Body

The following objects are set on message body result:

<table>
<thead>
<tr>
<th>Object type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>name of the path moved on dropbox</td>
</tr>
</tbody>
</table>

### 87.7. PUT (UPLOAD) OPERATION

Upload files on Dropbox.

Works as Camel producer.

Below are listed the options for this operation:

<table>
<thead>
<tr>
<th>Property</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uploadMode</td>
<td>true</td>
<td>add or force this option specifies how a file should be saved on dropbox: in case of &quot;add&quot; the new file will be renamed if a file with the same name already exists on dropbox. In case of &quot;force&quot; if a file with the same name already exists on dropbox, this will be overwritten.</td>
</tr>
<tr>
<td>localPath</td>
<td>false</td>
<td>Folder or file to upload on Dropbox from the local filesystem. If this option has been configured then it takes precedence over uploading as a single file with content from the Camel message body (message body is converted into a byte array).</td>
</tr>
<tr>
<td>remotePath</td>
<td>false</td>
<td>Folder destination on Dropbox. If the property is not set, the component will upload the file on a remote path equal to the local path. With Windows or without an absolute localPath you may run into an exception like the following:</td>
</tr>
</tbody>
</table>

#### 87.7.1. Samples

```java
from("direct:start").to("dropbox://put?accessToken=XXX&clientIdentifier=XXX&uploadMode=add&localPath=/root/folder1") .to("mock:result");
```
And to upload a single file with content from the message body

```java
from("direct:start").to("dropbox://put?
    accessToken=XXX&clientIdentifier=XXX&uploadMode=add&localPath=/root/folder1&remotePath=/root/folder2")
  .to("mock:result");
```

The name of the file can be provided in the header `DropboxConstants.HEADER_PUT_FILE_NAME` or `Exchange.FILE_NAME` in that order of precedence. If no header has been provided then the message id (uuid) is used as the file name.

### 87.7.2. Result Message Headers

The following headers are set on message result:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Uploaded_file</strong></td>
<td>in case of single file upload, path of the remote path uploaded</td>
</tr>
<tr>
<td><strong>Uploaded_files</strong></td>
<td>in case of multiple files upload, string with the remote paths uploaded</td>
</tr>
</tbody>
</table>

### 87.7.3. Result Message Body

The following objects are set on message body result:

<table>
<thead>
<tr>
<th>Object type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String</strong></td>
<td>in case of single file upload, result of the upload operation, OK or KO</td>
</tr>
<tr>
<td><strong>Map&lt;String, DropboxResultCode&gt;</strong></td>
<td>in case of multiple files upload, a map with as key the path of the remote file uploaded and as value the result of the upload operation, OK or KO</td>
</tr>
</tbody>
</table>

### 87.8. SEARCH OPERATION

Search inside a remote Dropbox folder including its sub directories.

Works as Camel producer and as Camel consumer.

Below are listed the options for this operation:
<table>
<thead>
<tr>
<th>Property</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remotePath</td>
<td>true</td>
<td>Folder on Dropbox where to search in.</td>
</tr>
<tr>
<td>query</td>
<td>true</td>
<td>A space-separated list of sub-strings to search for. A file matches only if it contains all the sub-strings. If this option is not set, all files will be matched. The query is required to be provided in either the endpoint configuration or as a header CamelDropboxQuery on the Camel message.</td>
</tr>
</tbody>
</table>

### 87.8.1. Samples

```camel
from("dropbox://search?accessToken=XXX&clientIdentifier=XXX&remotePath=/XXX&query=XXX")
.to("mock:result");

from("direct:start")
.setHeader("CamelDropboxQuery", constant("XXX"))
.to("dropbox://search?accessToken=XXX&clientIdentifier=XXX&remotePath=/XXX")
.to("mock:result");
```

### 87.8.2. Result Message Headers

The following headers are set on message result:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOUND_FILES</td>
<td>list of file path founded</td>
</tr>
</tbody>
</table>

### 87.8.3. Result Message Body

The following objects are set on message body result:

<table>
<thead>
<tr>
<th>Object type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List&lt;DbxEntry&gt;</td>
<td>list of file path founded. For more information on this object refer to Dropbox documentation,</td>
</tr>
</tbody>
</table>
CHAPTER 88. EHCACHE COMPONENT

Available as of Camel version 2.18

The **ehcache** component enables you to perform caching operations using Ehcache 3 as the Cache Implementation.

This component supports producer and event based consumer endpoints.

The Cache consumer is an event based consumer and can be used to listen and respond to specific cache activities.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId.camel-ehcache</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

### 88.1. URI FORMAT

**ehcache://cacheName[?options]**

You can append query options to the URI in the following format, `?option=value&option=#beanRef&…`

### 88.2. OPTIONS

The Ehcache component supports 7 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Sets the global component configuration</td>
<td></td>
<td>EhcacheConfiguration</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>cacheManager</td>
<td>The cache manager</td>
<td></td>
<td>CacheManager</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>cacheManager Configuration</td>
<td>The cache manager configuration</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>cacheConfiguration</td>
<td>The default cache configuration to be used to create caches.</td>
<td></td>
<td>CacheConfiguration&lt;?,?,?&gt;</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>cachesConfigurations</td>
<td>A map of caches configurations to be used to create caches.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The Ehcache endpoint is configured using URI syntax:

```
<cacheName>
```

with the following path and query parameters:

### 88.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cacheName</code></td>
<td><code>Required</code> the cache name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 88.2.2. Query Parameters (17 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cacheManager</code> (common)</td>
<td>The cache manager</td>
<td></td>
<td>CacheManager</td>
</tr>
<tr>
<td><code>cacheManagerConfiguration</code> (common)</td>
<td>The cache manager configuration</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td><code>configurationUri</code> (common)</td>
<td>URI pointing to the Ehcache XML configuration file’s location</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>createCacheIfNotExist</code> (common)</td>
<td>Configure if a cache need to be created if it does exist or can’t be pre-configured.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### Property Placeholders

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>resolvePropertyPlaceholders</code> (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>eventFiring (consumer)</td>
<td>Set the the delivery mode (synchronous, asynchronous)</td>
<td>ASYNCHRONOUS</td>
<td>EventFiring</td>
</tr>
<tr>
<td>eventOrdering (consumer)</td>
<td>Set the the delivery mode (ordered, unordered)</td>
<td>ORDERED</td>
<td>EventOrdering</td>
</tr>
<tr>
<td>eventTypes (consumer)</td>
<td>Set the type of events to listen for</td>
<td>EVICTED, EXPIRED, REMOVED, CREATED, UPDATED</td>
<td>Set</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>action (producer)</td>
<td>To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>key (producer)</td>
<td>To configure the default action key. If a key is set in the message header, then the key from the header takes precedence.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>configuration (advanced)</td>
<td>The default cache configuration to be used to create caches.</td>
<td></td>
<td>CacheConfigurati on&lt;?,?&gt;</td>
</tr>
</tbody>
</table>
configurations (advanced) - A map of cache configuration to be used to create caches.

keyType (advanced) - The cache key type, default java.lang.Object

synchronous (advanced) - Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

valueType (advanced) - The cache value type, default java.lang.Object

88.2.3. Message Headers Camel

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelEhcacheAction</td>
<td>String</td>
<td>The operation to be performed on the cache, valid options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* CLEAR * PUT * PUT_ALL * PUT_IF_ABSENT * GET * GET_ALL * REMOVE * REMOVE_ALL * REPLACE</td>
</tr>
<tr>
<td>CamelEhcacheActionHasResult</td>
<td>Boolean</td>
<td>Set to true if the action has a result</td>
</tr>
<tr>
<td>CamelEhcacheActionSucceeded</td>
<td>Boolean</td>
<td>Set to true if the action succeeded</td>
</tr>
<tr>
<td>CamelEhcacheKey</td>
<td>Object</td>
<td>The cache key used for an action</td>
</tr>
<tr>
<td>CamelEhcacheKeys</td>
<td>Set&lt;Object&gt;</td>
<td>A list of keys, used in</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* PUT_ALL * GET_ALL * REMOVE_ALL</td>
</tr>
<tr>
<td>Header</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CamelEhcacheValue</td>
<td>Object</td>
<td>The value to put in the cache or the result of an operation</td>
</tr>
<tr>
<td>CamelEhcacheOldValue</td>
<td>Object</td>
<td>The old value associated to a key for actions like PUT_IF_ABSENT or the Object used for comparison for actions like REPLACE</td>
</tr>
<tr>
<td>CamelEhcacheEventType</td>
<td>EventType</td>
<td>The type of event received</td>
</tr>
</tbody>
</table>

### 88.3. EHCACHE BASED IDEMPOTENT REPOSITORY EXAMPLE:

```java
cacheManager manager = CacheManagerBuilder.newCacheManager(new XmlConfiguration("ehcache.xml"));
EhcacheIdempotentRepository repo = new EhcacheIdempotentRepository(manager, "idempotent-cache");

from("direct:in")
    .idempotentConsumer(header("messageId"), idempotentRepo)
    .to("mock:out");
```

### 88.4. EHCACHE BASED AGGREGATION REPOSITORY EXAMPLE:

```java
class EhcacheAggregationRepositoryRoutesTest extends CamelTestSupport {
    private static final String ENDPOINT_MOCK = "mock:result";
    private static final String ENDPOINT_DIRECT = "direct:one";
    private static final int[] VALUES = generateRandomArrayOfInt(10, 0, 30);
    private static final int SUM = IntStream.of(VALUES).reduce(0, (a, b) -> a + b);
    private static final String CORRELATOR = "CORRELATOR";

    @EndpointInject(uri = ENDPOINT_MOCK)
    private MockEndpoint mock;

    @Produce(uri = ENDPOINT_DIRECT)
    private ProducerTemplate producer;

    @Test
    public void checkAggregationFromOneRoute() throws Exception {
        mock.expectedMessageCount(VALUES.length);
```
mock.expectedBodiesReceived(SUM);

IntStream.of(VALUES).forEach(
    i -> producer.sendBodyAndHeader(i, CORRELATOR, CORRELATOR)
);

mock.assertIsSatisfied();

private Exchange aggregate(Exchange oldExchange, Exchange newExchange) {
    if (oldExchange == null) {
        return newExchange;
    } else {
        Integer n = newExchange.getIn().getBody(Integer.class);
        Integer o = oldExchange.getIn().getBody(Integer.class);
        Integer v = (o == null ? 0 : o) + (n == null ? 0 : n);

        oldExchange.getIn().setBody(v, Integer.class);

        return oldExchange;
    }
}

@override
protected RoutesBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        @Override
        public void configure() throws Exception {
            from(ENDPOINT_DIRECT)
                .routeId("AggregatingRouteOne")
                .aggregate(header(CORRELATOR))
                .aggregationRepository(createAggregateRepository())
                .aggregationStrategy(EhcacheAggregationRepositoryRoutesTest.this::aggregate)
                .completionSize(VALUES.length)
                .to("log:org.apache.camel.component.ehcache.processor.aggregate.level=INFO&showAll=true&multiline=true")
                    .to(ENDPOINT_MOCK);
        }
    };
}

protected EhcacheAggregationRepository createAggregateRepository() throws Exception {
    CacheManager cacheManager = CacheManagerBuilder.newCacheManager(new XmlConfiguration("ehcache.xml"));
    cacheManager.init();

    EhcacheAggregationRepository repository = new EhcacheAggregationRepository();
    repository.setCacheManager(cacheManager);
    repository.setCacheName("aggregate");

    return repository;
}
CHAPTER 89. EJB COMPONENT

Available as of Camel version 2.4

The `ejb:` component binds EJBs to Camel message exchanges.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ejb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

89.1. URI FORMAT

`ejb:ejbName[?options]`

Where `ejbName` can be any string which is used to look up the EJB in the Application Server JNDI Registry

89.2. OPTIONS

The EJB component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>context (producer)</td>
<td>The Context to use for looking up the EJBS</td>
<td></td>
<td>Context</td>
</tr>
<tr>
<td>properties (producer)</td>
<td>Properties for creating <code>javax.naming.Context</code> if a context has not been configured.</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The EJB endpoint is configured using URI syntax:

`ejb:beanName`

with the following path and query parameters:

89.2.1. Path Parameters (1 parameters):
89.2.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>beanName</td>
<td>Required Sets the name of the bean to invoke</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>method</td>
<td>Sets the name of the method to invoke on the bean</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>cache</td>

</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

89.3. BEAN BINDING

How bean methods to be invoked are chosen (if they are not specified explicitly through the method parameter) and how parameter values are constructed from the Message are all defined by the Bean Binding mechanism which is used throughout all of the various Bean Integration mechanisms in Camel.

89.4. EXAMPLES

In the following examples we use the Greater EJB which is defined as follows:

GreaterLocal.java

```java
public interface GreaterLocal {
    String hello(String name);
```
And the implementation

GreaterImpl.java

```java
@Stateless
class GreaterImpl implements GreaterLocal {
    public String hello(String name) {
        return "Hello " + name;
    }

    public String bye(String name) {
        return "Bye " + name;
    }
}
```

89.4.1. Using Java DSL

In this example we want to invoke the `hello` method on the EJB. Since this example is based on an unit test using Apache OpenEJB we have to set a `JndiContext` on the EJB component with the OpenEJB settings.

```java
@Override
protected CamelContext createCamelContext() throws Exception {
    CamelContext answer = new DefaultCamelContext();

    // enlist EJB component using the JndiContext
    EjbComponent ejb = answer.getComponent("ejb", EjbComponent.class);
    ejb.setContext(createEjbContext());

    return answer;
}
```

Then we are ready to use the EJB in the Camel route:

```java
from("direct:start")
    // invoke the greater EJB using the local interface and invoke the hello method
    .to("ejb:GreaterImplLocal?method=hello")
    .to("mock:result");
```
In a real application server

In a real application server you most likely do not have to setup a JndiContext on the EJB component as it will create a default JndiContext on the same JVM as the application server, which usually allows it to access the JNDI registry and lookup the EJBs. However if you need to access a application server on a remote JVM or the likes, you have to prepare the properties beforehand.

89.4.2. Using Spring XML

And this is the same example using Spring XML instead:

Again since this is based on an unit test we need to setup the EJB component:

```xml
    <!-- setup Camel EJB component -->
    <bean id="ejb" class="org.apache.camel.component.ejb.EjbComponent">
        <property name="properties" ref="jndiProperties"/>
    </bean>

    <!-- use OpenEJB context factory -->
    <p:properties id="jndiProperties">
        <prop key="java.naming.factory.initial">org.apache.openejb.client.LocalInitialContextFactory</prop>
    </p:properties>

    <camelContext xmlns="http://camel.apache.org/schema/spring">
        <route>
            <from uri="direct:start"/>
            <to uri="ejb:GreaterImplLocal?method=hello"/>
            <to uri="mock:result"/>
        </route>
    </camelContext>
```

Before we are ready to use EJB in the Camel routes:

```xml
    <camelContext xmlns="http://camel.apache.org/schema/spring">
        <route>
            <from uri="direct:start"/>
            <to uri="ejb:GreaterImplLocal?method=hello"/>
            <to uri="mock:result"/>
        </route>
    </camelContext>
```

CHAPTER 90. ELASTICSEARCH COMPONENT (DEPRECATED)

Available as of Camel version 2.11

The ElasticSearch component allows you to interface with an ElasticSearch server.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

90.1. URI FORMAT

```
elasticsearch://clusterName[?options]
```

90.2. ENDPOINT OPTIONS

The ElasticSearch component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>client (advanced)</td>
<td>To use an existing configured Elasticsearch client, instead of creating a client per endpoint.</td>
<td></td>
<td>Client</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Elasticsearch endpoint is configured using URI syntax:

```
elasticsearch:clusterName
```

with the following path and query parameters:

90.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterName</td>
<td>Required Name of cluster or use local for local mode</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

90.2.2. Query Parameters (11 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clientTransportSniff (producer)</td>
<td>Is the client allowed to sniff the rest of the cluster or not (default true). This setting maps to the client.transport.sniff setting.</td>
<td>true</td>
<td>Boolean</td>
</tr>
<tr>
<td>consistencyLevel (producer)</td>
<td>The write consistency level to use with INDEX and BULK operations (can be any of ONE, QUORUM, ALL or DEFAULT)</td>
<td>DEFAULT</td>
<td>WriteConsistency Level</td>
</tr>
<tr>
<td>data (producer)</td>
<td>Is the node going to be allowed to allocate data (shards) to it or not. This setting maps to the node.data setting.</td>
<td></td>
<td>Boolean</td>
</tr>
<tr>
<td>indexName (producer)</td>
<td>The name of the index to act against</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>indexType (producer)</td>
<td>The type of the index to act against</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>ip (producer)</td>
<td>The TransportClient remote host ip to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>operation (producer)</td>
<td>What operation to perform</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>pathHome (producer)</td>
<td>The path.home property of ElasticSearch configuration. You need to provide a valid path, otherwise the default, $user.home/.elasticsearch, will be used.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port (producer)</td>
<td>The TransportClient remote port to use (defaults to 9300)</td>
<td>9300</td>
<td>int</td>
</tr>
<tr>
<td>transportAddresses (producer)</td>
<td>Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for transportAddresses to be considered instead.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 90.3. LOCAL TESTING

If you want to run against a local (in JVM/classloader) ElasticSearch server, just set the clusterName value in the URI to "local". See the [client guide](#) for more details.
### 90.4. MESSAGE OPERATIONS

The following Elasticsearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

<table>
<thead>
<tr>
<th>operation</th>
<th>message body</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INDEX</td>
<td>Map, String, byte[] or XContentBuilder content to index</td>
<td>adds content to an index and returns the content’s indexId in the body. <strong>Camel 2.15,</strong> you can set the indexId by setting the message header with the key &quot;indexId&quot;.</td>
</tr>
<tr>
<td>GET_BY_ID</td>
<td>index id of content to retrieve</td>
<td>retrieves the specified index and returns a GetResult object in the body</td>
</tr>
<tr>
<td>DELETE</td>
<td>index id of content to delete</td>
<td>deletes the specified indexId and returns a DeleteResult object in the body</td>
</tr>
<tr>
<td>BULK_INDEX</td>
<td>a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)</td>
<td><em>Camel 2.14,</em> adds content to an index and return a List of the id of the successfully indexed documents in the body</td>
</tr>
<tr>
<td>Operation</td>
<td>Message Body</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>BULK</td>
<td>a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)</td>
<td><strong>Camel 2.15</strong>: Adds content to an index and returns the BulkResponse object in the body</td>
</tr>
<tr>
<td>SEARCH</td>
<td>Map or SearchRequest Object</td>
<td><strong>Camel 2.15</strong>: search the content with the map of query string</td>
</tr>
<tr>
<td>MULTIGET</td>
<td>List of MultiGetRequest.Item object</td>
<td><strong>Camel 2.17</strong>: retrieves the specified indexes, types etc. in MultiGetRequest and returns a MultiGetResponse object in the body</td>
</tr>
<tr>
<td>MULTISEARCH</td>
<td>List of SearchRequest.Object</td>
<td><strong>Camel 2.17</strong>: search for parameters specified in MultiSearchRequest and returns a MultiSearchResponse object in the body</td>
</tr>
<tr>
<td>EXISTS</td>
<td>Index name as header</td>
<td><strong>Camel 2.17</strong>: Returns a Boolean object in the body</td>
</tr>
</tbody>
</table>
**90.5. INDEX EXAMPLE**

Below is a simple INDEX example:

```xml
<route>
  <from uri="direct:index" />
  <to uri="elasticsearch://local?operation=INDEX&indexName=twitter&indexType=tweet"/>
</route>
```

A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```java
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

CHAPTER 91. ELASTICSEARCH5 COMPONENT
(DEPRECATED)

Available as of Camel version 2.19

The ElasticSearch component allows you to interface with an Elasticsearch 5.x API.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-elasticsearch5</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

91.1. URI FORMAT

```
elasticsearch5://clusterName[?options]
```

91.2. ENDPOINT OPTIONS

The Elasticsearch5 component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>client (advanced)</td>
<td>To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings.</td>
<td></td>
<td>TransportClient</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Elasticsearch5 endpoint is configured using URI syntax:

```
elasticsearch5:clusterName
```

with the following path and query parameters:

91.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterName</td>
<td>Required Name of the cluster</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### 91.2.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clientTransportSniff</code></td>
<td>Is the client allowed to sniff the rest of the cluster or not. This setting maps to the client.transport.sniff setting.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>

<td>The name of the index to act against</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>indexType</code></td>
<td>The type of the index to act against</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>ip</code></td>
<td>The TransportClient remote host ip to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>operation</code></td>
<td>What operation to perform</td>
<td></td>
<td>ElasticsearchOperation</td>
</tr>
<tr>
<td><code>pingSchedule</code></td>
<td>The time(in unit) the client ping the cluster.</td>
<td>5s</td>
<td>String</td>
</tr>
<tr>
<td><code>pingTimeout</code></td>
<td>The time(in unit) to wait for a ping response from a node too return.</td>
<td>5s</td>
<td>String</td>
</tr>
<tr>
<td><code>port</code></td>
<td>The TransportClient remote port to use (defaults to 9300)</td>
<td>9300</td>
<td>int</td>
</tr>
<tr>
<td><code>tcpCompress</code></td>
<td>true if compression (LZF) enable between all nodes.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>tcpConnectTimeout</code></td>
<td>The time(in unit) to wait for connection timeout.</td>
<td>30s</td>
<td>String</td>
</tr>
<tr>
<td><code>transportAddresses</code></td>
<td>Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for transportAddresses to be considered instead.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>waitForActiveShards</code></td>
<td>Index creation waits for the write consistency number of shards to be available</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td><code>synchronous</code></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>enableSSL</code></td>
<td>Enable SSL. Require X-Pack client jar on the classpath</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>password</strong></td>
<td>Password for authenticate against the cluster. Require XPack client jar on the classpath</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(authentication)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>user</strong></td>
<td>User for authenticate against the cluster. Requires transport_client role for accessing the cluster. Require XPack client jar on the classpath</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(authentication)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

91.3. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

<table>
<thead>
<tr>
<th>operation</th>
<th>message body</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>INDEX</strong></td>
<td>Map, String, byte[] or XContentBuilder content to index</td>
<td>Adds content to an index and returns the content’s indexId in the body. You can set the indexId by setting the message header with the key &quot;indexId&quot;.</td>
</tr>
<tr>
<td><strong>GET_BY_ID</strong></td>
<td>index id of content to retrieve</td>
<td>Retrieves the specified index and returns a GetResult object in the body</td>
</tr>
<tr>
<td><strong>DELETE</strong></td>
<td>index name and type of content to delete</td>
<td>Deletes the specified indexName and indexType and returns a DeleteResponse object in the body</td>
</tr>
<tr>
<td>operation</td>
<td>message body</td>
<td>description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DELETE_INDEX</td>
<td>index name of content to delete</td>
<td>Deletes the specified indexName and returns a DeleteIndexResponse object in the body</td>
</tr>
<tr>
<td>BULK_INDEX</td>
<td>a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)</td>
<td>Adds content to an index and return a List of the id of the successfully indexed documents in the body</td>
</tr>
<tr>
<td>BULK</td>
<td>a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)</td>
<td>Adds content to an index and returns the BulkResponse object in the body</td>
</tr>
<tr>
<td>Operation</td>
<td>Message Body</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SEARCH</td>
<td>Map, String or Search Request Object</td>
<td>Search the content with the map of query string</td>
</tr>
<tr>
<td>MULTI GET</td>
<td>List of MultiGetRequest.Item object</td>
<td>Retrieves the specified indexes, types etc. in MultiGetRequest and returns a MultiGetResponse object in the body</td>
</tr>
<tr>
<td>MULTI SEARCH</td>
<td>List of Search Request object</td>
<td>Search for parameters specified in MultiSearchRequest and returns a MultiSearchResponse object in the body</td>
</tr>
<tr>
<td>EXISTS</td>
<td>Index name as header</td>
<td>Checks the index exists or not and returns a Boolean flag in the body</td>
</tr>
<tr>
<td>UPDATE</td>
<td>Map, String, byte[] or XContentBuilder.content to update</td>
<td>Updates content to an index and returns the content's indexId in the body.</td>
</tr>
</tbody>
</table>

### 91.4. INDEX EXAMPLE

Below is a simple INDEX example

```xml
<route>
  <from uri="direct:index"/>
  <to uri="elasticsearch5://elasticsearch?operation=INDEX&indexName=twitter&indexType=tweet"/>
</route>
```
A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```java
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

- Getting Started
CHAPTER 92. ELASTICSEARCH REST COMPONENT

Available as of Camel version 2.21

The ElasticSearch component allows you to interface with an ElasticSearch 6.x API using the REST Client library.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch-rest</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

92.1. URI FORMAT

```
elasticsearch-rest://clusterName[?options]
```

92.2. ENDPOINT OPTIONS

The Elasticsearch Rest component supports 12 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>client (advanced)</td>
<td>To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings.</td>
<td></td>
<td>RestClient</td>
</tr>
<tr>
<td>hostAddresses (advanced)</td>
<td>Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for hostAddresses to be considered instead.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>socketTimeout (advanced)</td>
<td>The timeout in ms to wait before the socket will timeout.</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>connectionTimeout (advanced)</td>
<td>The time in ms to wait before connection will timeout.</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>user (advance)</td>
<td>Basic authenticate user</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>password (producer)</td>
<td>Password for authenticate</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>enableSSL (advanced)</td>
<td>Enable SSL</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>maxRetryTimeout (advanced)</td>
<td>The time in ms before retry</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>enableSniffer (advanced)</td>
<td>Enable automatically discover nodes from a running Elasticsearch cluster</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>snifferInterval (advanced)</td>
<td>The interval between consecutive ordinary sniff executions in milliseconds. Will be honoured when sniffOnFailure is disabled or when there are no failures between consecutive sniff executions</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>sniffAfterFailure Delay (advanced)</td>
<td>The delay of a sniff execution scheduled after a failure (in milliseconds)</td>
<td>60000</td>
<td>int</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Elasticsearch Rest endpoint is configured using URI syntax:

```
elasticsearch-rest:clusterName
```

with the following path and query parameters:

### 92.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterName</td>
<td>Required Name of the cluster</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 92.2.2. Query Parameters (11 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectionTimeout (producer)</td>
<td>The time in ms to wait before connection will timeout.</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>disconnect (producer)</td>
<td>Disconnect after it finish calling the producer</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

CHAPTER 92. ELASTICSEARCH REST COMPONENT
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>enableSSL (producer)</td>
<td>Enable SSL</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>hostAddresses</td>
<td><strong>Required</strong> Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for hostAddresses to be considered instead.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>indexName (producer)</td>
<td>The name of the index to act against</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>indexType (producer)</td>
<td>The type of the index to act against</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>maxRetryTimeout</td>
<td>The time in ms before retry</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>operation (producer)</td>
<td>What operation to perform</td>
<td></td>
<td>ElasticsearchOperation</td>
</tr>
<tr>
<td>socketTimeout</td>
<td>The timeout in ms to wait before the socket will timeout.</td>
<td>30000</td>
<td>int</td>
</tr>
<tr>
<td>waitForActiveShards</td>
<td>Index creation waits for the write consistency number of shards to be available</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 92.3. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.
<table>
<thead>
<tr>
<th>operation</th>
<th>message body</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index</td>
<td>Map, String, byte[], XContentTypeBuilder or IndexRequest content to index</td>
<td>Adds content to an index and returns the content's indexId in the body. You can set the indexId by setting the message header with the key &quot;indexId&quot;.</td>
</tr>
<tr>
<td>GetById</td>
<td>String or GetRequest index id of content to retrieve</td>
<td>Retrieves the specified index and returns a GetResult object in the body</td>
</tr>
<tr>
<td>Delete</td>
<td>String or DeleteRequest index name and type of content to delete</td>
<td>Deletes the specified indexName and indexType and returns a DeleteResponse object in the body</td>
</tr>
<tr>
<td>DeleteIndex</td>
<td>String or DeleteRequest index name of the index to delete</td>
<td>Deletes the specified indexName and returns a status code the body</td>
</tr>
<tr>
<td>Operation</td>
<td>Message Body</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>BulkIndex</td>
<td>a List, BulkRequest, or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)</td>
<td>Adds content to an index and return a List of the id of the successfully indexed documents in the body</td>
</tr>
<tr>
<td>Bulk</td>
<td>a List, BulkRequest, or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String)</td>
<td>Adds content to an index and returns the BulkItemResponse[] object in the body</td>
</tr>
<tr>
<td>Search</td>
<td>Map, String or SearchRequest</td>
<td>Search the content with the map of query string</td>
</tr>
</tbody>
</table>
92.4. CONFIGURE THE COMPONENT AND ENABLE BASIC AUTHENTICATION

To use the Elasticsearch component is has to be configured with a minimum configuration.

```java
ElasticsearchComponent elasticsearchComponent = new ElasticsearchComponent();
elasticsearchComponent.setHostAddresses("myelkhost:9200");
camelContext.addComponent("elasticsearch-rest", elasticsearchComponent);
```

For basic authentication with elasticsearch or using reverse http proxy in front of the elasticsearch cluster, simply setup basic authentication and SSL on the component like the example below

```java
ElasticsearchComponent elasticsearchComponent = new ElasticsearchComponent();
elasticsearchComponent.setHostAddresses("myelkhost:9200");
elasticsearchComponent.setUserName("elkuser");
elasticsearchComponent.setPassword("secure!!");
elasticsearchComponent.setEnableSSL(true);
camelContext.addComponent("elasticsearch-rest", elasticsearchComponent);
```

92.5. INDEX EXAMPLE

Below is a simple INDEX example
A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```java
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

### 92.6. SEARCH EXAMPLE

Searching on specific field(s) and value use the Operation `Search`. Pass in the query JSON String or the Map

```java
from("direct:search")
.to("elasticsearch-rest://elasticsearch?operation=Search&indexName=twitter&indexType=tweet");
```

```java
String query = "{\"query\":{\"match\":{\"content\":\"new release of ApacheCamel\"}}}";
SearchHits response = template.requestBody("direct:search", query, SearchHits.class);
```

Search on specific field(s) using Map.

```java
Map<String, Object> actualQuery = new HashMap<>();
actualQuery.put("content", "new release of ApacheCamel");

Map<String, Object> match = new HashMap<>();
match.put("match", actualQuery);

Map<String, Object> query = new HashMap<>();
query.put("query", match);
SearchHits response = template.requestBody("direct:search", query, SearchHits.class);
```
CHAPTER 93. ELSQL COMPONENT

Available as of Camel version 2.16

The elsq: component is an extension to the existing SQL Component that uses ElSql to define the SQL queries.

This component uses spring-jdbc behind the scenes for the actual SQL handling.

This component can be used as a Transactional Client.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elsql</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The SQL component uses the following endpoint URI notation:

```
sql:elsqName:resourceUri[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&…`

The parameters to the SQL queries are named parameters in the elsq mapping files, and maps to corresponding keys from the Camel message, in the given precedence:

1. **Camel 2.16.1:** from message body if Simple expression.
2. from message body if its a `java.util.Map`
3. from message headers

If a named parameter cannot be resolved, then an exception is thrown.

### 93.1. OPTIONS

The EISQL component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>databaseVendor</td>
<td>To use a vendor specific com.opengamma.elsql.ElSqlConfig</td>
<td>ElSqlDatabaseVendor</td>
<td></td>
</tr>
<tr>
<td>dataSource</td>
<td>Sets the DataSource to use to communicate with the database.</td>
<td>DataSource</td>
<td></td>
</tr>
<tr>
<td>elSqlConfig</td>
<td>To use a specific configured ElSqlConfig. It may be better to use the databaseVendor option instead.</td>
<td>ElSqlConfig</td>
<td></td>
</tr>
</tbody>
</table>
The ElSQL endpoint is configured using URI syntax:

```
elsql:elsqlName:resourceUri
```

with the following path and query parameters:

### 93.1.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>elsqlName</td>
<td>The name of the elsql to use (is NAMED in the elsql file)</td>
<td>Required</td>
<td>String</td>
</tr>
<tr>
<td>resourceUri</td>
<td>The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 93.1.2. Query Parameters (47 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowNamedParameters</td>
<td>Whether to allow using named parameters in the queries.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint.

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

true  boolean
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>databaseVendor</code></td>
<td>To use a vendor specific com.opengamma.elsql.ElsqlConfig</td>
<td></td>
<td>ElSqlDatabaseVendor</td>
</tr>
<tr>
<td><code>dataSource</code></td>
<td>Sets the DataSource to use to communicate with the database.</td>
<td></td>
<td>DataSource</td>
</tr>
<tr>
<td><code>dataSourceRef</code></td>
<td><strong>Deprecated</strong> Sets the reference to a DataSource to lookup from the registry, to use for communicating with the database.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>outputClass</code></td>
<td>Specify the full package and class name to use as conversion when outputType=SelectOne.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>outputHeader</code></td>
<td>Store the query result in a header instead of the message body. By default, outputHeader == null and the query result is stored in the message body, any existing content in the message body is discarded. If outputHeader is set, the value is used as the name of the header to store the query result and the original message body is preserved.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>outputType</code></td>
<td>Make the output of consumer or producer to SelectList as List of Map, or SelectOne as single Java object in the following way:a) If the query has only single column, then that JDBC Column object is returned. (such as SELECT COUNT( ) FROM PROJECT will return a Long object.b) If the query has more than one column, then it will return a Map of that result.c) If the outputClass is set, then it will convert the query result into an Java bean object by calling all the setters that match the column names.It will assume your class has a default constructor to create instance with.d) If the query resulted in more than one rows, it throws an non-unique result exception.StreamList streams the result of the query using an Iterator. This can be used with the Splitter EIP in streaming mode to process the ResultSet in streaming fashion.</td>
<td>Select List</td>
<td>SqlOutputType</td>
</tr>
<tr>
<td><code>separator</code></td>
<td>The separator to use when parameter values is taken from message body (if the body is a String type), to be inserted at placeholders.Notice if you use named parameters, then a Map type is used instead. The default value is comma</td>
<td></td>
<td>char</td>
</tr>
<tr>
<td><code>breakBatchOnConsumeFail</code></td>
<td>Sets whether to break batch if onConsume failed.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>expectedUpdate Count (consumer)</td>
<td>Sets an expected update count to validate when using onConsume.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>maxMessagesPer Poll (consumer)</td>
<td>Sets the maximum number of messages to poll</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>onConsume (consumer)</td>
<td>After processing each row then this query can be executed, if the Exchange was processed successfully, for example to mark the row as processed. The query can have parameter.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>onConsumeBatchComplete (consumer)</td>
<td>After processing the entire batch, this query can be executed to bulk update rows etc. The query cannot have parameters.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>onConsumeFailed (consumer)</td>
<td>After processing each row then this query can be executed, if the Exchange failed, for example to mark the row as failed. The query can have parameter.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>routeEmptyResultSet (consumer)</td>
<td>Sets whether empty resultset should be allowed to be sent to the next hop. Defaults to false. So the empty resultset will be filtered out.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transacted (consumer)</td>
<td>Enables or disables transaction. If enabled then if processing an exchange failed then the consumerbreak out processing any further exchanges to cause a rollback eager.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useIterator (consumer)</td>
<td>Sets how resultset should be delivered to route. Indicates delivery as either a list or individual object. defaults to true.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### CHAPTER 93. ELSQL COMPONENT

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ExceptionHandler</code></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><code>exchangePattern</code></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>pollStrategy</code></td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td><code>processingStrategy</code></td>
<td>Allows to plugin to use a custom org.apache.camel.component.sql.SqlProcessingStrategy to execute queries when the consumer has processed the rows/batch.</td>
<td></td>
<td>SqlProcessingStrategy</td>
</tr>
<tr>
<td><code>batch</code></td>
<td>Enables or disables batch mode</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>noop</code></td>
<td>If set, will ignore the results of the SQL query and use the existing IN message as the OUT message for the continuation of processing</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>useMessageBodyForSql</code></td>
<td>Whether to use the message body as the SQL and then headers for parameters. If this option is enabled then the SQL in the uri is not used.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>alwaysPopulateStatement</code></td>
<td>If enabled then the populateStatement method from org.apache.camel.component.sql.SqlPrepareStatementStrategy is always invoked, also if there is no expected parameters to be prepared. When this is false then the populateStatement is only invoked if there is 1 or more expected parameters to be set; for example this avoids reading the message body/headers for SQL queries with no parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>parametersCount</code></td>
<td>If set greater than zero, then Camel will use this count value of parameters to replace instead of querying via JDBC metadata API. This is useful if the JDBC vendor could not return correct parameters count, then user may override instead.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><code>elSqlConfig</code></td>
<td>To use a specific configured ELSqlConfig. It may be better to use the databaseVendor option instead.</td>
<td></td>
<td>ELSqlConfig</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>placeholder</td>
<td>Specifies a character that will be replaced to in SQL query. Notice, that it is simple String.replaceAll() operation and no SQL parsing is involved (quoted strings will also change).</td>
<td>#</td>
<td>String</td>
</tr>
<tr>
<td>prepareStatementStrategy</td>
<td>Allows to plugin to use a custom org.apache.camel.component.sql.SqlPrepareStatementStrategy to control preparation of the query and prepared statement.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>templateOptions</td>
<td>Configures the Spring JdbcTemplate with the key/values from the Map</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>usePlaceholder</td>
<td>Sets whether to use placeholder and replace all placeholder characters with sign in the SQL queries.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffIdleThreshold</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffMultiplier</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>delay</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td>greedy</td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>initialDelay</td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>runLoggingLevel (scheduler)</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService (scheduler)</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td>ScheduledExecutorService</td>
<td></td>
</tr>
<tr>
<td>scheduler (scheduler)</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumerScheduler</td>
</tr>
<tr>
<td>schedulerProperties (scheduler)</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td>Map</td>
<td></td>
</tr>
<tr>
<td>startScheduler (scheduler)</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit (scheduler)</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLISECONDS</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay (scheduler)</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 93.2. RESULT OF THE QUERY

For **select** operations, the result is an instance of `List<Map<String, Object>>` type, as returned by the `JdbcTemplate.queryForList()` method. For **update** operations, the result is the number of updated rows, returned as an `Integer`. 

By default, the result is placed in the message body. If the `outputHeader` parameter is set, the result is placed in the header. This is an alternative to using a full message enrichment pattern to add headers, it provides a concise syntax for querying a sequence or some other small value into a header. It is convenient to use `outputHeader` and `outputType` together:

### 93.3. HEADER VALUES

When performing **update** operations, the SQL Component stores the update count in the following message headers:
<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel SqlUpdateCount</td>
<td>The number of rows updated for update operations, returned as an Integer object.</td>
</tr>
<tr>
<td>Camel SqlRowCount</td>
<td>The number of rows returned for select operations, returned as an Integer object.</td>
</tr>
</tbody>
</table>

93.3.1. Sample

In the given route below, we want to get all the projects from the projects table. Notice the SQL query has 2 named parameters, :#lic and :#min.

Camel will then lookup for these parameters from the message body or message headers. Notice in the example above we set two headers with constant value for the named parameters:

```java
from("direct:projects")
  .setHeader("lic", constant("ASF"))
  .setHeader("min", constant(123))
  .to("elsql:projects:com/foo/orders.elsql")
```

And the elsol mapping file

```sql
@NAME(projects)
SELECT *
FROM projects
WHERE license = :lic AND id > :min
ORDER BY id
```

Though if the message body is a java.util.Map then the named parameters will be taken from the body.

```java
from("direct:projects")
  .to("elsql:projects:com/foo/orders.elsql")
```

In from Camel 2.16.1 onwards you can use Simple expressions as well, which allows to use an OGNL like notation on the message body, where it assumes to have getLicense and getMinimum methods:

```java
@NAME(projects)
SELECT *
FROM projects
WHERE license = :${body.license} AND id > :${body.minimum}
ORDER BY id
```

CHAPTER 94. ETCD COMPONENT

Available as of Camel version 2.18

The camel etcd component allows you to work with Etcd, a distributed reliable key-value store.

94.1. URI FORMAT

- `etcd:namespace/path[?options]`

94.2. URI OPTIONS

The etcd component supports 7 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>uris (common)</td>
<td>To set the URIs the client connects.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sslContextParameters (common)</td>
<td>To configure security using SSLContextParameters.</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
<tr>
<td>userName (common)</td>
<td>The user name to use for basic authentication.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>password (common)</td>
<td>The password to use for basic authentication.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>configuration (advanced)</td>
<td>Sets the common configuration shared among endpoints</td>
<td></td>
<td>EtcdConfiguration</td>
</tr>
<tr>
<td>useGlobalSslContextParameters (security)</td>
<td>Enable usage of global SSL context parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The etcd endpoint is configured using URI syntax:

- `etcd:namespace/path`

with the following path and query parameters:

94.2.1. Path Parameters (2 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Required The API namespace to use</td>
<td></td>
<td>EtcdNamespace</td>
</tr>
<tr>
<td>path</td>
<td>The path the endpoint refers to</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 94.2.2. Query Parameters (29 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>recursive (common)</td>
<td>To apply an action recursively.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>servicePath (common)</td>
<td>The path to look for for service discovery</td>
<td>/services/</td>
<td>String</td>
</tr>
<tr>
<td>timeout (common)</td>
<td>To set the maximum time an action could take to complete.</td>
<td></td>
<td>Long</td>
</tr>
<tr>
<td>uris (common)</td>
<td>To set the URIs the client connects.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyExchangeOnTimeout (consumer)</td>
<td>To send an empty message in case of timeout watching for a key.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a customExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>fromIndex</td>
<td>The index to watch from</td>
<td>0</td>
<td>Long</td>
</tr>
<tr>
<td>pollStrategy</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>timeToLive</td>
<td>To set the lifespan of a key in milliseconds.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>backoffErrorThreshold</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>backoffIdleThreshold</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>backoffMultiplier</td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>delay</td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).                                                                                                                                 500</td>

<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>runLoggingLevel</td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>scheduledExecutorService</td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td></td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td>scheduler</td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumer</td>
</tr>
<tr>
<td>schedulerProperties</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>startScheduler</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLIES</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>password</td>
<td>The password to use for basic authentication.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>sslContextParameters</td>
<td>To configure security using SSLContextParameters.</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
<tr>
<td>userName</td>
<td>The user name to use for basic authentication.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
CHAPTER 95. OSGI EVENTADMIN COMPONENT

Available as of Camel version 2.6

The eventadmin component can be used in an OSGi environment to receive OSGi EventAdmin events and process them.

95.1. DEPENDENCIES

Maven users need to add the following dependency to their pom.xml

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-eventadmin</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where ${camel-version} must be replaced by the actual version of Camel (2.6.0 or higher).

95.2. URI FORMAT

```
eventadmin:topic[?options]
```

where topic is the name of the topic to listen too.

95.3. URI OPTIONS

The OSGi EventAdmin component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bundleContext (common)</td>
<td>The OSGi BundleContext is automatic injected by Camel</td>
<td></td>
<td>BundleContext</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The OSGi EventAdmin endpoint is configured using URI syntax:

```
eventadmin:topic
```

with the following path and query parameters:

95.3.1. Path Parameters (1 parameters):
### 95.3.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>send</strong> (common)</td>
<td>Whether to use 'send' or 'synchronous' deliver. Default false (async delivery)</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong> (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern</strong> (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><strong>synchronous</strong> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 95.4. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 95.5. MESSAGE BODY

The in message body will be set to the received Event.
95.6. EXAMPLE USAGE

```xml
<route>
    <from uri="eventadmin::*"/>
    <to uri="stream:out"/>
</route>
```
CHAPTER 96. EXEC COMPONENT

Available as of Camel version 2.3

The exec component can be used to execute system commands.

96.1. DEPENDENCIES

Maven users need to add the following dependency to their pom.xml

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-exec</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where ${camel-version} must be replaced by the actual version of Camel (2.3.0 or higher).

96.2. URI FORMAT

exec://executable[?options]

where executable is the name, or file path, of the system command that will be executed. If executable name is used (e.g. exec:java), the executable must in the system path.

96.3. URI OPTIONS

The Exec component has no options.

The Exec endpoint is configured using URI syntax:

```
exec:executable
```

with the following path and query parameters:

96.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>executable</td>
<td>Required Sets the executable to be executed. The executable must not be empty or null.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

96.3.2. Query Parameters (8 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
</table>
## 96.4. MESSAGE HEADERS

The supported headers are defined in `org.apache.camel.component.exec.ExecBinding`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args</code> (producer)</td>
<td>The arguments may be one or many whitespace-separated tokens.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>binding</code> (producer)</td>
<td>A reference to a <code>org.apache.commons.exec.ExecBinding</code> in the Registry.</td>
<td></td>
<td>ExecBinding</td>
</tr>
<tr>
<td><code>commandExecutor</code> (producer)</td>
<td>A reference to a <code>org.apache.commons.exec.ExecCommandExecutor</code> in the Registry that customizes the command execution. The default command executor utilizes the commons-exec library, which adds a shutdown hook for every executed command.</td>
<td></td>
<td>ExecCommandExecutor</td>
</tr>
<tr>
<td><code>outFile</code> (producer)</td>
<td>The name of a file, created by the executable, that should be considered as its output. If no <code>outFile</code> is set, the standard output (stdout) of the executable will be used instead.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>timeout</code> (producer)</td>
<td>The timeout, in milliseconds, after which the executable should be terminated. If execution has not completed within the timeout, the component will send a termination request.</td>
<td></td>
<td>long</td>
</tr>
<tr>
<td><code>useStderrOnEmptyStdout</code> (producer)</td>
<td>A boolean indicating that when stdout is empty, this component will populate the Camel Message Body with stderr. This behavior is disabled (false) by default.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>workingDir</code> (producer)</td>
<td>The directory in which the command should be executed. If null, the working directory of the current process will be used.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>synchronous</code> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Message</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------</td>
<td>---------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ExecBinding .EXEC_COMMAND_EXECUTABLE</td>
<td>String</td>
<td>in</td>
<td>The name of the system command that will be executed. Overrides <strong>executable</strong> in the URI.</td>
</tr>
<tr>
<td>ExecBinding .EXEC_COMMAND_ARGS</td>
<td>java.util.List &lt;String&gt;</td>
<td>in</td>
<td>Command-line arguments to pass to the executed process. The arguments are used literally - no quoting is applied. Overrides any existing <strong>args</strong> in the URI.</td>
</tr>
<tr>
<td>ExecBinding .EXEC_COMMAND_ARGS</td>
<td>String</td>
<td>in</td>
<td>Camel 2.5: The arguments of the executable as a Single string where each argument is whitespace separated (see <strong>args</strong> in URI option). The arguments are used literally, no quoting is applied. Overrides any existing <strong>args</strong> in the URI.</td>
</tr>
<tr>
<td>ExecBinding .EXEC_COMMAND_OUT_FILE</td>
<td>String</td>
<td>in</td>
<td>The name of a file, created by the executable, that should be considered as its output. Overrides any existing <strong>outFile</strong> in the URI.</td>
</tr>
<tr>
<td>ExecBinding .EXEC_COMMAND_TIMEOUT</td>
<td>long</td>
<td>in</td>
<td>The timeout, in milliseconds, after which the executable should be terminated. Overrides any existing <strong>timeout</strong> in the URI.</td>
</tr>
<tr>
<td>ExecBinding .EXEC_COMMAND_WORKING_DIR</td>
<td>String</td>
<td>in</td>
<td>The directory in which the command should be executed. Overrides any existing <strong>workingDir</strong> in the URI.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Message</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ExecBinding.EXEC_EXIT_VALUE</td>
<td>int</td>
<td>out</td>
<td>The value of this header is the exit value of the executable. Non-zero exit values typically indicate abnormal termination. Note that the exit value is OS-dependent.</td>
</tr>
<tr>
<td>ExecBinding.EXEC_STDERR</td>
<td>java.io.InputStream</td>
<td>out</td>
<td>The value of this header points to the standard error stream (stderr) of the executable. If no stderr is written, the value is null.</td>
</tr>
<tr>
<td>ExecBinding.EXEC_USE_STDERR_ON_EMPTY_STDOUT</td>
<td>boolean</td>
<td>in</td>
<td>Indicates that when stdout is empty, this component will populate the Camel Message Body with stderr. This behavior is disabled (false) by default.</td>
</tr>
</tbody>
</table>

### 96.5. MESSAGE BODY

If the Exec component receives an in message body that is convertible to java.io.InputStream, it is used to feed input to the executable via its stdin. After execution, the message body is the result of the execution,— that is, an org.apache.camel.components.exec.ExecResult instance containing the stdout, stderr, exit value, and out file. This component supports the following ExecResult type converters for convenience:

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecResult</td>
<td>java.io.InputStream</td>
</tr>
<tr>
<td>ExecResult</td>
<td>String</td>
</tr>
<tr>
<td>ExecResult</td>
<td>byte []</td>
</tr>
<tr>
<td>ExecResult</td>
<td>org.w3c.dom.Document</td>
</tr>
</tbody>
</table>

If an out file is specified (in the endpoint via outFile or the message headers via ExecBinding.EXEC_COMMAND_OUT_FILE), converters will return the content of the out file. If no out file is used, then this component will convert the stdout of the process to the target type. For more details, please refer to the usage examples below.
96.6. USAGE EXAMPLES

96.6.1. Executing word count (Linux)

The example below executes `wc` (word count, Linux) to count the words in file `/usr/share/dict/words`. The word count (output) is written to the standard output stream of `wc`.

```java
from("direct:exec")
  .to("exec:wc?args=--words /usr/share/dict/words")
  .process(new Processor() {
      public void process(Exchange exchange) throws Exception {
          // By default, the body is ExecResult instance
          assertIsInstanceOf(ExecResult.class, exchange.getIn().getBody());
          // Use the Camel Exec String type converter to convert the ExecResult to String
          String wordCountOutput = exchange.getIn().getBody(String.class);
          // do something with the word count
      }
  });
```

96.6.2. Executing java

The example below executes `java` with 2 arguments: `-server` and `-version`, provided that `java` is in the system path.

```java
from("direct:exec")
  .to("exec:java?args=-server -version")
```

The example below executes `java` in `c:\temp` with 3 arguments: `-server`, `-version` and the system property `user.name`.

```java
from("direct:exec")
  .to("exec:c:/program files/jdk/bin/java?args=-server -version -Duser.name=Camel&workingDir=c:/temp")
```

96.6.3. Executing Ant scripts

The following example executes Apache Ant (Windows only) with the build file `CamelExecBuildFile.xml`, provided that `ant.bat` is in the system path, and that `CamelExecBuildFile.xml` is in the current directory.

```java
from("direct:exec")
  .to("exec:ant.bat?args=-f CamelExecBuildFile.xml")
```

In the next example, the `ant.bat` command redirects its output to `CamelExecOutFile.txt` with `-I`. The file `CamelExecOutFile.txt` is used as the out file with `outFile=CamelExecOutFile.txt`. The example assumes that `ant.bat` is in the system path, and that `CamelExecBuildFile.xml` is in the current directory.

```java
from("direct:exec")
```
96.6.4. Executing `echo` (Windows)

Commands such as `echo` and `dir` can be executed only with the command interpreter of the operating system. This example shows how to execute such a command - `echo` - in Windows.

```java
.process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        InputStream outFile = exchange.getIn().getBody(InputStream.class);
        assertIsInstanceOf(InputStream.class, outFile);
        // do something with the out file here
    }
});
```

CHAPTER 97. FACEBOOK COMPONENT

Available as of Camel version 2.14

The Facebook component provides access to all of the Facebook APIs accessible using Facebook4J. It allows producing messages to retrieve, add, and delete posts, likes, comments, photos, albums, videos, photos, checkins, locations, links, etc. It also supports APIs that allow polling for posts, users, checkins, groups, locations, etc.

Facebook requires the use of OAuth for all client application authentication. In order to use camel-facebook with your account, you’ll need to create a new application within Facebook at https://developers.facebook.com/apps and grant the application access to your account. The Facebook application’s id and secret will allow access to Facebook APIs which do not require a current user. A user access token is required for APIs that require a logged in user. More information on obtaining a user access token can be found at https://developers.facebook.com/docs/facebook-login/access-tokens/.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-facebook</artifactId>
    <version>${camel-version}</version>
</dependency>
```

97.1. URI FORMAT

```
facebook://[endpoint]?[options]
```

97.2. FACEBOOKCOMPONENT

The facebook component can be configured with the Facebook account settings below, which are mandatory. The values can be provided to the component using the bean property configuration of type org.apache.camel.component.facebook.config.FacebookConfiguration. The OAuthAccessToken option may be omitted but that will only allow access to application APIs.

The Facebook component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td></td>
<td>FacebookConfiguration</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td>(advanced)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Facebook endpoint is configured using URI syntax:
facebook:methodName

with the following path and query parameters:

### 97.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>methodName</td>
<td>Required What operation to perform</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 97.2.2. Query Parameters (102 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>achievementURL</td>
<td>The unique URL of the achievement</td>
<td></td>
<td>URL</td>
</tr>
<tr>
<td>albumId</td>
<td>The album ID</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>albumUpdate</td>
<td>The facebook Album to be created or updated</td>
<td></td>
<td>AlbumUpdate</td>
</tr>
<tr>
<td>appId</td>
<td>The ID of the Facebook Application</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>center</td>
<td>Location latitude and longitude</td>
<td></td>
<td>GeoLocation</td>
</tr>
<tr>
<td>checkinId</td>
<td>The checkin ID</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>checkinUpdate</td>
<td>Deprecated The checkin to be created. Deprecated, instead create a Post with an attached location</td>
<td></td>
<td>CheckinUpdate</td>
</tr>
<tr>
<td>clientURL</td>
<td>Facebook4J API client URL</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>clientVersion</td>
<td>Facebook4J client API version</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>commentId</td>
<td>The comment ID</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>commentUpdate</td>
<td>The facebook Comment to be created or updated</td>
<td></td>
<td>CommentUpdate</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>debugEnabled</td>
<td>Enables debug output. Effective only with the embedded logger</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>description</td>
<td>The description text</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>distance</td>
<td>Distance in meters</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>domainId</td>
<td>The domain ID</td>
<td></td>

<td>The application Secret</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### 97.3. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint names and options from the table below. Endpoints can also use the short name without the `get` or `search` prefix, except `checkin` due to ambiguity between `getCheckin` and `searchCheckin`. Endpoint options that are not mandatory are denoted by `[ ]`.

Producer endpoints can also use a special option `inBody` that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message. For example, the facebook endpoint in the following route retrieves activities for the user id value in the incoming message body.

```java
from("direct:test").to("facebook://activities?inBody=userId")...
```

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format `CamelFacebook.https://cwiki.apache.org/confluence/pages/createpage.action?spaceKey=CAMEL&title=option&linkCreation=true&fromPageId=34020899[option]`. For example, the `userId` option value in the previous route could alternately be provided in the message header `CamelFacebook.userId`. Note that the `inBody` option overrides message header, e.g. the endpoint option `inBody=user` would override a `CamelFacebook.userId` header.

Endpoints that return a String return an Id for the created or modified entity, e.g. `addAlbumPhoto` returns the new album Id. Endpoints that return a boolean, return true for success and false otherwise. In case of Facebook API errors the endpoint will throw a `RuntimeCamelException` with a `facebook4j.FacebookException` cause.

### 97.4. CONSUMER ENDPOINTS:

Any of the producer endpoints that take a `reading#reading` parameter can be used as a consumer endpoint. The polling consumer uses the `since` and `until` fields to get responses within the polling interval. In addition to other reading fields, an initial `since` value can be provided in the endpoint for the first poll.

Rather than the endpoints returning a List (or `facebook4j.ResponseList`) through a single route exchange, camel-facebook creates one route exchange per returned object. As an example, if "facebook://home" results in five posts, the route will be executed five times (once for each Post).
97.5. READING OPTIONS

The **reading** option of type `facebook4j.Reading` adds support for reading parameters, which allow selecting specific fields, limits the number of results, etc. For more information see [Graph API#reading - Facebook Developers](Graph_API#reading - Facebook_Developers).

It is also used by consumer endpoints to poll Facebook data to avoid sending duplicate messages across polls.

The reading option can be a reference or value of type `facebook4j.Reading`, or can be specified using the following reading options in either the endpoint URI or exchange header with `CamelFacebook` prefix.

97.6. MESSAGE HEADER

Any of the [URI options](URI_options) can be provided in a message header for producer endpoints with `CamelFacebook` prefix.

97.7. MESSAGE BODY

All result message bodies utilize objects provided by the Facebook4J API. Producer endpoints can specify the option name for incoming message body in the `inBody` endpoint parameter.

For endpoints that return an array, or `facebook4j.ResponseList`, or `java.util.List`, a consumer endpoint will map every elements in the list to distinct messages.

97.8. USE CASES

To create a post within your Facebook profile, send this producer a `facebook4j.PostUpdate` body.

```java
from("direct:foo")
  .to("facebook://postFeed/inBody=postUpdate");
```

To poll, every 5 sec (You can set the polling consumer options by adding a prefix of "consumer"), all statuses on your home feed:

```java
from("facebook://home?consumer.delay=5000")
  .to("bean:blah");
```

Searching using a producer with dynamic options from header.

In the bar header we have the Facebook search string we want to execute in public posts, so we need to assign this value to the CamelFacebook.query header.

```java
from("direct:foo")
  .setHeader("CamelFacebook.query", header("bar"))
  .to("facebook://posts");
```
CHAPTER 98. FHIR JSON DATAFORMAT

The FHIR-JSON Data Format leverages HAPI-FHIR's JSON parser to parse to/from JSON format to/from a HAPI-FHIR's IBaseResource.

98.1. FHIR JSON FORMAT OPTIONS

The FHIR JSon dataformat supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fhirVersion</td>
<td>DSTU3</td>
<td>String</td>
<td>The version of FHIR to use. Possible values are: DSTU2, DSTU2_HL7ORG, DSTU2_1, DSTU3, R4</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>
CHAPTER 99. FHIR XML DATAFORMAT

Available as of Camel version 2.21

The FHIR-XML Data Format leverages HAPI-FHIR’s XML parser to parse to/from XML format to/from a HAPI-FHIR’s IBaseResource.

99.1. FHIR XML FORMAT OPTIONS

The FHIR XML dataformat supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fhirVersion</td>
<td>DSTU 3</td>
<td>String</td>
<td>The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>
CHAPTER 100. FILE COMPONENT

Available as of Camel version 1.0

The File component provides access to file systems, allowing files to be processed by any other Camel Components or messages from other components to be saved to disk.

### 100.1. URI FORMAT

| file:directoryName[?options] |
| or |
| file://directoryName[?options] |

Where **directoryName** represents the underlying file directory.

You can append query options to the URI in the following format, ?option=value&option=value&...

**Only directories**

Camel supports only endpoints configured with a starting directory. So the **directoryName** must be a directory.

If you want to consume a single file only, you can use the **fileName** option, e.g. by setting **fileName=thefilename**.

Also, the starting directory must not contain dynamic expressions with $$\{ \}$$ placeholders. Again use the **fileName** option to specify the dynamic part of the filename.

**WARNING**

Avoid reading files currently being written by another application

Beware the JDK File IO API is a bit limited in detecting whether another application is currently writing/copying a file. And the implementation can be different depending on OS platform as well. This could lead to that Camel thinks the file is not locked by another process and start consuming it. Therefore you have to do your own investigation what suites your environment. To help with this Camel provides different **readLock** options and **doneFileName** option that you can use. See also the section Consuming files from folders where others drop files directly.

### 100.2. URI OPTIONS

The File component has no options.

The File endpoint is configured using URI syntax:

| file:directoryName |

with the following path and query parameters:
### 100.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>directoryName</td>
<td>Required The starting directory</td>
<td></td>
<td>File</td>
</tr>
</tbody>
</table>

### 100.2.2. Query Parameters (81 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset (common)</td>
<td>This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>doneFileName     (common)</td>
<td>Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only $file.name and $file.name.noext is supported as dynamic placeholders.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>fileName (common)</td>
<td>Use Expression such as File Language to dynamically set the filename. For consumers, it’s used as a filename filter. For producers, it’s used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today’s file using the File Language syntax: mydata-$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>delete (consumer)</td>
<td>If true, the file will be deleted after it is processed successfully.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>moveFailed (consumer)</td>
<td>Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>noop (consumer)</td>
<td>If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>preMove (consumer)</td>
<td>Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>preSort (consumer)</td>
<td>When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>recursive (consumer)</td>
<td>If a directory, will look for files in all the sub-directories as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>directoryMustExist (consumer)</td>
<td>Similar to startingDirectoryMustExist but this applies during polling recursive sub directories.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the default exchange pattern when creating an exchange.</td>
<td>ExchangePattern</td>
<td></td>
</tr>
<tr>
<td>extendedAttributes (consumer)</td>
<td>To define which file attributes of interest. Like posix:permissions,posix:owner,basic:lastAccessTime, it supports basic wildcard like posix:, basic:lastAccessTime</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>inProgressRepository (consumer)</td>
<td>A pluggable in-progress repository org.apache.camel.spi.IdempotentRepository. The in-progress repository is used to account the current in progress files being consumed. By default a memory based repository is used.</td>
<td>String&gt;</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td>localWorkDirectory (consumer)</td>
<td>When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>onCompletionExceptionHandler (consumer)</td>
<td>To use a custom org.apache.camel.spi.ExceptionHandler to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>pollStrategy (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. In other words the error occurred while the polling was gathering information, for instance access to a file network failed so Camel cannot access it to scan for files. The default implementation will log the caused exception at WARN level and ignore it.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td>probeContentType (consumer)</td>
<td>Whether to enable probing of the content type. If enable then the consumer uses link FilesprobeContentType(java.nio.file.Path) to determine the content-type of the file, and store that as a header with key link ExchangeFILE_CONTENT_TYPE on the Message.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>processStrategy (consumer)</td>
<td>A pluggable org.apache.camel.component.file.GenericFileProcessStrategy allowing you to implement your own readLock option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the readLock option does not apply.</td>
<td></td>
<td>GenericFileProcessStrategy&lt;T&gt;</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td>startingDirectory</td>
<td>Whether the starting directory must exist. Mind that the autoCreate option is default enabled, which means the starting directory is normally auto created if it doesn’t exist. You can disable autoCreate and enable this to ensure the starting directory must exist. Will thrown an exception if the directory doesn’t exist.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>fileExist</td>
<td>What to do if a file already exists with the same name. Override, which is the default, replaces the existing file. Append - adds content to the existing file. Fail - throws a GenericFileOperationException, indicating that there is already an existing file. Ignore - silently ignores the problem and does not override the existing file, but assumes everything is okay. Move - option requires to use the moveExisting option to be configured as well. The option eagerDeleteTargetFile can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The Move option will move any existing files, before writing the target file. TryRename is only applicable if tempFileName option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers.</td>
<td>Override</td>
<td>GenericFileExist</td>
</tr>
<tr>
<td>flatten</td>
<td>Flatten is used to flatten the file name path to strip any leading paths, so it’s just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>moveExisting</td>
<td>Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>tempFileName</strong></td>
<td>The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>tempPrefix</strong></td>
<td>This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>allowNullBody</strong></td>
<td>Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>chmod</strong></td>
<td>Specify the file permissions which is sent by the producer, the chmod value must be between 000 and 777; If there is a leading digit like in 0755 we will ignore it.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>chmodDirectory</strong></td>
<td>Specify the directory permissions used when the producer creates missing directories, the chmod value must be between 000 and 777; If there is a leading digit like in 0755 we will ignore it.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>eagerDeleteTargetFile</strong></td>
<td>Whether or not to eagerly delete any existing target file. This option only applies when you use fileExists=Override and the tempFileName option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exists during the temp file is being written. This ensure the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when fileExist=Move is enabled, and an existing file exists. If this option copyAndDeleteOnRenameFails false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>forceWrites (producer)</td>
<td>Whether to force syncing writes to the file system. You can turn this off if you do not want this level of guarantee, for example if writing to logs / audit logs etc; this would yield better performance.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>keepLastModified (producer)</td>
<td>Will keep the last modified timestamp from the source file (if any). Will use the Exchange.FILE_LAST_MODIFIED header to located the timestamp. This header can contain either a java.util.Date or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>autoCreate (advanced)</td>
<td>Automatically create missing directories in the file’s pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>bufferSize (advanced)</td>
<td>Write buffer sized in bytes.</td>
<td>131072</td>
<td>int</td>
</tr>
<tr>
<td>copyAndDeleteOnRenameFail (advanced)</td>
<td>Whether to fallback and do a copy and delete file, in case the file could not be renamed directly. This option is not available for the FTP component.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>renameUsingCopy (advanced)</td>
<td>Perform rename operations using a copy and delete strategy. This is primarily used in environments where the regular rename operation is unreliable (e.g. across different file systems or networks). This option takes precedence over the copyAndDeleteOnRenameFail parameter that will automatically fall back to the copy and delete strategy, but only after additional delays.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>antExclude (filter)</td>
<td>Ant style filter exclusion. If both antInclude and antExclude are used, antExclude takes precedence over antInclude. Multiple exclusions may be specified in comma-delimited format.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>antFilterCaseSensitive (filter)</td>
<td>Sets case sensitive flag on ant filter</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>antinclude (filter)</td>
<td>Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>eagerMaxMessagesPerPoll (filter)</td>
<td>Allows for controlling whether the limit from maxMessagesPerPoll is eager or not. If eager then the limit is during the scanning of files. Where as false would scan all files, and then perform sorting. Setting this option to false allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>exclude (filter)</td>
<td>Is used to exclude files, if filename matches the regex pattern (matching is case insensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the RAW() syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>filterDirectory (filter)</td>
<td>Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as $date:now:yyyyMMdd</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>filterFile (filter)</td>
<td>Filters the file based on Simple language. For example to filter on file size, you can use $file:size 5000</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>idempotent (filter)</td>
<td>Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRUCache that holds 1000 entries. If noop=true then idempotent will be enabled as well to avoid consuming the same files over and over again.</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>idempotentKey (filter)</td>
<td>To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: idempotentKey=$file:name-$file:size</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>idempotentRepository (filter)</td>
<td>A pluggable repository org.apache.camel.spi.IdempotentRepository which by default use MemoryMessageIdRepository if none is specified and idempotent is true.</td>
<td></td>
<td>String&gt;</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------------</td>
</tr>
<tr>
<td>include (filter)</td>
<td>Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the RAW() syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>maxDepth (filter)</td>
<td>The maximum depth to traverse when recursively processing a directory.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>maxMessagesPerPoll (filter)</td>
<td>To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use maxMessagesPerPoll=500, then only the first 500 files will be picked up, and then sorted. You can use the eagerMaxMessagesPerPoll option and set this to false to allow to scan all files first and then sort afterwards.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>minDepth (filter)</td>
<td>The minimum depth to start processing when recursively processing a directory. Using minDepth=1 means the base directory. Using minDepth=2 means the first sub directory.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>move (filter)</td>
<td>Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a .done subdirectory just enter .done.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>exclusiveReadLockStrategy (lock)</td>
<td>Pluggable read-lock as a org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy implementation.</td>
<td></td>
<td>GenericFileExclusiveReadLockStrategy&lt;T&gt;</td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Default** | **Type**
---|---|---|---
readLock (lock) | Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/ modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail for the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan. | none | String
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>readLockCheckInterval (lock)</td>
<td>Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>readLockDeleteOrphanLock Files (lock)</td>
<td>Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockLoggingLevel (lock)</td>
<td>Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename.</td>
<td>DEBUG</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>readLockMarkerFile (lock)</td>
<td>Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockMinAge (lock)</td>
<td>This option applied only for readLock=change. This option allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use readLockMinAge=300s to require the file is at last 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age.</td>
<td>0</td>

<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>readLockMinLength</td>
<td>This option applied only for readLock=changed. This option allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files.</td>
<td>1</td>
<td>long</td>
</tr>
<tr>
<td>readLockRemoveOnCommit</td>
<td>This option applied only for readLock=idempotent. This option allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockRemoveOnRollback</td>
<td>This option applied only for readLock=idempotent. This option allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit).</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockTimeout</td>
<td>Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.</td>
<td>10000</td>

TIP

**Default behavior for file producer** By default it will override any existing file, if one exist with the same name.

### 100.3. MOVE AND DELETE OPERATIONS

Any move or delete operations is executed after (post command) the routing has completed; so during processing of the Exchange the file is still located in the inbox folder.

Let's illustrate this with an example:

```java
from("file://inbox?move=.done").to("bean:handleOrder");
```

When a file is dropped in the inbox folder, the file consumer notices this and creates a new FileExchange that is routed to the handleOrder bean. The bean then processes the File object. At this point in time the file is still located in the inbox folder. After the bean completes, and thus the route is completed, the file consumer will perform the move operation and move the file to the .done sub-folder.

The move and the preMove options are considered as a directory name (though if you use an expression such as File Language, or Simple then the result of the expression evaluation is the file name to be used - eg if you set
move=../backup/copy-of-$\{file:name\}

then that’s using the File Language which we use return the file name to be used), which can be either relative or absolute. If relative, the directory is created as a sub-folder from within the folder where the file was consumed.

By default, Camel will move consumed files to the \texttt{.camel} sub-folder relative to the directory where the file was consumed.

If you want to delete the file after processing, the route should be:

from("file://inbox?delete=true").to("bean:handleOrder");

We have introduced a pre move operation to move files before they are processed. This allows you to mark which files have been scanned as they are moved to this sub folder before being processed.

from("file://inbox?preMove=inprogress").to("bean:handleOrder");

You can combine the pre move and the regular move:

from("file://inbox?preMove=inprogress&move=.done").to("bean:handleOrder");

So in this situation, the file is in the \	exttt{inprogress} folder when being processed and after it’s processed, it’s moved to the \texttt{.done} folder.

\textbf{100.4. FINELY GRAINED CONTROL OVER MOVE AND PREMOVE OPTION}

The move and preMove options are Expression-based, so we have the full power of the File Language to do advanced configuration of the directory and name pattern.

Camel will, in fact, internally convert the directory name you enter into a File Language expression. So when we enter move=.done Camel will convert this into: $\{file:parent\}/.done/$\{"file:onlyname\}. This is only done if Camel detects that you have not provided a $\{ \} in the option value yourself. So when you enter a $\{ \} Camel will not convert it and thus you have the full power.

So if we want to move the file into a backup folder with today’s date as the pattern, we can do:

move=backup/$\{date:now:yyyyMMdd\}/$\{file:name\}

\textbf{100.5. ABOUT MOVEFAILED}

The moveFailed option allows you to move files that could not be processed successfully to another location such as an error folder of your choice. For example to move the files in an error folder with a timestamp you can use moveFailed=/error/$\{file:name.noext\}-$\{date:now:yyyyMMddHHmmssSSS\}.$\{"file:ext\}.

See more examples at File Language

\textbf{100.6. MESSAGE HEADERS}

The following headers are supported by this component:

\textbf{100.6.1. File producer only}
<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Camel FileName</strong></td>
<td>Specifies the name of the file to write (relative to the endpoint directory). This name can be a String; a String with a File Language or Simple expression; or an Expression object. If it's null then Camel will auto-generate a filename based on the message unique ID.</td>
</tr>
<tr>
<td><strong>Camel FileNameProduced</strong></td>
<td>The actual absolute filepath (path + name) for the output file that was written. This header is set by Camel and its purpose is providing end-users with the name of the file that was written.</td>
</tr>
<tr>
<td><strong>Camel OverruleFileName</strong></td>
<td>Camel 2.11: Is used for overruling CamelFileName header and use the value instead (but only once, as the producer will remove this header after writing the file). The value can be only be a String. Notice that if the option fileName has been configured, then this is still being evaluated.</td>
</tr>
</tbody>
</table>

### 100.6.2. File consumer only

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Camel FileName</strong></td>
<td>Name of the consumed file as a relative file path with offset from the starting directory configured on the endpoint.</td>
</tr>
<tr>
<td><strong>Camel FileNameOnly</strong></td>
<td>Only the file name (the name with no leading paths).</td>
</tr>
<tr>
<td><strong>Camel FileAbsolutePath</strong></td>
<td>A boolean option specifying whether the consumed file denotes an absolute path or not. Should normally be false for relative paths. Absolute paths should normally not be used but we added to the move option to allow moving files to absolute paths. But can be used elsewhere as well.</td>
</tr>
<tr>
<td><strong>Camel FileAbsolutePath</strong></td>
<td>The absolute path to the file. For relative files this path holds the relative path instead.</td>
</tr>
<tr>
<td><strong>Camel FilePath</strong></td>
<td>The file path. For relative files this is the starting directory + the relative filename. For absolute files this is the absolute path.</td>
</tr>
<tr>
<td><strong>Camel FileRelativePath</strong></td>
<td>The relative path.</td>
</tr>
</tbody>
</table>
### 100.7. BATCH CONSUMER

This component implements the Batch Consumer.

### 100.8. EXCHANGE PROPERTIES, FILE CONSUMER ONLY

As the file consumer implements the BatchConsumer it supports batching the files it polls. By batching we mean that Camel will add the following additional properties to the Exchange, so you know the number of files polled, the current index, and whether the batch is already completed.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel Batch Size</td>
<td>The total number of files that was polled in this batch.</td>
</tr>
<tr>
<td>Camel Batch Index</td>
<td>The current index of the batch. Starts from 0.</td>
</tr>
<tr>
<td>Camel Batch Complete</td>
<td>A boolean value indicating the last Exchange in the batch. Is only true for the last entry.</td>
</tr>
</tbody>
</table>

This allows you for instance to know how many files exist in this batch and for instance let the Aggregator2 aggregate this number of files.

### 100.9. USING CHARSET

Available as of Camel 2.9.3
Available as of Camel 2.9.3
The charset option allows for configuring an encoding of the files on both the consumer and producer endpoints. For example if you read utf-8 files, and want to convert the files to iso-8859-1, you can do:

```
from("file:inbox?charset=utf-8")
  .to("file:outbox?charset=iso-8859-1")
```

You can also use the `convertBodyTo` in the route. In the example below we have still input files in utf-8 format, but we want to convert the file content to a byte array in iso-8859-1 format. And then let a bean process the data. Before writing the content to the outbox folder using the current charset.

```
from("file:inbox?charset=utf-8")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .to("file:outbox");
```

If you omit the charset on the consumer endpoint, then Camel does not know the charset of the file, and would by default use "UTF-8". However you can configure a JVM system property to override and use a different default encoding with the key `org.apache.camel.default.charset`.

In the example below this could be a problem if the files is not in UTF-8 encoding, which would be the default encoding for read the files.
In this example when writing the files, the content has already been converted to a byte array, and thus would write the content directly as is (without any further encodings).

```
from("file:inbox")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .to("file:outbox");
```

You can also override and control the encoding dynamic when writing files, by setting a property on the exchange with the key `Exchange.CHARSET_NAME`. For example in the route below we set the property with a value from a message header.

```
from("file:inbox")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .setProperty(Exchange.CHARSET_NAME, header("someCharsetHeader"))
  .to("file:outbox");
```

We suggest to keep things simpler, so if you pickup files with the same encoding, and want to write the files in a specific encoding, then favor to use the `charset` option on the endpoints.

Notice that if you have explicit configured a `charset` option on the endpoint, then that configuration is used, regardless of the `Exchange.CHARSET_NAME` property.

If you have some issues then you can enable DEBUG logging on `org.apache.camel.component.file`, and Camel logs when it reads/write a file using a specific charset.
For example the route below will log the following:

```
from("file:inbox?charset=utf-8")
  .to("file:outbox?charset=iso-8859-1")
```

And the logs:
100.10. COMMON GOTCHAS WITH FOLDER AND FILENAMES

When Camel is producing files (writing files) there are a few gotchas affecting how to set a filename of your choice. By default, Camel will use the message ID as the filename, and since the message ID is normally a unique generated ID, you will end up with filenames such as: ID-MACHINENAME-2443-1211718892437-1-0. If such a filename is not desired, then you must provide a filename in the CamelFileName message header. The constant, Exchange.FILE_NAME, can also be used.

The sample code below produces files using the message ID as the filename:

```java
from("direct:report").to("file:target/reports");
```

To use `report.txt` as the filename you have to do:

```java
from("direct:report").setHeader(Exchange.FILE_NAME, constant("report.txt")).to("file:target/reports");
```

i. the same as above, but with CamelFileName:

```java
from("direct:report").setHeader("CamelFileName", constant("report.txt")).to("file:target/reports");
```

And a syntax where we set the filename on the endpoint with the fileName URL option.

```java
from("direct:report").to("file:target/reports/?fileName=report.txt");
```

100.11. FILENAME EXPRESSION

Filename can be set either using the expression option or as a string-based File Language expression in the CamelFileName header. See the File Language for syntax and samples.

100.12. CONSUMING FILES FROM FOLDERS WHERE OTHERS DROP FILES DIRECTLY

Beware if you consume files from a folder where other applications write files to directly. Take a look at the different readLock options to see what suits your use cases. The best approach is however to write to another folder and after the write move the file in the drop folder. However if you write files directly to the drop folder then the option changed could better detect whether a file is currently being written/copied as it uses a file changed algorithm to see whether the file size / modification changes over a period of time. The other readLock options rely on Java File API that sadly is not always very good at detecting this. You may also want to look at the doneFileName option, which uses a marker file (done file) to signal when a file is done and ready to be consumed.

100.13. USING DONE FILES

Available as of Camel 2.6

See also section writing done files below.
If you want only to consume files when a done file exists, then you can use the doneFileName option on the endpoint.

```java
from("file:bar?doneFileName=done");
```

Will only consume files from the bar folder, if a done file exists in the same directory as the target files. Camel will automatically delete the done file when it’s done consuming the files. From Camel 2.9.3 onwards Camel will not automatically delete the done file if noop=true is configured.

However it is more common to have one done file per target file. This means there is a 1:1 correlation. To do this you must use dynamic placeholders in the doneFileName option. Currently Camel supports the following two dynamic tokens: `file:name` and `file:name.noext` which must be enclosed in `{} .

```java
from("file:bar?doneFileName=${file:name}.done");
```

In this example only files will be polled if there exists a done file with the name `file name.done`. For example

- **hello.txt** - is the file to be consumed
- **hello.txt.done** - is the associated done file

You can also use a prefix for the done file, such as:

```java
from("file:bar?doneFileName=ready-$(file:name)");
```

- **hello.txt** - is the file to be consumed
- **ready-hello.txt** - is the associated done file

### 100.14. WRITING DONE FILES

**Available as of Camel 2.6**

After you have written a file you may want to write an additional done file as a kind of marker, to indicate to others that the file is finished and has been written. To do that you can use the doneFileName option on the file producer endpoint.

```java
.to("file:bar?doneFileName=done");
```

Will simply create a file named `done` in the same directory as the target file.

However it is more common to have one done file per target file. This means there is a 1:1 correlation. To do this you must use dynamic placeholders in the doneFileName option. Currently Camel supports the following two dynamic tokens: `file:name` and `file:name.noext` which must be enclosed in `{} .

```java
.to("file:bar?doneFileName=done-$(file:name)");
```

Will for example create a file named `done-foo.txt` if the target file was `foo.txt` in the same directory as the target file.

```java
.to("file:bar?doneFileName=${file:name}.done");
```
Will for example create a file named `foo.txt.done` if the target file was `foo.txt` in the same directory as the target file.

```
.to("file:bar?doneFileName=${file:name.noext}.done");
```

Will for example create a file named `foo.done` if the target file was `foo.txt` in the same directory as the target file.

### 100.15. SAMPLES

#### #=== Read from a directory and write to another directory

```
from("file://inputdir/?delete=true").to("file://outputdir")
```

### 100.15.1. Read from a directory and write to another directory using a overrule dynamic name

```
from("file://inputdir/?delete=true").to("file://outputdir?overruleFile=copy-of-${file:name}")
```

Listen on a directory and create a message for each file dropped there. Copy the contents to the `outputdir` and delete the file in the `inputdir`.

### 100.15.2. Reading recursively from a directory and writing to another

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir")
```

Listen on a directory and create a message for each file dropped there. Copy the contents to the `outputdir` and delete the file in the `inputdir`. Will scan recursively into sub-directories. Will lay out the files in the same directory structure in the `outputdir` as the `inputdir`, including any sub-directories.

```
inputdir/foo.txt
inputdir/sub/bar.txt
```

Will result in the following output layout:

```
outputdir/foo.txt
outputdir/sub/bar.txt
```

### 100.16. USING FLATTEN

If you want to store the files in the `outputdir` directory in the same directory, disregarding the source directory layout (e.g. to flatten out the path), you just add the `flatten=true` option on the file producer side:

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir?flatten=true")
```

Will result in the following output layout:

```
outputdir/foo.txt
outputdir/bar.txt
```
100.17. READING FROM A DIRECTORY AND THE DEFAULT MOVE OPERATION

Camel will by default move any processed file into a .camel subdirectory in the directory the file was consumed from.

```java
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir")
```

Affects the layout as follows:

before

- inputdir/foo.txt
- inputdir/sub/bar.txt

after

- inputdir/.camel/foo.txt
- inputdir/sub/.camel/bar.txt
- outputdir/foo.txt
- outputdir/sub/bar.txt

100.18. READ FROM A DIRECTORY AND PROCESS THE MESSAGE IN JAVA

The body will be a `File` object that points to the file that was just dropped into the `inputdir` directory.

```java
from("file://inputdir/").process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        Object body = exchange.getIn().getBody();
        // do some business logic with the input body
    }
});
```

100.19. WRITING TO FILES

Camel is of course also able to write files, i.e. produce files. In the sample below we receive some reports on the SEDA queue that we process before they are being written to a directory.

100.19.1. Write to subdirectory using Exchange.FILE_NAME

Using a single route, it is possible to write a file to any number of subdirectories. If you have a route setup as such:

```java
<route>
    <from uri="bean:myBean"/>
    <to uri="file:/rootDirectory"/>
</route>
```

You can have `myBean` set the header `Exchange.FILE_NAME` to values such as:
Exchange.FILE_NAME = hello.txt => /rootDirectory/hello.txt
Exchange.FILE_NAME = foo/bye.txt => /rootDirectory/foobye.txt

This allows you to have a single route to write files to multiple destinations.

100.19.2. Writing file through the temporary directory relative to the final destination

Sometime you need to temporarily write the files to some directory relative to the destination directory. Such situation usually happens when some external process with limited filtering capabilities is reading from the directory you are writing to. In the example below files will be written to the /var/myapp/filesInProgress directory and after data transfer is done, they will be atomically moved to the '/var/myapp/finalDirectory' directory.

```java
from("direct:start").to("file://var/myapp/finalDirectory?tempPrefix=../filesInProgress/");
```

100.20. USING EXPRESSION FOR FILENAMES

In this sample we want to move consumed files to a backup folder using today's date as a sub-folder name:

```java
from("file://inbox?move=backup/${date:now:yyyyMMdd}/${file:name}").to("...");
```

See File Language for more samples.

100.21. AVOIDING READING THE SAME FILE MORE THAN ONCE (IDEMPOTENT CONSUMER)

Camel supports Idempotent Consumer directly within the component so it will skip already processed files. This feature can be enabled by setting the `idempotent=true` option.

```java
from("file://inbox?idempotent=true").to("...");
```

Camel uses the absolute file name as the idempotent key, to detect duplicate files. From Camel 2.11 onwards you can customize this key by using an expression in the idempotentKey option. For example to use both the name and the file size as the key

```xml
<route>
  <from uri="file://inbox?idempotent=true&idempotentKey=${file:name}-${file:size}"
  <to uri="bean:processInbox"/>
</route>
```

By default Camel uses a in memory based store for keeping track of consumed files, it uses a least recently used cache holding up to 1000 entries. You can plugin your own implementation of this store by using the `idempotentRepository` option using the `#` sign in the value to indicate it’s a referring to a bean in the Registry with the specified `id`.

```xml
<bean id="myStore" class="com.mycompany.MyIdempotentStore"/>
```

<!-- define our store as a plain spring bean -->
Camel will log at **DEBUG** level if it skips a file because it has been consumed before:

```
DEBUG FileConsumer is idempotent and the file has been consumed before. Will skip this file: target/idempotent/report.txt
```

### 100.22. USING A FILE BASED IDEMPOTENT REPOSITORY

In this section we will use the file based idempotent repository

```
org.apache.camel.processor.idempotent.FileIdempotentRepository
```

instead of the in-memory based that is used as default.

This repository uses a 1st level cache to avoid reading the file repository. It will only use the file repository to store the content of the 1st level cache. Thereby the repository can survive server restarts.

It will load the content of the file into the 1st level cache upon startup. The file structure is very simple as it stores the key in separate lines in the file. By default, the file store has a size limit of 1mb. When the file grows larger Camel will truncate the file store, rebuilding the content by flushing the 1st level cache into a fresh empty file.

We configure our repository using Spring XML creating our file idempotent repository and define our file consumer to use our repository with the `idempotentRepository` using `#` sign to indicate Registry lookup:

### 100.23. USING A JPA BASED IDEMPOTENT REPOSITORY

In this section we will use the JPA based idempotent repository instead of the in-memory based that is used as default.

First we need a persistence-unit in `META-INF/persistence.xml` where we need to use the class

```
org.apache.camel.processor.idempotent.jpa.MessageProcessed
```

and define our JPA idempotent repository in the spring XML file as well:

```
<persistence-unit name="idempotentDb" transaction-type="RESOURCE_LOCAL">
  <class>org.apache.camel.processor.idempotent.jpa.MessageProcessed</class>
  <properties>
    <property name="openjpa.ConnectionURL" value="jdbc:derby:target/idempotentTest;create=true"/>
    <property name="openjpa.ConnectionDriverName" value="org.apache.derby.jdbc.EmbeddedDriver"/>
    <property name="openjpa.jdbc.SynchronizeMappings" value="buildSchema"/>
    <property name="openjpa.Log" value="DefaultLevel=WARN, Tool=INFO"/>
    <property name="openjpa.Multithreaded" value="true"/>
  </properties>
</persistence-unit>
```

Next, we can create our JPA idempotent repository in the spring XML file as well:

```
<bean id="jpaStore" class="org.apache.camel.processor.idempotent.jpa.JpaMessageIdRepository">
  <!-- Here we refer to the entityFactory -->
  <constructor-arg index="0" ref="entityManagerFactory"/>
  <!-- This 2nd parameter is the name (= a category name). -->
</bean>
```
And yes then we just need to refer to the `jpaStore` bean in the file consumer endpoint using the `idempotentRepository` using the `#` syntax option:

```xml
<route>
  <from uri="file://inbox?idempotent=true&idempotentRepository=#jpaStore"/>
  <to uri="bean:processInbox"/>
</route>
```

### 100.24. FILTER USING ORG.APACHE.CAMEL.COMPONENT.FILE_GENERICFILEFILTER

Camel supports pluggable filtering strategies. You can then configure the endpoint with such a filter to skip certain files being processed.

In the sample we have built our own filter that skips files starting with `skip` in the filename:

And then we can configure our route using the `filter` attribute to reference our filter (using `#` notation) that we have defined in the spring XML file:

```xml
<route>
  <from uri="file://inbox?filter=#myFilter"/>
  <to uri="bean:processInbox"/>
</route>
```

### 100.25. FILTERING USING ANT PATH MATCHER

The ANT path matcher is shipped out-of-the-box in the `camel-spring` jar. So you need to depend on `camel-spring` if you are using Maven.

The reasons is that we leverage Spring’s `AntPathMatcher` to do the actual matching.

The file paths is matched with the following rules:

- `?` matches one character
- `*` matches zero or more characters
- `**` matches zero or more directories in a path

**TIP**

New options from Camel 2.10 onwards There are now `antInclude` and `antExclude` options to make it easy to specify ANT style include/exclude without having to define the filter. See the URI options above for more information.

The sample below demonstrates how to use it:
100.25.1. Sorting using Comparator

Camel supports pluggable sorting strategies. This strategy it to use the build in \texttt{java.util.Comparator} in Java. You can then configure the endpoint with such a comparator and have Camel sort the files before being processed.

In the sample we have built our own comparator that just sorts by file name:

And then we can configure our route using the \texttt{sorter} option to reference to our sorter (\texttt{mySorter}) we have defined in the spring XML file:

\begin{verbatim}
<!-- define our sorter as a plain spring bean -->
<bean id="mySorter" class="com.mycompany.MyFileSorter"/>

<route>
  <from uri="file://inbox?sorter=#mySorter"/>
  <to uri="bean:processInbox"/>
</route>
\end{verbatim}

\textbf{TIP}

\textit{URI options can reference beans using the \# syntax}\textit{In the Spring DSL route above notice that we can refer to beans in the Registry by prefixing the id with \#. So writing \texttt{sorter=#mySorter}, will instruct Camel to go look in the Registry for a bean with the ID, \texttt{mySorter}.}

100.25.2. Sorting using sortBy

Camel supports pluggable sorting strategies. This strategy it to use the \texttt{File Language} to configure the sorting. The \texttt{sortBy} option is configured as follows:

\begin{verbatim}
sortBy=group 1;group 2;group 3;...
\end{verbatim}

Where each group is separated with semi colon. In the simple situations you just use one group, so a simple example could be:

\begin{verbatim}
sortBy=file:name
\end{verbatim}

This will sort by file name, you can reverse the order by prefixing \texttt{reverse:} to the group, so the sorting is now \texttt{Z..A}:

\begin{verbatim}
sortBy=reverse:file:name
\end{verbatim}

As we have the full power of \texttt{File Language} we can use some of the other parameters, so if we want to sort by file size we do:

\begin{verbatim}
sortBy=file:length
\end{verbatim}

You can configure to ignore the case, using \texttt{ignoreCase:} for string comparison, so if you want to use file name sorting but to ignore the case then we do:

\begin{verbatim}
sortBy=ignoreCase:file:name
\end{verbatim}

You can combine ignore case and reverse, however reverse must be specified first:
In the sample below we want to sort by last modified file, so we do:

```
sortBy=file:modified
```

And then we want to group by name as a 2nd option so files with same modification is sorted by name:

```
sortBy=file:modified;file:name
```

Now there is an issue here, can you spot it? Well the modified timestamp of the file is too fine as it will be in milliseconds, but what if we want to sort by date only and then subgroup by name? Well as we have the true power of File Language we can use its date command that supports patterns. So this can be solved as:

```
sortBy=date:file:yyyyMMdd;file:name
```

Yeah, that is pretty powerful, oh by the way you can also use reverse per group, so we could reverse the file names:

```
sortBy=date:file:yyyyMMdd;reverse:file:name
```

### 100.26. USING GENERICFILEPROCESSSTRATEGY

The option `processStrategy` can be used to use a custom `GenericFileProcessStrategy` that allows you to implement your own `begin`, `commit` and `rollback` logic.

For instance let's assume a system writes a file in a folder you should consume. But you should not start consuming the file before another `ready` file has been written as well.

So by implementing our own `GenericFileProcessStrategy` we can implement this as:

- In the `begin()` method we can test whether the special `ready` file exists. The `begin` method returns a `boolean` to indicate if we can consume the file or not.
- In the `abort()` method (Camel 2.10) special logic can be executed in case the `begin` operation returned `false`, for example to cleanup resources etc.
- In the `commit()` method we can move the actual file and also delete the `ready` file.

### 100.27. USING FILTER

The `filter` option allows you to implement a custom filter in Java code by implementing the `org.apache.camel.component.file.GenericFileFilter` interface. This interface has an `accept` method that returns a boolean. Return `true` to include the file, and `false` to skip the file. From Camel 2.10 onwards, there is a `isDirectory` method on `GenericFile` whether the file is a directory. This allows you to filter unwanted directories, to avoid traversing down unwanted directories.

For example to skip any directories which starts with "**skip**" in the name, can be implemented as follows:

### 100.28. USING CONSUMER.BRIDGEERRORHANDLER

Available as of Camel 2.10
If you want to use the Camel Error Handler to deal with any exception occurring in the file consumer, then you can enable the `consumer.bridgeErrorHandler` option as shown below:

```java
// to handle any IOException being thrown
onException(IOException.class)
    .handled(true)
    .log("IOException occurred due: \${exception.message}\")
    .transform().simple("Error \${exception.message}\")
    .to("mock:error");

// this is the file route that pickup files, notice how we bridge the consumer to use the Camel routing error handler
// the exclusiveReadLockStrategy is only configured because this is from an unit test, so we use that to simulate exceptions
from("file:target/nospace?consumer.bridgeErrorHandler=true")
    .convertBodyTo(String.class)
    .to("mock:result");
```

So all you have to do is to enable this option, and the error handler in the route will take it from there.

**IMPORTANT**

**Important when using consumer.bridgeErrorHandler** When using consumer.bridgeErrorHandler, then interceptors, OnCompletions does not apply. The Exchange is processed directly by the Camel Error Handler, and does not allow prior actions such as interceptors, onCompletion to take action.

### 100.29. DEBUG LOGGING

This component has log level **TRACE** that can be helpful if you have problems.

### 100.30. SEE ALSO

- File Language
- FTP
- Polling Consumer
CHAPTER 101. FILE LANGUAGE

Available as of Camel version 1.1

INFO:*File language is now merged with Simple language* From Camel 2.2 onwards, the file language is now merged with Simple language which means you can use all the file syntax directly within the simple language.

The File Expression Language is an extension to the Simple language, adding file related capabilities. These capabilities are related to common use cases working with file path and names. The goal is to allow expressions to be used with the File and FTP components for setting dynamic file patterns for both consumer and producer.

101.1. FILE LANGUAGE OPTIONS

The File language supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resultType</td>
<td></td>
<td>String</td>
<td>Sets the class name of the result type (type from output)</td>
</tr>
<tr>
<td>trim</td>
<td>true</td>
<td>Boolean</td>
<td>Whether to trim the value to remove leading and trailing whitespaces and line breaks</td>
</tr>
</tbody>
</table>

101.2. SYNTAX

This language is an extension to the Simple language so the Simple syntax applies also. So the table below only lists the additional. As opposed to Simple language File Language also supports Constant expressions so you can enter a fixed filename.

All the file tokens use the same expression name as the method on the java.io.File object, for instance file:.absolute refers to the java.io.File.getAbsolute() method. Notice that not all expressions are supported by the current Exchange. For instance the FTP component supports some of the options, where as the File component supports all of them.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Type</th>
<th>File Consumer</th>
<th>File Producer</th>
<th>FTP Consumer</th>
<th>FTP Producer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file:name</td>
<td>String</td>
<td>yes</td>
<td>no</td>
<td>yes</td>
<td>no</td>
<td>refers to the file name (is relative to the starting directory, see note below)</td>
</tr>
<tr>
<td>file:name.ext</td>
<td>String</td>
<td>yes</td>
<td>no</td>
<td>yes</td>
<td>no</td>
<td>Camel 2.3: refers to the file extension only</td>
</tr>
<tr>
<td>Expression</td>
<td>Type</td>
<td>File Consumer</td>
<td>File Producer</td>
<td>FTP Consumer</td>
<td>FTP Producer</td>

<td>Refers to the file last modified returned as a Date type</td>
</tr>
<tr>
<td>date:command:pattern_</td>
<td>String</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
<td>for date formatting using the java.text.SimpleDateFormat patterns. Is an extension to the Simple language. Additional command is: file (consumers only) for the last modified timestamp of the file. Notice: all the commands from the Simple language can also be used.</td>
</tr>
</tbody>
</table>

**101.3. FILE TOKEN EXAMPLE**

**101.3.1. Relative paths**
We have a `java.io.File` handle for the file `hello.txt` in the following relative directory: `.\filelanguage\test`. And we configure our endpoint to use this starting directory `.\filelanguage`. The file tokens will return as:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>file:name</td>
<td><code>test\hello.txt</code></td>
</tr>
<tr>
<td>file:name.ext</td>
<td><code>txt</code></td>
</tr>
<tr>
<td>file:name.noext</td>
<td><code>test\hello</code></td>
</tr>
<tr>
<td>file:onlyname</td>
<td><code>hello.txt</code></td>
</tr>
<tr>
<td>file:onlyname.noext</td>
<td><code>hello</code></td>
</tr>
<tr>
<td>file:ext</td>
<td><code>txt</code></td>
</tr>
<tr>
<td>file:parent</td>
<td><code>filelanguage\test</code></td>
</tr>
<tr>
<td>file:path</td>
<td><code>filelanguage\test\hello.txt</code></td>
</tr>
<tr>
<td>file:absolute</td>
<td><code>false</code></td>
</tr>
<tr>
<td>file:absolute.path</td>
<td><code>\workspace\camel\camel-core\target\filelanguage\test\hello.txt</code></td>
</tr>
</tbody>
</table>

### 101.3.2. Absolute paths

We have a `java.io.File` handle for the file `hello.txt` in the following absolute directory: `\workspace\camel\camel-core\target\filelanguage\test`. And we configure our endpoint to use the absolute starting directory `\workspace\camel\camel-core\target\filelanguage`. The file tokens will return as:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>file:name</td>
<td><code>test\hello.txt</code></td>
</tr>
<tr>
<td>file:name.ext</td>
<td><code>txt</code></td>
</tr>
<tr>
<td>file:name.noext</td>
<td><code>test\hello</code></td>
</tr>
<tr>
<td>file:onlyname</td>
<td><code>hello.txt</code></td>
</tr>
<tr>
<td>file:onlyname.noext</td>
<td><code>hello</code></td>
</tr>
<tr>
<td>file:ext</td>
<td><code>txt</code></td>
</tr>
<tr>
<td>Expression</td>
<td>Returns</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>file:parent</td>
<td>\workspace\camel\camel-core\target\filelanguage\test</td>
</tr>
<tr>
<td>file:path</td>
<td>\workspace\camel\camel-core\target\filelanguage\test\hello.txt</td>
</tr>
<tr>
<td>file:absolute</td>
<td>true</td>
</tr>
<tr>
<td>file:absolute.path</td>
<td>\workspace\camel\camel-core\target\filelanguage\test\hello.txt</td>
</tr>
</tbody>
</table>

101.4. SAMPLES

You can enter a fixed **Constant** expression such as *myfile.txt*:

```java
fileName="myfile.txt"
```

Let's assume we use the file consumer to read files and want to move the read files to backup folder with the current date as a sub folder. This can be achieved using an expression like:

```java
fileName="backup/${date:now:yyyyMMdd}/${file:name.noext}.bak"
```

Relative folder names are also supported so suppose the backup folder should be a sibling folder then you can append .. as:

```java
fileName="../backup/${date:now:yyyyMMdd}/${file:name.noext}.bak"
```

As this is an extension to the **Simple** language we have access to all the goodies from this language also, so in this use case we want to use the in.header.type as a parameter in the dynamic expression:

```java
fileName="../backup/${date:now:yyyyMMdd}/type-${in.header.type}/backup-of-${file:name.noext}.bak"
```

If you have a custom Date you want to use in the expression then Camel supports retrieving dates from the message header.

```java
fileName="orders/order-${in.header.customerId}-${date:in.header.orderDate:yyyyMMdd}.xml"
```

And finally we can also use a bean expression to invoke a POJO class that generates some String output (or convertible to String) to be used:

```java
fileName="uniquefile-${bean:myguidgenerator.generateid}.txt"
```

And of course all this can be combined in one expression where you can use the **File Language**, **Simple** and the **Bean** language in one combined expression. This is pretty powerful for those common file path patterns.
101.5. USING SPRING PROPERTYPLACEHOLDERCONFIGURER TOGETHER WITH THE FILE COMPONENT

In Camel you can use the File Language directly from the Simple language which makes a Content Based Router easier to do in Spring XML, where we can route based on file extensions as shown below:

```xml
<from uri="file://input/orders"/>
<choice>
  <when>
    <simple>${file:ext} == 'txt'</simple>
    <to uri="bean:orderService?method=handleTextFiles"/>
  </when>
  <when>
    <simple>${file:ext} == 'xml'</simple>
    <to uri="bean:orderService?method=handleXmlFiles"/>
  </when>
  <otherwise>
    <to uri="bean:orderService?method=handleOtherFiles"/>
  </otherwise>
</choice>
```

If you use the fileName option on the File endpoint to set a dynamic filename using the File Language then make sure you use the alternative syntax (available from Camel 2.5 onwards) to avoid clashing with Springs PropertyPlaceholderConfigurer.

**bundle-context.xml**

```xml
<bean id="propertyPlaceholder" class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
  <property name="location" value="classpath:bundle-context.cfg" />
</bean>

<bean id="sampleRoute" class="SampleRoute">
  <property name="fromEndpoint" value="${fromEndpoint}" />
  <property name="toEndpoint" value="${toEndpoint}" />
</bean>
```

**bundle-context.cfg**

```xml
fromEndpoint=activemq:queue:test
toEndpoint=file://fileRoute/out?fileName=test-$simple{date:now:yyyyMMdd}.txt
```

Notice how we use the $simple \{ \} syntax in the toEndpoint above. If you don’t do this, there is a clash and Spring will throw an exception like

```java
org.springframework.beans.factory.BeanDefinitionStoreException: Invalid bean definition with name 'sampleRoute' defined in class path resource [bundle-context.xml]: Could not resolve placeholder 'date:now:yyyyMMdd'
```

101.6. DEPENDENCIES

The File language is part of camel-core.
CHAPTER 102. FLATPACK COMPONENT

Available as of Camel version 1.4

The Flatpack component supports fixed width and delimited file parsing via the FlatPack library. Notice: This component only supports consuming from flatpack files to Object model. You can not (yet) write from Object model to flatpack format.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

102.1. URI FORMAT

```
flatpack:[delim|fixed]:flatPackConfig.pzmap.xml[?options]
```

Or for a delimited file handler with no configuration file just use

```
flatpack:someName[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&…`

102.2. URI OPTIONS

The Flatpack component has no options.

The Flatpack endpoint is configured using URI syntax:

```
flatpack:type:resourceUri
```

with the following path and query parameters:

102.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Whether to use fixed or delimiter</td>
<td>delim</td>
<td>FlatpackType</td>
</tr>
<tr>
<td>resourceUri</td>
<td>Required URL for loading the flatpack mapping file from classpath or file system</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

102.2.2. Query Parameters (25 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowShortLines</td>
<td>Allows for lines to be shorter than expected and ignores the extra characters</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>delimiter</td>
<td>The default character delimiter for delimited files.</td>
<td></td>
<td>char</td>
</tr>
<tr>
<td>ignoreExtraColumns</td>
<td>Allows for lines to be longer than expected and ignores the extra characters</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>ignoreFirstRecord</td>
<td>Whether the first line is ignored for delimited files (for the column headers).</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>splitRows</td>
<td>Sets the Component to send each row as a separate exchange once parsed</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>textQualifier</td>
<td>The text qualifier for delimited files.</td>
<td></td>
<td>char</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendEmptyMessage</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>pollStrategy</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollStrategy</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>synchronous</strong> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>backoffErrorThreshold</strong></td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><strong>backoffIdleThreshold</strong></td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><strong>backoffMultiplier</strong></td>
<td>To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><strong>delay</strong></td>
<td>Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>500</td>
<td>long</td>
</tr>
<tr>
<td><strong>greedy</strong></td>
<td>If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>initialDelay</strong></td>
<td>Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td><strong>runLoggingLevel</strong></td>
<td>The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that.</td>
<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td><strong>scheduledExecutorService</strong></td>
<td>Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool.</td>
<td></td>
<td>ScheduledExecutorService</td>
</tr>
<tr>
<td><strong>scheduler</strong></td>
<td>To use a cron scheduler from either camel-spring or camel-quartz2 component</td>
<td>none</td>
<td>ScheduledPollConsumerScheduler</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>schedulerProperties (scheduler)</td>
<td>To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>startScheduler (scheduler)</td>
<td>Whether the scheduler should be auto started.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>timeUnit (scheduler)</td>
<td>Time unit for initialDelay and delay options.</td>
<td>MILLISECONDS</td>
<td>TimeUnit</td>
</tr>
<tr>
<td>useFixedDelay (scheduler)</td>
<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 102.3. EXAMPLES

- **flatpack:fixed:foo.pzmap.xml** creates a fixed-width endpoint using the foo.pzmap.xml file configuration.

- **flatpack:delim:bar.pzmap.xml** creates a delimited endpoint using the bar.pzmap.xml file configuration.

- **flatpack:foo** creates a delimited endpoint called **foo** with no file configuration.

### 102.4. MESSAGE HEADERS

Camel will store the following headers on the IN message:

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>camelFlatpackCounter</td>
<td>The current row index. For splitRows=false the counter is the total number of rows.</td>
</tr>
</tbody>
</table>

### 102.5. MESSAGE BODY

The component delivers the data in the IN message as a org.apache.camel.component.flatpack.DataSetList object that has converters for java.util.Map or java.util.List.

Usually you want the Map if you process one row at a time (splitRows=true). Use List for the entire content (splitRows=false), where each element in the list is a Map. Each Map contains the key for the column name and its corresponding value.

For example to get the firstname from the sample below:

```java
Map row = exchange.getIn().getBody(Map.class);
String firstName = row.get("FIRSTNAME");
```
However, you can also always get it as a **List** (even for `splitRows=true`). The same example:

```java
List data = exchange.getIn().getBody(List.class);
Map row = (Map)data.get(0);
String firstName = row.get("FIRSTNAME");
```

### 102.6. HEADER AND TRAILER RECORDS

The header and trailer notions in Flatpack are supported. However, you **must** use fixed record IDs:

- **header** for the header record (must be lowercase)
- **trailer** for the trailer record (must be lowercase)

The example below illustrates this fact that we have a header and a trailer. You can omit one or both of them if not needed.

```xml
<RECORD id="header" startPosition="1" endPosition="3" indicator="HBT">
  <COLUMN name="INDICATOR" length="3"/>
  <COLUMN name="DATE" length="8"/>
</RECORD>

<COLUMN name="FIRSTNAME" length="35"/>
<COLUMN name="LASTNAME" length="35"/>
<COLUMN name="ADDRESS" length="100"/>
<COLUMN name="CITY" length="100"/>
<COLUMN name="STATE" length="2"/>
<COLUMN name="ZIP" length="5"/>

<RECORD id="trailer" startPosition="1" endPosition="3" indicator="FBT">
  <COLUMN name="INDICATOR" length="3"/>
  <COLUMN name="STATUS" length="7"/>
</RECORD>
```

### 102.7. USING THE ENDPOINT

A common use case is sending a file to this endpoint for further processing in a separate route. For example:

```xml
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="file://someDirectory"/>
    <to uri="flatpack:foo"/>
  </route>

  <route>
    <from uri="flatpack:foo"/>
    ...
  </route>
</camelContext>
```

You can also convert the payload of each message created to a **Map** for easy Bean Integration.
102.8. FLATPACK DATAFORMAT

The Flatpack component ships with the Flatpack data format that can be used to format between fixed width or delimited text messages to a List of rows as Map.

- marshal = from List<Map<String, Object>> to OutputStream (can be converted to String)
- unmarshal = from java.io.InputStream (such as a File or String) to a java.util.List as an org.apache.camel.component.flatpack.DataSetList instance.

The result of the operation will contain all the data. If you need to process each row one by one you can split the exchange, using Splitter.

Notice: The Flatpack library does currently not support header and trailers for the marshal operation.

102.9. OPTIONS

The data format has the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>definition</td>
<td>null</td>
<td>The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap.</td>
</tr>
<tr>
<td>fixed</td>
<td>false</td>
<td>Delimited or fixed.</td>
</tr>
<tr>
<td>ignore FirstRecord</td>
<td>true</td>
<td>Whether the first line is ignored for delimited files (for the column headers).</td>
</tr>
<tr>
<td>textQualifier</td>
<td>&quot;</td>
<td>If the text is qualified with a char such as &quot;.</td>
</tr>
<tr>
<td>delimiter</td>
<td>,</td>
<td>The delimiter char (could be ; , or similar)</td>
</tr>
<tr>
<td>parser Factory</td>
<td>null</td>
<td>Uses the default Flatpack parser factory.</td>
</tr>
<tr>
<td>allow Short Lines</td>
<td>false</td>
<td>Camel 2.9.7 and 2.10.5 onwards: Allows for lines to be shorter than expected and ignores the extra characters.</td>
</tr>
<tr>
<td>ignore Extra Columns</td>
<td>false</td>
<td>Camel 2.9.7 and 2.10.5 onwards: Allows for lines to be longer than expected and ignores the extra characters.</td>
</tr>
</tbody>
</table>

102.10. USAGE
To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```java
FlatpackDataFormat fp = new FlatpackDataFormat();
fp.setDefinition(new ClassPathResource("INVENTORY-Delimited.pzmap.xml"));
... from("file:order/in").unmarshal(df).to("seda:queue:neworder");
```

The sample above will read files from the order/in folder and unmarshal the input using the Flatpack configuration file INVENTORY-Delimited.pzmap.xml that configures the structure of the files. The result is a DataSetList object we store on the SEDA queue.

In the code above we marshal the data from a Object representation as a List of rows as Maps. The rows as Map contains the column name as the key, and the the corresponding value. This structure can be created in Java code from e.g. a processor. We marshal the data according to the Flatpack format and convert the result as a String object and store it on a JMS queue.

### 102.12. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 103. FLATPACK DATAFORMAT

Available as of Camel version 2.1

The Flatpack component ships with the Flatpack data format that can be used to format between fixed width or delimited text messages to a `List` of rows as `Map`.

- marshal = from `List<Map<String, Object>>` to `OutputStream` (can be converted to `String`)
- unmarshal = from `java.io.InputStream` (such as a `File` or `String`) to a `java.util.List` as an `org.apache.camel.component.flatpack.DataSetList` instance.

The result of the operation will contain all the data. If you need to process each row one by one you can split the exchange, using Splitter.

**Notice:** The Flatpack library does currently not support header and trailers for the marshal operation.

103.1. OPTIONS

The Flatpack dataformat supports 9 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>definition</td>
<td>String</td>
<td>String</td>
<td>The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap.</td>
</tr>
<tr>
<td>fixed</td>
<td>false</td>
<td>Boolean</td>
<td>Delimited or fixed. Is by default false = delimited</td>
</tr>
<tr>
<td>ignoreFirstRecord</td>
<td>true</td>
<td>Boolean</td>
<td>Whether the first line is ignored for delimited files (for the column headers). Is by default true.</td>
</tr>
<tr>
<td>textQualifier</td>
<td></td>
<td>String</td>
<td>If the text is qualified with a character. Uses quote character by default.</td>
</tr>
<tr>
<td>delimiter</td>
<td>,</td>
<td>String</td>
<td>The delimiter char (could be ; , or similar)</td>
</tr>
<tr>
<td>allowShortLines</td>
<td>false</td>
<td>Boolean</td>
<td>Allows for lines to be shorter than expected and ignores the extra characters</td>
</tr>
<tr>
<td>ignoreExtraColumns</td>
<td>false</td>
<td>Boolean</td>
<td>Allows for lines to be longer than expected and ignores the extra characters.</td>
</tr>
<tr>
<td>parserFactoryRef</td>
<td></td>
<td>String</td>
<td>References to a custom parser factory to lookup in the registry</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>
103.2. USAGE

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```java
FlatpackDataFormat fp = new FlatpackDataFormat();
fp.setDefinition(new ClassPathResource("INVENTORY-Delimited.pzmap.xml"));
...
from("file:order/in").unmarshal(df).to("seda:queue:neworder");
```

The sample above will read files from the order/in folder and unmarshal the input using the Flatpack configuration file INVENTORY-Delimited.pzmap.xml that configures the structure of the files. The result is a `DataSetList` object we store on the SEDA queue.

```java
FlatpackDataFormat df = new FlatpackDataFormat();
df.setDefinition(new ClassPathResource("PEOPLE-FixedLength.pzmap.xml"));
df.setFixed(true);
df.setIgnoreFirstRecord(false);
from("seda:people").marshal(df).convertBodyTo(String.class).to("jms:queue:people");
```

In the code above we marshal the data from a Object representation as a `List` of rows as `Maps`. The rows as `Map` contains the column name as the key, and the the corresponding value. This structure can be created in Java code from e.g. a processor. We marshal the data according to the Flatpack format and convert the result as a `String` object and store it on a JMS queue.

103.3. DEPENDENCIES

To use Flatpack in your camel routes you need to add the a dependency on `camel-flatpack` which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
</dependency>
```
CHAPTER 104. APACHE FLINK COMPONENT

Available as of Camel version 2.18

This documentation page covers the Apache Flink component for the Apache Camel. The `camel-flink` component provides a bridge between Camel connectors and Flink tasks. This Camel Flink connector provides a way to route message from various transports, dynamically choosing a flink task to execute, use incoming message as input data for the task and finally deliver the results back to the Camel pipeline.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flink</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

### 104.1. URI FORMAT

Currently, the Flink Component supports only Producers. One can create DataSet, DataStream jobs.

```
flink:dataset?dataset=#myDataSet&dataSetCallback=#dataSetCallback
flink:datastream?datastream=#myDataStream&dataStreamCallback=#dataStreamCallback
```

**FlinkEndpoint Options**

The Apache Flink endpoint is configured using URI syntax:

```
flink:endpointType
```

with the following path and query parameters:

#### 104.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpointType</td>
<td>Required Type of the endpoint (dataset, datastream).</td>
<td></td>
<td>EndpointType</td>
</tr>
</tbody>
</table>

#### 104.1.2. Query Parameters (6 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>collect  (producer)</td>
<td>Indicates if results should be collected or counted.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td>dataSet (producer)</td>
<td>DataSet to compute against.</td>
<td></td>
<td>DataSet</td>
</tr>
<tr>
<td>dataSetCallback (producer)</td>
<td>Function performing action against a DataSet.</td>
<td></td>
<td>DataSetCallback</td>
</tr>
<tr>
<td>dataStream (producer)</td>
<td>DataStream to compute against.</td>
<td></td>
<td>DataStream</td>
</tr>
<tr>
<td>dataStreamCallback (producer)</td>
<td>Function performing action against a DataStream.</td>
<td></td>
<td>DataStreamCallback</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 104.2. FLINKCOMPONENT OPTIONS

The Apache Flink component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSet (producer)</td>
<td>DataSet to compute against.</td>
<td></td>
<td>DataSet</td>
</tr>
<tr>
<td>dataStream (producer)</td>
<td>DataStream to compute against.</td>
<td></td>
<td>DataStream</td>
</tr>
<tr>
<td>dataSetCallback (producer)</td>
<td>Function performing action against a DataSet.</td>
<td></td>
<td>DataSetCallback</td>
</tr>
<tr>
<td>dataStreamCallback (producer)</td>
<td>Function performing action against a DataStream.</td>
<td></td>
<td>DataStreamCallback</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 104.3. FLINK DATASET CALLBACK

```java
@Bean
public DataSetCallback<Long> dataSetCallback() {
    return new DataSetCallback<Long>() {
```
public Long onDataSet(DataSet dataSet, Object... objects) {
    try {
        dataSet.print();
        return new Long(0);
    } catch (Exception e) {
        return new Long(-1);
    }
}

@Bean
public VoidDataStreamCallback dataStreamCallback() {
    return new VoidDataStreamCallback() {
        @Override
        public void doOnDataStream(DataStream dataStream, Object... objects) throws Exception {
            dataStream.flatMap(new Splitter()).print();
            environment.execute("data stream test");
        }
    };
}

CHAPTER 104. APACHE FLINK COMPONENT

104.4. FLINK DATASTREAM CALLBACK

104.5. CAMEL-FLINK PRODUCER CALL

CamelContext camelContext = new SpringCamelContext(context);

String pattern = "foo";

try {
    ProducerTemplate template = camelContext.createProducerTemplate();
    camelContext.start();
    Long count = template.requestBody("flink:dataSet?dataSet=#myDataSet&dataSetCallback=#countLinesContaining", pattern, Long.class);
} finally {
    camelContext.stop();
}

104.6. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 105. FOP COMPONENT

Available as of Camel version 2.10

The FOP component allows you to render a message into different output formats using Apache FOP.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-fop</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

105.1. URI FORMAT

fop://outputFormat?[options]

105.2. OUTPUT FORMATS

The primary output format is PDF but other output formats are also supported:

<table>
<thead>
<tr>
<th>name</th>
<th>output Format</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDF</td>
<td>application/pdf</td>
<td>Portable Document Format</td>
</tr>
<tr>
<td>PS</td>
<td>application/postscript</td>
<td>Adobe Postscript</td>
</tr>
<tr>
<td>PCL</td>
<td>application/x-pcl</td>
<td>Printer Control Language</td>
</tr>
<tr>
<td>PNG</td>
<td>image/png</td>
<td>PNG images</td>
</tr>
<tr>
<td>JPEG</td>
<td>image/jpeg</td>
<td>JPEG images</td>
</tr>
<tr>
<td>SVG</td>
<td>image/svg+xml</td>
<td>Scalable Vector Graphics</td>
</tr>
</tbody>
</table>
The complete list of valid output formats can be found [here](#).

## 105.3. EndPoint Options

The FOP component has no options.

The FOP endpoint is configured using URI syntax:

```
fop:outputType
```

with the following path and query parameters:

### 105.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>outputType</td>
<td>Required The primary output format is PDF but other output formats are also supported.</td>
<td>FopOutputType</td>
<td></td>
</tr>
</tbody>
</table>

### 105.3.2. Query Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>fopFactory</td>
<td>Allows to use a custom configured or implementation of org.apache.fop.apps.FopFactory.</td>
<td></td>
<td>FopFactory</td>
</tr>
</tbody>
</table>
The location of a configuration file which can be loaded from classpath or file system.

Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

The location of a configuration file with the following structure. From Camel 2.12 onwards the file is loaded from the classpath by default. You can use file:, or classpath: as prefix to load the resource from file or classpath. In previous releases the file is always loaded from file system.

fopFactory

Allows to use a custom configured or implementation of org.apache.fop.apps.FopFactory.

### 105.4. MESSAGE OPERATIONS

<table>
<thead>
<tr>
<th>name</th>
<th>default value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelFop.OutputFormat</td>
<td></td>
<td>Overrides the output format for that message</td>
</tr>
<tr>
<td>CamelFop.Encrypt.userPassword</td>
<td></td>
<td>PDF user password</td>
</tr>
<tr>
<td>CamelFop.Encrypt.ownerPassword</td>
<td></td>
<td>PDF owner passoword</td>
</tr>
<tr>
<td>CamelFop.Encrypt.allowPrint</td>
<td>true</td>
<td>Allows printing the PDF</td>
</tr>
<tr>
<td>name</td>
<td>default value</td>
<td>description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>CamelFop.Encrypt.allowCopyContent</td>
<td>true</td>
<td>Allows copying content of the PDF</td>
</tr>
<tr>
<td>CamelFop.Encrypt.alloWEditContent</td>
<td>true</td>
<td>Allows editing content of the PDF</td>
</tr>
<tr>
<td>CamelFop.Encrypt.alloWEditAnnotations</td>
<td>true</td>
<td>Allows editing annotation of the PDF</td>
</tr>
<tr>
<td>CamelFop.Render.producer</td>
<td>Apache FOP</td>
<td>Metadata element for the system/software that produces the document</td>
</tr>
<tr>
<td>CamelFop.Render.creator</td>
<td></td>
<td>Metadata element for the user that created the document</td>
</tr>
<tr>
<td>CamelFop.Render.creationDate</td>
<td></td>
<td>Creation Date</td>
</tr>
<tr>
<td>CamelFop.Render.author</td>
<td></td>
<td>Author of the content of the document</td>
</tr>
<tr>
<td>CamelFop.Render.title</td>
<td></td>
<td>Title of the document</td>
</tr>
</tbody>
</table>
105.5. EXAMPLE

Below is an example route that renders PDFs from xml data and xslt template and saves the PDF files in target folder:

```java
from("file:source/data/xml")
    .to("xslt:xslt/template.xsl")
    .to("fop:application/pdf")
    .to("file:target/data");
```

For more information, see these resources...

105.6. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 106. FREEMARKER COMPONENT

Available as of Camel version 2.10

The freemarker: component allows for processing a message using a FreeMarker template. This can be ideal when using Templating to generate responses for requests.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-freemarker</artifactId>
    <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

106.1. URI FORMAT

freemarker:templateName[?options]

Where templateName is the classpath-local URI of the template to invoke; or the complete URL of the remote template (eg: file://folder/myfile.ftl).

You can append query options to the URI in the following format, ?option=value&option=value&…

106.2. OPTIONS

The Freemarker component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (advanced)</td>
<td>To use an existing freemarker.template.Configuration instance as the configuration.</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Freemarker endpoint is configured using URI syntax:

freemarker:resourceUri

with the following path and query parameters:

106.2.1. Path Parameters (1 parameters):
### 106.2.2. Query Parameters (5 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Sets the Freemarker configuration to use</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>contentCache</td>
<td>Sets whether to use resource content cache or not</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>encoding</td>
<td>Sets the encoding to be used for loading the template file.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>templateUpdateDelay</td>
<td>Number of seconds the loaded template resource will remain in the cache.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 106.3. HEADERS

Headers set during the FreeMarker evaluation are returned to the message and added as headers. This provides a mechanism for the FreeMarker component to return values to the Message.

An example: Set the header value of `fruit` in the FreeMarker template:

```java
${request.setHeader('fruit', 'Apple')}
```

The header, `fruit`, is now accessible from the `message.out.headers`.

### 106.4. FREEMARKER CONTEXT

Camel will provide exchange information in the FreeMarker context (just a `Map`). The `Exchange` is transferred as:
From Camel 2.14, you can set up your custom FreeMarker context in the message header with the key "CamelFreemarkerDataModel" just like this:

```java
Map<String, Object> variableMap = new HashMap<String, Object>();
variableMap.put("headers", headersMap);
variableMap.put("body", "Monday");
variableMap.put("exchange", exchange);
exchange.getIn().setHeader("CamelFreemarkerDataModel", variableMap);
```

### 106.5. HOT RELOADING

The FreeMarker template resource is by default not hot reloadable for both file and classpath resources (expanded jar). If you set `contentCache=false`, then Camel will not cache the resource and hot reloading is thus enabled. This scenario can be used in development.

### 106.6. DYNAMIC TEMPLATES

Camel provides two headers by which you can define a different resource location for a template or the template content itself. If any of these headers is set then Camel uses this over the endpoint configured resource. This allows you to provide a dynamic template at runtime.

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
<th>Support Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>FreemarkerConstants.FREEMARKER_RESOURSE</td>
<td>org.springframework.core.io.Resource</td>
<td>The template resource</td>
<td>&lt;= 2.1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>key</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>exchange</td>
<td>The <strong>Exchange</strong> itself.</td>
</tr>
<tr>
<td>exchange.properties</td>
<td>The <strong>Exchange</strong> properties.</td>
</tr>
<tr>
<td>headers</td>
<td>The headers of the In message.</td>
</tr>
<tr>
<td>camelContext</td>
<td>The Camel Context.</td>
</tr>
<tr>
<td>request</td>
<td>The In message.</td>
</tr>
<tr>
<td>body</td>
<td>The In message body.</td>
</tr>
<tr>
<td>response</td>
<td>The Out message (only for InOut message exchange pattern).</td>
</tr>
</tbody>
</table>
106.7. SAMPLES

For example you could use something like:

```java
from("activemq:My.Queue").
to("freemarker:com/acme/MyResponse.ftl");
```

To use a FreeMarker template to formulate a response for a message for InOut message exchanges (where there is a `JMSReplyTo` header).

If you want to use InOnly and consume the message and send it to another destination you could use:

```java
from("activemq:My.Queue").
to("freemarker:com/acme/MyResponse.ftl").
to("activemq:Another.Queue");
```

And to disable the content cache, e.g. for development usage where the `.ftl` template should be hot reloaded:

```java
from("activemq:My.Queue").
to("freemarker:com/acme/MyResponse.ftl?contentCache=false").
to("activemq:Another.Queue");
```
And a file-based resource:

```camel
from("activemq:My.Queue").
to("freemarker:file://myfolder/MyResponse.ftl?contentCache=false").
to("activemq:Another.Queue");
```

In Camel 2.1 it’s possible to specify what template the component should use dynamically via a header, so for example:

```camel
from("direct:in").
setHeader(FreemarkerConstants.FREEMARKER_RESOURCE_URI).constant("path/to/my/template.ft l").
to("freemarker:dummy");
```

### 106.8. THE EMAIL SAMPLE

In this sample we want to use FreeMarker templating for an order confirmation email. The email template is laid out in FreeMarker as:

```freemarker
Dear ${headers.lastName}, ${headers.firstName}
Thanks for the order of ${headers.item}.
Regards Camel Riders Bookstore
${body}
```

And the java code:

### 106.9. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 107. FTP COMPONENT

Available as of Camel version 1.1

This component provides access to remote file systems over the FTP and SFTP protocols.

When consuming from remote FTP server make sure you read the section titled Default when consuming files further below for details related to consuming files.

Absolute path is not supported. Camel 2.16 will translate absolute path to relative by trimming all leading slashes from directoryname. There’ll be WARN message printed in the logs.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ftp</artifactId>
  <version>x.x.x</version>
  <optional>true</optional>
</dependency>
```

107.1. URI FORMAT

ftp://[username@[[:port[/directoryname]?options]
sftp://[username@[[:port[/directoryname]?options]
ftps://[username@[[:port[/directoryname]?options]

Where directoryname represents the underlying directory. The directory name is a relative path. Absolute path’s is not supported. The relative path can contain nested folders, such as /inbox/us.

For Camel versions before Camel 2.16, the directoryName must exist already as this component does not support the autoCreate option (which the file component does). The reason is that its the FTP administrator (FTP server) task to properly setup user accounts, and home directories with the right file permissions etc.

For Camel 2.16, autoCreate option is supported. When consumer starts, before polling is scheduled, there’s additional FTP operation performed to create the directory configured for endpoint. The default value for autoCreate is true.

If no username is provided, then anonymous login is attempted using no password.
If no port number is provided, Camel will provide default values according to the protocol (ftp = 21, sftp = 22, ftps = 2222).

You can append query options to the URI in the following format, ?option=value&option=value&…

This component uses two different libraries for the actual FTP work. FTP and FTPS uses Apache Commons Net while SFTP uses JCraft JSCH.

The FTPS component is only available in Camel 2.2 or newer.
FTPS (also known as FTP Secure) is an extension to FTP that adds support for the Transport Layer Security (TLS) and the Secure Sockets Layer (SSL) cryptographic protocols.

107.2. URI OPTIONS
The options below are exclusive for the FTP component.

The FTP component has no options.

The FTP endpoint is configured using URI syntax:

```
ftp:host:port/directoryName
```

with the following path and query parameters:

### 107.2.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Required Hostname of the FTP server</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>Port of the FTP server</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>directoryName</td>
<td>The starting directory</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 107.2.2. Query Parameters (108 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>binary (common)</td>
<td>Specifies the file transfer mode, BINARY or ASCII. Default is ASCII (false).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>charset (common)</td>
<td>This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>disconnect (common)</td>
<td>Whether or not to disconnect from remote FTP server right after use. Disconnect will only disconnect the current connection to the FTP server. If you have a consumer which you want to stop, then you need to stop the consumer/route instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>doneFileName (common)</td>
<td>Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only $file.name and $file.name.noext is supported as dynamic placeholders.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>fileName (common)</td>
<td>Use Expression such as File Language to dynamically set the filename. For consumers, it’s used as a filename filter. For producers, it’s used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used – this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today’s file using the File Language syntax: mydata-$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>passiveMode (common)</td>
<td>Sets passive mode connections. Default is active mode connections.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>separator (common)</td>
<td>Sets the path separator to be used. UNIX = Uses unix style path separator Windows = Uses windows style path separator Auto = (is default) Use existing path separator in file name</td>
<td>UNIX</td>
<td>PathSeparator</td>
</tr>
<tr>
<td>transferLoggingInterval Seconds (common)</td>
<td>Configures the interval in seconds to use when logging the progress of upload and download operations that are in-flight. This is used for logging progress when operations takes longer time.</td>
<td>5</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>

<tr>
<td>processStrategy (consumer)</td>
<td>A pluggable org.apache.camel.component.file.GenericFileProcess Strategy allowing you to implement your own readLock option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the readLock option does not apply.</td>
<td></td>
<td>GenericFileProcessStrategy&lt;T&gt;</td>
</tr>
<tr>
<td>receiveBufferSize (consumer)</td>
<td>The receive (download) buffer size Used only by FTPClient</td>
<td>32768</td>
<td>int</td>
</tr>
<tr>
<td>startingDirectory MustExist (consumer)</td>
<td>Whether the starting directory must exist. Mind that the autoCreate option is default enabled, which means the starting directory is normally auto created if it doesn’t exist. You can disable autoCreate and enable this to ensure the starting directory must exist. Will throw an exception if the directory doesn’t exist.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useList (consumer)</td>
<td>Whether to allow using LIST command when downloading a file. Default is true. In some use cases you may want to download a specific file and are not allowed to use the LIST command, and therefore you can set this option to false. Notice when using this option, then the specific file to download does not include meta-data information such as file size, timestamp, permissions etc, because those information is only possible to retrieve when LIST command is in use.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>fileExist (producer)</td>
<td>What to do if a file already exists with the same name. Override, which is the default, replaces the existing file. Append - adds content to the existing file. Fail - throws a GenericFileOperationException, indicating that there is already an existing file. Ignore - silently ignores the problem and does not override the existing file, but assumes everything is okay. Move - option requires to use the moveExisting option to be configured as well. The option eagerDeleteTargetFile can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The Move option will move any existing files, before writing the target file. TryRename is only applicable if tempFileName option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers.</td>
<td>Override</td>
<td>GenericFileExist</td>

<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>flatten (producer)</td>
<td>Flatten is used to flatten the file name path to strip any leading paths, so it’s just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>moveExisting (producer)</td>
<td>Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>tempFileName (producer)</td>
<td>The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>tempPrefix (producer)</td>
<td>This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>allowNullBody (producer)</td>
<td>Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>chmod (producer)</td>
<td>Allows you to set chmod on the stored file. For example chmod=640.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>disconnectOnBatchComplete (producer)</td>
<td>Whether or not to disconnect from remote FTP server right after a Batch upload is complete. disconnectOnBatchComplete will only disconnect the current connection to the FTP server.</td>

</tbody>
</table>
**readLock** (lock)

Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail for the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>readLockCheckInterval (lock)</td>
<td>Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>readLockDeleteOrphanLock Files (lock)</td>
<td>Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockLogging Level (lock)</td>
<td>Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename.</td>
<td>DEBUG</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>readLockMarkerFile (lock)</td>
<td>Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockMinAge (lock)</td>
<td>This option applied only for readLock=change. This option allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use readLockMinAge=300s to require the file is at last 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age.</td>

</tr>
<tr>
<td>shuffle (sort)</td>
<td>To shuffle the list of files (sort in random order)</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### 107.3. FTPS Component Default Trust Store

When using the `ftpClient`, properties related to SSL with the FTPS component, the trust store accept all certificates. If you only want trust selective certificates, you have to configure the trust store with the `ftpClient.trustStore.xxx` options or by configuring a custom `ftpClient`.

When using `sslContextParameters`, the trust store is managed by the configuration of the provided SSLContextParameters instance.

You can configure additional options on the `ftpClient` and `ftpClientConfig` from the URI directly by using the `ftpClient` or `ftpClientConfig` prefix.

For example to set the `setDataTimeout` on the `FTPClient` to 30 seconds you can do:

```xml
<bean id="myConfig" class="org.apache.commons.net.ftp.FTPClientConfig">
  <property name="lenientFutureDates" value="true"/>
  <property name="serverLanguageCode" value="fr"/>
</bean>
```

See the documentation of the Apache Commons FTP FTPClientConfig for possible options and more details. And as well for Apache Commons FTP FTPClient.

If you do not like having many and long configuration in the url you can refer to the `ftpClient` or `ftpClientConfig` to use by letting Camel lookup in the Registry for it.

For example:

```xml
<bean id="myConfig" class="org.apache.commons.net.ftp.FTPClientConfig">
  <property name="lenientFutureDates" value="true"/>
  <property name="serverLanguageCode" value="fr"/>
</bean>
```
And then let Camel lookup this bean when you use the # notation in the url.

```xml
<bean />
```

from("ftp://foo@myserver?password=secret&ftpClientConfig=#myConfig").to("bean:foo");

### 107.4. EXAMPLES

- `ftp://someoneelse@someotherftpserver.co.uk:12049/reports/2008/password=secret&binary=false`
- `ftp://publicftpserver.com/download`

### 107.5. CONCURRENCY

FTP Consumer does not support concurrency

The FTP consumer (with the same endpoint) does not support concurrency (the backing FTP client is not thread safe). You can use multiple FTP consumers to poll from different endpoints. It is only a single endpoint that does not support concurrent consumers.

The FTP producer does **not** have this issue, it supports concurrency.

### 107.6. MORE INFORMATION

This component is an extension of the File component. So there are more samples and details on the File component page.

### 107.7. DEFAULT WHEN CONSUMING FILES

The FTP consumer will by default leave the consumed files untouched on the remote FTP server. You have to configure it explicitly if you want it to delete the files or move them to another location. For example you can use `delete=true` to delete the files, or use `move=.done` to move the files into a hidden done sub directory.

The regular File consumer is different as it will by default move files to a `.camel` sub directory. The reason Camel does **not** do this by default for the FTP consumer is that it may lack permissions by default to be able to move or delete files.

#### 107.7.1. limitations

The option `readLock` can be used to force Camel **not** to consume files that is currently in the progress of being written. However, this option is turned off by default, as it requires that the user has write access. See the options table at File2 for more details about read locks.

There are other solutions to avoid consuming files that are currently being written over FTP; for instance, you can write to a temporary destination and move the file after it has been written.

When moving files using `move` or `preMove` option the files are restricted to the FTP_ROOT folder. That prevents you from moving files outside the FTP area. If you want to move files to another area you can use soft links and move files into a soft linked folder.
107.8. MESSAGE HEADERS

The following message headers can be used to affect the behavior of the component

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelFileName</td>
<td>Specifies the output file name (relative to the endpoint directory) to be used for the output message when sending to the endpoint. If this is not present and no expression either, then a generated message ID is used as the filename instead.</td>
</tr>
<tr>
<td>CamelFileNameProduced</td>
<td>The actual filepath (path + name) for the output file that was written. This header is set by Camel and its purpose is providing end-users the name of the file that was written.</td>
</tr>
<tr>
<td>CamelFileIndex</td>
<td>Current index out of total number of files being consumed in this batch.</td>
</tr>
<tr>
<td>CamelFileSize</td>
<td>Total number of files being consumed in this batch.</td>
</tr>
<tr>
<td>CamelFileHost</td>
<td>The remote hostname.</td>
</tr>
<tr>
<td>CamelFileLocalWorkPath</td>
<td>Path to the local work file, if local work directory is used.</td>
</tr>
</tbody>
</table>

In addition the FTP/FTPS consumer and producer will enrich the Camel Message with the following headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelFtpReplyCode</td>
<td>Camel 2.11.1: The FTP client reply code (the type is a integer)</td>
</tr>
<tr>
<td>CamelFtpReplyString</td>
<td>Camel 2.11.1: The FTP client reply string</td>
</tr>
</tbody>
</table>

107.9. ABOUT TIMEOUTS

The two set of libraries (see top) has different API for setting timeout. You can use the connectTimeout option for both of them to set a timeout in millis to establish a network connection. An individual soTimeout can also be set on the FTP/FTPS, which corresponds to using ftpClient.soTimeout. Notice SFTP will automatically use connectTimeout as its soTimeout. The timeout option only applies for FTP/FTSP as the data timeout, which corresponds to the ftpClient.dataTimeout value. All timeout values are in millis.

107.10. USING LOCAL WORK DIRECTORY
Camel supports consuming from remote FTP servers and downloading the files directly into a local work
directory. This avoids reading the entire remote file content into memory as it is streamed directly into
the local file using FileOutputStream.

Camel will store to a local file with the same name as the remote file, though with .inprogress as
extension while the file is being downloaded. Afterwards, the file is renamed to remove the .inprogress
suffix. And finally, when the Exchange is complete the local file is deleted.

So if you want to download files from a remote FTP server and store it as files then you need to route to
a file endpoint such as:

```java
from("ftp://someone@someserver.com?password=secret&localWorkDirectory=/tmp").to("file://inbox");
```

**TIP**

The route above is ultra efficient as it avoids reading the entire file content into memory. It will download
the remote file directly to a local file stream. The java.io.File handle is then used as the Exchange body.
The file producer leverages this fact and can work directly on the work file java.io.File handle and
perform a java.io.File.rename to the target filename. As Camel knows it’s a local work file, it can
optimize and use a rename instead of a file copy, as the work file is meant to be deleted anyway.

### 107.11. STEPWISE CHANGING DIRECTORIES

Camel FTP can operate in two modes in terms of traversing directories when consuming files (eg
downloading) or producing files (eg uploading)

- stepwise
- not stepwise

You may want to pick either one depending on your situation and security issues. Some Camel end users
can only download files if they use stepwise, while others can only download if they do not. At least you
have the choice to pick (from Camel 2.6 onwards).

In Camel 2.0 - 2.5 there is only one mode and it is:

- before 2.5 not stepwise
- 2.5 stepwise

From Camel 2.6 onwards there is now an option stepwise you can use to control the behavior.

Note that stepwise changing of directory will in most cases only work when the user is confined to it’s
home directory and when the home directory is reported as "/".

The difference between the two of them is best illustrated with an example. Suppose we have the
following directory structure on the remote FTP server we need to traverse and download files:

```
/one/two/sub-a
/one/two/sub-b
```

And that we have a file in each of sub-a (a.txt) and sub-b (b.txt) folder.
107.11.1. Using stepwise=true (default mode)

```
TYPE A
200 Type set to A
PWD
257 "/" is current directory.
CWD one
250 CWD successful. "/one" is current directory.
CWD two
250 CWD successful. "/one/two" is current directory.
SYST
215 UNIX emulated by FileZilla
PORT 127.0.0.1,17.94
200 Port command successful
LIST
150 Opening data channel for directory list.
226 Transfer OK
CWD sub-a
250 CWD successful. "/one/two/sub-a" is current directory.
PORT 127.0.0.1,17.95
200 Port command successful
LIST
150 Opening data channel for directory list.
226 Transfer OK
CDUP
200 CDUP successful. "/one/two" is current directory.
CWD sub-b
250 CWD successful. "/one/two/sub-b" is current directory.
PORT 127.0.0.1,17.96
200 Port command successful
LIST
150 Opening data channel for directory list.
226 Transfer OK
CDUP
200 CDUP successful. "/one/two" is current directory.
CWD /
250 CWD successful. "/" is current directory.
PWD
257 "/" is current directory.
CWD one
250 CWD successful. "/one" is current directory.
CWD two
250 CWD successful. "/one/two" is current directory.
PORT 127.0.0.1,17.97
200 Port command successful
RETR foo.txt
150 Opening data channel for file transfer.
226 Transfer OK
CWD /
250 CWD successful. "/" is current directory.
PWD
257 "/" is current directory.
CWD one
250 CWD successful. "/one" is current directory.
CWD two
250 CWD successful. "/one/two" is current directory.
```
As you can see when stepwise is enabled, it will traverse the directory structure using CD xxx.

107.11.2. Using stepwise=false

Logged on
TYPE A
SYST
UNIX emulated by FileZilla
PORT 127.0.0.1,14,122
List one/two
Opening data channel for directory list
Transfer OK
PORT 127.0.0.1,14,123
List one/two/sub-a
Opening data channel for directory list
Transfer OK
PORT 127.0.0.1,14,124
List one/two/sub-b
Opening data channel for directory list
Transfer OK
PORT 127.0.0.1,14,125
List one/two/foo.txt
As you can see when not using stepwise, there are no CD operation invoked at all.

107.12. SAMPLES

In the sample below we set up Camel to download all the reports from the FTP server once every hour (60 min) as BINARY content and store it as files on the local file system.

And the route using Spring DSL:

```xml
<route>
  <from uri="ftp://scott@localhost/public/reports?password=tiger&binary=true&delay=60000" />
  <to uri="file://target/test-reports" />
</route>
```

107.12.1. Consuming a remote FTPS server (implicit SSL) and client authentication

```java
from("ftps://admin@localhost:2222/public/camel?password=admin&securityProtocol=SSL&isImplicit=true
 &ftpClient.keyStore.file=./src/test/resources/server.jks
 &ftpClient.keyStore.password=password&ftpClient.keyStore.keyPassword=password")
  .to("bean:foo");
```

107.12.2. Consuming a remote FTPS server (explicit TLS) and a custom trust store configuration

```java
from("ftps://admin@localhost:2222/public/camel?
 password=admin&ftpClient.trustStore.file=./src/test/resources/server.jks&ftpClient.trustStore.password=
 password")
  .to("bean:foo");
```

107.13. FILTER USING ORG.APACHE.CAMEL.COMPONENT.FILE.GENERICFILEFILTER

Camel supports pluggable filtering strategies. This strategy it to use the build in org.apache.camel.component.file.GenericFileFilter in Java. You can then configure the endpoint with such a filter to skip certain filters before being processed.
In the sample we have built our own filter that only accepts files starting with report in the filename.

And then we can configure our route using the `filter` attribute to reference our filter (using `#` notation) that we have defined in the spring XML file:

```xml
<!-- define our sorter as a plain spring bean -->
<bean id="myFilter" class="com.mycompany.MyFileFilter"/>

<route>
    <from uri="ftp://someuser@sometftpserver.com?password=secret&amp;filter=#myFilter"/>
    <to uri="bean:processInbox"/>
</route>
```

107.14. FILTERING USING ANT PATH MATCHER

The ANT path matcher is a filter that is shipped out-of-the-box in the `camel-spring` jar. So you need to depend on `camel-spring` if you are using Maven. The reason is that we leverage Spring’s `AntPathMatcher` to do the actual matching.

The file paths are matched with the following rules:

- `?` matches one character
- `*` matches zero or more characters
- `**` matches zero or more directories in a path

The sample below demonstrates how to use it:

107.15. USING A PROXY WITH SFTP

To use an HTTP proxy to connect to your remote host, you can configure your route in the following way:

```xml
<!-- define our sorter as a plain spring bean -->
<bean id="proxy" class="com.jcraft.jsch.ProxyHTTP">
    <constructor-arg value="localhost"/>
    <constructor-arg value="7777"/>
</bean>

<route>
    <from uri="sftp://localhost:9999/root?username=admin&amp;password=admin&amp;proxy=#proxy"/>
    <to uri="bean:processFile"/>
</route>
```

You can also assign a user name and password to the proxy, if necessary. Please consult the documentation for `com.jcraft.jsch.Proxy` to discover all options.

107.16. SETTING PREFERRED SFTP AUTHENTICATION METHOD

If you want to explicitly specify the list of authentication methods that should be used by `sftp` component, use `preferredAuthentication` option. If for example you would like Camel to attempt to authenticate with private/public SSH key and fallback to user/password authentication in the case when no public key is available, use the following route configuration:
**107.17. CONSUMING A SINGLE FILE USING A FIXED NAME**

When you want to download a single file and know the file name, you can use `fileName=myFileName.txt` to tell Camel the name of the file to download. By default, the consumer will still do an FTP LIST command to do a directory listing and then filter these files based on the `fileName` option. Though in this use-case it may be desirable to turn off the directory listing by setting `useList=false`. For example, the user account used to login to the FTP server may not have permission to do an FTP LIST command. So you can turn off this with `useList=false`, and then provide the fixed name of the file to download with `fileName=myFileName.txt`, then the FTP consumer can still download the file. If the file for some reason does not exist, then Camel will by default throw an exception, you can turn this off and ignore this by setting `ignoreFileNotFoundOrPermissionError=true`.

For example to have a Camel route that picks up a single file, and delete it after use you can do:

```java
from("sftp://localhost:9999/root?
    username=admin&password=admin&preferredAuthentications=publickey,password").
to("bean:processFile");
```

**107.17.18. DEBUG LOGGING**

This component has log level `TRACE` that can be helpful if you have problems.

CHAPTER 108. FTPS COMPONENT

Available as of Camel version 2.2

This component provides access to remote file systems over the FTP and SFTP protocols.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-ftp</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

For more information you can look at FTP component

108.1. URI OPTIONS

The options below are exclusive for the FTPS component.

The FTPS component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>useGlobalSslContext Parameters (security)</td>
<td>Enable usage of global SSL context parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The FTPS endpoint is configured using URI syntax:

```text
ftps:host:port/directoryName
```

with the following path and query parameters:

108.1.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Required Hostname of the FTP server</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>Port of the FTP server</td>
<td></td>
<td>int</td>
</tr>
</tbody>
</table>
### 108.1.2. Query Parameters (116 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>binary</strong></td>
<td>Specifies the file transfer mode, BINARY or ASCII. Default is ASCII (false).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>charset</strong></td>
<td>This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>disconnect</strong></td>
<td>Whether or not to disconnect from remote FTP server right after use. Disconnect will only disconnect the current connection to the FTP server. If you have a consumer which you want to stop, then you need to stop the consumer/route instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>doneFileName</strong></td>
<td>Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only $file.name and $file.name.noext is supported as dynamic placeholders.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td>fileName (common)</td>
<td>Use Expression such as File Language to dynamically set the filename. For consumers, it’s used as a filename filter. For producers, it’s used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today’s file using the File Language syntax: mydata-$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>passiveMode (common)</td>
<td>Sets passive mode connections. Default is active mode connections.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>separator (common)</td>
<td>Sets the path separator to be used. UNIX = Uses unix style path separator Windows = Uses windows style path separator Auto = (is default) Use existing path separator in file name</td>
<td>UNIX</td>
<td>PathSeparator</td>
</tr>
<tr>
<td>transferLoggingInterval (common)</td>
<td>Configures the interval in seconds to use when logging the progress of upload and download operations that are in-flight. This is used for logging progress when operations takes longer time.</td>
<td>5</td>
<td>int</td>
</tr>
<tr>
<td>transferLoggingLevel (common)</td>
<td>Configure the logging level to use when logging the progress of upload and download operations.</td>
<td>DEBUG</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>transferLoggingVerbose (common)</td>
<td>Configures whether the perform verbose (fine grained) logging of the progress of upload and download operations.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### fastExistsCheck (common)
If set this option to be true, camel-ftp will use the list file directly to check if the file exists. Since some FTP server may not support to list the file directly, if the option is false, camel-ftp will use the old way to list the directory and check if the file exists. This option also influences readLock=changed to control whether it performs a fast check to update file information or not. This can be used to speed up the process if the FTP server has a lot of files.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fastExistsCheck</strong></td>
<td>If set this option to be true, camel-ftp will use the list file directly to check if the file exists. Since some FTP server may not support to list the file directly, if the option is false, camel-ftp will use the old way to list the directory and check if the file exists. This option also influences readLock=changed to control whether it performs a fast check to update file information or not. This can be used to speed up the process if the FTP server has a lot of files.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### bridgeErrorHandler (consumer)
Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bridgeErrorHandler</strong></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### delete (consumer)
If true, the file will be deleted after it is processed successfully.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>delete</strong></td>
<td>If true, the file will be deleted after it is processed successfully.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### moveFailed (consumer)
Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>moveFailed</strong></td>
<td>Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again.</td>
<td>String</td>
</tr>
</tbody>
</table>

### noop (consumer)
If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>noop</strong></td>
<td>If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### preMove (consumer)
Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>preMove</strong></td>
<td>Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order.</td>
<td>String</td>
</tr>
</tbody>
</table>
### preSort (consumer)
When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>preSort (consumer)</td>
<td>When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### recursive (consumer)
If a directory, will look for files in all the sub-directories as well.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>recursive (consumer)</td>
<td>If a directory, will look for files in all the sub-directories as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### resumeDownload (consumer)
Configures whether resume download is enabled. This must be supported by the FTP server (almost all FTP servers support it). In addition the options localWorkDirectory must be configured so downloaded files are stored in a local directory, and the option binary must be enabled, which is required to support resuming of downloads.

<table>
<thead>
<tr>

<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### sendEmptyMessageWhenIdle (consumer)
If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendEmptyMessageWhenIdle (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### streamDownload (consumer)
Sets the download method to use when not using a local working directory. If set to true, the remote files are streamed to the route as they are read. When set to false, the remote files are loaded into memory before being sent into the route.

<table>
<thead>
<tr>
<th>Name</th>

</tr>
<tr>
<td>receiveBufferSize (consumer)</td>
<td>The receive (download) buffer size Used only by FTPClient</td>
<td>32768</td>
<td>int</td>
</tr>
<tr>
<td>startingDirectory MustExist (consumer)</td>
<td>Whether the starting directory must exist. Mind that the autoCreate option is default enabled, which means the starting directory is normally auto created if it doesn’t exist. You can disable autoCreate and enable this to ensure the starting directory must exist. Will thrown an exception if the directory doesn’t exist.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useList (consumer)</td>
<td>Whether to allow using LIST command when downloading a file. Default is true. In some use cases you may want to download a specific file and are not allowed to use the LIST command, and therefore you can set this option to false. Notice when using this option, then the specific file to download does not include meta-data information such as file size, timestamp, permissions etc, because those information is only possible to retrieve when LIST command is in use.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>fileExist (producer)</td>
<td>What to do if a file already exists with the same name. Override, which is the default, replaces the existing file. Append - adds content to the existing file. Fail - throws a GenericFileOperationException, indicating that there is already an existing file. Ignore - silently ignores the problem and does not override the existing file, but assumes everything is okay. Move - option requires to use the moveExisting option to be configured as well. The option eagerDeleteTargetFile can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The Move option will move any existing files, before writing the target file. TryRename is only applicable if tempFileName option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers.</td>
<td>Override</td>
<td>GenericFileExist</td>
</tr>
</tbody>
</table>
### flatten (producer)
Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths.

<table>
<thead>

<td>exclusiveReadLockStrategy (lock)</td>
<td>Pluggable read-lock as a org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy implementation.</td>
<td></td>
<td>GenericFileExclusiveReadLockStrategy &lt;T&gt;</td>
</tr>
</tbody>
</table>
**readLock** *(lock)*

Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (*fileName.camelLock*) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail for the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>readLockCheckInterval (lock)</td>
<td>Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>readLockDeleteOrphanLockFiles (lock)</td>
<td>Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockLoggingLevel (lock)</td>
<td>Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename.</td>
<td>DEBUG</td>
<td>LoggingLevel</td>
</tr>
<tr>
<td>readLockMarkerFile (lock)</td>
<td>Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>readLockMinAge (lock)</td>
<td>This option applied only for readLock=change. This option allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use readLockMinAge=300s to require the file is at last 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age.</td>

<tr>
<td>readLockTimeout (lock)</td>
<td>Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit.</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>

</tr>
</tbody>
</table>
CHAPTER 109. GANGLIA COMPONENT

Available as of Camel version 2.15

Provides a mechanism to send a value (the message body) as a metric to the Ganglia monitoring system. Uses the gmetric4j library. Can be used in conjunction with standard Ganglia and JMXetric for monitoring metrics from the OS, JVM and business processes through a single platform.

You should have a Ganglia gmond agent running on the machine where your JVM runs. The gmond sends a heartbeat to the Ganglia infrastructure, camel-ganglia can’t send the heartbeat itself currently.

On most Linux systems (Debian, Ubuntu, Fedora and RHEL/CentOS with EPEL) you can just install the Ganglia agent package and it runs automatically using multicast configuration. You can configure it to use regular UDP unicast if you prefer.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId.camel-ganglia</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

109.1. URI FORMAT

```
ganglia:address:port[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`

109.2. GANGLIA COMPONENT AND ENDPOINT URI OPTIONS

The Ganglia component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td></td>
<td>GangliaConfiguration</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ganglia endpoint is configured using URI syntax:

```
ganglia:host:port
```
with the following path and query parameters:

109.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Host name for Ganglia server</td>
<td>239.2.11.71</td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>Port for Ganglia server</td>
<td>8649</td>
<td>int</td>
</tr>
</tbody>
</table>

109.2.2. Query Parameters (13 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dmax (producer)</td>
<td>Minimum time in seconds before Ganglia will purge the metric value if it expires. Set to 0 and the value will remain in Ganglia indefinitely until a gmond agent restart.</td>
<td>0</td>
<td>int</td>
</tr>
<tr>
<td>groupName (producer)</td>
<td>The group that the metric belongs to.</td>
<td>java</td>
<td>String</td>
</tr>
<tr>
<td>metricName (producer)</td>
<td>The name to use for the metric.</td>
<td>metric</td>
<td>String</td>
</tr>
<tr>
<td>mode (producer)</td>
<td>Send the UDP metric packets using MULTICAST or UNICAST</td>
<td>MULTICAST</td>
<td>UDPAddressingMode</td>
</tr>
<tr>
<td>prefix (producer)</td>
<td>Prefix the metric name with this string and an underscore.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>slope (producer)</td>
<td>The slope</td>
<td>BOTH</td>
<td>GMetricSlope</td>
</tr>
<tr>
<td>spoofHostname (producer)</td>
<td>Spoofing information IP:hostname</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>tmax (producer)</td>
<td>Maximum time in seconds that the value can be considered current. After this, Ganglia considers the value to have expired.</td>
<td>60</td>
<td>int</td>
</tr>
<tr>
<td>ttl (producer)</td>
<td>If using multicast, set the TTL of the packets</td>
<td>5</td>
<td>int</td>
</tr>
<tr>
<td>type (producer)</td>
<td>The type of value</td>
<td>STRING</td>
<td>GMetricType</td>
</tr>
</tbody>
</table>
109.3. MESSAGE BODY

Any value (such as a string or numeric type) in the body is sent to the Ganglia system.

109.4. RETURN VALUE / RESPONSE

Ganglia sends metrics using unidirectional UDP or multicast. There is no response or change to the message body.

109.5. EXAMPLES

109.5.1. Sending a String metric

The message body will be converted to a String and sent as a metric value. Unlike numeric metrics, String values can’t be charted but Ganglia makes them available for reporting. The os_version string at the top of every Ganglia host page is an example of a String metric.

```java
from("direct:string.for.ganglia")
  .setHeader(GangliaConstants.METRIC_NAME, simple("my_string_metric"))
  .setHeader(GangliaConstants.METRIC_TYPE, GMetricType.STRING)
  .to("direct:ganglia.tx");

from("direct:ganglia.tx")
  .to("ganglia:239.2.11.71:8649?mode=MULTICAST&prefix=test");
```

109.5.2. Sending a numeric metric

```java
from("direct:value.for.ganglia")
  .setHeader(GangliaConstants.METRIC_NAME, simple("widgets_in_stock"))
  .setHeader(GangliaConstants.METRIC_TYPE, GMetricType.UINT32)
  .setHeader(GangliaConstants.METRIC_UNITS, simple("widgets"))
  .to("direct:ganglia.tx");
```
from("direct:ganglia.tx")
  .to("ganglia:239.2.11.71:8649?mode=MULTICAST&prefix=test");
CHAPTER 110. GEOCODER COMPONENT

Available as of Camel version 2.12

The geocoder: component is used for looking up geocodes (latitude and longitude) for a given address, or reverse lookup. The component uses the Java API for Google Geocoder library.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-geocoder</artifactId>
  <version>x.x.x</version>
</dependency>

<!-- use the same version as your Camel core version -->
```

110.1. URI FORMAT

```text
geocoder:address:name[?options]
geocoder:latlng:latitude,longitude[?options]
```

110.2. OPTIONS

The Geocoder component has no options.

The Geocoder endpoint is configured using URI syntax:

```text
geocoder:address:latlng
```

with the following path and query parameters:

110.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>The geo address which should be prefixed with address:</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>latlng</td>
<td>The geo latitude and longitude which should be prefixed with latlng:</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

110.2.2. Query Parameters (14 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clientId (producer)</td>
<td>To use google premium with this client id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>clientKey (producer)</td>
<td>To use google premium with this client key</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>headersOnly (producer)</td>
<td>Whether to only enrich the Exchange with headers, and leave the body as-is.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>language (producer)</td>
<td>The language to use.</td>
<td>en</td>
<td>String</td>
</tr>
<tr>
<td>httpClientConfigurer (advanced)</td>
<td>Register a custom configuration strategy for new HttpClient instances created by producers or consumers such as to configure authentication mechanisms etc</td>
<td></td>
<td>HttpClientConfigurer</td>
</tr>
<tr>
<td>httpConnectionManager (advanced)</td>
<td>To use a custom HttpConnectionManager to manage connections</td>
<td></td>
<td>HttpConnectionManager</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>proxyAuthDomain (proxy)</td>
<td>Domain for proxy NTML authentication</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthHost (proxy)</td>
<td>Optional host for proxy NTML authentication</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthMethod (proxy)</td>
<td>Authentication method for proxy, either as Basic, Digest or NTLM.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthPassword (proxy)</td>
<td>Password for proxy authentication</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthUsername (proxy)</td>
<td>Username for proxy authentication</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyHost (proxy)</td>
<td>The proxy host name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (proxy)</td>
<td>The proxy port number</td>
<td></td>
<td>Integer</td>
</tr>
</tbody>
</table>

### 110.3. EXCHANGE DATA FORMAT
Camel will deliver the body as a `com.google.code.geocoder.model.GeocodeResponse` type. And if the address is "current" then the response is a String type with a JSON representation of the current location.

If the option `headersOnly` is set to `true` then the message body is left as-is, and only headers will be added to the Exchange.

### 110.4. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelGeoCoderStatus</td>
<td>Mandatory. Status code from the geocoder library. If status is <code>GeocoderStatus.OK</code> then additional headers is enriched</td>
</tr>
<tr>
<td>CamelGeoCoderAddress</td>
<td>The formatted address</td>
</tr>
<tr>
<td>CamelGeoCoderLat</td>
<td>The latitude of the location.</td>
</tr>
<tr>
<td>CamelGeoCoderLng</td>
<td>The longitude of the location.</td>
</tr>
<tr>
<td>CamelGeoCoderLatlng</td>
<td>The latitude and longitude of the location. Separated by comma.</td>
</tr>
<tr>
<td>CamelGeoCoderCity</td>
<td>The city long name.</td>
</tr>
<tr>
<td>CamelGeoCoderRegionCode</td>
<td>The region code.</td>
</tr>
<tr>
<td>CamelGeoCoderRegionName</td>
<td>The region name.</td>
</tr>
<tr>
<td>CamelGeoCoderCountryLong</td>
<td>The country long name.</td>
</tr>
<tr>
<td>CamelGeoCoderCountryShort</td>
<td>The country short name.</td>
</tr>
</tbody>
</table>

Notice not all headers may be provided depending on available data and mode in use (address vs latlng).

### 110.5. SAMPLES

In the example below we get the latitude and longitude for Paris, France.

```java
from("direct:start")
.to("geocoder:address:Paris, France")
.template.sendBodyAndHeader("direct:start", "Hello", GeoCoderConstants.ADDRESS, "Copenhagen, Denmark");
```

If you provide a header with the `CamelGeoCoderAddress` then that overrides the endpoint configuration, so to get the location of Copenhagen, Denmark we can send a message with a headers as shown:

```java
from("direct:start")
.to("geocoder:address:Paris, France")
.template.sendBodyAndHeader("direct:start", "Hello", GeoCoderConstants.ADDRESS, "Copenhagen, Denmark");
```
To get the address for a latitude and longitude we can do:

```java
from("direct:start")
  .to("geocoder:latlng:40.714224,-73.961452")
  .log("Location ${header.CamelGeocoderAddress} is at lat/lng: ${header.CamelGeocoderLatlng}
and in country ${header.CamelGeoCoderCountryShort}")
```

Which will log

```
Location 285 Bedford Avenue, Brooklyn, NY 11211, USA is at lat/lng: 40.71412890,-73.96140740
and in country US
```

To get the current location you can use "current" as the address as shown:

```java
from("direct:start")
  .to("geocoder:address:current")
```

CHAPTER 110. GEOCODER COMPONENT

799
CHAPTER 111. GIT COMPONENT

Available as of Camel version 2.16

The `git:` component allows you to work with a generic Git repository.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-git</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

**URI Format**

`git://localRepositoryPath[?options]`

### 111.1. URI OPTIONS

The producer allows to do operations on a specific repository.
The consumer allows consuming commits, tags and branches on a specific repository.

The Git component has no options.

The Git endpoint is configured using URI syntax:

```text
git:localPath
```

with the following path and query parameters:

#### 111.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>localPath</td>
<td>Required Local repository path</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 111.1.2. Query Parameters (13 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>branchName</td>
<td>The branch name to work on</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>password</td>
<td>Remote repository password</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>remoteName</td>
<td>The remote repository name to use in particular operation like pull</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>remotePath</td>
<td>The remote repository path</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>tagName</td>
<td>The tag name to work on</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>username</td>
<td>Remote repository username</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>type</td>
<td>The consumer type</td>
<td></td>
<td>GitType</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>allowEmpty</td>
<td>The flag to manage empty git commits</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>operation</td>
<td>The operation to do on the repository</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 111.2. MESSAGE HEADERS
<table>
<thead>
<tr>
<th>Name</th>
<th>Default Value</th>
<th>Type</th>
<th>Context</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel GitOperation</td>
<td>null</td>
<td>String</td>
<td>Producer</td>
<td>The operation to do on a repository, if not specified as endpoint option</td>
</tr>
<tr>
<td>Camel GitFileName</td>
<td>null</td>
<td>String</td>
<td>Producer</td>
<td>The file name in an add operation</td>
</tr>
<tr>
<td>Camel GitCommitMessage</td>
<td>null</td>
<td>String</td>
<td>Producer</td>
<td>The commit message related in a commit operation</td>
</tr>
<tr>
<td>Camel GitCommitUsername</td>
<td>null</td>
<td>String</td>
<td>Producer</td>
<td>The commit username in a commit operation</td>
</tr>
<tr>
<td>Camel GitCommitEmail</td>
<td>null</td>
<td>String</td>
<td>Producer</td>
<td>The commit email in a commit operation</td>
</tr>
<tr>
<td>Camel GitCommitId</td>
<td>null</td>
<td>String</td>
<td>Producer</td>
<td>The commit id</td>
</tr>
<tr>
<td>Camel GitAllowEmpty</td>
<td>null</td>
<td>Boolean</td>
<td>Producer</td>
<td>The flag to manage empty git commits</td>
</tr>
</tbody>
</table>

### 111.3. PRODUCER EXAMPLE

Below is an example route of a producer that add a file test.java to a local repository, commit it with a specific message on master branch and then push it to remote repository.

```xml
from("direct:start")
    .setHeader(GitConstants.GIT_FILE_NAME, constant("test.java"))
    .to("git:///tmp/testRepo?operation=add")
    .setHeader(GitConstants.GIT_COMMIT_MESSAGE, constant("first commit"))
    .to("git:///tmp/testRepo?operation=commit")
    .to("git:///tmp/testRepo?operation=push&remotePath=https://foo.com/test/test.git&username=xxx&password=xxx")
```

### 111.4. CONSUMER EXAMPLE
Below is an example route of a consumer that consumes commit:

```java
        from("git://tmp/testRepo?type=commit")
            .to(....)
```
CHAPTER 112. GITHUB COMPONENT

Available as of Camel version 2.15

The GitHub component interacts with the GitHub API by encapsulating `egit-github`. It currently provides polling for new pull requests, pull request comments, tags, and commits. It is also able to produce comments on pull requests, as well as close the pull request entirely.

Rather than webhooks, this endpoint relies on simple polling. Reasons include:

- Concern for reliability/stability
- The types of payloads we’re polling aren’t typically large (plus, paging is available in the API)
- The need to support apps running somewhere not publicly accessible where a webhook would fail

Note that the GitHub API is fairly expansive. Therefore, this component could be easily expanded to provide additional interactions.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-github</artifactId>
  <version>${camel-version}</version>
</dependency>
```

112.1. URI FORMAT

```
github://endpoint[?options]
```

112.2. MANDATORY OPTIONS:

Note that these can be configured directly through the endpoint.

The GitHub component has no options.

The GitHub endpoint is configured using URI syntax:

```
github:type/branchName
```

with the following path and query parameters:

112.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Required What git operation to execute</td>
<td></td>
<td>GitHubType</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------</td>
<td>---------</td>
<td>-----------</td>
</tr>
<tr>
<td>branchName</td>
<td>Name of branch</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

112.2.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>oauthToken</td>
<td>GitHub OAuth token, required unless username &amp; password are provided</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>password</td>
<td>GitHub password, required unless oauthToken is provided</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>repoName</td>
<td><strong>Required</strong> GitHub repository name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>repoOwner</td>
<td><strong>Required</strong> GitHub repository owner (organization)</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>username</td>
<td>GitHub username, required unless oauthToken is provided</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a customExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>encoding</td>
<td>To use the given encoding when getting a git commit file</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>state</td>
<td>To set git commit status state</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Default** | **Type**
--- | --- | --- | ---
**targetUrl** (producer) | To set git commit status target url |  | String
**synchronous** (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean

### 112.3. CONSUMER ENDPOINTS:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Context</th>
<th>Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>pullRequest</td>
<td>polling</td>
<td>org.eclipse.egit.github.core.PullRequest</td>
</tr>
<tr>
<td>pullRequestComment</td>
<td>polling</td>
<td>org.eclipse.egit.github.core.Comment (comment on the general pull request discussion) or org.eclipse.egit.github.core.CommitComment (inline comment on a pull request diff)</td>
</tr>
<tr>
<td>tag</td>
<td>polling</td>
<td>org.eclipse.egit.github.core.RepositoryTag</td>
</tr>
<tr>
<td>commit</td>
<td>polling</td>
<td>org.eclipse.egit.github.core.RepositoryCommit</td>
</tr>
</tbody>
</table>

### 112.4. PRODUCER ENDPOINTS:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Body</th>
<th>Message Headers</th>
</tr>
</thead>
<tbody>
<tr>
<td>pullRequestComment</td>
<td>String (comment text)</td>
<td>- GitHubPullRequest (integer) (REQUIRED): Pull request number.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- GitHubInResponseTo (integer): Required if responding to another inline comment on the pull request diff. If left off, a general comment on the pull request discussion is assumed.</td>
</tr>
<tr>
<td>closePullRequest</td>
<td>none</td>
<td>- GitHubPullRequest (integer) (REQUIRED): Pull request number.</td>
</tr>
<tr>
<td>createIssue (From Camel 2.18)</td>
<td>String (issue body text)</td>
<td>- GitHubIssueTitle (String) (REQUIRED): Issue Title.</td>
</tr>
</tbody>
</table>
CHAPTER 113. GZIP DATAFORMAT

Available as of Camel version 2.0

The GZip Data Format is a message compression and de-compression format. It uses the same deflate algorithm that is used in Zip DataFormat, although some additional headers are provided. This format is produced by popular gzip/gunzip tool. Messages marshalled using GZip compression can be unmarshalled using GZip decompression just prior to being consumed at the endpoint. The compression capability is quite useful when you deal with large XML and Text based payloads or when you read messages previously compressed using gzip tool.

113.1. OPTIONS

The GZip dataformat supports 1 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

113.2. MARSHAL

In this example we marshal a regular text/XML payload to a compressed payload employing gzip compression format and send it an ActiveMQ queue called MY_QUEUE.

```java
from("direct:start").marshal().gzip().to("activemq:queue:MY_QUEUE");
```

113.3. UNMARSHAL

In this example we unmarshal a gzipped payload from an ActiveMQ queue called MY_QUEUE to its original format, and forward it for processing to the UnGZippedMessageProcessor.

```java
from("activemq:queue:MY_QUEUE").unmarshal().gzip().process(new UnGZippedMessageProcessor());
```

113.4. DEPENDENCIES

This data format is provided in camel-core so no additional dependencies is needed.
CHAPTER 114. GOOGLE BIGQUERY COMPONENT

Available as of Camel version 2.20

114.1. COMPONENT DESCRIPTION

The Google Bigquery component provides access to Cloud BigQuery Infrastructure via the Google Client Services API.

The current implementation does not use gRPC.

The current implementation does not support querying BigQuery i.e. is a producer only.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-bigquery</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

114.2. AUTHENTICATION CONFIGURATION

Google BigQuery component authentication is targeted for use with the GCP Service Accounts. For more information please refer to Google Cloud Platform Auth Guide

Google security credentials can be set explicitly via one of the two options:

- Service Account Email and Service Account Key (PEM format)
- GCP credentials file location

If both are set, the Service Account Email/Key will take precedence.

Or implicitly, where the connection factory falls back on Application Default Credentials.

**OBS!** The location of the default credentials file is configurable - via GOOGLE_APPLICATION_CREDENTIALS environment variable.

Service Account Email and Service Account Key can be found in the GCP JSON credentials file as client_email and private_key respectively.

114.3. URI FORMAT

```
google-bigquery://project-id:datasetId[:tableId]?[options]
```

114.4. OPTIONS

The Google BigQuery component supports 4 options which are listed below.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>projectId (producer)</td>
<td>Google Cloud Project Id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>datasetId (producer)</td>
<td>BigQuery Dataset Id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>connectionFactor (producer)</td>
<td>ConnectionFactory to obtain connection to Bigquery Service. If non provided the default one will be used</td>
<td></td>
<td>GoogleBigQuery ConnectionFactory</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Google BigQuery endpoint is configured using URI syntax:

```text
google-bigquery:projectId:datasetId:tableName
```

with the following path and query parameters:

### 114.4.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>projectId</td>
<td>Required Google Cloud Project Id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>datasetId</td>
<td>Required BigQuery Dataset Id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>tableId</td>
<td>BigQuery table id</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 114.4.2. Query Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectionFactory (producer)</td>
<td>ConnectionFactory to obtain connection to Bigquery Service. If non provided the default one will be used.</td>
<td></td>
<td>GoogleBigQuery ConnectionFactory</td>
</tr>
<tr>
<td>useAsInsertId (producer)</td>
<td>Field name to use as insert id</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### 114.5. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelGoogleBigQuery.TableNameSuffix</td>
<td>String</td>
<td>Table suffix to use when inserting data</td>
</tr>
<tr>
<td>CamelGoogleBigQuery.InsertId</td>
<td>String</td>
<td>InsertId to use when inserting data</td>
</tr>
<tr>
<td>CamelGoogleBigQuery.PartitionDecorator</td>
<td>String</td>
<td>Partition decorator to indicate partition to use when inserting data</td>
</tr>
<tr>
<td>CamelGoogleBigQuery.TableNameId</td>
<td>String</td>
<td>Table id where data will be submitted. If specified will override endpoint configuration</td>
</tr>
</tbody>
</table>

### 114.6. PRODUCER ENDPOINTS

Producer endpoints can accept and deliver to BigQuery individual and grouped exchanges alike. Grouped exchanges have `Exchange.GROUPED_EXCHANGE` property set.

Google BigQuery producer will send a grouped exchange in a single api call unless different table suffix or partition decorators are specified in which case it will break it down to ensure data is written with the correct suffix or partition decorator.
Google BigQuery endpoint expects the payload to be either a map or list of maps. A payload containing a map will insert a single row and a payload containing a list of map’s will insert a row for each entry in the list.

114.7. TEMPLATE TABLES

Templated tables can be specified using the `GoogleBigQueryConstants.TABLE_SUFFIX` header.

I.e. the following route will create tables and insert records sharded on a per day basis:

```java
from("direct:start")
  .header(GoogleBigQueryConstants.TABLE_SUFFIX, "_${date:now:yyyyMMdd}"")
  .to("google-bigquery:sampleDataset:sampleTable")
```

Note it is recommended to use partitioning for this use case.

114.8. PARTITIONING

Reference: https://cloud.google.com/bigquery/docs/creating-partitioned-tables

Partitioning is specified when creating a table and if set data will be automatically partitioned into separate tables. When inserting data a specific partition can be specified by setting the `GoogleBigQueryConstants.PARTITION_DECORATOR` header on the exchange.

114.9. ENSURING DATA CONSISTENCY

Reference: https://cloud.google.com/bigquery/streaming-data-into-bigquery#dataconsistency

A insert id can be set on the exchange with the header `GoogleBigQueryConstants.INSERT_ID` or by specifying query parameter `useAsInsertId`. As an insert id need to be specified per row inserted the exchange header can’t be used when the payload is a list - if the payload is a list the `GoogleBigQueryConstants.INSERT_ID` will be ignored. In that case use the query parameter `useAsInsertId`. 
CHAPTER 115. GOOGLE CALENDAR COMPONENT

Available as of Camel version 2.15

The Google Calendar component provides access to Google Calendar via the Google Calendar Web APIs.

Google Calendar uses the OAuth 2.0 protocol for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to create an account and generate OAuth credentials. Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the OAuth playground.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-calendar</artifactId>
  <version>2.15.0</version>
</dependency>
```

115.1. 1. GOOGLE CALENDAR OPTIONS

The Google Calendar component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td>GoogleCalendar Configuration</td>
</tr>
<tr>
<td>clientFactory</td>
<td>To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleCalendarClientFactory</td>
<td>GoogleCalendarClientFactory</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true boolean</td>
</tr>
</tbody>
</table>

The Google Calendar endpoint is configured using URI syntax:

```
google-calendar:apiName/methodName
```

with the following path and query parameters:

115.1.1. Path Parameters (2 parameters):
### Name | Description | Default | Type  
--- | --- | --- | ---  
apiName | **Required** What kind of operation to perform | | GoogleCalendarAPI  
methodName | **Required** What sub operation to use for the selected operation | | String  

#### 115.1.2. Query Parameters (14 parameters):

| Name | Description | Default | Type  
--- | --- | --- | ---  
accessToken | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String  
applicationName | Google calendar application name. Example would be camel-google-calendar/1.0 | | String  
clientId | Client ID of the calendar application | | String  
clientSecret | Client secret of the calendar application | | String  
eEmailAddress | The emailAddress of the Google Service Account. | | String  
inBody | Sets the name of a parameter to be passed in the exchange In Body | | String  
p12FileName | The name of the p12 file which has the private key to use with the Google Service Account. | | String  
refreshToken | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String  
scopes | Specifies the level of permissions you want a calendar application to have to a user account. You can separate multiple scopes by comma. See https://developers.google.com/google-apps/calendar/auth for more info. | | String  

---
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>user (common)</td>
<td>The email address of the user the application is trying to impersonate in the service account flow</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 115.2. URI FORMAT

The GoogleCalendar Component uses the following URI format:

```
google-calendar://endpoint-prefix/endpoint?[options]```

Endpoint prefix can be one of:

- acl
- calendars
- channels
- colors
- events
- freebusy
- list
- settings
115.3. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option inBody that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format CamelGoogleCalendar.<option>. Note that the inBody option overrides message header, i.e. the endpoint option inBody=option would override a CamelGoogleCalendar.option header.

115.4. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use Scheduled Poll Consumer Options with a consumer. prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

115.5. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a CamelGoogleCalendar. prefix.

115.6. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the GoogleCalendarComponent. Producer endpoints can specify the option name for incoming message body in the inBody endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.
CHAPTER 116. GOOGLE DRIVE COMPONENT

Available as of Camel version 2.14

The Google Drive component provides access to the Google Drive file storage service via the Google Drive Web APIs.

Google Drive uses the OAuth 2.0 protocol for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to create an account and generate OAuth credentials. Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the OAuth playground.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-drive</artifactId>
  <version>2.14-SNAPSHOT</version>
</dependency>
```

116.1. URI FORMAT

The GoogleDrive Component uses the following URI format:

```
google-drive://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- drive-about
- drive-apps
- drive-changes
- drive-channels
- drive-children
- drive-comments
- drive-files
- drive-parents
- drive-permissions
- drive-properties
- drive-realtime
- drive-replies
- drive-revisions
116.2. GOOGLEDRIVECOMPONENT

The Google Drive component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (common)</td>
<td>To use the shared configuration</td>
<td></td>
<td>GoogleDriveConfiguration</td>
</tr>
<tr>
<td>clientFactory (advanced)</td>
<td>To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleDriveClientFactory</td>
<td></td>
<td>GoogleDriveClientFactory</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Google Drive endpoint is configured using URI syntax:

```
google-drive:apiName/methodName
```

with the following path and query parameters:

116.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiName</td>
<td>Required What kind of operation to perform</td>
<td></td>
<td>GoogleDriveApiName</td>
</tr>
<tr>
<td>methodName</td>
<td>Required What sub operation to use for the selected operation</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

116.2.2. Query Parameters (12 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessToken (common)</td>
<td>OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>applicationName (common)</td>
<td>Google drive application name. Example would be camel-google-drive/1.0</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td><code>clientFactory</code></td>
<td>To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleDriveClientFactory</td>
<td></td>
<td>GoogleDriveClientFactory</td>
</tr>
<tr>
<td><code>clientId</code></td>
<td>Client ID of the drive application</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>clientSecret</code></td>
<td>Client secret of the drive application</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>inBody</code></td>
<td>Sets the name of a parameter to be passed in the exchange In Body</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>refreshToken</code></td>
<td>OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>scopes</code></td>
<td>Specifies the level of permissions you want a drive application to have to a user account. See <a href="https://developers.google.com/drive/web/scopes">https://developers.google.com/drive/web/scopes</a> for more info.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td><code>bridgeErrorHandler</code></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>exceptionHandler</code></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><code>exchangePattern</code></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>synchronous</code></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 116.3. PRODUCER ENDPOINTS
Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option `inBody` that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format `CamelGoogleDrive.<option>`. Note that the `inBody` option overrides message header, i.e. the endpoint option `inBody=option` would override a `CamelGoogleDrive.option` header.

For more information on the endpoints and options see API documentation at: https://developers.google.com/drive/v2/reference/

### 116.4. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use Scheduled Poll Consumer Options with a `consumer.` prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

### 116.5. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a `CamelGoogleDrive.` prefix.

### 116.6. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the GoogleDriveComponent. Producer endpoints can specify the option name for incoming message body in the `inBody` endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.
CHAPTER 117. GOOGLE MAIL COMPONENT

Available as of Camel version 2.15

The Google Mail component provides access to Gmail via the Google Mail Web APIs.

Google Mail uses the OAuth 2.0 protocol for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to create an account and generate OAuth credentials. Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the OAuth playground.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-mail</artifactId>
  <version>2.15-SNAPSHOT</version>
</dependency>
```

117.1. URI FORMAT

The GoogleMail Component uses the following URI format:

```
google-mail://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- attachments
- drafts
- history
- labels
- messages
- threads
- users

117.2. GOOGLEMAILCOMPONENT

The Google Mail component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td></td>
<td>GoogleMailConfiguration</td>
</tr>
</tbody>
</table>

| (common)           |                                    |                          |                           |

Red Hat Fuse 7.2 Apache Camel Component Reference
The Google Mail endpoint is configured using URI syntax:

```
google-mail:apiName/methodName
```

with the following path and query parameters:

### 117.2.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiName</td>
<td>Required What kind of operation to perform</td>
<td></td>
<td>GoogleMailApiName</td>
</tr>
<tr>
<td>methodName</td>
<td>Required What sub operation to use for the selected operation</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 117.2.2. Query Parameters (11 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessToken</td>
<td>OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage.</td>
<td></td>
<td>String</td>
</tr>

</tr>
</tbody>
</table>
### 117.3. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option `inBody` that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format `CamelGoogleMail.<option>`. Note that the

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>inBody</code> (common)</td>
<td>Sets the name of a parameter to be passed in the exchange In Body</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>refreshToken</code> (common)</td>
<td>OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>scopes</code> (common)</td>
<td>Specifies the level of permissions you want a mail application to have to a user account. See <a href="https://developers.google.com/gmail/api/auth/scopes">https://developers.google.com/gmail/api/auth/scopes</a> for more info.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td><code>bridgeErrorHandler</code> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. <td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><code>exchangePattern</code> (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>synchronous</code> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
**inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleMail.option** header.

For more information on the endpoints and options see API documentation at: https://developers.google.com/gmail/api/v1/reference/

### 117.4. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use **Scheduled Poll Consumer Options** with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

### 117.5. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleMail.** prefix.

### 117.6. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the GoogleMailComponent. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.
CHAPTER 118. GOOGLE PUBSUB COMPONENT

Available as of Camel version 2.19

The Google Pubsub component provides access to Cloud Pub/Sub Infrastructure via the Google Client Services API.

The current implementation does not use gRPC.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-pubsub</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

118.1. URI FORMAT

The GoogleMail Component uses the following URI format:

```
geoogle-pubsub://project-id:destinationName?[options]
```

Destination Name can be either a topic or a subscription name.

118.2. OPTIONS

The Google Pubsub component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectionFactor</td>
<td>Sets the connection factory to use: provides the ability to</td>
<td></td>
<td>GooglePubsubConnectionFactory</td>
</tr>
<tr>
<td>(common)</td>
<td>explicitly manage connection credentials: the path to the</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>key file - the Service Account Key / Email pair</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholder</td>
<td>on itself when starting. Only properties which are of String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Placeholders</td>
<td>type can use property placeholders.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Google Pubsub endpoint is configured using URI syntax:

```
geoogle-pubsub:projectId:destinationName
```

with the following path and query parameters:

118.2.1. Path Parameters (2 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>projectId</td>
<td>Required Project Id</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>destinationName</td>
<td>Required Destination Name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 118.2.2. Query Parameters (9 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ackMode (common)</td>
<td>AUTO = exchange gets ack’ed/nack’ed on completion. NONE = downstream process has to ack/nack explicitly</td>
<td>AUTO</td>
<td>AckMode</td>
</tr>
<tr>
<td>concurrentConsumers (common)</td>
<td>The number of parallel streams consuming from the subscription</td>
<td>1</td>
<td>Integer</td>
</tr>
<tr>
<td>connectionFactory (common)</td>
<td>ConnectionFactory to obtain connection to PubSub Service. If non provided the default will be used.</td>
<td></td>
<td>GooglePubsubConnectionFactory</td>
</tr>
<tr>
<td>loggerId (common)</td>
<td>Logger ID to use when a match to the parent route required</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>maxMessagesPerPoll (common)</td>
<td>The max number of messages to receive from the server in a single API call</td>
<td>1</td>
<td>Integer</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
</tbody>
</table>
### 118.3. PRODUCER ENDPOINTS

Producer endpoints can accept and deliver to PubSub individual and grouped exchanges alike. Grouped exchanges have `Exchange.GROUPED_EXCHANGE` property set.

Google PubSub expects the payload to be `byte[]` array, Producer endpoints will send:

- String body as `byte[]` encoded as UTF-8
- `byte[]` body as is
- Everything else will be serialised into `byte[]` array

A Map set as message header `GooglePubsubConstants.ATTRIBUTES` will be sent as PubSub attributes. Once exchange has been delivered to PubSub the PubSub Message ID will be assigned to the header `GooglePubsubConstants.MESSAGE_ID`.

### 118.4. CONSUMER ENDPOINTS

Google PubSub will redeliver the message if it has not been acknowledged within the time period set as a configuration option on the subscription.

The component will acknowledge the message once exchange processing has been completed.

If the route throws an exception, the exchange is marked as failed and the component will NACK the message - it will be redelivered immediately.

To ack/nack the message the component uses Acknowledgement ID stored as header `GooglePubsubConstants.ACK_ID`. If the header is removed or tampered with, the ack will fail and the message will be redelivered again after the ack deadline.

### 118.5. MESSAGE HEADERS

Headers set by the consumer endpoints:

- `GooglePubsubConstants.MESSAGE_ID`
- `GooglePubsubConstants.ATTRIBUTES`
- `GooglePubsubConstants.PUBLISH_TIME`
- `GooglePubsubConstants.ACK_ID`

### 118.6. MESSAGE BODY

---

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

---
The consumer endpoint returns the content of the message as byte[] - exactly as the underlying system sends it. It is up for the route to convert/unmarshall the contents.

### 118.7. AUTHENTICATION CONFIGURATION

Google Pubsub component authentication is targeted for use with the GCP Service Accounts. For more information please refer to [Google Cloud Platform Auth Guide](#).

Google security credentials can be set explicitly via one of the two options:

- Service Account Email and Service Account Key (PEM format)
- GCP credentials file location

If both are set, the Service Account Email/Key will take precedence.

Or implicitly, where the connection factory falls back on [Application Default Credentials](#).

**OBS!** The location of the default credentials file is configurable - via GOOGLE_APPLICATION_CREDENTIALS environment variable.

Service Account Email and Service Account Key can be found in the GCP JSON credentials file as client_email and private_key respectively.

### 118.8. ROLLBACK AND REDELIVERY

The rollback for Google PubSub relies on the idea of the Acknowledgement Deadline - the time period where Google PubSub expects to receive the acknowledgement. If the acknowledgement has not been received, the message is redelivered.

Google provides an API to extend the deadline for a message.

More information in [Google PubSub Documentation](#).

So, rollback is effectively a deadline extension API call with zero value - i.e. deadline is reached now and message can be redelivered to the next consumer.

It is possible to delay the message redelivery by setting the acknowledgement deadline explicitly for the rollback by setting the message header `GooglePubsubConstants.ACK_DEADLINE` to the value in seconds.
 CHAPTER 119. GROOVY LANGUAGE

Available as of Camel version 1.3

Camel supports Groovy among other Scripting Languages to allow an Expression or Predicate to be used in the DSL or Xml Configuration.

To use a Groovy expression use the following Java code

```java
... groovy("someGroovyExpression") ...
```

For example you could use the groovy function to create an Predicate in a Message Filter or as an Expression for a Recipient List

### 119.1. GROOVY OPTIONS

The Groovy language supports 1 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trim</td>
<td>true</td>
<td>Boolean</td>
<td>Whether to trim the value to remove leading and trailing whitespaces and line breaks</td>
</tr>
</tbody>
</table>

### 119.2. CUSTOMIZING GROOVY SHELL

Sometimes you may need to use custom GroovyShell instance in your Groovy expressions. To provide custom GroovyShell, add implementation of the org.apache.camel.language.groovy.GroovyShellFactory SPI interface to your Camel registry. For example after adding the following bean to your Spring context...

```java
public class CustomGroovyShellFactory implements GroovyShellFactory {

    public GroovyShell createGroovyShell(Exchange exchange) {
        ImportCustomizer importCustomizer = new ImportCustomizer();
        importCustomizer.addStaticStars("com.example.Utils");
        CompilerConfiguration configuration = new CompilerConfiguration();
        configuration.addCompilationCustomizers(importCustomizer);
        return new GroovyShell(configuration);
    }
}
```

...Camel will use your custom GroovyShell instance (containing your custom static imports), instead of the default one.

### 119.3. EXAMPLE

```java
// lets route if a line item is over $100
from("queue:foo").filter(groovy("request.lineItems.any { i -> i.value > 100 }")).to("queue:bar")
```
And the Spring DSL:

```xml
<route>
  <from uri="queue:foo"/>
  <filter>
    <groovy>request.lineItems.any { i -> i.value > 100 } </groovy>
    <to uri="queue:bar"/>
  </filter>
</route>
```

## 119.4. SCRIPTCONTEXT

The JSR-223 scripting languages ScriptContext is pre configured with the following attributes all set at ENGINE_SCOPE:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>org.apache.camel.CamelContext</td>
<td>The Camel Context (It cannot be used in groovy)</td>
</tr>
<tr>
<td>exchange</td>
<td>org.apache.camel.Exchange</td>
<td>The current Exchange</td>
</tr>
<tr>
<td>request</td>
<td>org.apache.camel.Message</td>
<td>The message (IN message)</td>
</tr>
</tbody>
</table>

### 119.5. ADDITIONAL ARGUMENTS TO SCRIPTINGENGINE

**Available as of Camel 2.8**

You can provide additional arguments to the `ScriptingEngine` using a header on the Camel message with the key `CamelScriptArguments`. See this example:

```
.setHeader("myHeader").groovy("context.resolvePropertyPlaceholders( + '{{' + request.headers.get('&#39;foo&#39;' + }}') + ")")
```

From Camel 2.9 onwards you can now use the properties function and the same example is simpler:

```
.setHeader("myHeader").groovy("properties.resolve(request.headers.get(&#39;foo&#39;))")
```

### 119.6. USING PROPERTIES FUNCTION

**Available as of Camel 2.9**

If you need to use the `Properties` component from a script to lookup property placeholders, then its a bit cumbersome to do so. For example to set a header name `myHeader` with a value from a property placeholder, which key is provided in a header named "foo".

```
.setHeader("myHeader").groovy(""context.resolvePropertyPlaceholders( + '{{' + request.headers.get(&#39;foo&#39; + }}') + ")")
```

### 119.7. LOADING SCRIPT FROM EXTERNAL RESOURCE

**Available as of Camel 2.11**

You can externalize the script and have Camel load it from a resource such as "classpath:“, "file:“, or "http:“. This is done using the following syntax: "resource:scheme:location", eg to refer to a file on the classpath you can do:

```
.setHeader("myHeader").groovy("resource:classpath:mygroovy.groovy")
```
119.8. HOW TO GET THE RESULT FROM MULTIPLE STATEMENTS SCRIPT

Available as of Camel 2.14

As the scriptengine eval method just return a Null if it runs a multiple statements script. Camel now look up the value of script result by using the key of “result” from the value set. If you have multiple statements script, you need to make sure you set the value of result variable as the script return value.

```groovy
bar = "baz";
# some other statements ...
# camel take the result value as the script evaluation result
result = body * 2 + 1
```

119.9. DEPENDENCIES

To use scripting languages in your camel routes you need to add a dependency on camel-groovy.

If you use Maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-groovy</artifactId>
  <version>x.x.x</version>
</dependency>
```
The gRPC component allows you to call or expose Remote Procedure Call (RPC) services using Protocol Buffers (protobuf) exchange format over HTTP/2 transport.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-grpc</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

### 120.1. URI FORMAT

```
grpc://service[?options]
```

### 120.2. ENDPOINT OPTIONS

The gRPC component has no options.

The gRPC endpoint is configured using URI syntax:

```
grpc:host:port/service
```

with the following path and query parameters:

#### 120.2.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td><strong>Required</strong> The gRPC server host name. This is localhost or 0.0.0.0 when being a consumer or remote server host name when using producer.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td><strong>Required</strong> The gRPC local or remote server port</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>service</td>
<td><strong>Required</strong> Fully qualified service name from the protocol buffer descriptor file (package dot service definition name)</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 120.2.2. Query Parameters (25 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>flowControlWindow</strong> (common)</td>
<td>The HTTP/2 flow control window size (MiB)</td>
<td>1048576</td>
<td>int</td>
</tr>
<tr>
<td><strong>maxMessageSize</strong> (common)</td>
<td>The maximum message size allowed to be received/sent (MiB)</td>
<td>4194304</td>
<td>int</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>consumerStrategy</strong> (consumer)</td>
<td>This option specifies the top-level strategy for processing service requests and responses in streaming mode. If an aggregation strategy is selected, all requests will be accumulated in the list, then transferred to the flow, and the accumulated responses will be sent to the sender. If a propagation strategy is selected, request is sent to the stream, and the response will be immediately sent back to the sender.</td>
<td>PROPAGATION</td>
<td>GrpcConsumerStrategy</td>
</tr>
<tr>
<td><strong>forwardOnCompleted</strong> (consumer)</td>
<td>Determines if onCompleted events should be pushed to the Camel route.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>forwardOnError</strong> (consumer)</td>
<td>Determines if onError events should be pushed to the Camel route. Exceptions will be set as message body.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>maxConcurrentCallsPerConnection</strong> (consumer)</td>
<td>The maximum number of concurrent calls permitted for each incoming server connection</td>
<td>2147483647</td>
<td>int</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong> (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td><strong>exchangePattern</strong> (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td>ExchangePattern</td>
<td></td>
</tr>
<tr>
<td><strong>method</strong> (producer)</td>
<td>gRPC method name</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
<td>--------------------</td>
</tr>
<tr>
<td>producerStrategy</td>
<td>The mode used to communicate with a remote gRPC server. In SIMPLE mode a single exchange is translated into a remote procedure call. In STREAMING mode all exchanges will be sent within the same request (input and output of the recipient gRPC service must be of type 'stream').</td>
<td>SIMPLE</td>
<td>GrpcProducerStrategy</td>
</tr>
<tr>
<td>streamRepliesTo</td>
<td>When using STREAMING client mode, it indicates the endpoint where responses should be forwarded.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>userAgent</td>
<td>The user agent header passed to the server</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>authenticationType</td>
<td>Authentication method type in advance to the SSL/TLS negotiation</td>
<td>NONE</td>
<td>GrpcAuthType</td>
</tr>
<tr>
<td>jwtAlgorithm</td>
<td>JSON Web Token sign algorithm</td>
<td>HMAC 256</td>
<td>JwtAlgorithm</td>
</tr>
<tr>
<td>jwtIssuer</td>
<td>JSON Web Token issuer</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>jwtSecret</td>
<td>JSON Web Token secret</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>jwtSubject</td>
<td>JSON Web Token subject</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>keyCertChainResource</td>
<td>The X.509 certificate chain file resource in PEM format link</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>keyPassword</td>
<td>The PKCS8 private key file password</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>keyResource</td>
<td>The PKCS8 private key file resource in PEM format link</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>negotiationType</td>
<td>Identifies the security negotiation type used for HTTP/2 communication</td>
<td>PLAIN TEXT</td>
<td>NegotiationType</td>
</tr>
<tr>
<td>serviceAccountResource</td>
<td>Service Account key file in JSON format resource link supported by the Google Cloud SDK</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
The following authentication mechanisms are built-in to gRPC and available in this component:

- **SSL/TLS**: gRPC has SSL/TLS integration and promotes the use of SSL/TLS to authenticate the server, and to encrypt all the data exchanged between the client and the server. Optional mechanisms are available for clients to provide certificates for mutual authentication.

- **Token-based authentication with Google**: gRPC provides a generic mechanism to attach metadata based credentials to requests and responses. Additional support for acquiring access tokens while accessing Google APIs through gRPC is provided. In general this mechanism must be used as well as SSL/TLS on the channel.

To enable these features the following component properties combinations must be configured:

<table>
<thead>
<tr>
<th>Num.</th>
<th>Option</th>
<th>Parameter</th>
<th>Value</th>
<th>Required/Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SSL/TLS</td>
<td>negotiationType</td>
<td>TLS</td>
<td>Required</td>
</tr>
<tr>
<td></td>
<td></td>
<td>keyCertChainResource</td>
<td></td>
<td>Required</td>
</tr>
<tr>
<td></td>
<td></td>
<td>keyResource</td>
<td></td>
<td>Required</td>
</tr>
<tr>
<td></td>
<td></td>
<td>keyPassword</td>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>trustCertCollectionResource</td>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td>2</td>
<td>Token-based authentication with Google API</td>
<td>authenticationType</td>
<td>GOOGLE</td>
<td>Required</td>
</tr>
<tr>
<td></td>
<td></td>
<td>negotiationType</td>
<td>TLS</td>
<td>Required</td>
</tr>
<tr>
<td></td>
<td></td>
<td>serviceAccountResource</td>
<td></td>
<td>Required</td>
</tr>
<tr>
<td>3</td>
<td>Custom JSON Web Token implementation authentication</td>
<td>authenticationType</td>
<td>JWT</td>
<td>Required</td>
</tr>
</tbody>
</table>
### Negotiation Type

<table>
<thead>
<tr>
<th>Num.</th>
<th>Option</th>
<th>Parameter</th>
<th>Value</th>
<th>Required/Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>negotiationType</td>
<td>NONE or TLS</td>
<td>Optional. The TLS/SSL not checking for this type, but strongly recommended.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>jwtAlgorithm</td>
<td>HMAC256(default) or (HMAC384, HMAC512)</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>jwtSecret</td>
<td>Required</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>jwtIssuer</td>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>jwtSubject</td>
<td>Optional</td>
<td></td>
</tr>
</tbody>
</table>

TLS with OpenSSL is currently the recommended approach for using gRPC over TLS component. Using the JDK for ALPN is generally much slower and may not support the necessary ciphers for HTTP2. This function is not implemented in the component.

### 120.4. GRPC Producer Resource Type Mapping

The table below shows the types of objects in the message body, depending on the types (simple or stream) of incoming and outgoing parameters, as well as the invocation style (synchronous or asynchronous). Please note, that invocation of the procedures with incoming stream parameter in asynchronous style are not allowed.

<table>
<thead>
<tr>
<th>Invocation style</th>
<th>Request type</th>
<th>Response type</th>
<th>Request Body Type</th>
<th>Result Body Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronous</td>
<td>simple</td>
<td>simple</td>
<td>Object</td>
<td>Object</td>
</tr>
<tr>
<td>synchronous</td>
<td>simple</td>
<td>stream</td>
<td>Object</td>
<td>List&lt;Object&gt;</td>
</tr>
<tr>
<td>synchronous</td>
<td>stream</td>
<td>simple</td>
<td>not allowed</td>
<td>not allowed</td>
</tr>
<tr>
<td>synchronous</td>
<td>stream</td>
<td>stream</td>
<td>not allowed</td>
<td>not allowed</td>
</tr>
<tr>
<td>asynchronous</td>
<td>simple</td>
<td>simple</td>
<td>Object</td>
<td>List&lt;Object&gt;</td>
</tr>
<tr>
<td>asynchronous</td>
<td>simple</td>
<td>stream</td>
<td>Object</td>
<td>List&lt;Object&gt;</td>
</tr>
<tr>
<td>asynchronous</td>
<td>stream</td>
<td>simple</td>
<td>Object or List&lt;Object&gt;</td>
<td>List&lt;Object&gt;</td>
</tr>
<tr>
<td>asynchronous</td>
<td>stream</td>
<td>stream</td>
<td>Object or List&lt;Object&gt;</td>
<td>List&lt;Object&gt;</td>
</tr>
</tbody>
</table>
120.5. GRPC CONSUMER HEADERS (WILL BE INSTALLED AFTER THE CONSUMER INVOCATION)

<table>
<thead>
<tr>
<th>Header name</th>
<th>Description</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelGrpcMethodName</td>
<td>Method name handled by the consumer service</td>
<td></td>
</tr>
<tr>
<td>CamelGrpcEventType</td>
<td>Received event type from the sent request</td>
<td>onNext, onCompleted, onError</td>
</tr>
<tr>
<td>CamelGrpcUserAgent</td>
<td>If provided, the given agent will prepend the gRPC library's user agent information</td>
<td></td>
</tr>
</tbody>
</table>

120.6. EXAMPLES

Below is a simple synchronous method invoke with host and port parameters

```java
from("direct:grpc-sync")
```

An asynchronous method invoke

```java
from("direct:grpc-async")
```

gRPC service consumer with propagation consumer strategy

```java
  .to("direct:grpc-service");
```

gRPC service producer with streaming producer strategy (requires a service that uses "stream" mode as input and output)

```java
from("direct:grpc-request-stream")

from("direct:grpc-response-stream")
  .log("Response received: ${body}");
```
gRPC service consumer TLS/SLL security negotiation enable

```java
from("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
  .to("direct:tls-enable")
```

gRPC service producer with custom JSON Web Token implementation authentication

```java
from("direct:grpc-jwt")
  .to("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
    method=pingSyncSync&synchronous=true&authenticationType=JWT&jwtSecret=supersecuredsecret")
```

## 120.7. CONFIGURATION

It’s it is recommended to use Maven Protocol Buffers Plugin which calls Protocol Buffer Compiler (protoc) tool to generate Java source files from .proto (protocol buffer definition) files for the custom project. This plugin will generate procedures request and response classes, their builders and gRPC procedures stubs classes as well.

Following steps are required:

Insert operating system and CPU architecture detection extension inside `<build>` tag of the project `pom.xml` or set `${os.detected.classifier}` parameter manually

```xml
<extensions>
  <extension>
    <groupId>kr.motd.maven</groupId>
    <artifactId>os-maven-plugin</artifactId>
    <version>1.4.1.Final</version>
  </extension>
</extensions>
```

Insert gRPC and protobuf Java code generator plugin `<plugins>` tag of the project `pom.xml`

```xml
<plugin>
  <groupId>org.xolstice.maven.plugins</groupId>
  <artifactId>protobuf-maven-plugin</artifactId>
  <version>0.5.0</version>
  <configuration>
    <protocArtifact>com.google.protobuf:protoc:${protobuf-version}:exe:${os.detected.classifier}</protocArtifact>
    <pluginArtifact>io.grpc:protoc-gen-grpc-java:${grpc-version}:exe:${os.detected.classifier}</pluginArtifact>
  </configuration>
  <executions>
    <execution>
      <goals>
        <goal>compile</goal>
        <goal>compile-custom</goal>
        <goal>test-compile</goal>
      </goals>
    </execution>
  </executions>
</plugin>
```

CHAPTER 121. GUAVA EVENTBUS COMPONENT

Available as of Camel version 2.10

The Google Guava EventBus allows publish-subscribe-style communication between components without requiring the components to explicitly register with one another (and thus be aware of each other). The guava-eventbus: component provides integration bridge between Camel and Google Guava EventBus infrastructure. With the latter component, messages exchanged with the Guava EventBus can be transparently forwarded to the Camel routes. EventBus component allows also to route body of Camel exchanges to the Guava EventBus.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-guava-eventbus</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

121.1. URI FORMAT

guava-eventbus:busName[?options]

Where busName represents the name of the com.google.common.eventbus.EventBus instance located in the Camel registry.

121.2. OPTIONS

The Guava EventBus component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>eventBus (common)</td>
<td>To use the given Guava EventBus instance</td>
<td></td>
<td>EventBus</td>
</tr>
<tr>
<td>listenerInterface (common)</td>
<td>The interface with method(s) marked with the Subscribe annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling DeadEvent properly. This option cannot be used together with eventClass option.</td>
<td></td>
<td>Class&lt;?&gt;</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Guava EventBus endpoint is configured using URI syntax:
guava-eventbus:eventBusRef

with the following path and query parameters:

### 121.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>eventBusRef</td>
<td>To lookup the Guava EventBus from the registry with the given name</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 121.2.2. Query Parameters (6 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>eventClass</td>
<td>If used on the consumer side of the route, will filter events received from the EventBus to the instances of the class and superclasses of eventClass. Null value of this option is equal to setting it to the java.lang.Object i.e. the consumer will capture all messages incoming to the event bus. This option cannot be used together with listenerInterface option.</td>
<td></td>
<td>Class&lt;??&gt;</td>
</tr>
<tr>
<td>listenerInterface</td>
<td>The interface with method(s) marked with the Subscribe annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling DeadEvent properly. This option cannot be used together with eventClass option.</td>
<td></td>
<td>Class&lt;??&gt;</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spiExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
</tbody>
</table>
### 121.3. USAGE

Using **guava-eventbus** component on the consumer side of the route will capture messages sent to the Guava EventBus and forward them to the Camel route. Guava EventBus consumer processes incoming messages **asynchronously**.

```java
SimpleRegistry registry = new SimpleRegistry();
EventBus eventBus = new EventBus();
registry.put("busName", eventBus);
CamelContext camel = new DefaultCamelContext(registry);

from("guava-eventbus:busName").to("seda:queue");

eventBus.post("Send me to the SEDA queue.");
```

Using **guava-eventbus** component on the producer side of the route will forward body of the Camel exchanges to the Guava EventBus instance.

```java
SimpleRegistry registry = new SimpleRegistry();
EventBus eventBus = new EventBus();
registry.put("busName", eventBus);
CamelContext camel = new DefaultCamelContext(registry);

from("direct:start").to("guava-eventbus:busName");

ProducerTemplate producerTemplate = camel.createProducerTemplate();
producer.sendBody("direct:start", "Send me to the Guava EventBus.");

eventBus.register(new Object(){
    @Subscribe
    public void messageHander(String message) {
        System.out.println("Message received from the Camel: " + message);
    }
});
```

### 121.4. DEADEVENT CONSIDERATIONS

Keep in mind that due to the limitations caused by the design of the Guava EventBus, you cannot specify event class to be received by the listener without creating class annotated with **@Subscribe** method. This limitation implies that endpoint with **eventClass** option specified actually listens to all
possible events (java.lang.Object) and filter appropriate messages programmatically at runtime. The snipped below demonstrates an appropriate excerpt from the Camel code base.

```java
@Subscribe
public void eventReceived(Object event) {
    if (eventClass == null || eventClass.isAssignableFrom(event.getClass())) {
        doEventReceived(event);
    }
    ...
}
```

This drawback of this approach is that EventBus instance used by Camel will never generate com.google.common.eventbus.DeadEvent notifications. If you want Camel to listen only to the precisely specified event (and therefore enable DeadEvent support), use listenerInterface endpoint option. Camel will create dynamic proxy over the interface you specify with the latter option and listen only to messages specified by the interface handler methods. The example of the listener interface with single method handling only SpecificEvent instances is demonstrated below.

```java
package com.example;

public interface CustomListener {

    @Subscribe
    void eventReceived(SpecificEvent event);
}
```

The listener presented above could be used in the endpoint definition as follows.

```java
from("guava-eventbus:busName?listenerInterface=com.example.CustomListener").to("seda:queue");
```

121.5. CONSUMING MULTIPLE TYPE OF EVENTS

In order to define multiple type of events to be consumed by Guava EventBus consumer use listenerInterface endpoint option, as listener interface could provide multiple methods marked with the @Subscribe annotation.

```java
package com.example;

public interface MultipleEventsListener {

    @Subscribe
    void someEventReceived(SomeEvent event);

    @Subscribe
    void anotherEventReceived(AnotherEvent event);
}
```

The listener presented above could be used in the endpoint definition as follows.

```java
from("guava-eventbus:busName?listenerInterface=com.example.MultipleEventsListener").to("seda:queue");
```
121.6. HAWTDB

Available as of Camel 2.3

HawtDB is a very lightweight and embedable key value database. It allows together with Camel to provide persistent support for various Camel features such as Aggregator.

Deprecated

The HawtDB project is being deprecated and replaced by leveldb as the lightweight and embedable key value database. To make using leveldb easy there is a leveldbjni project for that. The Apache ActiveMQ project is planning on using leveldb as their primary file based message store in the future, to replace kahadb.

There is a camel-leveldb component we recommend to use instead of this.

Issue with HawtDB 1.4 or older

There is a bug in HawtDB 1.4 or older which means the filestore will not free unused space. That means the file keeps growing. This has been fixed in HawtDB 1.5 which is shipped with Camel 2.5 onwards.

Current features it provides:

- HawtDBAggregationRepository

121.6.1. Using HawtDBAggregationRepository

HawtDBAggregationRepository is an AggregationRepository which on the fly persists the aggregated messages. This ensures that you will not loose messages, as the default aggregator will use an in memory only AggregationRepository.

It has the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repositoryName</td>
<td>String</td>
<td>A mandatory repository name. Allows you to use a shared HawtDBFile for multiple repositories.</td>
</tr>
<tr>
<td>persistentFileName</td>
<td>String</td>
<td>Filename for the persistent storage. If no file exists on startup a new file is created.</td>
</tr>
<tr>
<td>buffer Size</td>
<td>int</td>
<td>The size of the memory segment buffer which is mapped to the file store. By default its 8mb. The value is in bytes.</td>
</tr>
<tr>
<td>sync</td>
<td>boolean</td>
<td>Whether or not the HawtDBFile should sync on write or not. Default is true. By sync on write ensures that its always waiting for all writes to be spooled to disk and thus will not loose updates. If you disable this option, then HawtDB will auto sync when it has batched up a number of writes.</td>
</tr>
<tr>
<td>Option</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>pageSize</td>
<td>short</td>
<td>The size of memory pages. By default its 512 bytes. The value is in bytes.</td>
</tr>
<tr>
<td>hawtDBFile</td>
<td>HawtDBFile</td>
<td>Use an existing configured <code>org.apache.camel.component.hawtdb.HawtDBFile</code> instance.</td>
</tr>
<tr>
<td>return OldExchange</td>
<td>boolean</td>
<td>Whether the get operation should return the old existing Exchange if any existed. By default this option is <code>false</code> to optimize as we do not need the old exchange when aggregating.</td>
</tr>
<tr>
<td>useRecovery</td>
<td>boolean</td>
<td>Whether or not recovery is enabled. This option is by default <code>true</code>. When enabled the Camel Aggregator automatic recover failed aggregated exchange and have them resubmitted.</td>
</tr>
<tr>
<td>recoveryInterval</td>
<td>long</td>
<td>If recovery is enabled then a background task is run every x’th time to scan for failed exchanges to recover and resubmit. By default this interval is 5000 millis.</td>
</tr>
<tr>
<td>maximumRedeliveries</td>
<td>int</td>
<td>Allows you to limit the maximum number of redelivery attempts for a recovered exchange. If enabled then the Exchange will be moved to the dead letter channel if all redelivery attempts failed. By default this option is disabled. If this option is used then the <code>deadLetterUri</code> option must also be provided.</td>
</tr>
<tr>
<td>deadLetterUri</td>
<td>String</td>
<td>An endpoint uri for a Dead Letter Channel where exhausted recovered Exchanges will be moved. If this option is used then the <code>maximumRedeliveries</code> option must also be provided.</td>
</tr>
<tr>
<td>optimisticLocking</td>
<td>false</td>
<td>Camel 2.12: To turn on optimistic locking, which often would be needed in clustered environments where multiple Camel applications shared the same HawtDB based aggregation repository.</td>
</tr>
</tbody>
</table>

The `repositoryName` option must be provided. Then either the `persistentFileName` or the `hawtDBFile` must be provided.

### 121.6.2. What is preserved when persisting

HawtDBAggregationRepository will only preserve any `Serializable` compatible data types. If a data type is not such a type its dropped and a `WARN` is logged. And it only persists the `Message` body and the `Message` headers. The `Exchange` properties are `not` persisted.

### 121.6.3. Recovery

The HawtDBAggregationRepository will by default recover any failed Exchange. It does this by having a background tasks that scans for failed Exchanges in the persistent store. You can use the `checkInterval` option to set how often this task runs. The recovery works as transactional which ensures
that Camel will try to recover and redeliver the failed Exchange. Any Exchange which was found to be recovered will be restored from the persistent store and resubmitted and send out again.

The following headers is set when an Exchange is being recovered/redelivered:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exchange.Redeclared</td>
<td>Boolean</td>
<td>Is set to true to indicate the Exchange is being redelivered.</td>
</tr>
</tbody>
</table>

Only when an Exchange has been successfully processed it will be marked as complete which happens when the `confirm` method is invoked on the `AggregationRepository`. This means if the same Exchange fails again it will be kept retried until it success.

You can use option `maximumRedeliveries` to limit the maximum number of redelivery attempts for a given recovered Exchange. You must also set the `deadLetterUri` option so Camel knows where to send the Exchange when the `maximumRedeliveries` was hit.

You can see some examples in the unit tests of camel-hawtdb, for example this test.

121.6.3.1. Using HawtDBAggregationRepository in Java DSL

In this example we want to persist aggregated messages in the `target/data/hawtdb.dat` file.

121.6.3.2. Using HawtDBAggregationRepository in Spring XML

The same example but using Spring XML instead:

121.6.4. Dependencies

To use HawtDB in your camel routes you need to add the a dependency on `camel-hawtdb`.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-hawtdb</artifactId>
    <version>2.3.0</version>
</dependency>
```

CHAPTER 122. HAZELCAST COMPONENT

Available as of Camel version 2.7

The hazelcast-component allows you to work with the Hazelcast distributed data grid / cache. Hazelcast is an in-memory data grid, entirely written in Java (single jar). It offers a great palette of different data stores like map, multi map (same key, n values), queue, list and atomic number. The main reason to use Hazelcast is its simple cluster support. If you have enabled multicast on your network you can run a cluster with hundred nodes with no extra configuration. Hazelcast can simply be configured to add additional features like n copies between nodes (default is 1), cache persistence, network configuration (if needed), near cache, eviction and so on. For more information consult the Hazelcast documentation on http://www.hazelcast.com/docs.jsp.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hazelcast</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

122.1. HAZELCAST COMPONENTS

See followings for each component usage: * map * multimap * queue * topic * list * seda * set * atomic number * cluster support (instance) * replicatedmap * ringbuffer

122.2. USING HAZELCAST REFERENCE

122.2.1. By its name

```
<bean id="hazelcastLifecycle" class="com.hazelcast.core.LifecycleService"
  factory-bean="hazelcastInstance" factory-method="getLifecycleService"
  destroy-method="shutdown" />

<bean id="config" class="com.hazelcast.config.Config">
  <constructor-arg type="java.lang.String" value="HZ.INSTANCE" />
</bean>

<bean id="hazelcastInstance" class="com.hazelcast.core.Hazelcast" factory-method="newHazelcastInstance">
  <constructor-arg type="com.hazelcast.config.Config" ref="config" />
</bean>

<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route id="testHazelcastInstanceBeanRefPut">
    <from uri="direct:testHazelcastInstanceBeanRefPut"/>
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>put</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstanceName=HZ.INSTANCE"/>
  </route>

  <route id="testHazelcastInstanceBeanRefGet">
    <from uri="direct:testHazelcastInstanceBeanRefGet"/>
  </route>
</camelContext>
```
122.2.2. By instance

```xml
<bean id="hazelcastInstance" class="com.hazelcast.core.Hazelcast" factory-method="newHazelcastInstance" />
<bean id="hazelcastLifecycle" class="com.hazelcast.core.LifecycleService"
     factory-bean="hazelcastInstance" factory-method="getLifecycleService"
     destroy-method="shutdown" />

<camelContext xmlns="http://camel.apache.org/schema/spring">
    <route id="testHazelcastInstanceBeanRefPut">
        <from uri="direct:testHazelcastInstanceBeanRefPut"/>
        <setHeader headerName="CamelHazelcastOperationType">
            <constant>put</constant>
        </setHeader>
        <to uri="hazelcast-map:testmap?hazelcastInstanceName=HZ.INSTANCE"/>
        <to uri="seda:out"/>
    </route>
    <route id="testHazelcastInstanceBeanRefGet">
        <from uri="direct:testHazelcastInstanceBeanRefGet"/>
        <setHeader headerName="CamelHazelcastOperationType">
            <constant>get</constant>
        </setHeader>
        <to uri="hazelcast-map:testmap?hazelcastInstanceName=HZ.INSTANCE"/>
        <to uri="seda:out"/>
    </route>
</camelContext>
```

122.3. PUBLISHING HAZELCAST INSTANCE AS AN OSGI SERVICE

If operating in an OSGI container and you would want to use one instance of hazelcast across all bundles in the same container. You can publish the instance as an OSGI service and bundles using the cache al need is to reference the service in the hazelcast endpoint.

122.3.1. Bundle A create an instance and publishes it as an OSGI service

```xml
<bean id="config" class="com.hazelcast.config.FileSystemXmlConfig">
    <argument type="java.lang.String" value="${hazelcast.config}"/>
</bean>

<bean id="hazelcastInstance" class="com.hazelcast.core.Hazelcast" factory-method="newHazelcastInstance">
    <argument type="com.hazelcast.config.Config" ref="config"/>
</bean>
```
122.3.2. Bundle B uses the instance

```xml
<camelContext xmlns="http://camel.apache.org/schema/blueprint">
  <route id="testHazelcastInstanceBeanRefPut">
    <from uri="direct:testHazelcastInstanceBeanRefPut"/>
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>put</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstance=#hazelcastInstance"/>
  </route>

  <route id="testHazelcastInstanceBeanRefGet">
    <from uri="direct:testHazelcastInstanceBeanRefGet"/>
    <setHeader headerName="CamelHazelcastOperationType">
      <constant>get</constant>
    </setHeader>
    <to uri="hazelcast-map:testmap?hazelcastInstance=#hazelcastInstance"/>
    <to uri="seda:out" />
  </route>
</camelContext>
```
CHAPTER 123. HAZELCAST ATOMIC NUMBER COMPONENT

Available as of Camel version 2.7

The Hazelcast atomic number component is one of Camel Hazelcast Components which allows you to access Hazelcast atomic number. An atomic number is an object that simply provides a grid wide number (long).

There is no consumer for this endpoint!

123.1. OPTIONS

The Hazelcast Atomic Number component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>(advanced)</td>
<td>If you don't specify the instance reference, Camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>(advanced)</td>
<td>If you don't specify the mode, then the node mode will be the default.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Hazelcast Atomic Number endpoint is configured using URI syntax:

```
hazelcast-atomicvalue:cacheName
```

with the following path and query parameters:

123.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td><em>Required</em> The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

123.1.2. Query Parameters (10 parameters):
## Name | Description | Default | Type
---|---|---|---
**reliable** *(common)* | Define if the endpoint will use a reliable Topic struct or not. | false | boolean

**defaultOperation** *(producer)* | To specify a default operation to use, if no operation header has been provided. | HazelcastOperation

**hazelcastInstance** *(producer)* | The hazelcast instance reference which can be used for hazelcast endpoint. | HazelcastInstance

**hazelcastInstance Name** *(producer)* | The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance. | String

**synchronous** *(advanced)* | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean

**concurrentConsumers** *(seda)* | To use concurrent consumers polling from the SEDA queue. | 1 | int

**onErrorDelay** *(seda)* | Milliseconds before consumer continues polling after an error has occurred. | 1000 | int

**pollTimeout** *(seda)* | The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown. | 1000 | int

**transacted** *(seda)* | If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete. | false | boolean

**transferExchange** *(seda)* | If set to true the whole Exchange will be transfered. If header or body contains not serializable objects, they will be skipped. | false | boolean

### 123.2. ATOMIC NUMBER PRODUCER - TO("HAZELCAST-ATOMICVALUE:FOO")

The operations for this producer are:  * setvalue (set the number with a given value)  * get  * increase (+1)  * decrease (-1)  * destroy

Header Variables for the request message:
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelHazelcastOperationType</td>
<td>String</td>
<td>valid values are: setvalue, get, increase, decrease, destroy</td>
</tr>
</tbody>
</table>

### 123.2.1. Sample for set:

**Java DSL:**

```java
from("direct:set")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.SET_VALUE))
  .toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

**Spring DSL:**

```xml
<route>
  <from uri="direct:set" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>setvalue</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />  
</route>
```

Provide the value to set inside the message body (here the value is 10):

```java
template.sendBody("direct:set", 10);  
```

### 123.2.2. Sample for get:

**Java DSL:**

```java
from("direct:get")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
  .toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

**Spring DSL:**

```xml
<route>
  <from uri="direct:get" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>get</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />  
</route>
```

You can get the number with:

```java
long body = template.requestBody("direct:get", null, Long.class);  
```
123.2.3. Sample for increment:

Java DSL:

```java
definedirect.increment")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.INCREMENT))
  .toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```java
<route>
  <from uri="direct:increment" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>increment</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

The actual value (after increment) will be provided inside the message body.

123.2.4. Sample for decrement:

Java DSL:

```java
definedirect.decrement")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DECREMENT))
  .toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```java
<route>
  <from uri="direct:decrement" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>decrement</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo" />
</route>
```

The actual value (after decrement) will be provided inside the message body.

123.2.5. Sample for destroy

Java DSL:

```java
from("direct:destroy")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DESTROY))
  .toF("hazelcast-%sfoo", HazelcastConstants.ATOMICNUMBER_PREFIX);
```

Spring DSL:

```java
<route>
```

854
<from uri="direct:destroy" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>destroy</constant>
  </setHeader>
  <to uri="hazelcast-atomicvalue:foo"/>
</route>
CHAPTER 124. HAZELCAST INSTANCE COMPONENT

Available as of Camel version 2.7

The Hazelcast instance component is one of Camel Hazelcast Components which allows you to consume join/leave events of the cache instance in the cluster. Hazelcast makes sense in one single "server node", but it's extremely powerful in a clustered environment.

This endpoint provides no producer!

124.1. OPTIONS

The Hazelcast Instance component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance (advanced)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastMode (advanced)</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don’t specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Hazelcast Instance endpoint is configured using URI syntax:

```
hazelcast-instance:cacheName
```

with the following path and query parameters:

124.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

124.1.2. Query Parameters (16 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reliable</strong> <em>(common)</em></td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong> <em>(consumer)</em></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pick up incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>defaultOperation</strong> <em>(consumer)</em></td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelmastOperation</td>
</tr>
<tr>
<td><strong>hazelcastInstance</strong> <em>(consumer)</em></td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td><strong>hazelcastInstance Name</strong> <em>(consumer)</em></td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>pollingTimeout</strong> <em>(consumer)</em></td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td><strong>poolSize</strong> <em>(consumer)</em></td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td><strong>queueConsumer Mode</strong> <em>(consumer)</em></td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong> <em>(consumer)</em></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern</strong> <em>(consumer)</em></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><strong>synchronous</strong> <em>(advanced)</em></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>concurrentConsumers (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>onErrorDelay (seda)</td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>pollTimeout (seda)</td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>transacted (seda)</td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange (seda)</td>
<td>If set to true the whole Exchange will be transfered. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

124.2. INSTANCE CONSUMER - FROM("HAZELCAST-INSTANCE:FOO")

The instance consumer fires if a new cache instance will join or leave the cluster.

Here’s a sample:

```java
fromF("hazelcast-%%sfoo", HazelcastConstants.INSTANCE_PREFIX)
    .log("instance...")
    .choice()   
      .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
        .log("...added")
        .to("mock:added")
      .otherwise()   
        .log("...removed")
        .to("mock:removed");
```

Each event provides the following information inside the message header:

Header Variables inside the response message:
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HazelcastListenerTime</td>
<td>Long</td>
<td>time of the event in millis</td>
</tr>
<tr>
<td>Camel HazelcastListenerType</td>
<td>String</td>
<td>the map consumer sets here &quot;instancelistener&quot;</td>
</tr>
<tr>
<td>Camel HazelcastListenerAction</td>
<td>String</td>
<td>type of event - here <strong>added</strong> or <strong>removed</strong>.</td>
</tr>
<tr>
<td>Camel HazelcastInstanceHost</td>
<td>String</td>
<td>host name of the instance</td>
</tr>
<tr>
<td>Camel HazelcastInstancePort</td>
<td>Integer</td>
<td>port number of the instance</td>
</tr>
</tbody>
</table>
CHAPTER 125. HAZELCAST LIST COMPONENT

Available as of Camel version 2.7

The Hazelcast List component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed list.

125.1. OPTIONS

The Hazelcast List component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don’t specify the</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>(advanced)</td>
<td>instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don’t specify the mode,</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>(advanced)</td>
<td>then the node mode will be the default.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td>which are of String type can use property placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Hazelcast List endpoint is configured using URI syntax:

```
hazelcast-list:cacheName
```

with the following path and query parameters:

125.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

125.1.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>hazelcastInstance Name</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>Name (common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>reliable</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>pollingTimeout</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>poolSize</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>queueConsumer Mode</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>concurrentConsumers</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>(seda)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>onErrorDelay (seda)</td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>pollTimeout (seda)</td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>transacted (seda)</td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange (seda)</td>
<td>If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 125.2. LIST PRODUCER – TO(“HAZELCAST-LIST:FOO”)

The list producer provides 7 operations: * add * addAll * set * get * removevalue * removeAll * clear

#### 125.2.1. Sample for add:

```java
from("direct:add")
 .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.ADD))
 .toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX);
```

#### 125.2.2. Sample for get:

```java
from("direct:get")
 .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
 .toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX)
 .to("seda:out");
```

#### 125.2.3. Sample for setvalue:

```java
from("direct:set")
 .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.SET_VALUE))
 .toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX);
```

#### 125.2.4. Sample for removevalue:

```java
```
Note that CamelHazelcastObjectIndex header is used for indexing purpose.

125.3. LIST CONSUMER – FROM("HAZELCAST-LIST:FOO")

The list consumer provides 2 operations: * add * remove

```java
from("direct:removevalue")
 .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.REMOVE_VALUE))
 .toF("hazelcast-%sbar", HazelcastConstants.LIST_PREFIX);
```

```java
CHAPTER 125. HAZELCAST LIST COMPONENT
863
```
CHAPTER 126. HAZELCAST MAP COMPONENT

Available as of Camel version 2.7

The Hazelcast Map component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed map.

126.1. OPTIONS

The Hazelcast Map component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance (advanced)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastMode (advanced)</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don’t specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Hazelcast Map endpoint is configured using URI syntax:

```
hazelcast-map:cacheName
```

with the following path and query parameters:

126.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

126.1.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation (common)</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>hazelcastInstance</strong></td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>Name (common)</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>reliable</strong></td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong></td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>pollingTimeout</strong></td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>poolSize</strong></td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>queueConsumerMode</strong></td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>exceptionHandler</strong></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>exchangePattern</strong></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>(consumer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>synchronous</strong></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>concurrentConsumers</strong></td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>(seda)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>onErrorDelay</td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>pollTimeout</td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>transacted</td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange</td>
<td>If set to true the whole Exchange will be transfered. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 126.2. MAP CACHE PRODUCER - TO("HAZELCAST-MAP:FOO")

If you want to store a value in a map you can use the map cache producer.

The map cache producer provides follow operations specified by `CamelHazelcastOperationType` header:

- put
- putIfAbsent
- get
- getAll
- keySet
- containsKey
- containsValue
- delete
- update
- query
- clear
- evict
- evictAll
All operations are provided inside the "hazelcast.operation.type" header variable. In Java DSL you can use the constants from org.apache.camel.component.hazelcast.HazelcastOperation.

Header Variables for the request message:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelHazelcastOperationType</td>
<td>String</td>
<td>as already described.</td>
</tr>
<tr>
<td>CamelHazelcastObjectId</td>
<td>String</td>
<td>the object id to store / find your object inside the cache (not needed for the query operation)</td>
</tr>
</tbody>
</table>

**put** and **putIfAbsent** operations provide an eviction mechanism:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelHazelcastObjectTtlValue</td>
<td>Integer</td>
<td>value of TTL.</td>
</tr>
<tr>
<td>CamelHazelcastObjectTtlUnit</td>
<td>java.util.current.TimeUnit</td>
<td>value of time unit (DAYS/HOURS/MINUTES/...)</td>
</tr>
</tbody>
</table>

You can call the samples with:

```
template.sendBodyAndHeader("direct:[put|get|update|delete|query|evict]", "my-foo", HazelcastConstants.OBJECT_ID, "4711");
```

### 126.2.1. Sample for put:

**Java DSL:**

```
from("direct:put")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
  .toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);
```

**Spring DSL:**

```
<route>
```
Sample for **put** with eviction:

Java DSL:

```java
from("direct:put")
 .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
 .setHeader(HazelcastConstants.TTL_VALUE, constant(Long.valueOf(1)))
 .setHeader(HazelcastConstants.TTL_UNIT, constant(TimeUnit.MINUTES))
 .toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);
```

Spring DSL:

```xml
<from uri="direct:put" />
<setHeader headerName="hazelcast.operation.type"><constant>put</constant></setHeader>
<to uri="hazelcast-map:foo" />
</route>
```

126.2.2. Sample for **get**:

Java DSL:

```java
from("direct:get")
 .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
 .toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX)
 .to("seda:out");
```

Spring DSL:

```xml
<from uri="direct:get" />
<setHeader headerName="hazelcast.operation.type"><constant>get</constant></setHeader>
</route>
```
### 126.2.3. Sample for update:

Java DSL:

```java
from("direct:update")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.UPDATE))
    .toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);
```

Spring DSL:

```xml
<route>
  <from uri="direct:update"/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>update</constant>
  </setHeader>
  <to uri="hazelcast-map:foo"/>
</route>
```

### 126.2.4. Sample for delete:

Java DSL:

```java
from("direct:delete")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DELETE))
    .toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX);
```

Spring DSL:

```xml
<route>
  <from uri="direct:delete"/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>delete</constant>
  </setHeader>
  <to uri="hazelcast-map:foo"/>
</route>
```

### 126.2.5. Sample for query

Java DSL:

```java
from("direct:query")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.QUERY))
    .toF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX)
    .to("seda:out");
```

Spring DSL:
For the query operation Hazelcast offers a SQL like syntax to query your distributed map.

```xml
<route>
  <from uri="direct:query" />
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>query</constant>
  </setHeader>
  <to uri="hazelcast-map:foo" />
  <to uri="seda:out" />
</route>
```

String q1 = "bar > 1000";
template.sendBodyAndHeader("direct:query", null, HazelcastConstants.QUERY, q1);

### 126.3. MAP CACHE CONSUMER - FROM("HAZELCAST-MAP:FOO")

Hazelcast provides event listeners on their data grid. If you want to be notified if a cache will be manipulated, you can use the map consumer. There’re 4 events: put, update, delete and envict. The event type will be stored in the "hazelcast.listener.action" header variable. The map consumer provides some additional information inside these variables:

Header Variables inside the response message:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelHazelcastListenerTime</td>
<td>Long</td>
<td>time of the event in millis</td>
</tr>
<tr>
<td>CamelHazelcastListenerType</td>
<td>String</td>
<td>the map consumer sets here &quot;cachelistener&quot;</td>
</tr>
<tr>
<td>CamelHazelcastListenerAction</td>
<td>String</td>
<td>type of event - here added, updated, envicted and removed.</td>
</tr>
<tr>
<td>CamelHazelcastObjectId</td>
<td>String</td>
<td>the oid of the object</td>
</tr>
</tbody>
</table>
The object value will be stored within **put** and **update** actions inside the message body.

Here’s a sample:

```java
fromF("hazelcast-%sfoo", HazelcastConstants.MAP_PREFIX)
   .log("object...")
   .choice()
      .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
         .log("...added")
         .to("mock:added")
      .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ENVICTED))
         .log("...envicted")
         .to("mock:envicted")
      .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.UPDATED))
         .log("...updated")
         .to("mock:updated")
      .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
         .log("...removed")
         .to("mock:removed")
      .otherwise()
         .log("fail!");
```
CHAPTER 127. HAZELCAST MULTIMAP COMPONENT

Available as of Camel version 2.7

The Hazelcast Multimap component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed multimap.

127.1. OPTIONS

The Hazelcast Multimap component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don’t specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Hazelcast Multimap endpoint is configured using URI syntax:

```
hazelcast-multimap:cacheName
```

with the following path and query parameters:

**127.1.1. Path Parameters (1 parameters):**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

**127.1.2. Query Parameters (16 parameters):**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastInstance Name</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>reliable</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>pollingTimeout</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>poolSize</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>queueConsumer Mode</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrent Consumers</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
</tbody>
</table>
127.2. MULTIMAP CACHE PRODUCER - TO("HAZELCAST-MULTIMAP:FOO")

A multimap is a cache where you can store n values to one key. The multimap producer provides 4 operations (put, get, removevalue, delete).

Header Variables for the request message:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HazeltcastOperationType</td>
<td>String</td>
<td>valid values are: put, get, removevalue, delete From Camel 2.16: clear.</td>
</tr>
<tr>
<td>Camel HazelcastObjectId</td>
<td>String</td>
<td>the object id to store / find your object inside the cache</td>
</tr>
</tbody>
</table>

127.2.1. Sample for put:

Java DSL:

```java
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.to(String.format("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX));
```
Spring DSL:

```xml
<route>
  <from uri="direct:put"/>
  <log message="put.."/>
    <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>put</constant>
  </setHeader>
  <to uri="hazelcast-multimap:foo"/>
</route>
```

127.2.2. Sample for removevalue:

Java DSL:

```java
from("direct:removevalue")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.REMOVE_VALUE))
  .toF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX);
```

Spring DSL:

```xml
<route>
  <from uri="direct:removevalue"/>
  <log message="removevalue..."/>
    <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>removevalue</constant>
  </setHeader>
  <to uri="hazelcast-multimap:foo"/>
</route>
```

To remove a value you have to provide the value you want to remove inside the message body. If you have a multimap object `{key: "4711" values: ["my-foo","my-bar"]}` you have to put "my-foo" inside the message body to remove the "my-foo" value.

127.2.3. Sample for get:

Java DSL:

```java
from("direct:get")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
  .toF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX)
  .to("seda:out");
```

Spring DSL:

```xml
<route>
  <from uri="direct:get"/>
  <log message="get.."/>
    <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>get</constant>
  </setHeader>
</route>
```
127.2.4. Sample for delete:

**Java DSL:**

```java
from("direct:delete")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DELETE))
    .toF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX);
```

**Spring DSL:**

```xml
<route>
    <from uri="direct:delete" />
    <log message="delete.."/>
    <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
    <setHeader headerName="hazelcast.operation.type">
        <constant>delete</constant>
    </setHeader>
    <to uri="hazelcast-multimap:foo"/>
</route>
```

you can call them in your test class with:

```java
template.sendBodyAndHeader("direct:[put|get|removevalue|delete]", "my-foo", HazelcastConstants.OBJECT_ID, "4711");
```

### 127.3. MULTIMAP CACHE CONSUMER - FROM("HAZELCAST-MULTIMAP:FOO")

For the multimap cache this component provides the same listeners / variables as for the map cache consumer (except the update and enviction listener). The only difference is the `multimap` prefix inside the URI. Here is a sample:

```java
fromF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX)
    .log("object...")
    .choice()
        .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
            .log("...added")
            .to("mock:added")
    // .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ENVICTED))
    //     .log("...envicted")
    //     .to("mock:envicted")
        .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
            .log("...removed")
```
Header Variables inside the response message:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HazelcastListenerTime</td>
<td>Long</td>
<td>time of the event in millis</td>
</tr>
<tr>
<td>Camel HazelcastListenerType</td>
<td>String</td>
<td>the map consumer sets here &quot;cachelistener&quot;</td>
</tr>
<tr>
<td>Camel HazelcastListenerAction</td>
<td>String</td>
<td>type of event - here <strong>added</strong> and <strong>removed</strong> (and soon <strong>evicted</strong>)</td>
</tr>
<tr>
<td>Camel HazelcastObjectId</td>
<td>String</td>
<td>the oid of the object</td>
</tr>
<tr>
<td>Camel HazelcastCacheName</td>
<td>String</td>
<td>the name of the cache - e.g. &quot;foo&quot;</td>
</tr>
<tr>
<td>Camel HazelcastCacheType</td>
<td>String</td>
<td>the type of the cache - here multimap</td>
</tr>
</tbody>
</table>
CHAPTER 128. HAZELCAST QUEUE COMPONENT

Available as of Camel version 2.7

The Hazelcast Queue component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed queue.

128.1. OPTIONS

The Hazelcast Queue component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td>HazelcastInstance</td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>If you don't specify the instance reference, camel will use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Hazelcast Queue endpoint is configured using URI syntax:

```
hazelcast-queue:cacheName
```

with the following path and query parameters:

128.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

128.1.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td>hazelcastInstance (common)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastInstance Name (common)</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel–hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>reliable (common)</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>pollingTimeout (consumer)</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>poolSize (consumer)</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>queueConsumer Mode (consumer)</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrentConsumers (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
</tbody>
</table>
### onErrorDelay (seda)
Milliseconds before consumer continues polling after an error has occurred.

<table>
<thead>
<tr>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>int</td>
</tr>
</tbody>
</table>

### pollTimeout (seda)
The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.

<table>
<thead>
<tr>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>int</td>
</tr>
</tbody>
</table>

### transacted (seda)
If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.

<table>
<thead>
<tr>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### transferExchange (seda)
If set to true the whole Exchange will be transfered. If header or body contains not serializable objects, they will be skipped.

<table>
<thead>
<tr>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

## 128.2. QUEUE PRODUCER – TO(“HAZELCAST-QUEUE:FOO”)

The queue producer provides 10 operations: * add * put * poll * peek * offer * remove value * remaining capacity * remove all * remove if * drain to * take * retain all

### 128.2.1. Sample for add:

```java
from("direct:add")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.ADD))
.toF("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX);
```

### 128.2.2. Sample for put:

```java
from("direct:put")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUT))
.toF("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX);
```

### 128.2.3. Sample for poll:

```java
from("direct:poll")
.setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.POLL))
.toF("hazelcast:%sbar", HazelcastConstants.QUEUE_PREFIX);
```

### 128.2.4. Sample for peek:
from("direct:peek")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PEEK))
  .toF("hazelcast:%sbar", HazelcastConstants.QUEUE_PREFIX);

128.2.5. Sample for offer:

from("direct:offer")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.OFFER))
  .toF("hazelcast:%sbar", HazelcastConstants.QUEUE_PREFIX);

128.2.6. Sample for removevalue:

from("direct:removevalue")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.REMOVE_VALUE))
  .toF("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX);

128.2.7. Sample for remaining capacity:

from("direct:remaining-capacity")
  .setHeader(HazelcastConstants.OPERATION,
              constant(HazelcastOperation.REMAINING_CAPACITY)).to(
      String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));

128.2.8. Sample for remove all:

from("direct:removeAll")
  .setHeader(HazelcastConstants.OPERATION,
              constant(HazelcastOperation.REMOVE_ALL)).to(
      String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));

128.2.9. Sample for remove if:

from("direct:removeIf")
  .setHeader(HazelcastConstants.OPERATION,
              constant(HazelcastOperation.REMOVE_IF)).to(
      String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));

128.2.10. Sample for drain to:

from("direct:drainTo")
  .setHeader(HazelcastConstants.OPERATION,
              constant(HazelcastOperation.DRAIN_TO)).to(
      String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));

128.2.11. Sample for take:

from("direct:take")
  .setHeader(HazelcastConstants.OPERATION,
              constant(HazelcastOperation.TAKE)).to(
      String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));

128.2.12. Sample for retain all:

-
from("direct:retainAll").setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.RETAIN_ALL)).to(String.format("hazelcast-%sbar", HazelcastConstants.QUEUE_PREFIX));

### 128.3. QUEUE CONSUMER – FROM(“HAZELCAST-QUEUE:FOO”)  

The queue consumer provides two different modes:

- **Poll**
- **Listen**

**Sample for Poll mode**

```java
```

In this way the consumer will poll the queue and return the head of the queue or null after a timeout.

In **Listen** mode instead the consumer will listen for events on queue.

The queue consumer in **Listen** mode provides 2 operations: * add * remove

**Sample for Listen mode**

```java
fromF("hazelcast-%smm", HazelcastConstants.QUEUE_PREFIX)
  .log("object...")
  .choice()
    .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
      .log("...added")
      .to("mock:added")
    .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
      .log("...removed")
      .to("mock:removed")
    .otherwise()
      .log("fail!");
```
CHAPTER 129. HAZELCAST REPLICATED MAP COMPONENT

Available as of Camel version 2.16

The Hazelcast instance component is one of Camel Hazelcast Components which allows you to consume join/leave events of the cache instance in the cluster. A replicated map is a weakly consistent, distributed key-value data structure with no data partition.

129.1. OPTIONS

The Hazelcast Replicated Map component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>hazelcastInstance</code></td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td><code>hazelcastMode</code></td>
<td>The hazelcast mode reference which kind of instance should be used. If you don’t specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td><code>resolvePropertyPlaceholders</code></td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Hazelcast Replicated Map endpoint is configured using URI syntax:

```
hazelcast-replicatedmap:cacheName
```

with the following path and query parameters:

129.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cacheName</code></td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

129.1.2. Query Parameters (16 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation (common)</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>hazelcastInstance (common)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastInstance Name (common)</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>reliable (common)</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>pollingTimeout (consumer)</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>poolSize (consumer)</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>queueConsumer Mode (consumer)</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrentConsumers (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
</tbody>
</table>
### Name of the Tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>onErrorDelay</code></td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td><code>pollTimeout</code></td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td><code>transacted</code></td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>transferExchange</code></td>
<td>If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 129.2. REPLICATEDMAP CACHE PRODUCER

The replicatedmap producer provides 4 operations: * put * get * delete * clear

**Header Variables for the request message:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Camel HazelcastOperationType</code></td>
<td>String</td>
<td>valid values are: put, get, removevalue, delete</td>
</tr>
<tr>
<td><code>Camel HazelcastObjectId</code></td>
<td>String</td>
<td>the object id to store / find your object inside the cache</td>
</tr>
</tbody>
</table>

#### 129.2.1. Sample for put:

Java DSL:

```java
to(String.format("hazelcast-%sbar", HazelcastConstants.REPLICATEDMAP_PREFIX));
```
Spring DSL:

```xml
<route>
  <from uri="direct:put"/>
  <log message="put.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>put</constant>
  </setHeader>
  <to uri="hazelcast-replicatedmap:foo"/>
</route>

129.2.2. Sample for get:

Java DSL:

```java
from("direct:get")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.GET))
  .toF("hazelcast-%sbar", HazelcastConstants.REPLICATEDMAP_PREFIX)
  .to("seda:out");
```

Spring DSL:

```xml
<route>
  <from uri="direct:get"/>
  <log message="get.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>get</constant>
  </setHeader>
  <to uri="hazelcast-replicatedmap:foo"/>
  <to uri="seda:out"/>
</route>

129.2.3. Sample for delete:

Java DSL:

```java
from("direct:delete")
  .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.DELETE))
  .toF("hazelcast-%sbar", HazelcastConstants.REPLICATEDMAP_PREFIX);
```

Spring DSL:

```xml
<route>
  <from uri="direct:delete"/>
  <log message="delete.."/>
  <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
  <setHeader headerName="hazelcast.operation.type">
    <constant>delete</constant>
  </setHeader>
  <to uri="hazelcast-replicatedmap:foo"/>
</route>
you can call them in your test class with:

```java
template.sendBodyAndHeader("direct:[put|get|delete|clear]", "my-foo",
HazelcastConstants.OBJECT_ID, "4711");
```

### 129.3. REPLICATEDMAP CACHE CONSUMER

For the multimap cache this component provides the same listeners / variables as for the map cache consumer (except the update and evict listener). The only difference is the `multimap` prefix inside the URI. Here is a sample:

```java
fromF("hazelcast-%sbar", HazelcastConstants.MULTIMAP_PREFIX)
    .log("object...")
    .choice()
        .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ADDED))
            .log("...added")
            .to("mock:added")
        // .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.ENVICTED))
        //     .log("...envicted")
        //     .to("mock:envicted")
        .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.REMOVED))
            .log("...removed")
            .to("mock:removed")
        .otherwise()
            .log("fail!");
```

Header Variables inside the response message:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HazelcastListenerTime</td>
<td>Long</td>
<td>time of the event in millis</td>
</tr>
<tr>
<td>Camel HazelcastListenerType</td>
<td>String</td>
<td>the map consumer sets here &quot;cachelistener&quot;</td>
</tr>
<tr>
<td>Camel HazelcastListenerAction</td>
<td>String</td>
<td>type of event – here <strong>added</strong> and <strong>removed</strong> (and soon <strong>envicted</strong>)</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>CamelHazelcastObjectId</td>
<td>String</td>
<td>the oid of the object</td>
</tr>
<tr>
<td>CamelHazelcastCacheName</td>
<td>String</td>
<td>the name of the cache - e.g. &quot;foo&quot;</td>
</tr>
<tr>
<td>CamelHazelcastCacheType</td>
<td>String</td>
<td>the type of the cache - here replicatedmap</td>
</tr>
</tbody>
</table>
CHAPTER 130. HAZELCAST RINGBUFFER COMPONENT

Available as of Camel version 2.16

Available from Camel 2.16

The Hazelcast ringbuffer component is one of Camel Hazelcast Components which allows you to access Hazelcast ringbuffer. Ringbuffer is a distributed data structure where the data is stored in a ring-like structure. You can think of it as a circular array with a certain capacity.

130.1. OPTIONS

The Hazelcast Ringbuffer component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td></td>
<td>If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Hazelcast Ringbuffer endpoint is configured using URI syntax:

```
hazelcast-ringbuffer:cacheName
```

with the following path and query parameters:

130.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td><strong>Required</strong> The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

130.1.2. Query Parameters (10 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>reliable (common)</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>defaultOperation (producer)</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>hazelcastInstance (producer)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastInstance Name (producer)</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrentConsumers (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>onErrorDelay (seda)</td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>pollTimeout (seda)</td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>transacted (seda)</td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange (seda)</td>
<td>If set to true the whole Exchange will be transferred. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

130.2. RINGBUFFER CACHE PRODUCER

The ringbuffer producer provides 5 operations: * add * readonceHead * readonceTail * remainingCapacity * capacity

Header Variables for the request message:
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CamelHazelcastOperationType</code></td>
<td>String</td>
<td>valid values are: put, get, removevalue, delete</td>
</tr>
<tr>
<td><code>CamelHazelcastObjectId</code></td>
<td>String</td>
<td>the object id to store / find your object inside the cache</td>
</tr>
</tbody>
</table>

130.2.1. Sample for put:

Java DSL:

```java
toF("direct:put")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.ADD))
    .toF(String.format("hazelcast-%sbar", HazelcastConstants.RINGBUFFER_PREFIX));
```

Spring DSL:

```xml
<from uri="direct:put" />
    <log message="put.." />
        <!-- If using version 2.8 and above set headerName to "CamelHazelcastOperationType" -->
        <setHeader headerName="hazelcast.operation.type">
            <constant>add</constant>
        </setHeader>
        <to uri="hazelcast-ringbuffer:foo" />
</route>
```

130.2.2. Sample for readonce from head:

Java DSL:

```java
from("direct:get")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.READ_ONCE_HEAD))
    .toF("hazelcast-%sbar", HazelcastConstants.RINGBUFFER_PREFIX)
    .to("seda:out");
```
CHAPTER 131. HAZELCAST SEDA COMPONENT

Available as of Camel version 2.7

The Hazelcast SEDA component is one of Camel Hazelcast Components which allows you to access Hazelcast BlockingQueue. SEDA component differs from the rest components provided. It implements a work-queue in order to support asynchronous SEDA architectures, similar to the core “SEDA” component.

131.1. OPTIONS

The Hazelcast SEDA component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don't specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don't specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Hazelcast SEDA endpoint is configured using URI syntax:

```
hazelcast-seda:cacheName
```

with the following path and query parameters:

131.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

131.1.2. Query Parameters (16 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastInstance Name</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>reliable</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>pollingTimeout</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>poolSize</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>queueConsumer Mode</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandel is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td>concurrentConsumers (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>onErrorDelay (seda)</td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>pollTimeout (seda)</td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>transacted (seda)</td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange (seda)</td>
<td>If set to true the whole Exchange will be transfered. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 131.2. SEDA PRODUCER – TO(“HAZELCAST-SEDA:FOO”)

The SEDA producer provides no operations. You only send data to the specified queue.

**Java DSL:**

```java
from("direct:foo")
  .to("hazelcast-seda:foo");
```

**Spring DSL:**

```xml
<route>
  <from uri="direct:start" />
  <to uri="hazelcast-seda:foo" />
</route>
```

### 131.3. SEDA CONSUMER – FROM(“HAZELCAST-SEDA:FOO”)

The SEDA consumer provides no operations. You only retrieve data from the specified queue.

**Java DSL:**

```java
from("hazelcast-seda:foo")
  .to("mock:result");
```
Spring DSL:

```xml
<route>
  <from uri="hazelcast-seda:foo"/>
  <to uri="mock:result"/>
</route>
```
CHAPTER 132. HAZELCAST SET COMPONENT

Available as of Camel version 2.7

The Hazelcast Set component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed set.

132.1. OPTIONS

The Hazelcast Set component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default Type</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td>HazelcastInstance</td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>(advanced)</td>
<td>If you don’t specify the instance reference, camel use the default hazelcast</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>instance from the camel-hazelcast instance.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>(advanced)</td>
<td>If you don’t specify the mode, then the node mode will be the default.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty</td>
<td>Whether the component should resolve property placeholders on itself when</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Placeholders</td>
<td>starting. Only properties which are of String type can use property</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(advanced)</td>
<td>placeholders.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Hazelcast Set endpoint is configured using URI syntax:

```
hazelcast-set:cacheName
```

with the following path and query parameters:

132.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

132.1.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation</td>
<td>To specify a default operation to use, if no operation header has been</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>(common)</td>
<td>provided.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------------</td>
</tr>
<tr>
<td>hazelcastInstance (common)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastInstance Name (common)</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>reliable (common)</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>pollingTimeout (consumer)</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td>poolSize (consumer)</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>queueConsumer Mode (consumer)</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>concurrentConsumers (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>onErrorDelay</td>
<td>Milliseconds before consumer continues polling after an error has occurred.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>pollTimeout</td>
<td>The timeout used when consuming from the SEDA queue. When a timeout occurs, the consumer can check whether it is allowed to continue running. Setting a lower value allows the consumer to react more quickly upon shutdown.</td>
<td>1000</td>
<td>int</td>
</tr>
<tr>
<td>transacted</td>
<td>If set to true then the consumer runs in transaction mode, where the messages in the seda queue will only be removed if the transaction commits, which happens when the processing is complete.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange</td>
<td>If set to true the whole Exchange will be transfered. If header or body contains not serializable objects, they will be skipped.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
CHAPTER 133. HAZELCAST TOPIC COMPONENT

Available as of Camel version 2.15

The Hazelcast Topic component is one of Camel Hazelcast Components which allows you to access Hazelcast distributed topic.

133.1. OPTIONS

The Hazelcast Topic component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hazelcastInstance</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td>hazelcastMode</td>
<td>The hazelcast mode reference which kind of instance should be used. If you don’t specify the mode, then the node mode will be the default.</td>
<td>node</td>
<td>String</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Hazelcast Topic endpoint is configured using URI syntax:

```
hazelcast-topic:cacheName
```

with the following path and query parameters:

133.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

133.1.2. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultOperation</td>
<td>To specify a default operation to use, if no operation header has been provided.</td>
<td></td>
<td>HazelcastOperation</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------------</td>
</tr>
<tr>
<td><code>hazelcastInstance</code> (common)</td>
<td>The hazelcast instance reference which can be used for hazelcast endpoint.</td>
<td></td>
<td>HazelcastInstance</td>
</tr>
<tr>
<td><code>hazelcastInstance Name</code> (common)</td>
<td>The hazelcast instance reference name which can be used for hazelcast endpoint. If you don’t specify the instance reference, camel use the default hazelcast instance from the camel-hazelcast instance.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>reliable</code> (common)</td>
<td>Define if the endpoint will use a reliable Topic struct or not.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>bridgeErrorHandler</code> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>pollingTimeout</code> (consumer)</td>
<td>Define the polling timeout of the Queue consumer in Poll mode</td>
<td>10000</td>
<td>long</td>
</tr>
<tr>
<td><code>poolSize</code> (consumer)</td>
<td>Define the Pool size for Queue Consumer Executor</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td><code>queueConsumer Mode</code> (consumer)</td>
<td>Define the Queue Consumer mode: Listen or Poll</td>
<td>Listen</td>
<td>HazelcastQueueConsumer Mode</td>
</tr>
<tr>
<td><code>exceptionHandler</code> (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td><code>exchangePattern</code> (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><code>synchronous</code> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>concurrentConsumers</code> (seda)</td>
<td>To use concurrent consumers polling from the SEDA queue.</td>
<td>1</td>
<td>int</td>
</tr>
</tbody>
</table>
### 133.2. TOPIC PRODUCER – TO(“HAZELCAST-TOPIC:FOO”)

The topic producer provides only one operation (publish).

#### 133.2.1. Sample for publish:

```java
from("direct:add")
    .setHeader(HazelcastConstants.OPERATION, constant(HazelcastOperation.PUBLISH))
    .toF("hazelcast-%sbar", HazelcastConstants.PUBLISH_OPERATION);
```

### 133.3. TOPIC CONSUMER – FROM(“HAZELCAST-TOPIC:FOO”)

The topic consumer provides only one operation (received). This component is supposed to support multiple consumption as it’s expected when it comes to topics so you are free to have as much consumers as you need on the same hazelcast topic.

```java
fromF("hazelcast-%sfoo", HazelcastConstants.TOPIC_PREFIX)
    .choice()
    .when(header(HazelcastConstants.LISTENER_ACTION).isEqualTo(HazelcastConstants.RECEIVED))
        .log("...message received")
    .otherwise()
        .log("...this should never have happened")
```
CHAPTER 134. HBASE COMPONENT

Available as of Camel version 2.10

This component provides an idempotent repository, producers and consumers for Apache HBase.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hbase</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

134.1. APACHE HBASE OVERVIEW

HBase is an open-source, distributed, versioned, column-oriented store modeled after Google’s Bigtable: A Distributed Storage System for Structured Data. You can use HBase when you need random, realtime read/write access to your Big Data. More information at Apache HBase.

134.2. CAMEL AND HBASE

When using a data store inside a camel route, there is always the challenge of specifying how the camel message will stored to the datastore. In document based stores things are more easy as the message body can be directly mapped to a document. In relational databases an ORM solution can be used to map properties to columns etc. In column based stores things are more challenging as there is no standard way to perform that kind of mapping.

HBase adds two additional challenges:

- HBase groups columns into families, so just mapping a property to a column using a name convention is just not enough.

- HBase doesn’t have the notion of type, which means that it stores everything as byte[] and doesn’t know if the byte[] represents a String, a Number, a serialized Java object or just binary data.

To overcome these challenges, camel-hbase makes use of the message headers to specify the mapping of the message to HBase columns. It also provides the ability to use some camel-hbase provided classes that model HBase data and can be easily convert to and from xml/json etc. Finally it provides the ability to the user to implement and use his own mapping strategy.

Regardless of the mapping strategy camel-hbase will convert a message into an org.apache.camel.component.hbase.model.HBaseData object and use that object for its internal operations.

134.3. CONFIGURING THE COMPONENT

The HBase component can be provided a custom HBaseConfiguration object as a property or it can create an HBase configuration object on its own based on the HBase related resources that are found on classpath.
If no configuration object is provided to the component, the component will create one. The created configuration will search the class path for an hbase-site.xml file, from which it will draw the configuration. You can find more information about how to configure HBase clients at: HBase client configuration and dependencies.

### 134.4. HBASE PRODUCER

As mentioned above camel provides producers endpoints for HBase. This allows you to store, delete, retrieve or query data from HBase using your camel routes.

**hbase://tableName**

where **table** is the table name.

The supported operations are:

- Put
- Get
- Delete
- Scan

### 134.4.1. Supported URI options

The HBase component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use the shared configuration</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>poolMaxSize</td>
<td>Maximum number of references to keep for each table in the HTable pool. The default value is 10.</td>
<td>10</td>
<td>int</td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The HBase endpoint is configured using URI syntax:

```
hbase:tableName
```

with the following path and query parameters:
134.4.2. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>Required The name of the table.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

134.4.3. Query Parameters (16 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cellMappingStrategyFactory</td>
<td>To use a custom CellMappingStrategyFactory that is responsible for mapping cells.</td>
<td></td>
<td>CellMappingStrategyFactory</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>filters</td>
<td>A list of filters to use.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>mappingStrategyClassName</td>
<td>The class name of a custom mapping strategy implementation.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>mappingStrategyName</td>
<td>The strategy to use for mapping Camel messages to HBase columns. Supported values: header, or body.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>rowMapping</td>
<td>To map the key/values from the Map to a HBaseRow. The following keys is supported: rowId - The id of the row. This has limited use as the row usually changes per Exchange. rowType - The type to convert rowId to. Supported operations: CamelHBaseScan. family - The column family. Supports a number suffix for referring to more than one columns. qualifier - The column qualifier. Supports a number suffix for referring to more than one columns. value - The value. Supports a number suffix for referring to more than one columns. valueType - The value type. Supports a number suffix for referring to more than one columns. Supported operations: CamelHBaseGet, and CamelHBaseScan.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>rowModel</td>
<td>An instance of org.apache.camel.component.hbase.model.HBaseRow which describes how each row should be modeled</td>
<td></td>
<td>HBaseRow</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>userGroupInformation</td>
<td>Defines privileges to communicate with HBase such as using kerberos.</td>
<td></td>
<td>UserGroupInformation</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>maxMessagesPerPoll (consumer)</td>
<td>Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>operation (consumer)</td>
<td>The HBase operation to perform</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>remove (consumer)</td>
<td>If the option is true, Camel HBase Consumer will remove the rows which it processes.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>removeHandler (consumer)</td>
<td>To use a custom HBaseRemoveHandler that is executed when a row is to be removed.</td>
<td>HBaseRemoveHandler</td>
<td></td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>ExceptionHandler</td>
<td></td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td>ExchangePattern</td>
<td></td>
</tr>
<tr>
<td>maxResults (producer)</td>
<td>The maximum number of rows to scan.</td>
<td>100</td>
<td>int</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 134.4.4. Put Operations.

HBase is a column based store, which allows you to store data into a specific column of a specific row. Columns are grouped into families, so in order to specify a column you need to specify the column family and the qualifier of that column. To store data into a specific column you need to specify both the column and the row.

The simplest scenario for storing data into HBase from a camel route, would be to store part of the message body to specified HBase column.
The route above assumes that the message body contains an object that has an id and value property and will store the content of value in the HBase column myfamily:myqualifier in the row specified by id. If we needed to specify more than one column/value pairs we could just specify additional column mappings. Notice that you must use numbers from the 2nd header onwards, eg RowId2, RowId3, RowId4, etc. Only the 1st header does not have the number 1.

It is important to remember that you can use uri options, message headers or a combination of both. It is recommended to specify constants as part of the uri and dynamic values as headers. If something is defined both as header and as part of the uri, the header will be used.

134.4.5. Get Operations.

A Get Operation is an operation that is used to retrieve one or more values from a specified HBase row. To specify what are the values that you want to retrieve you can just specify them as part of the uri or as message headers.
In the example above the result of the get operation will be stored as a header with name CamelHBaseValue.

134.4.6. Delete Operations.

You can also use camel-hbase to perform HBase delete operation. The delete operation will remove an entire row. All that needs to be specified is one or more rows as part of the message headers.

```xml
<route>
  <from uri="direct:in"/>
  <!-- Set the HBase Row of the Get -->
  <setHeader headerName="CamelHBaseRowId">
    <el>${in.body.id}</el>
  </setHeader>
  <to uri="hbase:mutable?operation=CamelHBaseDelete"/>
</route>
```

134.4.7. Scan Operations.

A scan operation is the equivalent of a query in HBase. You can use the scan operation to retrieve multiple rows. To specify what columns should be part of the result and also specify how the values will be converted to objects you can use either uri options or headers.

```xml
<route>
  <from uri="direct:in"/>
  <!-- Set the HBase Row of the Get -->
  <setHeader headerName="CamelHBaseRowId">
    <el>${in.body.id}</el>
  </setHeader>
  <to uri="hbase:mutable?operation=CamelHBaseScan&family=myfamily&qualifier=myqualifier&valueType=java.lang.Long&rowType=java.lang.String"/>
  <to uri="log:out"/>
</route>
```

In this case it's probable that you also also need to specify a list of filters for limiting the results. You can specify a list of filters as part of the uri and camel will return only the rows that satisfy **ALL** the filters. To have a filter that will be aware of the information that is part of the message, camel defines the ModelAwareFilter. This will allow your filter to take into consideration the model that is defined by the message and the mapping strategy.

When using a ModelAwareFilter camel-hbase will apply the selected mapping strategy to the in message, will create an object that models the mapping and will pass that object to the Filter.

For example to perform scan using as criteria the message headers, you can make use of the ModelAwareColumnMatchingFilter as shown below.

```xml
<route>
  <from uri="direct:scan"/>
</route>
```
The route above assumes that a pojo is with properties firstName and lastName is passed as the message body, it takes those properties and adds them as part of the message headers. The default mapping strategy will create a model object that will map the headers to HBase columns and will pass that model the the ModelAwareColumnMatchingFilter. The filter will filter out any rows, that do not contain columns that match the model. It is like query by example.

134.5. HBASE CONSUMER

The Camel HBase Consumer, will perform repeated scan on the specified HBase table and will return the scan results as part of the message. You can either specify header mapping (default) or body mapping. The later will just add the org.apache.camel.component.hbase.model.HBaseData as part of the message body.

You can specify the columns that you want to be return and their types as part of the uri options:
The example above will create a model object that is consisted of the specified fields and the scan results will populate the model object with values. Finally the mapping strategy will be used to map this model to the camel message.

### 134.6. HBASE IDEMPOTENT REPOSITORY

The camel-hbase component also provides an idempotent repository which can be used when you want to make sure that each message is processed only once. The HBase idempotent repository is configured with a table, a column family and a column qualifier and will create to that table a row per message.

```java
HBaseConfiguration configuration = HBaseConfiguration.create();
HBaseIdempotentRepository repository = new HBaseIdempotentRepository(configuration, tableName, family, qualifier);

from("direct:in")
  .idempotentConsumer(header("messageId"), repository)
  .to("log:out");
```

### 134.7. HBASE MAPPING

It was mentioned above that you the default mapping strategies are **header** and **body** mapping. Below you can find some detailed examples of how each mapping strategy works.

#### 134.7.1. HBase Header mapping Examples

The header mapping is the default mapping. To put the value "myvalue" into HBase row "myrow" and column "myfamily:mycolum" the message should contain the following headers:

<table>
<thead>
<tr>
<th>Header</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HBase RowId</td>
<td>myrow</td>
</tr>
<tr>
<td>Camel HBase Family</td>
<td>myfamily</td>
</tr>
<tr>
<td>Camel HBase Qualifier</td>
<td>myqualifier</td>
</tr>
<tr>
<td>Camel HBase Value</td>
<td>myvalue</td>
</tr>
</tbody>
</table>

HBaseConfiguration configuration = HBaseConfiguration.create();
HBaseIdempotentRepository repository = new HBaseIdempotentRepository(configuration, tableName, family, qualifier);

from("direct:in")
  .idempotentConsumer(header("messageId"), repository)
  .to("log:out");
To put more values for different columns and/or different rows you can specify additional headers suffixed with the index of the headers, e.g:

<table>
<thead>
<tr>
<th>Header</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HBase RowId</td>
<td>myrow</td>
</tr>
<tr>
<td>Camel HBase Family</td>
<td>myfamily</td>
</tr>
<tr>
<td>Camel HBase Qualifier</td>
<td>myqualifier</td>
</tr>
<tr>
<td>Camel HBase Value</td>
<td>myvalue</td>
</tr>
<tr>
<td>Camel HBase RowId2</td>
<td>myrow2</td>
</tr>
<tr>
<td>Camel HBase Family2</td>
<td>myfamily</td>
</tr>
<tr>
<td>Camel HBase Qualifier2</td>
<td>myqualifier</td>
</tr>
<tr>
<td>Camel HBase Value2</td>
<td>myvalue2</td>
</tr>
</tbody>
</table>

In the case of retrieval operations such as get or scan you can also specify for each column the type that you want the data to be converted to. For example:

<table>
<thead>
<tr>
<th>Header</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel HBase Family</td>
<td>myfamily</td>
</tr>
</tbody>
</table>
Please note that in order to avoid boilerplate headers that are considered constant for all messages, you can also specify them as part of the endpoint uri, as you will see below.

### 134.7.2. Body mapping Examples

In order to use the body mapping strategy you will have to specify the option mappingStrategy as part of the uri, for example:

```plaintext
hbase:mytable?mappingStrategyName=body
```

To use the body mapping strategy the body needs to contain an instance of `org.apache.camel.component.hbase.model.HBaseData`. You can construct the object above can be used for example in a put operation and will result in creating or updating the row with id `myRowId` and add the value `myvalue` to the column `myfamily:myqualifier`.

The body mapping strategy might not seem very appealing at first. The advantage it has over the header mapping strategy is that the HBaseData object can be easily converted to or from xml/json.

### 134.8. SEE ALSO

- Polling Consumer
- Apache HBase
CHAPTER 135. HDFS COMPONENT (DEPRECATED)

Available as of Camel version 2.8

The `hdfs` component enables you to read and write messages from/to an HDFS file system. HDFS is the distributed file system at the heart of Hadoop.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hdfs</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

135.1. URI FORMAT

```
hdfs://hostname[:port][/path][?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`

The path is treated in the following way:

1. As a consumer, if it’s a file, it just reads the file, otherwise if it represents a directory it scans all the file under the path satisfying the configured pattern. All the files under that directory must be of the same type.

2. As a producer, if at least one split strategy is defined, the path is considered a directory and under that directory the producer creates a different file per split named using the configured `UuidGenerator`.

**Note**

When consuming from hdfs then in normal mode, a file is split into chunks, producing a message per chunk. You can configure the size of the chunk using the `chunkSize` option. If you want to read from hdfs and write to a regular file using the file component, then you can use the `fileMode=Append` to append each of the chunks together.

135.2. OPTIONS

The HDFS component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>jAASConfiguration (common)</td>
<td>To use the given configuration for security with JAAS.</td>
<td></td>
<td>Configuration</td>
</tr>
</tbody>
</table>
Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

true
boolean

The HDFS endpoint is configured using URI syntax:

```
hdfs:hostName:port/path
```

with the following path and query parameters:

### 135.2.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostName</td>
<td>Required HDFS host to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>HDFS port to use</td>
<td>8020</td>
<td>int</td>
</tr>
<tr>
<td>path</td>
<td>Required The directory path to use</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 135.2.2. Query Parameters (38 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectOnStartu p</td>
<td>Whether to connect to the HDFS file system on starting the producer/consumer. If false then the connection is created on-demand. Notice that HDFS may take up till 15 minutes to establish a connection, as it has hardcoded 45 x 20 sec redelivery. By setting this option to false allows your application to startup, and not block for up till 15 minutes.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>fileSystemType</td>
<td>Set to LOCAL to not use HDFS but local java.io.File instead.</td>
<td>HDFS</td>
<td>HdfsFileSystemType</td>
</tr>
<tr>
<td>fileType</td>
<td>The file type to use. For more details see Hadoop HDFS documentation about the various files types.</td>
<td>NORM AL_FILE</td>
<td>HdfsFileType</td>
</tr>
<tr>
<td>keyType</td>
<td>The type for the key in case of sequence or map files.</td>
<td>NULL</td>
<td>WritableType</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td><strong>owner</strong> (common)</td>
<td>The file owner must match this owner for the consumer to pickup the file. Otherwise the file is skipped.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>valueType</strong> (common)</td>
<td>The type for the key in case of sequence or map files</td>
<td></td>
<td>BYTES WritableType</td>
</tr>
<tr>
<td><strong>bridgeErrorHandler</strong> (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>delay</strong> (consumer)</td>
<td>The interval (milliseconds) between the directory scans.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td><strong>initialDelay</strong> (consumer)</td>
<td>For the consumer, how much to wait (milliseconds) before to start scanning the directory.</td>
<td></td>
<td>long</td>
</tr>
<tr>
<td><strong>pattern</strong> (consumer)</td>
<td>The pattern used for scanning the directory</td>
<td>*</td>
<td>String</td>
</tr>
<tr>
<td><strong>sendEmptyMessageWhenIdle</strong> (consumer)</td>
<td>If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead.</td>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>exceptionHandler</strong> (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern</strong> (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><strong>pollStrategy</strong> (consumer)</td>
<td>A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel.</td>
<td></td>
<td>PollingConsumerPollingStrategy</td>
</tr>
<tr>
<td><strong>append</strong> (producer)</td>
<td>Append to existing file. Notice that not all HDFS file systems support the append option.</td>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td>overwrite (producer)</td>
<td>Whether to overwrite existing files with the same name</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>blockSize (advanced)</td>
<td>The size of the HDFS blocks</td>
<td>67108864</td>
<td>long</td>
</tr>
<tr>
<td>bufferSize (advanced)</td>
<td>The buffer size used by HDFS</td>
<td>4096</td>
<td>int</td>
</tr>
<tr>
<td>checkIdleInterval (advanced)</td>
<td>How often (time in millis) in to run the idle checker background task. This option is only in use if the splitter strategy is IDLE.</td>
<td>500</td>
<td>int</td>
</tr>
<tr>
<td>chunkSize (advanced)</td>
<td>When reading a normal file, this is split into chunks producing a message per chunk.</td>
<td>4096</td>
<td>int</td>
</tr>
<tr>
<td>compressionCodec (advanced)</td>
<td>The compression codec to use</td>
<td>DEFAULT</td>
<td>HdfsCompressionCodec</td>
</tr>
<tr>
<td>compressionType (advanced)</td>
<td>The compression type to use (is default not in use)</td>
<td>NONE</td>
<td>CompressionType</td>
</tr>
<tr>
<td>openedSuffix (advanced)</td>
<td>When a file is opened for reading/writing the file is renamed with this suffix to avoid to read it during the writing phase.</td>
<td>opened</td>
<td>String</td>
</tr>
<tr>
<td>readSuffix (advanced)</td>
<td>Once the file has been read is renamed with this suffix to avoid to read it again.</td>
<td>read</td>
<td>String</td>
</tr>
<tr>
<td>replication (advanced)</td>
<td>The HDFS replication factor</td>
<td>3</td>
<td>short</td>
</tr>
</tbody>
</table>
In the current version of Hadoop opening a file in append mode is disabled since it’s not very reliable. So, for the moment, it’s only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way: If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured UuidGenerator. Every time a splitting condition is met, a new file is created. The splitStrategy option is defined as a string with the following syntax: splitStrategy=ST:value,ST:value,… where ST can be: BYTES a new file is created, and the old is closed when the number of written bytes is more than value MESSAGES a new file is created, and the old is closed when the number of written messages is more than value IDLE a new file is created, and the old is closed when no writing happened in the last value milliseconds.

<td>TRACE</td>
<td>LoggingLevel</td>
</tr>
</tbody>
</table>
### 135.2.3. KeyType and ValueType

- **NULL** it means that the key or the value is absent
- **BYTE** for writing a byte, the java Byte class is mapped into a BYTE
- **BYTES** for writing a sequence of bytes. It maps the java ByteBuffer class
- **INT** for writing java integer
- **FLOAT** for writing java float
- **LONG** for writing java long
- **DOUBLE** for writing java double
- **TEXT** for writing java strings

BYTES is also used with everything else, for example, in Camel a file is sent around as an InputStream, in this case is written in a sequence file or a map file as a sequence of bytes.

### 135.3. SPLITTING STRATEGY

In the current version of Hadoop opening a file in append mode is disabled since it’s not very reliable. So, for the moment, it’s only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way:
If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured UuidGenerator.

Every time a splitting condition is met, a new file is created. The splitStrategy option is defined as a string with the following syntax:

\[\text{splitStrategy} = \text{<ST>:<value>}, \text{<ST>:<value>}, *\]

where <ST> can be:

- **BYTES** a new file is created, and the old is closed when the number of written bytes is more than <value>
- **MESSAGES** a new file is created, and the old is closed when the number of written messages is more than <value>
- **IDLE** a new file is created, and the old is closed when no writing happened in the last <value> milliseconds

**Note**

Note that this strategy currently requires either setting an IDLE value or setting the HdfsConstants.HDFS_CLOSE header to false to use the BYTES/MESSAGES configuration...otherwise, the file will be closed with each message.

For example:

```
```

It means: a new file is created either when it has been idle for more than 1 second or if more than 5 bytes have been written. So, running `hadoop fs -ls /tmp/simple-file` you’ll see that multiple files have been created.

### 135.4. MESSAGE HEADERS

The following headers are supported by this component:

#### 135.4.1. Producer only

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelFileName</td>
<td>Camel 2.13: Specifies the name of the file to write (relative to the endpoint path). The name can be a String or an Expression object. Only relevant when not using a split strategy.</td>
</tr>
</tbody>
</table>

### 135.5. CONTROLLING TO CLOSE FILE STREAM

**Available as of Camel 2.10.4**

When using the HDFS producer **without** a split strategy, then the file output stream is by default closed after the write. However you may want to keep the stream open, and only explicitly close the stream later. For that you can use the header `HdfsConstants.HDFS_CLOSE` (value = "CamelHdfsClose") to control this. Setting this value to a boolean allows you to explicit control whether the stream should be closed or not.
Notice this does not apply if you use a split strategy, as there are various strategies that can control when the stream is closed.

135.6. USING THIS COMPONENT IN OSGI

This component is fully functional in an OSGi environment, however, it requires some actions from the user. Hadoop uses the thread context class loader in order to load resources. Usually, the thread context classloader will be the bundle class loader of the bundle that contains the routes. So, the default configuration files need to be visible from the bundle class loader. A typical way to deal with it is to keep a copy of core-default.xml in your bundle root. That file can be found in the hadoop-common.jar.
CHAPTER 136. HDFS2 COMPONENT

Available as of Camel version 2.14

The hdfs2 component enables you to read and write messages from/to an HDFS file system using Hadoop 2.x. HDFS is the distributed file system at the heart of Hadoop.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hdfs2</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

136.1. URI FORMAT

```
hdfs2://hostname[:port]/[path][?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&…`

The path is treated in the following way:

1. as a consumer, if it’s a file, it just reads the file, otherwise if it represents a directory it scans all the file under the path satisfying the configured pattern. All the files under that directory must be of the same type.

2. as a producer, if at least one split strategy is defined, the path is considered a directory and under that directory the producer creates a different file per split named using the configured UuidGenerator.

When consuming from hdfs2 then in normal mode, a file is split into chunks, producing a message per chunk. You can configure the size of the chunk using the chunkSize option. If you want to read from hdfs and write to a regular file using the file component, then you can use the fileMode=Append to append each of the chunks together.

136.2. OPTIONS

The HDFS2 component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>jAASConfiguration</td>
<td>To use the given configuration for security with JAAS.</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The HDFS2 endpoint is configured using URI syntax:
with the following path and query parameters:

### 136.2.1. Path Parameters (3 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostName</td>
<td>Required HDFS host to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>port</td>
<td>HDFS port to use</td>
<td>8020</td>
<td>int</td>
</tr>
<tr>
<td>path</td>
<td>Required The directory path to use</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 136.2.2. Query Parameters (38 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

<tr>
<td>backoffErrorThreshold (scheduler)</td>
<td>The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>backoffIdleThreshold (scheduler)</td>
<td>The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in.</td>
<td>int</td>
<td></td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
--- | --- | --- | ---
**backoffMultiplier** (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. |  | int

**delay** (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long

**greedy** (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean

**initialDelay** (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long

**runLoggingLevel** (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel

**scheduledExecutorService** (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. |  | ScheduledExecutorService

**scheduler** (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler

**schedulerProperties** (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. |  | Map

**startScheduler** (scheduler) | Whether the scheduler should be auto started. | true | boolean

**timeUnit** (scheduler) | Time unit for initialDelay and delay options. | MILLIS | TimeUnit

**useFixedDelay** (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean

### 136.2.3. KeyType and ValueType
136.3. SPLITTING STRATEGY

In the current version of Hadoop opening a file in append mode is disabled since it’s not very reliable. So, for the moment, it’s only possible to create new files. The Camel HDFS endpoint tries to solve this problem in this way:

- If the split strategy option has been defined, the hdfs path will be used as a directory and files will be created using the configured UuidGenerator
- Every time a splitting condition is met, a new file is created. The splitStrategy option is defined as a string with the following syntax: splitStrategy=<ST>:<value>,<ST>:<value>,*

where <ST> can be:

- BYTES a new file is created, and the old is closed when the number of written bytes is more than <value>
- MESSAGES a new file is created, and the old is closed when the number of written messages is more than <value>
- IDLE a new file is created, and the old is closed when no writing happened in the last <value> milliseconds

Note that this strategy currently requires either setting an IDLE value or setting the HdfsConstants.HDFS_CLOSE header to false to use the BYTES/MESSAGES configuration…otherwise, the file will be closed with each message.

For example:

```
```

It means: a new file is created either when it has been idle for more than 1 second or if more than 5 bytes have been written. So, running `hadoop fs -ls /tmp/simple-file` you’ll see that multiple files have been created.
136.4. MESSAGE HEADERS

The following headers are supported by this component:

136.4.1. Producer only

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel FileName</td>
<td>Camel 2.13: Specifies the name of the file to write (relative to the endpoint path). The name can be a String or an Expression object. Only relevant when not using a split strategy.</td>
</tr>
</tbody>
</table>

136.5. CONTROLLING TO CLOSE FILE STREAM

When using the HDFS2 producer without a split strategy, then the file output stream is by default closed after the write. However you may want to keep the stream open, and only explicitly close the stream later. For that you can use the header HdfsConstants.HDFS_CLOSE (value = "CamelHdfsClose") to control this. Setting this value to a boolean allows you to explicit control whether the stream should be closed or not.

Notice this does not apply if you use a split strategy, as there are various strategies that can control when the stream is closed.

136.6. USING THIS COMPONENT IN OSGI

There are some quirks when running this component in an OSGi environment related to the mechanism Hadoop 2.x uses to discover different org.apache.hadoop.fs.FileSystem implementations. Hadoop 2.x uses java.util.ServiceLoader which looks for /META-INF/services/org.apache.hadoop.fs.FileSystem files defining available filesystem types and implementations. These resources are not available when running inside OSGi.

As with camel-hdfs component, the default configuration files need to be visible from the bundle class loader. A typical way to deal with it is to keep a copy of core-default.xml (and e.g., hdfs-default.xml) in your bundle root.

136.6.1. Using this component with manually defined routes

There are two options:

1. Package /META-INF/services/org.apache.hadoop.fs.FileSystem resource with bundle that defines the routes. This resource should list all the required Hadoop 2.x filesystem implementations.

2. Provide boilerplate initialization code which populates internal, static cache inside org.apache.hadoop.fs.FileSystem class:

   conf.setClass("fs.file.impl", org.apache.hadoop.fs.LocalFileSystem.class, FileSystem.class);
   conf.setClass("fs.hdfs.impl", org.apache.hadoop.hdfs.DistributedFileSystem.class, FileSystem.class);
   ...
136.6.2. Using this component with Blueprint container

Two options:

2. Add the following to the blueprint definition file:

```xml
<bean id="hdfsOsgiHelper" class="org.apache.camel.component.hdfs2.HdfsOsgiHelper">
    <argument>
        <map>
            <entry key="file:///" value="org.apache.hadoop.fs.LocalFileSystem" />
            <entry key="hdfs://localhost:9000/" value="org.apache.hadoop.hdfs.DistributedFileSystem" />
            ...
        </map>
    </argument>
</bean>

<bean id="hdfs2" class="org.apache.camel.component.hdfs2.HdfsComponent" depends-on="hdfsOsgiHelper" />
```

This way Hadoop 2.x will have correct mapping of URI schemes to filesystem implementations.
CHAPTER 137. HEADERSMAP

Available as of Camel 2.20

The camel-headersmap is a faster implementation of a case-insensitive map which can be plugged in and used by Camel at runtime to have slight faster performance in the Camel Message headers.

137.1. AUTO DETECTION FROM CLASSPATH

To use this implementation all you need to do is to add the camel-headersmap dependency to the classpath, and Camel should auto-detect this on startup and log as follows:

Detected and using custom HeadersMapFactory:
org.apache.camel.component.headersmap.FastHeadersMapFactory@71e9ebae

For spring-boot there is a camel-headersmap-starter dependency you should use.

137.2. MANUAL ENABLING

If you use OSGi or the implementation is not added to the classpath, you need to enable this explicit such .Title

CamelContext camel = ...
camel.setHeadersMapFactory(new FastHeadersMapFactory());

Or in XML DSL (spring or blueprint XML file) you can declare the factory as a <bean>

<bean id="fastMapFactory"
class="org.apache.camel.component.headersmap.FastHeadersMapFactory"/>

and then Camel should detect the bean and use the factory, which is logged:
CHAPTER 138. HESSIAN DATAFORMAT (DEPRECATED)

Available as of Camel version 2.17

Hessian is Data Format for marshalling and unmarshalling messages using Caucho’s Hessian format.

If you want to use Hessian Data Format from Maven, add the following dependency to your pom.xml:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hessian</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

138.1. OPTIONS

The Hessian dataformat supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>whitelistEnabled</td>
<td>true</td>
<td>Boolean</td>
<td>Define if Whitelist feature is enabled or not</td>
</tr>
<tr>
<td>allowedUnmarshalObjects</td>
<td>String</td>
<td></td>
<td>Define the allowed objects to be unmarshalled</td>
</tr>
<tr>
<td>deniedUnmarshalObjects</td>
<td>String</td>
<td></td>
<td>Define the denied objects to be unmarshalled</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

138.2. USING THE HESSIAN DATA FORMAT IN JAVA DSL

```java
from("direct:in")
  .marshal().hessian();
```

138.3. USING THE HESSIAN DATA FORMAT IN SPRING DSL

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:in"/>
    <marshal ref="hessian"/>
  </route>
</camelContext>
```
Bruce is used to solving complex problems. He is known for his ability to break down complex issues into simpler, more manageable parts. He typically starts by gathering all relevant data and resources, then carefully analyzing each piece to identify the root cause of the problem. Once he has a clear understanding of the issue, he begins to develop a step-by-step plan for resolution. Bruce is particularly skilled at identifying innovative solutions that others might not have considered. He is known for his disciplined approach, ensuring that every step of the plan is carefully executed to achieve the desired outcome. His attention to detail and commitment to excellence have earned him a reputation as a trusted advisor and problem solver.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

<td>Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 139.3. SCHEDULED POLL CONSUMER

This component implements the ScheduledPollConsumer. Only the last message from the provided 'consumeUsers' are retrieved and sent as Exchange body. If you do not want the same message to be retrieved again when there are no new messages on next poll then you can add the idempotent consumer as shown below. All the options on the ScheduledPollConsumer can also be used for more control on the consumer.

```java
@Overwrite
class override configure() throws Exception {
    String hipchatEndpointUri = "hipchat://?authToken=XXXX&consumeUsers=@Joe,@John";
    from(hipchatEndpointUri)
        .idempotentConsumer()
            .simple("${in.header.HipchatMessageDate} ${in.header.HipchatFromUser}"
                    MemoryIdempotentRepository.memoryIdempotentRepository(200)
            )
        .to("mock:result");
}
```

### 139.3.1. Message headers set by the Hipchat consumer

<table>
<thead>
<tr>
<th>Header</th>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HipchatFromUser</td>
<td>HipchatConstants.FR_LOG_USER</td>
<td>String</td>
<td>The body has the message that was sent from this user to the owner of authToken</td>
</tr>
<tr>
<td>HipchatMessageDate</td>
<td>HipchatConstants.MESSAGE_DATE</td>
<td>String</td>
<td>The date message was sent. The format is ISO-8601 as present in the Hipchat response.</td>
</tr>
</tbody>
</table>

### 139.4. HIPCHAT PRODUCER
Producer can send messages to both Room’s and User’s simultaneously. The body of the exchange is sent as message. Sample usage is shown below. Appropriate headers needs to be set.

```java
@override
class HipchatProducer
{
    public void configure() throws Exception {
        String hipchatEndpointUri = "hipchat://?authToken=XXXX";
        from("direct:start")
            .to(hipchatEndpointUri)
            .to("mock:result");
    }
}
```

### 139.4.1. Message headers evaluated by the Hipchat producer

<table>
<thead>
<tr>
<th>Header</th>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>HipchatToUser</code></td>
<td><code>HipchatConstants.T_O_USER</code></td>
<td><code>String</code></td>
<td>The Hipchat user to which the message needs to be sent.</td>
</tr>
<tr>
<td><code>HipchatToRoom</code></td>
<td><code>HipchatConstants.T_O_ROOM</code></td>
<td><code>String</code></td>
<td>The Hipchat room to which the message needs to be sent.</td>
</tr>
<tr>
<td><code>HipchatMessageFormat</code></td>
<td><code>HipchatConstants.MESSAGE_FORMAT</code></td>
<td><code>String</code></td>
<td>Valid formats are 'text' or 'html'. <strong>Default:</strong> 'text'</td>
</tr>
<tr>
<td><code>HipchatMessageBackgroundColor</code></td>
<td><code>HipchatConstants.MESSAGE_BACKGROUND_COLOR</code></td>
<td><code>String</code></td>
<td>Valid color values are 'yellow', 'green', 'red', 'purple', 'gray', 'random'. <strong>Default:</strong> 'yellow' (Room Only)</td>
</tr>
<tr>
<td><code>HipchatTriggerNotification</code></td>
<td><code>HipchatConstants.TRIGGER_NOTIFY</code></td>
<td><code>String</code></td>
<td>Valid values are 'true' or 'false'. Whether this message should trigger a user notification (change the tab color, play a sound, notify mobile phones, etc). <strong>Default:</strong> 'false' (Room Only)</td>
</tr>
</tbody>
</table>

### 139.4.2. Message headers set by the Hipchat producer
<table>
<thead>
<tr>
<th>Header</th>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HipchatToUserResponseStatus</td>
<td>HipchatConstants.TO_USE_RESPONSE_STATUS</td>
<td>StatusLine</td>
<td>The status of the API response received when message sent to the user.</td>
</tr>
</tbody>
</table>

### 139.4.3. Configuring Http Client

The HipChat component allow your own HttpClient configuration. This can be done by defining a reference for CloseableHttpClient in the registry (e.g. Spring Context) and then, set the parameter during the Endpoint definition, for example:

```xml
```

To see more information about Http Client configuration, please check the official documentation.

### 139.4.4. Dependencies

Maven users will need to add the following dependency to their pom.xml.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hipchat</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.15.0 or higher)
CHAPTER 140. HL7 DATAFORMAT

Available as of Camel version 2.0

The HL7 component is used for working with the HL7 MLLP protocol and HL7 v2 messages using the HAPI library.

This component supports the following:

- HL7 MLLP codec for Mina
- HL7 MLLP codec for Netty4 from Camel 2.15 onwards
- Type Converter from/to HAPI and String
- HL7 DataFormat using the HAPI library
- Even more ease-of-use as it’s integrated well with the camel-mina2 component.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hl7</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

140.1. HL7 MLLP PROTOCOL

HL7 is often used with the HL7 MLLP protocol, which is a text based TCP socket based protocol. This component ships with a Mina and Netty4 Codec that conforms to the MLLP protocol so you can easily expose an HL7 listener accepting HL7 requests over the TCP transport layer. To expose a HL7 listener service, the camel-mina2 or camel-netty4 component is used with the HL7MLLPCodec (mina2) or HL7MLLPNettyDecoder/HL7MLLPNettyEncoder (Netty4).

HL7 MLLP codec can be configured as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startByte</td>
<td>0x0b</td>
<td>The start byte spanning the HL7 payload.</td>
</tr>
<tr>
<td>endByte1</td>
<td>0x1c</td>
<td>The first end byte spanning the HL7 payload.</td>
</tr>
<tr>
<td>endByte2</td>
<td>0x0d</td>
<td>The 2nd end byte spanning the HL7 payload.</td>
</tr>
<tr>
<td>charset</td>
<td>JVM Default</td>
<td>The encoding (a charset name) to use for the codec. If not provided, Camel will use the JVM default Charset.</td>
</tr>
</tbody>
</table>
### 140.1.1. Exposing an HL7 listener using Mina

In the Spring XML file, we configure a mina2 endpoint to listen for HL7 requests using TCP on port 8888:

```xml
<endpoint id="hl7MinaListener" uri="mina2:tcp://localhost:8888?sync=true&codec=#hl7codec"/>
```

The `sync=true` indicates that this listener is synchronous and therefore will return a HL7 response to the caller. The HL7 codec is setup with `codec=#hl7codec`. Note that `hl7codec` is just a Spring bean ID, so it could be named `mygreatcodecforhl7` or whatever. The codec is also set up in the Spring XML file:

```xml
<bean id="hl7codec" class="org.apache.camel.component.hl7.HL7MLLPCodec">
    <property name="charset" value="iso-8859-1"/>
</bean>
```

The endpoint `hl7MinaListener` can then be used in a route as a consumer, as this Java DSL example illustrates:

```java
from("hl7MinaListener") .bean("patientLookupService");
```

This is a very simple route that will listen for HL7 and route it to a service named `patientLookupService`. This is also Spring bean ID, configured in the Spring XML as:

```xml
<bean id="patientLookupService" class="com.mycompany.healthcare.service.PatientLookupService"/>
```

The business logic can be implemented in POJO classes that do not depend on Camel, as shown here:

```java
import ca.uhn.hl7v2.HL7Exception;
import ca.uhn.hl7v2.model.Message;
import ca.uhn.hl7v2.model.v24.segment.QRD;

public class PatientLookupService {
    public Message lookupPatient(Message input) throws HL7Exception {
        QRD qrd = (QRD) input.get("QRD");
        String patientId = qrd.getWhoSubjectFilter(0).getIDNumber().getValue();

        // find patient data based on the patient id and create a HL7 model object with the response
```
140.1.2. Exposing an HL7 listener using Netty (available from Camel 2.15 onwards)

In the Spring XML file, we configure a netty4 endpoint to listen for HL7 requests using TCP on port 8888:

```xml
<endpoint id="hl7NettyListener" url="netty4.tcp://localhost:8888?sync=true&encoder=#hl7encoder&decoder=#hl7decoder"/>
```

`sync=true` indicates that this listener is synchronous and therefore will return a HL7 response to the caller. The HL7 codec is setup with `encoder=#hl7encoder` and `decoder=#hl7decoder`. Note that `hl7encoder` and `hl7decoder` are just bean IDs, so they could be named differently. The beans can be set in the Spring XML file:

```xml
<bean id="hl7decoder" class="org.apache.camel.component.hl7.HL7MLLPNettyDecoderFactory"/>
<bean id="hl7encoder" class="org.apache.camel.component.hl7.HL7MLLPNettyEncoderFactory"/>
```

The endpoint `hl7NettyListener` can then be used in a route as a consumer, as this Java DSL example illustrates:

```java
from("hl7NettyListener")
    .bean("patientLookupService");
```

### 140.2. HL7 MODEL USING JAVA.LANG.STRING OR BYTE[]

The HL7 MLLP codec uses plain String as its data format. Camel uses its Type Converter to convert to/from strings to the HAPI HL7 model objects, but you can use the plain String objects if you prefer, for instance if you wish to parse the data yourself.

As of Camel 2.14.1 you can also let both the Mina and Netty codecs use a plain `byte[]` as its data format by setting the `produceString` property to false. The Type Converter is also capable of converting the `byte[]` to/from HAPI HL7 model objects.

### 140.3. HL7V2 MODEL USING HAPI

The HL7v2 model uses Java objects from the HAPI library. Using this library, you can encode and decode from the EDI format (ER7) that is mostly used with HL7v2.

The sample below is a request to lookup a patient with the patient ID **0101701234**.

```java
MSH|^~\&|MYSENDER|MYRECEIVER|MYAPPLICATION||200612211200||QRY^A19|1234|P|2.4
QRD|200612211200|R|I|GetPatient|||1^RD|0101701234|DEM||
```

Using the HL7 model you can work with a `ca.uhn.hl7v2.model.Message` object, e.g. to retrieve a patient ID:

```java
Message msg = exchange.getIn().getBody(Message.class);
QRD qrd = (QRD)msg.get("QRD");
String patientId = qrd.getWhoSubjectFilter(0).getIDNumber().getValue(); // 0101701234
```
This is powerful when combined with the HL7 listener, because you don’t have to work with `byte[]`, `String` or any other simple object formats. You can just use the HAPI HL7v2 model objects. If you know the message type in advance, you can be more type-safe:

```java
QRY_A19 msg = exchange.getIn().getBody(QRY_A19.class);
String patientId = msg.getQRD().getWhoSubjectFilter(0).getIDNumber().getValue();
```

### 140.4. HL7 DATAFORMAT

The HL7 component ships with a HL7 data format that can be used to marshal or unmarshal HL7 model objects.

The HL7 dataformat supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validate</td>
<td>true</td>
<td>Boolean</td>
<td>Whether to validate the HL7 message Is by default true.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

- **marshal** = from Message to byte stream (can be used when responding using the HL7 MLLP codec)
- **unmarshal** = from byte stream to Message (can be used when receiving streamed data from the HL7 MLLP)

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```java
DataFormat hl7 = new HL7DataFormat();

from("direct:hl7in")
  .marshal(hl7)
  .to("jms:queue:hl7out");
```

In the sample above, the HL7 is marshalled from a HAPI Message object to a byte stream and put on a JMS queue.

The next example is the opposite:

```java
DataFormat hl7 = new HL7DataFormat();

from("jms:queue:hl7out")
  .unmarshal(hl7)
  .to("patientLookupService");
```
Here we unmarshal the byte stream into a HAPI Message object that is passed to our patient lookup service.

140.4.1. Serializable messages

As of HAPI 2.0 (used by Camel 2.11), the HL7v2 model classes are fully serializable. So you can put HL7v2 messages directly into a JMS queue (i.e. without calling `marshal()` and read them again directly from the queue (i.e. without calling `unmarshal()`).

140.4.2. Segment separators

As of Camel 2.11, `unmarshal` does not automatically fix segment separators anymore by converting `\n` to `\r`. If you need this conversion, `org.apache.camel.component.hl7.HL7#convertLFToCR` provides a handy Expression for this purpose.

140.4.3. Charset

As of Camel 2.14.1, both `marshal` and `unmarshal` evaluate the charset provided in the field `MSH-18`. If this field is empty, by default the charset contained in the corresponding Camel charset property/header is assumed. You can even change this default behavior by overriding the `guessCharsetName` method when inheriting from the `HL7DataFormat` class.

There is a shorthand syntax in Camel for well-known data formats that are commonly used. Then you don’t need to create an instance of the `HL7DataFormat` object:

```
from("direct:hl7in")
  .marshal().hl7()
  .to("jms:queue:hl7out");

from("jms:queue:hl7out")
  .unmarshal().hl7()
  .to("patientLookupService");
```

140.5. MESSAGE HEADERS

The unmarshal operation adds these fields from the MSH segment as headers on the Camel message:

<table>
<thead>
<tr>
<th>Key</th>
<th>MSH field</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camel Sending Application</td>
<td>MSH-3</td>
<td>MYSERVER</td>
</tr>
<tr>
<td>Key</td>
<td>MSH field</td>
<td>Example</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------</td>
<td>---------------</td>
</tr>
<tr>
<td>Camel HL7 Sending Facility</td>
<td>MSH-4</td>
<td>MYSERVERAPP</td>
</tr>
<tr>
<td>Camel HL7 Receiving Application</td>
<td>MSH-5</td>
<td>MYCLIENT</td>
</tr>
<tr>
<td>Camel HL7 Receiving Facility</td>
<td>MSH-6</td>
<td>MYCLIENTAPP</td>
</tr>
<tr>
<td>Camel HL7 Timestamp</td>
<td>MSH-7</td>
<td>20071231235900</td>
</tr>
<tr>
<td>Camel HL7 Security</td>
<td>MSH-8</td>
<td>null</td>
</tr>
<tr>
<td>Camel HL7 MessageType</td>
<td>MSH-9-1</td>
<td>ADT</td>
</tr>
<tr>
<td>Camel HL7 TriggerEvent</td>
<td>MSH-9-2</td>
<td>A01</td>
</tr>
<tr>
<td>Camel HL7 MessageControl</td>
<td>MSH-10</td>
<td>1234</td>
</tr>
</tbody>
</table>
Camel HL7ProcessingId | MSH-11 | P
Camel HL7VersionId | MSH-12 | 2.4
`Camel HL7Context` | `\` | `(Camel 2.14) contains the HapiContext that was used to parse the message`
Camel HL7Charset | MSH-18 | (Camel 2.14.1) UNICODE UTF-8

All headers except CamelHL7Context are `String` types. If a header value is missing, its value is `null`.

### 140.6. OPTIONS

The HL7 Data Format supports the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validate</td>
<td>true</td>
<td>Whether the HAPI Parser should validate the message using the default validation rules. It is recommended to use the parser or hapiContext option and initialize it with the desired HAPI ValidationContext</td>
</tr>
<tr>
<td>parser</td>
<td>ca.uhn.hl7v2.parser.GenericParser</td>
<td>Custom parser to be used. Must be of type ca.uhn.hl7v2.parser.Parser. Note that GenericParser also allows to parse XML-encoded HL7v2 messages</td>
</tr>
<tr>
<td>hapiContext</td>
<td>ca.uhn.hl7v2.DefaultHapiContext</td>
<td>Camel 2.14: Custom HAPI context that can define a custom parser, custom ValidationContext etc. This gives you full control over the HL7 parsing and rendering process.</td>
</tr>
</tbody>
</table>

### 140.7. DEPENDENCIES
To use HL7 in your Camel routes you’ll need to add a dependency on camel-hl7 listed above, which implements this data format.

The HAPI library is split into a base library and several structure libraries, one for each HL7v2 message version:

- v2.1 structures library
- v2.2 structures library
- v2.3 structures library
- v2.3.1 structures library
- v2.4 structures library
- v2.5 structures library
- v2.5.1 structures library
- v2.6 structures library

By default camel-hl7 only references the HAPI base library. Applications are responsible for including structure libraries themselves. For example, if an application works with HL7v2 message versions 2.4 and 2.5 then the following dependencies must be added:

```xml
<dependency>
  <groupId>ca.uhn.hapi</groupId>
  <artifactId>hapi-structures-v24</artifactId>
  <version>2.2</version>
  <!-- use the same version as your hapi-base version -->
</dependency>
<dependency>
  <groupId>ca.uhn.hapi</groupId>
  <artifactId>hapi-structures-v25</artifactId>
  <version>2.2</version>
  <!-- use the same version as your hapi-base version -->
</dependency>
```

Alternatively, an OSGi bundle containing the base library, all structures libraries and required dependencies (on the bundle classpath) can be downloaded from the central Maven repository.

```xml
<dependency>
  <groupId>ca.uhn.hapi</groupId>
  <artifactId>hapi-osgi-base</artifactId>
  <version>2.2</version>
</dependency>
```

140.8. TERSER LANGUAGE

HAPI provides a Terser class that provides access to fields using a commonly used terse location specification syntax. The Terser language allows to use this syntax to extract values from messages and to use them as expressions and predicates for filtering, content-based routing etc.

Sample:
140.9. HL7 VALIDATION PREDICATE

Often it is preferable to first parse a HL7v2 message and in a separate step validate it against a HAPI ValidationContext.

Sample:

```java
import static org.apache.camel.component.hl7.HL7.terser;

// extract patient ID from field QRD-8 in the QRY_A19 message above and put into message header
from("direct:test1")
  .setHeader("PATIENT_ID", terser("QRD-8(0)-1"))
  .to("mock:test1");

// continue processing if extracted field equals a message header
from("direct:test2")
  .filter(terser("QRD-8(0)-1").isEqualTo(header("PATIENT_ID")))
  .to("mock:test2");
```

140.10. HL7 VALIDATION PREDICATE USING THE HAPICONTEXT (CAMEL 2.14)

The HAPI Context is always configured with a ValidationContext (or a ValidationRuleBuilder), so you can access the validation rules indirectly. Furthermore, when unmarshalling the HL7DataFormat forwards the configured HAPI context in the CamelHL7Context header, and the validation rules of this context can be easily reused:

```java
import static org.apache.camel.component.hl7.HL7.messageConformsTo;
import static org.apache.camel.component.hl7.HL7.messageConforms;

HapiContext hapiContext = new DefaultHapiContext();
hapiContext.getParserConfiguration().setValidating(false); // don't validate during parsing

// customize HapiContext some more ... e.g. enforce that PID-8 in ADT_A01 messages of version 2.4 is not empty
ValidationRuleBuilder builder = new ValidationRuleBuilder() {
  @Override
  protected void configure() {
    forVersion(Version.V24)
      .message("ADT", "A01")
      .terser("PID-8", !empty());
  }
};
```

CHAPTER 140. HL7 DATAFORMAT
A common task in HL7v2 processing is to generate an acknowledgement message as response to an incoming HL7v2 message, e.g. based on a validation result. The `ack` expression lets us accomplish this very elegantly:

```
import static org.apache.camel.component.hl7.HL7.messageConformsTo;
import static org.apache.camel.component.hl7.HL7.ack;
import ca.uhn.hl7v2.validation.impl.DefaultValidation;

// Use standard or define your own validation rules
ValidationContext defaultContext = new DefaultValidation();

from("direct:test1")
  .onException(Exception.class)
  .handled(true)
  .transform(ack()) // auto-generates negative ack because of exception in Exchange
  .end()
  .validate(messageConformsTo(defaultContext))
  // do something meaningful here
```

### 140.11. HL7 ACKNOWLEDGEMENT EXPRESSION

A common task in HL7v2 processing is to generate an acknowledgement message as response to an incoming HL7v2 message, e.g. based on a validation result. The `ack` expression lets us accomplish this very elegantly:

```
import static org.apache.camel.component.hl7.HL7.messageConformsTo;
import static org.apache.camel.component.hl7.HL7.ack;
import ca.uhn.hl7v2.validation.impl.DefaultValidation;

// Use standard or define your own validation rules
ValidationContext defaultContext = new DefaultValidation();

from("direct:test1")
  .onException(Exception.class)
  .handled(true)
  .transform(ack()) // auto-generates negative ack because of exception in Exchange
  .end()
  .validate(messageConformsTo(defaultContext))
  // do something meaningful here
```

### 140.12. MORE SAMPLES

In the following example, a plain `String` HL7 request is sent to an HL7 listener that sends back a response:

In the next sample, HL7 requests from the HL7 listener are routed to the business logic, which is implemented as plain POJO registered in the registry as `hl7service`.

Then the Camel routes using the `RouteBuilder` may look as follows:

Note that by using the HL7 DataFormat the Camel message headers are populated with the fields from the MSH segment. The headers are particularly useful for filtering or content-based routing as shown in the example above.
CHAPTER 141. HTTP COMPONENT (DEPRECATED)

Available as of Camel version 1.0

The http: component provides HTTP based endpoints for consuming external HTTP resources (as a client to call external servers using HTTP).

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-http</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

141.1. URI FORMAT

```
http:hostname[:port][/resourceUri][?param1=value1][&param2=value2]
```

Will by default use port 80 for HTTP and 443 for HTTPS.

**camel-http vs camel-jetty**

You can only produce to endpoints generated by the HTTP component. Therefore it should never be used as input into your camel Routes. To bind/expose an HTTP endpoint via a HTTP server as input to a camel route, you can use the Jetty Component or the Servlet Component.

141.2. EXAMPLES

Call the url with the body using POST and return response as out message. If body is null call URL using GET and return response as out message.

Java DSL

```
from("direct:start")
  .to("http://myhost/mypath");
```

Spring DSL

```
<from uri="direct:start"/>
<to uri="http://oldhost"/>
```

You can override the HTTP endpoint URI by adding a header. Camel will call the http://newhost. This is very handy for e.g. REST urls.

Java DSL

```
from("direct:start")
  .setHeader(Exchange.HTTP_URI, simple("http://myserver/orders/${header.orderId}"))
  .to("http://dummyhost");
```

URI parameters can either be set directly on the endpoint URI or as a header.
Java DSL

```java
from("direct:start")
  .to("http://oldhost?order=123&detail=short");
from("direct:start")
  .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
  .to("http://oldhost");
```

Set the HTTP request method to POST

Java DSL

Spring DSL

```java
from("direct:start")
  .setHeader(Exchange.HTTP_METHOD, constant("POST"))
  .to("http://www.google.com");
```

```xml
<from uri="direct:start"/>
<setHeader headerName="CamelHttpMethod">
  <constant>POST</constant>
</setHeader>
<to uri="http://www.google.com"/>
<to uri="mock:results"/>
```

### 141.3. HTTP OPTIONS

The HTTP component supports 8 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>httpClientConfigurer</code> (advanced)</td>
<td>To use the custom <code>HttpClientConfigurer</code> to perform configuration of the <code>HttpClient</code> that will be used.</td>
<td></td>
<td><code>HttpClientConfigurer</code></td>
</tr>
<tr>
<td><code>httpConnectionManager</code> (advanced)</td>
<td>To use a custom <code>HttpConnectionManager</code> to manage connections</td>
<td></td>
<td><code>HttpConnectionManager</code></td>
</tr>
<tr>
<td><code>httpBinding</code> (producer)</td>
<td>To use a custom <code>HttpBinding</code> to control the mapping between Camel message and <code>HttpClient</code>.</td>
<td></td>
<td><code>HttpBinding</code></td>
</tr>
<tr>
<td><code>httpConfiguration</code> (producer)</td>
<td>To use the shared <code>HttpConfiguration</code> as base configuration.</td>
<td></td>
<td><code>HttpConfiguration</code></td>
</tr>
<tr>
<td><code>allowJavaSerializedObject</code> (producer)</td>
<td>Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
---|---|---|---
**useGlobalSslContext Parameters** (security) | Enable usage of global SSL context parameters. | false | boolean
**headerFilterStrategy** (filter) | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. | HeaderFilterStrategy
**resolveProperty Placeholders** (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean

The HTTP endpoint is configured using URI syntax:

```text
http://httpUri
```

with the following path and query parameters:

#### 141.3.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpUri</td>
<td>Required The url of the HTTP endpoint to call.</td>
<td></td>
<td>URI</td>
</tr>
</tbody>
</table>

#### 141.3.2. Query Parameters (38 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td><code>disableStreamCache</code>  (common)</td>
<td>Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>headerFilterStrategy</code> (common)</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td><code>httpBinding</code> (common)</td>
<td>To use a custom HttpBinding to control the mapping between Camel message and HttpClient.</td>
<td></td>
<td>HttpBinding</td>
</tr>
<tr>
<td><code>bridgeEndpoint</code> (producer)</td>
<td>If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint’s URI for request. You may also set the option throwExceptionOnFailure to be false to let the HttpProducer send all the fault response back.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>chunked</code> (producer)</td>
<td>If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>connectionClose</code> (producer)</td>
<td>Specifies whether a Connection Close header must be added to HTTP Request. By default connectionClose is false.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>copyHeaders</code> (producer)</td>
<td>If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------------</td>
</tr>
<tr>
<td>httpMethod (producer)</td>
<td>Configure the HTTP method to use. The HttpMethod header cannot override this option if set.</td>
<td></td>
<td>HttpMethods</td>
</tr>
<tr>
<td>ignoreResponseBody (producer)</td>
<td>If this option is true, The http producer won’t read response body and cache the input stream</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>preserveHostHeader (producer)</td>
<td>If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL’s for a proxied service</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>throwExceptionOnFailure (producer)</td>
<td>Option to disable throwing the HttpOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>transferException (producer)</td>
<td>If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type. On the producer side the exception will be deserialized and thrown as is, instead of the HttpOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>cookieHandler (producer)</td>
<td>Configure a cookie handler to maintain a HTTP session</td>
<td></td>
<td>CookieHandler</td>
</tr>
<tr>
<td>okStatusCodeRange (producer)</td>
<td>The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.</td>
<td>200-299</td>
<td>String</td>
</tr>
<tr>
<td>urlRewrite (producer)</td>
<td>Deprecated Refers to a custom org.apache.camel.component.http.UrlRewrite which allows you to rewrite urls when you bridge/proxy endpoints. See more details at <a href="http://camel.apache.org/urllrewrite.html">http://camel.apache.org/urllrewrite.html</a></td>
<td></td>
<td>UrlRewrite</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------------</td>
</tr>
<tr>
<td>httpClientConfigurer (advanced)</td>
<td>Register a custom configuration strategy for new HttpClient instances created by producers or consumers such as to configure authentication mechanisms etc</td>
<td></td>
<td>HttpClientConfigurer</td>
</tr>
<tr>
<td>httpClientOptions (advanced)</td>
<td>To configure the HttpClient using the key/values from the Map.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>httpConnectionManager (advanced)</td>
<td>To use a custom HttpConnectionManager to manage connections</td>
<td></td>
<td>HttpConnectionManager</td>
</tr>
<tr>
<td>httpConnectionManager Options (advanced)</td>
<td>To configure the HttpConnectionManager using the key/values from the Map.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>mapHttpMessageBody (advanced)</td>
<td>If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>mapHttpMessageFormUrlEncodedBody (advanced)</td>
<td>If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>mapHttpMessageHeaders (advanced)</td>
<td>If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>proxyAuthDomain (proxy)</td>
<td>Proxy authentication domain to use with NTLM</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthHost (proxy)</td>
<td>Proxy authentication host</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthMethod (proxy)</td>
<td>Proxy authentication method to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyAuthPassword (proxy)</td>
<td>Proxy authentication password</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
--- | --- | --- | ---
proxyAuthPort (proxy) | Proxy authentication port |  | int
proxyAuthScheme (proxy) | Proxy authentication scheme to use |  | String
proxyAuthUsername (proxy) | Proxy authentication username |  | String
proxyHost (proxy) | Proxy hostname to use |  | String
proxyPort (proxy) | Proxy port to use |  | int
authDomain (security) | Authentication domain to use with NTML |  | String
authHost (security) | Authentication host to use with NTML |  | String
authMethod (security) | Authentication methods allowed to use as a comma separated list of values Basic, Digest or NTLM. |  | String
authMethodPriority (security) | Which authentication method to prioritize to use, either as Basic, Digest or NTLM. |  | String
authPassword (security) | Authentication password |  | String
authUsername (security) | Authentication username |  | String

### 141.4. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exchange.HTTP.URI</td>
<td>String</td>
<td>URI to call. Will override existing URI set directly on the endpoint. This uri is the uri of the http server to call. Its not the same as the Camel endpoint uri, where you can configure endpoint options such as security etc. This header does not support that, its only the uri of the http server.</td>
</tr>
<tr>
<td>Exchange.HTTP.METHOD</td>
<td>String</td>
<td>HTTP Method / Verb to use (GET/POST/PUT/DELETE/HEAD/OPTIONS/TRACE)</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Exchange.HTTP_PATH</td>
<td>String</td>
<td>Request URI’s path, the header will be used to build the request URI with the HTTP_URI. <strong>Camel 2.3.0:</strong> If the path is start with &quot;/&quot;, http producer will try to find the relative path based on the Exchange.HTTP_BASE_URI header or the exchange.getFromEndpoint().getEndpointUri();</td>
</tr>
<tr>
<td>Exchange.HTTP_QUERY</td>
<td>String</td>
<td>URI parameters. Will override existing URI parameters set directly on the endpoint.</td>
</tr>
<tr>
<td>Exchange.HTTP_RESPONSE_CODE</td>
<td>int</td>
<td>The HTTP response code from the external server. Is 200 for OK.</td>
</tr>
<tr>
<td>Exchange.HTTP_CHARACTER_ENCODING</td>
<td>String</td>
<td>Character encoding.</td>
</tr>
<tr>
<td>Exchange.CONTENT_TYPE</td>
<td>String</td>
<td>The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as text/html.</td>
</tr>
<tr>
<td>Exchange.CONTENT_ENCODING</td>
<td>String</td>
<td>The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as gzip.</td>
</tr>
<tr>
<td>Exchange.HTTP_SERVLET_REQUEST</td>
<td>HttpServletRequest</td>
<td>The <strong>HttpServletResponse</strong> object.</td>
</tr>
</tbody>
</table>
The header name above are constants. For the spring DSL you have to use the value of the constant instead of the name.

### 141.5. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

### 141.6. RESPONSE CODE

Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.
- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a `HttpOperationFailedException` with the information.
- Response code is 400+, Camel regards it as an external server failure and will throw a `HttpOperationFailedException` with the information.

**throwExceptionOnFailure**

The option, `throwExceptionOnFailure`, can be set to `false` to prevent the `HttpOperationFailedException` from being thrown for failed response codes. This allows you to get any response from the remote server. There is a sample below demonstrating this.

### 141.7. HTTPOPERATIONFAILEDexception

This exception contains the following information:

- The HTTP status code
141.8. WHICH HTTP METHOD WILL BE USED

The following algorithm is used to determine what HTTP method should be used:
1. Use method provided as endpoint configuration (httpMethod).
2. Use method provided in header (Exchange.HTTP_METHOD).
3. GET if query string is provided in header.
4. GET if endpoint is configured with a query string.
5. POST if there is data to send (body is not null).
6. GET otherwise.

141.9. HOW TO GET ACCESS TO HTTPSERVLETPROPERTY AND HTTPSERVLETRESPONSE

You can get access to these two using the Camel type converter system using

```java
HttpServletRequest request = exchange.getIn().getBody(HttpServletRequest.class);
HttpServletRequest response = exchange.getIn().getBody(HttpServletResponse.class);
```

141.10. USING CLIENT TIMEOUT - SO_TIMEOUT

See the unit test in this link

141.11. MORE EXAMPLES

141.11.1. Configuring a Proxy

Java DSL

```java
from("direct:start")
```

There is also support for proxy authentication via the `proxyUsername` and `proxyPassword` options.

141.11.2. Using proxy settings outside of URI

Java DSL

```java
context.getProperties().put("http.proxyHost", "172.168.18.9");
context.getProperties().put("http.proxyPort", "8080");
```

Spring DSL

```xml
<camelContext>
  <properties>
    <property key="http.proxyHost" value="172.168.18.9"/>
  </properties>
</camelContext>
```
Options on Endpoint will override options on the context.

141.12. CONFIGURING CHARSET
If you are using POST to send data you can configure the charset

```
setProperty(Exchange.CHARSET_NAME, "iso-8859-1");
```

141.13. SAMPLE WITH SCHEDULED POLL
The sample polls the Google homepage every 10 seconds and write the page to the file `message.html`:

```
from("timer://foo?fixedRate=true&delay=0&period=10000")
.to("http://www.google.com")
.setHeader(FileComponent.HEADER_FILE_NAME, "message.html").to("file:target/google");
```

141.14. GETTING THE RESPONSE CODE
You can get the HTTP response code from the HTTP component by getting the value from the Out message header with `Exchange.HTTP_RESPONSE_CODE`.

```
Exchange exchange = template.send("http://www.google.com/search", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().setHeader(Exchange.HTTP_QUERY, constant("hl=en&q=activemq"));
    }
});
Message out = exchange.getOut();
int responseCode = out.getHeader(Exchange.HTTP_RESPONSE_CODE, Integer.class);
```

141.15. USING THROWEXCEPTIONONFAILURE=false TO GET ANY RESPONSE BACK
In the route below we want to route a message that we enrich with data returned from a remote HTTP call. As we want any response from the remote server, we set the `throwExceptionOnFailure` option to `false` so we get any response in the `AggregationStrategy`. As the code is based on a unit test that simulates a HTTP status code 404, there is some assertion code etc.

141.16. DISABLING COOKIES
To disable cookies you can set the HTTP Client to ignore cookies by adding this URI option:
`httpClient.cookiePolicy=ignoreCookies`

141.17. ADVANCED USAGE
If you need more control over the HTTP producer you should use the `HttpComponent` where you can set various classes to give you custom behavior.
141.17.1. Setting MaxConnectionsPerHost

The HTTP Component has a `org.apache.commons.httpclient.HttpConnectionManager` where you can configure various global configuration for the given component. By global, we mean that any endpoint the component creates has the same shared `HttpConnectionManager`. So, if we want to set a different value for the max connection per host, we need to define it on the HTTP component and **not** on the endpoint URI that we usually use. So here comes:

First, we define the `http` component in Spring XML. Yes, we use the same scheme name, `http`, because otherwise Camel will auto-discover and create the component with default settings. What we need is to overrule this so we can set our options. In the sample below we set the max connection to 5 instead of the default of 2.

And then we can just use it as we normally do in our routes:

141.17.2. Using preemptive authentication

An end user reported that he had problem with authenticating with HTTPS. The problem was eventually resolved when he discovered the HTTPS server did not return a HTTP code 401 Authorization Required. The solution was to set the following URI option: `httpClient.authenticationPreemptive=true`

141.17.3. Accepting self signed certificates from remote server

See this [link](#) from a mailing list discussion with some code to outline how to do this with the Apache Commons HTTP API.

141.17.4. Setting up SSL for HTTP Client

Using the JSSE Configuration Utility

As of Camel 2.8, the HTTP4 component supports SSL/TLS configuration through the Camel JSSE Configuration Utility. This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the HTTP4 component.

The version of the Apache HTTP client used in this component resolves SSL/TLS information from a global "protocol" registry. This component provides an implementation, `org.apache.camel.component.http.SSLContextParametersSecureProtocolSocketFactory`, of the HTTP client’s protocol socket factory in order to support the use of the Camel JSSE Configuration utility. The following example demonstrates how to configure the protocol registry and use the registered protocol information in a route.

```java
    KeyStoreParameters ksp = new KeyStoreParameters();
    ksp.setResource("/users/home/server/keystore.jks");
    ksp.setPassword("keystorePassword");

    KeyManagersParameters kmp = new KeyManagersParameters();
    kmp.setKeyStore(ksp);
    kmp.setKeyPassword("keyPassword");

    SSLContextParameters scp = new SSLContextParameters();
    scp.setKeyManagers(kmp);

    ProtocolSocketFactory factory =
```
Configuring Apache HTTP Client Directly

Basically camel-http component is built on the top of Apache HTTP client, and you can implement a custom `org.apache.camel.component.http.HttpClientConfigurer` to do some configuration on the http client if you need full control of it.

However if you just want to specify the keystore and truststore you can do this with Apache HTTP `HttpClientConfigurer`, for example:

```java
Protocol authhttps = new Protocol("https", new AuthSSLProtocolSocketFactory(
  new URL("file:my.keystore"), "mypassword",
  new URL("file:my.truststore"), "mypassword"), 443);

Protocol.registerProtocol("https", authhttps);
```

And then you need to create a class that implements `HttpClientConfigurer`, and registers https protocol providing a keystore or truststore per example above. Then, from your camel route builder class you can hook it up like so:

```java
HttpComponent httpComponent = getContext().getComponent("http", HttpComponent.class);
httpComponent.setHttpClientConfigurer(new MyHttpClientConfigurer());
```

If you are doing this using the Spring DSL, you can specify your `HttpClientConfigurer` using the URL. For example:

```xml
<bean id="myHttpClientConfigurer" class="my.https.HttpClientConfigurer"/>
```

As long as you implement the HttpClientConfigurer and configure your keystore and truststore as described above, it will work fine.

• Jetty
CHAPTER 142. HTTP4 COMPONENT

Available as of Camel version 2.3

The http4: component provides HTTP based endpoints for calling external HTTP resources (as a client to call external servers using HTTP).

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-http4</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

camel-http4 vs camel-http

Camel-http4 uses Apache HttpClient 4.x while camel-http uses Apache HttpClient 3.x.

142.1. URI FORMAT

`http4:hostname[:port][/resourceUri]?option=value&option=value&…`

Will by default use port 80 for HTTP and 443 for HTTPS.

You can append query options to the URI in the following format, ?option=value&option=value&…

camel-http4 vs camel-jetty

You can only produce to endpoints generated by the HTTP4 component. Therefore it should never be used as input into your Camel Routes. To bind/expose an HTTP endpoint via a HTTP server as input to a Camel route, use the Jetty Component instead.

142.2. HTTP4 COMPONENT OPTIONS

The HTTP4 component supports 18 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpClientConfigurer</td>
<td>To use the custom HttpClientConfigurer to perform configuration of the HttpClient that will be used.</td>
<td>HttpClientConfigurer</td>
<td></td>
</tr>
<tr>
<td>clientConnectionManager</td>
<td>To use a custom and shared HttpClientConnectionManager to manage connections. If this has been configured then this is always used for all endpoints created by this component.</td>
<td>HttpClientConnectionManager</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sslContextParameters</code></td>
<td>To configure security using <code>SSLContextParameters</code>. Important: Only one instance of <code>org.apache.camel.util.jsse.SSLContextParameters</code> is supported per <code>HttpComponent</code>. If you need to use 2 or more different instances, you need to define a new <code>HttpComponent</code> per instance you need.</td>
<td></td>
<td><code>SSLContextParameters</code></td>
</tr>
<tr>
<td><code>useGlobalSslContextParameters</code></td>
<td>Enable usage of global SSL context parameters.</td>
<td><code>false</code></td>
<td><code>boolean</code></td>
</tr>
<tr>
<td><code>x509HostnameVerifier</code></td>
<td>To use a custom <code>X509HostnameVerifier</code> such as <code>DefaultHostnameVerifier</code> or <code>org.apache.http.conn.ssl.NoopHostnameVerifier</code>.</td>
<td></td>
<td><code>HostnameVerifier</code></td>
</tr>
<tr>
<td><code>maxTotalConnections</code></td>
<td>The maximum number of connections.</td>
<td><code>200</code></td>
<td><code>int</code></td>
</tr>
<tr>
<td><code>connectionsPerRoute</code></td>
<td>The maximum number of connections per route.</td>
<td><code>20</code></td>
<td><code>int</code></td>
</tr>
<tr>
<td><code>connectionTimeToLive</code></td>
<td>The time for connection to live, the time unit is millisecond, the default value is always keep alive.</td>
<td></td>
<td><code>long</code></td>
</tr>
<tr>
<td><code>cookieStore</code></td>
<td>To use a custom <code>org.apache.http.client.CookieStore</code>. By default the <code>org.apache.http.impl.client.BasicCookieStore</code> is used which is an in-memory only cookie store. Notice if <code>bridgeEndpoint=true</code> then the cookie store is forced to be a noop cookie store as cookie shouldn’t be stored as we are just bridging (eg acting as a proxy).</td>
<td></td>
<td><code>CookieStore</code></td>
</tr>
<tr>
<td><code>connectionRequestTimeout</code></td>
<td>The timeout in milliseconds used when requesting a connection from the connection manager. A timeout value of zero is interpreted as an infinite timeout. A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1</td>
<td><code>-1</code></td>
<td><code>int</code></td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
---|---|---|---
`connectTimeout` (timeout) | Determines the timeout in milliseconds until a connection is established. A timeout value of zero is interpreted as an infinite timeout. A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1 | -1 | `int`

`socketTimeout` (timeout) | Defines the socket timeout (SO_TIMEOUT) in milliseconds, which is the timeout for waiting for data or, put differently, a maximum period inactivity between two consecutive data packets). A timeout value of zero is interpreted as an infinite timeout. A negative value is interpreted as undefined (system default). Default: code -1 | -1 | `int`

`httpBinding` (advanced) | To use a custom HttpBinding to control the mapping between Camel message and HttpClient. |  | `HttpBinding`

`httpConfiguration` (advanced) | To use the shared HttpConfiguration as base configuration. |  | `HttpConfiguration`

`allowJavaSerializedObject` (advanced) | Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | `boolean`

`headerFilterStrategy` (filter) | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. |  | `HeaderFilterStrategy`

`resolvePropertyPlaceholders` (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | `boolean`

The HTTP4 endpoint is configured using URI syntax:

```
http4:httpUri
```

with the following path and query parameters:

142.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpUri</td>
<td><strong>Required</strong> The url of the HTTP endpoint to call.</td>
<td></td>
<td>URI</td>
</tr>
</tbody>
</table>

### 142.2.2. Query Parameters (48 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>disableStreamCache (common)</td>
<td>Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>headerFilterStrategy (common)</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>httpBinding (common)</td>
<td>To use a custom HttpBinding to control the mapping between Camel message and HttpClient.</td>
<td></td>
<td>HttpBinding</td>
</tr>
<tr>
<td>authenticationPreemptive (producer)</td>
<td>If this option is true, camel-http4 sends preemptive basic authentication to the server.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeEndpoint (producer)</td>
<td>If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint’s URI for request. You may also set the option throwExceptionOnFailure to be false to let the HttpProducer send all the fault response back.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>chunked (producer)</td>
<td>If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>clearExpiredCookies</td>
<td>Whether to clear expired cookies before sending the HTTP request. This ensures the cookies store does not keep growing by adding new cookies which is newer removed when they are expired.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>connectionClose</td>
<td>Specifies whether a Connection Close header must be added to HTTP Request. By default connectionClose is false.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>cookieStore</td>
<td>To use a custom CookieStore. By default the BasicCookieStore is used which is an in-memory only cookie store. Notice if bridgeEndpoint=true then the cookie store is forced to be a noop cookie store as cookie shouldn’t be stored as we are just bridging (eg acting as a proxy). If a cookieHandler is set then the cookie store is also forced to be a noop cookie store as cookie handling is then performed by the cookieHandler.</td>
<td></td>
<td>CookieStore</td>
</tr>
<tr>
<td>copyHeaders</td>
<td>If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers).</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>deleteWithBody</td>
<td>Whether the HTTP DELETE should include the message body or not. By default HTTP DELETE do not include any HTTP message. However in some rare cases users may need to be able to include the message body.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>httpMethod</td>
<td>Configure the HTTP method to use. The HttpMethod header cannot override this option if set.</td>
<td></td>
<td>HttpMethods</td>
</tr>
<tr>
<td>ignoreResponseBody</td>
<td>If this option is true, The http producer won’t read response body and cache the input stream</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>preserveHostHeader</td>
<td>If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL’s for a proxied service</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------------------</td>
</tr>
<tr>
<td>throwExceptionOnFailure</td>
<td>Option to disable throwing the HttpOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>transferException</td>
<td>If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type. On the producer side the exception will be deserialized and thrown as is, instead of the HttpOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>cookieHandler</td>
<td>Configure a cookie handler to maintain a HTTP session</td>
<td></td>
<td>CookieHandler</td>
</tr>
<tr>
<td>okStatusCodeRange</td>
<td>The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included.</td>
<td>200-299</td>
<td>String</td>
</tr>
<tr>
<td>urlRewrite</td>
<td>Deprecated Refers to a custom org.apache.camel.component.http.UrlRewrite which allows you to rewrite urls when you bridge/proxy endpoints. See more details at <a href="http://camel.apache.org/urlrewrite.html">http://camel.apache.org/urlrewrite.html</a></td>
<td></td>
<td>UrlRewrite</td>
</tr>
<tr>
<td>clientBuilder</td>
<td>Provide access to the http client request parameters used on new RequestConfig instances used by producers or consumers of this endpoint.</td>
<td></td>
<td>HttpClientBuilder</td>
</tr>
<tr>
<td>clientConnectionManager</td>
<td>To use a custom HttpClientConnectionManager to manage connections</td>
<td></td>
<td>HttpClientConnec tion Manager</td>
</tr>
<tr>
<td>connectionsPerRoute</td>
<td>The maximum number of connections per route.</td>

<td>int</td>
</tr>
<tr>
<td>httpClient</td>
<td>Sets a custom HttpClient to be used by the producer</td>
<td></td>
<td>HttpClient</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>httpClientConfigurer (advanced)</td>
<td>Register a custom configuration strategy for new HttpClient instances created by producers or consumers such as to configure authentication mechanisms etc</td>
<td></td>
<td>HttpClientConfigurer</td>
</tr>
<tr>
<td>httpClientOptions (advanced)</td>
<td>To configure the HttpClient using the key/values from the Map.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>httpContext (advanced)</td>
<td>To use a custom HttpContext instance</td>
<td></td>
<td>HttpContext</td>
</tr>
<tr>
<td>mapHttpMessageBody (advanced)</td>
<td>If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>mapHttpMessageFormUrlEncodedBody (advanced)</td>
<td>If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>mapHttpMessageHeaders (advanced)</td>
<td>If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>maxTotalConnections (advanced)</td>
<td>The maximum number of connections.</td>
<td>200</td>
<td>int</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useSystemProperties (advanced)</td>
<td>To use System Properties as fallback for configuration</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>proxyAuthDomain (proxy)</td>
<td>Proxy authentication domain to use with NTLM</td>
<td></td>
<td>String</td>

</tbody>
</table>

142.3. MESSAGE HEADERS
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exchange.HTTP_URI</td>
<td>String</td>
<td>URI to call. Will override existing URI set directly on the endpoint. This uri is the uri of the http server to call. Its not the same as the Camel endpoint uri, where you can configure endpoint options such as security etc. This header does not support that, its only the uri of the http server.</td>
</tr>
<tr>
<td>Exchange.HTTP_PATH</td>
<td>String</td>
<td>Request URI’s path, the header will be used to build the request URI with the HTTP_URI.</td>
</tr>
<tr>
<td>Exchange.HTTP_QUERY</td>
<td>String</td>
<td>URI parameters. Will override existing URI parameters set directly on the endpoint.</td>
</tr>
<tr>
<td>Exchange.HTTP_RESPONSE_CODE</td>
<td>int</td>
<td>The HTTP response code from the external server. Is 200 for OK.</td>
</tr>
<tr>
<td>Exchange.HTTP_RESPONSE_TEXT</td>
<td>String</td>
<td>The HTTP response text from the external server.</td>
</tr>
<tr>
<td>Exchange.HTTP_CHARACTER_ENCODING</td>
<td>String</td>
<td>Character encoding.</td>
</tr>
<tr>
<td>Exchange.CONTENT_TYPE</td>
<td>String</td>
<td>The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as text/html.</td>
</tr>
</tbody>
</table>
### 142.4. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

### 142.5. USING SYSTEM PROPERTIES

When setting useSystemProperties to true, the HTTP Client will look for the following System Properties and it will use it:

- `ssl.TrustManagerFactory.algorithm`
- `javax.net.ssl.trustStoreType`
- `javax.net.ssl.trustStore`
- `javax.net.ssl.trustStoreProvider`
- `javax.net.ssl.trustStorePassword`
- `java.home`
- `ssl.KeyManagerFactory.algorithm`
- `javax.net.ssl.keyStoreType`
- `javax.net.ssl.keyStore`
- `javax.net.ssl.keyStoreProvider`
- `javax.net.ssl.keyStorePassword`
- `http.proxyHost`
- `http.proxyPort`
- `http.nonProxyHosts`
- `http.keepAlive`
- `http.maxConnections`

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exchange.CONTENT_ENCODING</td>
<td>String</td>
<td>The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as <strong>gzip</strong>.</td>
</tr>
</tbody>
</table>
142.6. RESPONSE CODE
Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.
- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a `HttpOperationFailedException` with the information.
- Response code is 400+, Camel regards it as an external server failure and will throw a `HttpOperationFailedException` with the information.

`throwExceptionOnFailure` The option, `throwExceptionOnFailure`, can be set to `false` to prevent the `HttpOperationFailedException` from being thrown for failed response codes. This allows you to get any response from the remote server. There is a sample below demonstrating this.

142.7. HTTPOPERATIONFAILEDEXCEPTION
This exception contains the following information:

- The HTTP status code
- The HTTP status line (text of the status code)
- Redirect location, if server returned a redirect
- Response body as a `java.lang.String`, if server provided a body as response

142.8. WHICH HTTP METHOD WILL BE USED
The following algorithm is used to determine what HTTP method should be used:
1. Use method provided as endpoint configuration (`httpMethod`).
2. Use method provided in header (`Exchange.HTTP_METHOD`).
3. `GET` if query string is provided in header.
4. `GET` if endpoint is configured with a query string.
5. `POST` if there is data to send (body is not `null`).
6. `GET` otherwise.

142.9. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE
You can get access to these two using the Camel type converter system using

```
NOTE You can get the request and response not just from the processor after the camel-jetty or camel-cxf endpoint.
```

```
HttpServletRequest request = exchange.getIn().getBody(HttpServletRequest.class);
HttpServletResponse response = exchange.getIn().getBody(HttpServletResponse.class);
```

142.10. CONFIGURING URI TO CALL
You can set the HTTP producer’s URI directly form the endpoint URI. In the route below, Camel will call out to the external server, `oldhost`, using HTTP.
And the equivalent Spring sample:

```xml
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="http4://oldhost"/>
  </route>
</camelContext>
```

You can override the HTTP endpoint URI by adding a header with the key, `Exchange.HTTP_URI`, on the message.

```java
from("direct:start")
  .setHeader(Exchange.HTTP_URI, constant("http://newhost"))
  .to("http4://oldhost");
```

In the sample above Camel will call the `http://newhost` despite the endpoint is configured with `http4://oldhost`. If the `http4` endpoint is working in bridge mode, it will ignore the message header of `Exchange.HTTP_URI`.

### 142.11. CONFIGURING URI PARAMETERS

The `http` producer supports URI parameters to be sent to the HTTP server. The URI parameters can either be set directly on the endpoint URI or as a header with the key `Exchange.HTTP_QUERY` on the message.

```java
from("direct:start")
  .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
  .to("http4://oldhost");
```

Or options provided in a header:

```java
from("direct:start")
  .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
  .to("http4://oldhost");
```

### 142.12. HOW TO SET THE HTTP METHOD

(GET/PATCH/POST/PUT/DELETE/HEAD/OPTIONS/TRACE) TO THE HTTP PRODUCER

Using the `http PATCH` method

The `http PATCH` method is supported starting with Camel 2.11.3 / 2.12.1.

The HTTP4 component provides a way to set the HTTP request method by setting the message header. Here is an example:

```java
from("direct:start")
  .setHeader(Exchange.HTTP_METHOD,
```
The method can be written a bit shorter using the string constants:

```java
.setHeader("CamelHttpMethod", constant("POST"))
```

And the equivalent Spring sample:

```xml
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <from uri="direct:start"/>
  <setHeader headerName="CamelHttpMethod"><constant>POST</constant></setHeader>
  <to uri="http4://www.google.com"/>
  <to uri="mock:results"/>
</camelContext>
```

### 142.13. USING CLIENT TIMEOUT - SO_TIMEOUT

See the [HttpSOTimeoutTest](http://activemq.apache.org/camel/schema/spring) unit test.

**Since Camel 2.13.0**: See the updated [HttpSOTimeoutTest](http://activemq.apache.org/camel/schema/spring) unit test.

### 142.14. CONFIGURING A PROXY

The HTTP4 component provides a way to configure a proxy.

```java
from("direct:start")
```

There is also support for proxy authentication via the `proxyAuthUsername` and `proxyAuthPassword` options.

#### 142.14.1. Using proxy settings outside of URI

To avoid System properties conflicts, you can set proxy configuration only from the CamelContext or URI.

**Java DSL**:

```java
context.getProperties().put("http.proxyHost", "172.168.18.9");
context.getProperties().put("http.proxyPort", "8080");
```

**Spring XML**

```xml
<camelContext>
  <properties>
    <property key="http.proxyHost" value="172.168.18.9"/>
  </properties>
</camelContext>
```
Camel will first set the settings from Java System or CamelContext Properties and then the endpoint proxy options if provided. So you can override the system properties with the endpoint options.

Notice in Camel 2.8 there is also a `http.proxyScheme` property you can set to explicit configure the scheme to use.

### 142.15. CONFIGURING CHARSET

If you are using POST to send data you can configure the charset using the Exchange property:

```java
exchange.setProperty(Exchange.CHARSET_NAME, "ISO-8859-1");
```

#### 142.15.1. Sample with scheduled poll

This sample polls the Google homepage every 10 seconds and write the page to the file `message.html`:

```java
from("timer://foo?fixedRate=true&delay=0&period=10000")
.to("http4://www.google.com")
.setHeader(FileComponent.HEADER_FILE_NAME, "message.html")
.to("file:target/google");
```

#### 142.15.2. URI Parameters from the endpoint URI

In this sample we have the complete URI endpoint that is just what you would have typed in a web browser. Multiple URI parameters can of course be set using the & character as separator, just as you would in the web browser. Camel does no tricks here.

```java
// we query for Camel at the Google page
template.sendBody("http4://www.google.com/search?q=Camel", null);
```

#### 142.15.3. URI Parameters from the Message

```java
Map headers = new HashMap();
headers.put(Exchange.HTTP_QUERY, "q=Camel&lr=lang_en");
// we query for Camel and English language at Google
template.sendBody("http4://www.google.com/search", null, headers);
```

In the header value above notice that it should not be prefixed with ? and you can separate parameters as usual with the & char.

#### 142.15.4. Getting the Response Code

You can get the HTTP response code from the HTTP4 component by getting the value from the Out message header with `Exchange.HTTP_RESPONSE_CODE`.

```java
Exchange exchange = template.send("http4://www.google.com/search", new Processor() {
```

--

<property key="http.proxyPort" value="8080"/>
</properties>
</camelContext>

Red Hat Fuse 7.2 Apache Camel Component Reference

974
142.16. DISABLING COOKIES

To disable cookies you can set the HTTP Client to ignore cookies by adding this URI option:
```java
httpClient.cookiePolicy=ignoreCookies
```

142.17. ADVANCED USAGE

If you need more control over the HTTP producer you should use the `HttpComponent` where you can set various classes to give you custom behavior.

142.17.1. Setting up SSL for HTTP Client

Using the JSSE Configuration Utility

As of Camel 2.8, the HTTP4 component supports SSL/TLS configuration through the Camel JSSE Configuration Utility. This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the HTTP4 component.

Programmatic configuration of the component

```java
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

HttpComponent httpComponent = getContext().getComponent("https4", HttpComponent.class);
httpComponent.setSslContextParameters(scp);
```

Spring DSL based configuration of endpoint

```xml
<camel:sslContextParameters
    id="sslContextParameters">
  <camel:keyManagers
      keyPassword="keyPassword">
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
  </camel:keyManagers>
</camel:sslContextParameters>
```
Configuring Apache HTTP Client Directly

Basically camel-http4 component is built on the top of Apache HttpClient. Please refer to SSL/TLS customization for details or have a look into the org.apache.camel.component.http4.HttpsServerTestSupport unit test base class. You can also implement a custom org.apache.camel.component.http4.HttpClientConfigurer to do some configuration on the http client if you need full control of it.

However if you just want to specify the keystore and truststore you can do this with Apache HTTP HttpClientConfigurer, for example:

```java
KeyStore keystore = ...;
KeyStore truststore = ...;

SchemeRegistry registry = new SchemeRegistry();
registry.register(new Scheme("https", 443, new SSLSocketFactory(keystore, "mypassword", truststore)));
```

And then you need to create a class that implements HttpClientConfigurer, and registers https protocol providing a keystore or truststore per example above. Then, from your camel route builder class you can hook it up like so:

```java
HttpComponent httpComponent = getContext().getComponent("http4", HttpComponent.class);
httpComponent.setHttpClientConfigurer(new MyHttpClientConfigurer());
```

If you are doing this using the Spring DSL, you can specify your HttpClientConfigurer using the URI. For example:

```xml
<bean id="myHttpClientConfigurer" class="my.https.HttpClientConfigurer">
</bean>
<to uri="https4://myhostname.com:443/myURL?httpClientConfigurer=myHttpClientConfigurer"/>
```

As long as you implement the HttpClientConfigurer and configure your keystore and truststore as described above, it will work fine.

Using HTTPS to authenticate gotchas

An end user reported that he had problem with authenticating with HTTPS. The problem was eventually resolved by providing a custom configured org.apache.http.protocol.HttpContext:

1. Create a (Spring) factory for HttpContexts:

```java
KeyStore keystore = ...;
KeyStore truststore = ...;

SchemeRegistry registry = new SchemeRegistry();
registry.register(new Scheme("https", 443, new SSLSocketFactory(keystore, "mypassword", truststore)));
```

```java
HttpComponent httpComponent = getContext().getComponent("http4", HttpComponent.class);
httpComponent.setHttpClientConfigurer(new MyHttpClientConfigurer());
```

```xml
<bean id="myHttpClientConfigurer" class="my.https.HttpClientConfigurer">
</bean>
<to uri="https4://myhostname.com:443/myURL?httpClientConfigurer=myHttpClientConfigurer"/>
```

As long as you implement the HttpClientConfigurer and configure your keystore and truststore as described above, it will work fine.

Using HTTPS to authenticate gotchas

An end user reported that he had problem with authenticating with HTTPS. The problem was eventually resolved by providing a custom configured org.apache.http.protocol.HttpContext:

1. Create a (Spring) factory for HttpContexts:
private BasicScheme basicAuth = new BasicScheme();

public HttpContext getObject() {
    authCache.put(new HttpHost(httpHost, httpPort), basicAuth);

    httpContext.setAttribute(ClientContext.AUTH_CACHE, authCache);

    return httpContext;
}

// getter and setter

- 2. Declare an HttpContext in the Spring application context file:

```xml
<bean id="myHttpContext" factory-bean="httpContextFactory" factory-method="getObject"/>
```

- 3. Reference the context in the http4 URL:

```xml
```

Using different SSLContextParameters

The HTTP4 component only support one instance of org.apache.camel.util.jsse.SSLContextParameters per component. If you need to use 2 or more different instances, then you need to setup multiple HTTP4 components as shown below. Where we have 2 components, each using their own instance of sslContextParameters property.

```xml
<bean id="http4-foo" class="org.apache.camel.component.http4.HttpComponent">
    <property name="sslContextParameters" ref="sslContextParams1"/>
    <property name="x509HostnameVerifier" ref="hostnameVerifier"/>
</bean>

<bean id="http4-bar" class="org.apache.camel.component.http4.HttpComponent">
    <property name="sslContextParameters" ref="sslContextParams2"/>
    <property name="x509HostnameVerifier" ref="hostnameVerifier"/>
</bean>
```
CHAPTER 143. HYSTRIX COMPONENT

Available as of Camel version 2.18

The hystrix component integrates Netflix Hystrix circuit breaker in Camel routes.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-hystrix</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

For more information see the Hystrix EIP
CHAPTER 144. ICAL DATAFORMAT

Available as of Camel version 2.12

The iCal dataformat is used for working with iCalendar messages.

A typical iCalendar message looks like:

```
BEGIN:VCALENDAR
VERSION:2.0
PRODID:-//Events Calendar//iCal4j 1.0//EN
CALSCALE:GREGORIAN
BEGIN:VEVENT
DTSTAMP:20130324T180000Z
DTSTART:20130401T170000
DTEND:20130401T210000
SUMMARY:Progress Meeting
TZID:America/New_York
UID:00000000
ATTENDEE;ROLE=REQ-PARTICIPANT;CN=Developer 1:mailto:dev1@mycompany.com
ATTENDEE;ROLE=OPT-PARTICIPANT;CN=Developer 2:mailto:dev2@mycompany.com
END:VEVENT
END:VCALENDAR
```

144.1. OPTIONS

The iCal dataformat supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validating</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to validate.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

144.2. BASIC USAGE

To unmarshal and marshal the message shown above, your route will look like the following:

```
from("direct:ical-unmarshal")
.unmarshal(ical)
.to("mock:unmarshaled")
.marshall(ical)
.to("mock:marshaled");
```

Maven users will need to add the following dependency to their pom.xml for this component:
144.3. SEE ALSO

CHAPTER 145. IEC 60870 CLIENT COMPONENT

Available as of Camel version 2.20

The IEC 60870-5-104 Client component provides access to IEC 60870 servers using the Eclipse NeoSCADA™ implementation.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-iec60870</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The IEC 60870 Client component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultConnection Options (common)</td>
<td>Default connection options</td>
<td></td>
<td>ClientOptions</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

145.1. URI FORMAT

The URI syntax of the endpoint is:

```
iec60870-client:host:port/00-01-02-03-04
```

The information object address is encoded in the path in the syntax shows above. Please note that always the full, 5 octet address format is being used. Unused octets have to be filled with zero.

145.2. URI OPTIONS

The IEC 60870 Client endpoint is configured using URI syntax:

```
iec60870-client:uriPath
```

with the following path and query parameters:

145.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>uriPath</td>
<td>Required The object information address</td>
<td></td>
<td>ObjectAddress</td>
</tr>
</tbody>
</table>

145.2.2. Query Parameters (18 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataModuleOptions (common)</td>
<td>Data module options</td>
<td></td>
<td>DataModuleOptions</td>
</tr>
<tr>
<td>protocolOptions (common)</td>
<td>Protocol options</td>
<td></td>
<td>ProtocolOptions</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>acknowledgeWindow (connection)</td>
<td>Parameter W - Acknowledgment window.</td>
<td>10</td>
<td>short</td>
</tr>
<tr>
<td>adsuAddressType (connection)</td>
<td>The common ASDU address size. May be either SIZE_1 or SIZE_2.</td>
<td></td>
<td>ASDUAddressType</td>
</tr>
<tr>
<td>causeOfTransmissionType (connection)</td>
<td>The cause of transmission type. May be either SIZE_1 or SIZE_2.</td>
<td></td>
<td>CauseOfTransmissionType</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td>informationObjectAddressType (connection)</td>
<td>The information address size. May be either SIZE_1, SIZE_2 or SIZE_3.</td>
<td></td>
<td>InformationObject_AddressType</td>
</tr>
<tr>
<td>maxUnacknowledged (connection)</td>
<td>Parameter K - Maximum number of un-acknowledged messages.</td>
<td>15</td>
<td>short</td>
</tr>
<tr>
<td>timeout1 (connection)</td>
<td>Timeout T1 in milliseconds.</td>
<td>15000</td>
<td>int</td>
</tr>
<tr>
<td>timeout2 (connection)</td>
<td>Timeout T2 in milliseconds.</td>
<td>10000</td>
<td>int</td>
</tr>
<tr>
<td>timeout3 (connection)</td>
<td>Timeout T3 in milliseconds.</td>
<td>20000</td>
<td>int</td>
</tr>
<tr>
<td>ignoreBackgroundScan (data)</td>
<td>Whether background scan transmissions should be ignored.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>ignoreDaylightSavingTime (data)</td>
<td>Whether to ignore or respect DST</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>timeZone (data)</td>
<td>The timezone to use. May be any Java time zone string</td>
<td>UTC</td>
<td>TimeZone</td>
</tr>
<tr>
<td>connectionId (id)</td>
<td>An identifier grouping connection instances</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

A connection instance if identified by the host and port part of the URI, plus all parameters in the "id" group. If a new connection id is encountered the connection options will be evaluated and the connection instance is created with those options.

**NOTE**

If two URIs specify the same connection (host, port, ...) but different connection options, then it is undefined which of those connection options will be used.

The final connection options will be evaluated in the following order:

- If present, the connectionOptions parameter will be used
- Otherwise the defaultConnectionOptions instance is copied and customized in the following steps
- Apply protocolOptions if present
- Apply dataModuleOptions if present
- Apply all explicit connection parameters (e.g. timeZone)
CHAPTER 146. IEC 60870 SERVER COMPONENT

Available as of Camel version 2.20

The IEC 60870-5-104 Server component provides access to IEC 60870 servers using the Eclipse NeoSCADA™ implementation.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-iec60870</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The IEC 60870 Server component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultConnection Options</td>
<td>Default connection options</td>
<td></td>
<td>ServerOptions</td>
</tr>
<tr>
<td>(common)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>resolveProperty Placeholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

146.1. URI FORMAT

The URI syntax of the endpoint is:

```
ied0870-server:host:port/00-01-02-03-04
```

The information object address is encoded in the path in the syntax shows above. Please note that always the full, 5 octet address format is being used. Unused octets have to be filled with zero.

146.2. URI OPTIONS

The IEC 60870 Server endpoint is configured using URI syntax:

```
ied0870-server:uriPath
```

with the following path and query parameters:

146.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>uriPath</td>
<td>Required The object information address</td>
<td></td>
<td>ObjectAddress</td>
</tr>
</tbody>
</table>

146.2.2. Query Parameters (19 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataModuleOptions (common)</td>
<td>Data module options</td>
<td></td>
<td>DataModuleOptions</td>
</tr>
<tr>
<td>filterNonExecute (common)</td>
<td>Filter out all requests which don’t have the execute bit set</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>protocolOptions (common)</td>
<td>Protocol options</td>
<td></td>
<td>ProtocolOptions</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>acknowledgeWindow (connection)</td>
<td>Parameter W - Acknowledgment window.</td>
<td>10</td>
<td>short</td>
</tr>
<tr>
<td>adsuAddressType (connection)</td>
<td>The common ASDU address size. May be either SIZE_1 or SIZE_2.</td>
<td></td>

<td>boolean</td>
</tr>
<tr>
<td>ignoreDaylightSavingTime</td>
<td>Whether to ignore or respect DST</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>timeZone</td>
<td>The timezone to use. May be any Java timezone string</td>
<td>UTC</td>
<td>TimeZone</td>
</tr>
<tr>
<td>connectionId</td>
<td>An identifier grouping connection instances</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
CHAPTER 147. IGnite Cache Component

Available as of Camel version 2.17

The Ignite Cache endpoint is one of camel-ignite endpoints which allows you to interact with an Ignite Cache. This offers both a Producer (to invoke cache operations on an Ignite cache) and a Consumer (to consume changes from a continuous query).

The cache value is always the body of the message, whereas the cache key is always stored in the IgniteConstants.IGNITE_CACHE_KEY message header.

Even if you configure a fixed operation in the endpoint URI, you can vary it per-exchange by setting the IgniteConstants.IGNITE_CACHE_OPERATION message header.

147.1. OPTIONS

The Ignite Cache component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignite (common)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td>configurationResource (common)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>igniteConfiguration (common)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfiguratio</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ignite Cache endpoint is configured using URI syntax:

```
ignite-cache:cacheName
```

with the following path and query parameters:

147.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The cache name.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

147.1.2. Query Parameters (16 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagateIncomingBodyIfNoReturnValue</td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>treatCollectionsAsCacheObjects</td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>autoUnsubscribe</td>
<td>Whether auto unsubscribe is enabled in the Continuous Query Consumer.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>fireExistingQueryResults</td>
<td>Whether to process existing results that match the query. Used on initialization of the Continuous Query Consumer.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>oneExchangePerUpdate</td>
<td>Whether to pack each update in an individual Exchange, even if multiple updates are received in one batch. Only used by the Continuous Query Consumer.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>pageSize</td>
<td>The page size. Only used by the Continuous Query Consumer.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>query</td>
<td>The Query to execute, only needed for operations that require it, and for the Continuous Query Consumer.</td>
<td></td>
<td>Object&gt;&gt;</td>
</tr>
<tr>
<td>remoteFilter</td>
<td>The remote filter, only used by the Continuous Query Consumer.</td>
<td></td>
<td>Object&gt;</td>
</tr>
<tr>
<td>timeInterval</td>
<td>The time interval for the Continuous Query Consumer.</td>
<td>0</td>
<td>long</td>
</tr>
</tbody>
</table>
### Name Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>exceptionHandler</strong></td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td><strong>exchangePattern</strong></td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td><strong>cachePeekMode</strong></td>
<td>The CachePeekMode, only needed for operations that require it (link IgniteCacheOperationSIZE).</td>
<td>ALL</td>
<td>CachePeekMode</td>
</tr>
<tr>
<td><strong>failIfInexistentCache</strong></td>
<td>Whether to fail the initialization if the cache doesn’t exist.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>operation</strong></td>
<td>The cache operation to invoke. Possible values: GET, PUT, REMOVE, SIZE, REBALANCE, QUERY, CLEAR.</td>
<td></td>
<td>IgniteCacheOperation</td>
</tr>
<tr>
<td><strong>synchronous</strong></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 147.1.3. Headers used

This endpoint uses the following headers:

<table>
<thead>
<tr>
<th>Header name</th>
<th>Constant</th>
<th>Expected type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelligniteCacheKey</td>
<td>IgniteConstants.IGNORE_CACHE_KEY</td>
<td>String</td>
<td>The cache key for the entry value in the message body.</td>
</tr>
<tr>
<td>CamelligniteCacheQuery</td>
<td>IgniteConstants.IGNORE_CACHE_QUERY</td>
<td>Query</td>
<td>The query to run (producer) when invoking the QUERY operation.</td>
</tr>
<tr>
<td>CamelligniteCacheOperation</td>
<td>IgniteConstants.IGNORE_CACHE_OPERATION</td>
<td>IgniteCacheOperation enum</td>
<td>Allows you to dynamically change the cache operation to execute (producer).</td>
</tr>
<tr>
<td>Header name</td>
<td>Constant</td>
<td>Expected type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------</td>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>CamelIgnite CachePeek Mode</td>
<td>IgniteConstants.IGNITE_CACHE_PEEK_MODE</td>
<td>CachePeek Mode enum</td>
<td>Allows you to dynamically change the cache peek mode when running the SIZE operation.</td>
</tr>
<tr>
<td>CamelIgnite CacheEventType</td>
<td>IgniteConstants.IGNITE_CACHE_EVENT_TYPE</td>
<td>int (EventType constants)</td>
<td>This header carries the received event type when using the continuous query consumer.</td>
</tr>
<tr>
<td>CamelIgnite CacheName</td>
<td>IgniteConstants.IGNITE_CACHE_NAME</td>
<td>String</td>
<td>This header carries the cache name for which a continuous query event was received (consumer). It does not allow you to dynamically change the cache against which a producer operation is performed. Use EIPs for that (e.g. recipient list, dynamic router).</td>
</tr>
<tr>
<td>CamelIgnite CacheOldValue</td>
<td>IgniteConstants.IGNITE_CACHE_OLD_VALUE</td>
<td>Object</td>
<td>This header carries the old cache value when passed in the incoming cache event (consumer).</td>
</tr>
</tbody>
</table>
CHAPTER 148. IGNITE COMPUTE COMPONENT

Available as of Camel version 2.17

The Ignite Compute endpoint is one of camel-ignite endpoints which allows you to run compute operations on the cluster by passing in an IgniteCallable, an IgniteRunnable, an IgniteClosure, or collections of them, along with their parameters if necessary.

This endpoint only supports producers.

The host part of the endpoint URI is a symbolic endpoint ID, it is not used for any purposes.

The endpoint tries to run the object passed in the body of the IN message as the compute job. It expects different payload types depending on the execution type.

148.1. OPTIONS

The Ignite Compute component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignite (producer)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td>configurationResource (producer)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>igniteConfiguration (producer)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfiguration</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ignite Compute endpoint is configured using URI syntax:

```
ignite-compute:endpointId
```

with the following path and query parameters:

148.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpointId</td>
<td>Required The endpoint ID (not used).</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
148.1.2. Query Parameters (8 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterGroupExpr (producer)</td>
<td>An expression that returns the Cluster Group for the IgniteCompute instance.</td>
<td></td>
<td>ClusterGroupExpression</td>
</tr>
<tr>
<td>computeName (producer)</td>
<td>The name of the compute job, which will be set via link IgniteComputewithName(String).</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>executionType (producer)</td>
<td><strong>Required</strong> The compute operation to perform. Possible values: CALL, BROADCAST, APPLY, EXECUTE, RUN, AFFINITY_CALL, AFFINITY_RUN. The component expects different payload types depending on the operation.</td>
<td></td>
<td>IgniteComputeExecutionType</td>
</tr>
<tr>
<td>propagateIncomingBodyIfNoReturnValue (producer)</td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>taskName (producer)</td>
<td>The task name, only applicable if using the link IgniteComputeExecutionTypeEXECUTE execution type.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>timeoutMillis (producer)</td>
<td>The timeout interval for triggered jobs, in milliseconds, which will be set via link IgniteComputewithTimeout(long).</td>
<td></td>
<td>Long</td>
</tr>
<tr>
<td>treatCollectionsAsCacheObjects (producer)</td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

148.1.3. Expected payload types

Each operation expects the indicated types:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Expected payloads</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALL</td>
<td>Collection of IgniteCallable, or a single IgniteCallable.</td>
</tr>
<tr>
<td>BROADCAST</td>
<td>IgniteCallable, IgniteRunnable, IgniteClosure.</td>
</tr>
<tr>
<td>APPLY</td>
<td>IgniteClosure.</td>
</tr>
<tr>
<td>Operation</td>
<td>Expected payloads</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EXECUTE</td>
<td>ComputeTask, Class&lt;? extends ComputeTask&gt; or an object representing parameters if the taskName option is not null.</td>
</tr>
<tr>
<td>RUN</td>
<td>A Collection of IgniteRunnables, or a single IgniteRunnable.</td>
</tr>
<tr>
<td>AFFINITY_CALL</td>
<td>IgniteCallable.</td>
</tr>
<tr>
<td>AFFINITY_RUN</td>
<td>IgniteRunnable.</td>
</tr>
</tbody>
</table>

### 148.1.4. Headers used

This endpoint uses the following headers:

<table>
<thead>
<tr>
<th>Header name</th>
<th>Constant</th>
<th>Expected type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelIgnite ComputeExecutionType</td>
<td>IgniteConstants.IGNITE.Compose.EXECUTIO_N_TYPE</td>
<td>IgniteComputeExecutionType enum</td>
<td>Allows you to dynamically change the compute operation to perform.</td>
</tr>
<tr>
<td>CamelIgnite ComputeParameters</td>
<td>IgniteConstants.IGNITE.Compose.PARAMS</td>
<td>Any object or Collection of objects.</td>
<td>Parameters for APPLY, BROADCAST and EXECUTE operations.</td>
</tr>
<tr>
<td>CamelIgnite ComputeReducer</td>
<td>IgniteConstants.IGNITE.Compose.REDUCER</td>
<td>IgniteReducer</td>
<td>Reducer for the APPLY and CALL operations.</td>
</tr>
<tr>
<td>CamelIgnite ComputeAffinityCacheName</td>
<td>IgniteConstants.IGNITE.Compose.AFFINITY_CACHE_NAME</td>
<td>String</td>
<td>Affinity cache name for the AFFINITY_CALL and AFFINITY_RUN operations.</td>
</tr>
<tr>
<td>CamelIgnite ComputeAffinityKey</td>
<td>IgniteConstants.IGNITE.Compose.AFFINITY_KEY</td>
<td>Object</td>
<td>Affinity key for the AFFINITY_CALL and AFFINITY_RUN operations.</td>
</tr>
</tbody>
</table>
CHAPTER 149. IGNITE EVENTS COMPONENT

Available as of Camel version 2.17

The Ignite Events endpoint is one of camel-ignite endpoints which allows you to receive events from the Ignite cluster by creating a local event listener.

This endpoint only supports consumers. The Exchanges created by this consumer put the received Event object into the body of the IN message.

149.1. OPTIONS

The Ignite Events component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignite (consumer)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td>configurationResource (consumer)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>igniteConfiguration (consumer)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfiguration</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td></td>
<td>true boolean</td>
</tr>
</tbody>
</table>

The Ignite Events endpoint is configured using URI syntax:

```
ignite-events:endpointId
```

with the following path and query parameters:

149.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpointId</td>
<td>The endpoint ID (not used).</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

149.1.2. Query Parameters (8 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>clusterGroupExpression (consumer)</td>
<td>The cluster group expression.</td>
<td></td>
<td>ClusterGroupExpression</td>
</tr>
<tr>
<td>events (consumer)</td>
<td>The event IDs to subscribe to as a Set directly where the IDs are the different constants in org.apache.ignite.events.EventType.</td>
<td></td>
<td>Set&lt;Integer&gt;OrString</td>
</tr>
<tr>
<td>propagateIncomingBodyIfNoReturnValue (consumer)</td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>treatCollectionsAsCacheObjects (consumer)</td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
CHAPTER 150. IGNITE ID GENERATOR COMPONENT

Available as of Camel version 2.17

The Ignite ID Generator endpoint is one of camel-ignite endpoints which allows you to interact with Ignite Atomic Sequences and ID Generators.

This endpoint only supports producers.

150.1. OPTIONS

The Ignite ID Generator component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ignite</strong> (producer)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td><strong>configurationResource</strong> (producer)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td><strong>igniteConfiguration</strong> (producer)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfiguration</td>
</tr>
<tr>
<td><strong>resolvePropertyPlaceholders</strong> (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ignite ID Generator endpoint is configured using URI syntax:

```
ignite-idgen:name
```

with the following path and query parameters:

150.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>name</strong></td>
<td>Required The sequence name.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

150.1.2. Query Parameters (6 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>batchSize</strong></td>
<td>The batch size.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>initialValue</strong></td>
<td>The initial value.</td>
<td>0</td>
<td>Long</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>operation</strong></td>
<td>The operation to invoke on the Ignite ID Generator. Superseded by the IgniteConstants:IGNITE_IDGEN_OPERATION header in the IN message. Possible values: ADD_AND_GET, GET, GET_AND_ADD, GET_AND_INCREMENT, INCREMENT_AND_GET.</td>
<td></td>
<td>IgniteIdGenOperation</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>propagateIncomingBodyIfNoReturnValue</strong></td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>treatCollectionsAsCacheObjects</strong></td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(producer)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>synchronous</strong></td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The Ignite Messaging endpoint is one of camel-ignite endpoints which allows you to send and consume messages from an Ignite topic.

This endpoint supports producers (to send messages) and consumers (to receive messages).

### 151.1. OPTIONS

The Ignite Messaging component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignite (common)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td>configurationResource (common)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>igniteConfiguration (common)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfig</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ignite Messaging endpoint is configured using URI syntax:

```
ignite-messaging:topic
```

with the following path and query parameters:

### 151.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>topic</td>
<td>Required The topic name.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 151.1.2. Query Parameters (9 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagateIncomingBodyIfNoReturnValue</td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>treatCollectionsAsCacheObjects</td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>clusterGroupExpression</td>
<td>The cluster group expression.</td>
<td></td>
<td>ClusterGroupExpr</td>
</tr>
</tbody>
</table>
| sendMode                                               | The send mode to use. Possible values: UNORDERED, ORDERED.                                                                                                                                                                                                                                                                             | UNORDERED | IgniteMessagingS
send Mode                                                                 |         |                   |
| timeout                                                | The timeout for the send operation when using ordered messages.                                                                                                                                                                                                                                                                         |         | Long              |
| synchronous                                            | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).                                                                                                                                                                                                             | false   | boolean           |

### 151.1.3. Headers used

This endpoint uses the following headers:
<table>
<thead>
<tr>
<th>Header name</th>
<th>Constant</th>
<th>Expected type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camellgnite MessagingTopic</td>
<td>IgniteConstants.IGNITE_MESSAGING_TOPIC</td>
<td>String</td>
<td>Allows you to dynamically change the topic to send messages to (producer). It also carries the topic on which a message was received (consumer).</td>
</tr>
<tr>
<td>Camellgnite MessagingUUID</td>
<td>IgniteConstants.IGNITE_MESSAGING_UUID</td>
<td>UUID</td>
<td>This header is filled in with the UUID of the subscription when a message arrives (consumer).</td>
</tr>
</tbody>
</table>
CHAPTER 152. IGNITE QUEUES COMPONENT

Available as of Camel version 2.17

The Ignite Queue endpoint is one of camel-ignite endpoints which allows you to interact with Ignite Queue data structures.

This endpoint only supports producers.

152.1. OPTIONS

The Ignite Queues component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignite (producer)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td>configurationResource (producer)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>igniteConfiguration (producer)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfiguration</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ignite Queues endpoint is configured using URI syntax:

```
ignite-queue:name
```

with the following path and query parameters:

152.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required The queue name.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

152.1.2. Query Parameters (7 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>capacity</strong> (producer)</td>
<td>The queue capacity. Default: non-bounded.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td><strong>configuration</strong> (producer)</td>
<td>The collection configuration. Default: empty configuration. You can also conveniently set inner properties by using configuration.xyz=123 options.</td>
<td></td>
<td>CollectionConfiguration</td>
</tr>
<tr>
<td><strong>operation</strong> (producer)</td>
<td>The operation to invoke on the Ignite Queue. Superseded by the IgniteConstants.IGNITE_QUEUE_OPERATION header in the IN message. Possible values: CONTAINS, ADD, SIZE, REMOVE, ITERATOR, CLEAR, RETAIN_ALL, ARRAY, DRAIN, ELEMENT, PEEK, OFFER, POLL, TAKE, PUT.</td>
<td></td>
<td>IgniteQueueOperation</td>
</tr>
<tr>
<td><strong>propagateIncomingBodyIfNoReturnValue</strong> (producer)</td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>timeoutMillis</strong> (producer)</td>
<td>The queue timeout in milliseconds. Default: no timeout.</td>
<td></td>
<td>Long</td>
</tr>
<tr>
<td><strong>treatCollectionsAsCacheObjects</strong> (producer)</td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>synchronous</strong> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 152.1.3. Headers used

This endpoint uses the following headers:

<table>
<thead>
<tr>
<th>Header name</th>
<th>Constant</th>
<th>Expected type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamellIgniteQueueOperation</td>
<td>IgniteConstants.IGNITE_QUEUE_OPERATION</td>
<td>IgniteQueueOperation enum</td>
<td>Allows you to dynamically change the queue operation.</td>
</tr>
<tr>
<td>Header name</td>
<td>Constant</td>
<td>Expected type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Camellignite QueueMaxElements</td>
<td>IgniteConstants.IGNITE_QUEUE_MAX_ELEMENTS</td>
<td>Integer or int</td>
<td>When invoking the DRAIN operation, the amount of items to drain.</td>
</tr>
<tr>
<td>Camellignite QueueTransferredCount</td>
<td>IgniteConstants.IGNITE_QUEUE_TRNSFERED_COUNT</td>
<td>Integer or int</td>
<td>The amount of items transferred as the result of the DRAIN operation.</td>
</tr>
<tr>
<td>Camellignite QueueTimeoutMillis</td>
<td>IgniteConstants.IGNITE_QUEUE_TIMEOUT_MILLIS</td>
<td>Long or long</td>
<td>Dynamically sets the timeout in milliseconds to use when invoking the OFFER or POLL operations.</td>
</tr>
</tbody>
</table>
The Ignite Sets endpoint is one of camel-ignite endpoints which allows you to interact with Ignite Set data structures.

This endpoint only supports producers.

153.1. OPTIONS

The Ignite Sets component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignite (producer)</td>
<td>Sets the Ignite instance.</td>
<td></td>
<td>Ignite</td>
</tr>
<tr>
<td>configurationResource (producer)</td>
<td>Sets the resource from where to load the configuration. It can be a: URI, String (URI) or an InputStream.</td>
<td></td>
<td>Object</td>
</tr>
<tr>
<td>igniteConfiguration (producer)</td>
<td>Allows the user to set a programmatic IgniteConfiguration.</td>
<td></td>
<td>IgniteConfiguration</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Ignite Sets endpoint is configured using URI syntax:

```
ignite-set:name
```

with the following path and query parameters:

153.1.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required The set name.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

153.1.2. Query Parameters (5 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration (producer)</td>
<td>The collection configuration. Default: empty configuration. You can also conveniently set inner properties by using configuration.xyz=123 options.</td>
<td></td>
<td>CollectionConfiguration</td>
</tr>
<tr>
<td>operation (producer)</td>
<td>The operation to invoke on the Ignite Set. Superseded by the IgniteConstants.IGNITE_SETS_OPERATION header in the IN message. Possible values: CONTAINS, ADD, SIZE, REMOVE, ITERATOR, CLEAR, RETAIN_ALL, ARRAY. The set operation to perform.</td>
<td></td>
<td>IgniteSetOperation</td>
</tr>
<tr>
<td>propagateIncomingBodyIfNoReturnValue (producer)</td>
<td>Sets whether to propagate the incoming body if the return type of the underlying Ignite operation is void.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>treatCollectionsAsCacheObjects (producer)</td>
<td>Sets whether to treat Collections as cache objects or as Collections of items to insert/update/compute, etc.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 153.1.3. Headers used

This endpoint uses the following headers:

<table>
<thead>
<tr>
<th>Header name</th>
<th>Constant</th>
<th>Expected type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelIgniteSetsOperation</td>
<td>IgniteConstants.IGNITE_SETS_OPERATION</td>
<td>IgniteSetOperation enum</td>
<td>Allows you to dynamically change the set operation.</td>
</tr>
</tbody>
</table>
CHAPTER 154. INFLUXDB COMPONENT

Available as of Camel version 2.18

This component allows you to interact with InfluxDB [https://influxdata.com/time-series-platform/influxdb/](https://influxdata.com/time-series-platform/influxdb/) a time series database. The native body type for this component is Point (the native influxdb class), but it can also accept Map<String, Object> as message body and it will get converted to Point.class, please note that the map must contain an element with InfluxDbConstants.MEASUREMENT_NAME as key.

Additionally of course you may register your own Converters to your data type to Point, or use the (un)marshalling tools provided by camel.

From Camel 2.18 onwards Influxdb requires Java 8.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-influxdb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

154.1. URI FORMAT

```
influxdb://beanName?[options]
```

154.2. URI OPTIONS

The producer allows sending messages to a influxdb configured in the registry, using the native java driver.

The InfluxDB component has no options.

The InfluxDB endpoint is configured using URI syntax:

```
influxdb:connectionBean
```

with the following path and query parameters:

154.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectionBean</td>
<td>Required Connection to the influx database, of class InfluxDB.class</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

154.2.2. Query Parameters (6 parameters):
### Name | Description | Default | Type
--- | --- | --- | ---
**batch** (producer) | Define if this operation is a batch operation or not | false | boolean
**databaseName** (producer) | The name of the database where the time series will be stored | | String
**operation** (producer) | Define if this operation is an insert or a query | insert | String
**query** (producer) | Define the query in case of operation query | | String
**retentionPolicy** (producer) | The string that defines the retention policy to the data created by the endpoint | default | String
**synchronous** (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean

#### 154.3. MESSAGE HEADERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Default Value</th>
<th>Type</th>
<th>Context</th>
<th>Description</th>
</tr>
</thead>
</table>

#### 154.4. EXAMPLE

Below is an example route that stores a point into the db (taking the db name from the URI) specific key:

```java
from("direct:start")
    .setHeader(InfluxDbConstants.DBNAME_HEADER, constant("myTimeSeriesDB"))
    .to("influxdb://connectionBean");

from("direct:start")
    .to("influxdb://connectionBean?databaseName=myTimeSeriesDB");
```

For more information, see these resources...

#### 154.5. SEE ALSO

• Getting Started
CHAPTER 155. IRC COMPONENT

Available as of Camel version 1.1

The irc component implements an IRC (Internet Relay Chat) transport.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-irc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

155.1. URI FORMAT

irc:nick@host[:port]/#room[?options]
irc:nick@host[:port]?channels=#channel1,#channel2,#channel3[?options]

You can append query options to the URI in the following format, ?option=value&option=value&…

155.2. OPTIONS

The IRC component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>useGlobalSslContext Parameters (security)</td>
<td>Enable usage of global SSL context parameters.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The IRC endpoint is configured using URI syntax:

irc:hostname:port

with the following path and query parameters:

155.2.1. Path Parameters (2 parameters):
### 155.2.2. Query Parameters (24 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>autoRejoin</td>
<td>Whether to auto re-join when being kicked</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>namesOnJoin</td>
<td>Sends NAMES command to channel after joining it. link onReply has to be true in order to process the</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>nickname</td>
<td>The nickname used in chat.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>persistent</td>
<td>Deprecated Use persistent messages.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>realtime</td>
<td>The IRC user’s actual name.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td><code>colors</code> (advanced)</td>
<td>Whether or not the server supports color codes.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>synchronous</code> (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onJoin</code> (filter)</td>
<td>Handle user join events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onKick</code> (filter)</td>
<td>Handle kick events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onMode</code> (filter)</td>
<td>Handle mode change events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onNick</code> (filter)</td>
<td>Handle nickname change events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onPart</code> (filter)</td>
<td>Handle user part events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onPrivmsg</code> (filter)</td>
<td>Handle private message events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onQuit</code> (filter)</td>
<td>Handle user quit events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onReply</code> (filter)</td>
<td>Whether or not to handle general responses to commands or informational messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>onTopic</code> (filter)</td>
<td>Handle topic change events.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>nickPassword</code> (security)</td>
<td>Your IRC server nickname password.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>password</code> (security)</td>
<td>The IRC server password.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>sslContextParameters</code> (security)</td>
<td>Used for configuring security using SSL. Reference to a org.apache.camel.util.jsse.SSLContextParameters in the Registry. This reference overrides any configured SSLContextParameters at the component level. Note that this setting overrides the trustManager option.</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
<tr>
<td><code>trustManager</code> (security)</td>
<td>The trust manager used to verify the SSL server’s certificate.</td>
<td></td>
<td>SSLTrustManager</td>
</tr>
<tr>
<td><code>username</code> (security)</td>
<td>The IRC server user name.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 155.3. SSL SUPPORT

Red Hat Fuse 7.2 Apache Camel Component Reference

Page 1012
155.3.1. Using the JSSE Configuration Utility

As of Camel 2.9, the IRC component supports SSL/TLS configuration through the Camel JSSE Configuration Utility. This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the IRC component.

Programmatic configuration of the endpoint

```java
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/truststore.jks");
ksp.setPassword("keystorePassword");

TrustManagersParameters tmp = new TrustManagersParameters();
tmp.setKeyStore(ksp);

SSLContextParameters scp = new SSLContextParameters();
scp.setTrustManagers(tmp);

Registry registry = ...
registry.bind("sslContextParameters", scp);
...
from(...)  
.to("ircs://camel-prd-user@server:6669/#camel-test?nickname=camel-prd&password=password&sslContextParameters=#sslContextParameters");
```

Spring DSL based configuration of endpoint

```xml
...  
<camel:sslContextParameters>
    id="sslContextParameters"  
    <camel:trustManagers>  
        <camel:keyStore>
            resource="/users/home/server/truststore.jks"
            password="keystorePassword"/
        </camel:keyManagers>
    </camel:sslContextParameters>
...
<to uri="ircs://camel-prd-user@server:6669/#camel-test?nickname=camel-prd&password=password&sslContextParameters=#sslContextParameters"/>
```

155.3.2. Using the legacy basic configuration options

You can also connect to an SSL enabled IRC server, as follows:

```text
ircs:host[:port]/#room?username=user&password=pass
```

By default, the IRC transport uses SSLDefaultTrustManager. If you need to provide your own custom trust manager, use the trustManager parameter as follows:

```text
ircs:host[:port]/#room?
username=user&password=pass&trustManager=#referenceToMyTrustManagerBean
```
155.4. USING KEYS

Available as of Camel 2.2

Some irc rooms requires you to provide a key to be able to join that channel. The key is just a secret word.

For example we join 3 channels where as only channel 1 and 3 uses a key.

```
irc:nick@irc.server.org?channels=#chan1,#chan2,#chan3&keys=chan1Key,,chan3key
```

155.5. GETTING A LIST OF USERS OF THE CHANNEL

Using the `namesOnJoin` option one can invoke the IRC- NAMES command after the component has joined a channel. The server will reply with `irc.num = 353`. So in order to process the result the property `onReply` has to be `true`. Furthermore one has to filter the `onReply` exchanges in order to get the names.

For example we want to get all exchanges that contain the usernames of the channel:

```
from("ircs:nick@myserver:1234/#mychannelname?namesOnJoin=true&onReply=true")
.choice()
 .when(header("irc.messageType").isEqualToIgnoreCase("REPLY"))
 .filter(header("irc.num").isEqualTo("353"))
 .to("mock:result").stop();
```

CHAPTER 156. JACKSONXML DATAFORMAT

Available as of Camel version 2.16

Jackson XML is a Data Format which uses the Jackson library with the XMLMapper extension to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

INFO: If you are familiar with Jackson, this XML data format behaves in the same way as its JSON counterpart, and thus can be used with classes annotated for JSON serialization/deserialization.

This extension also mimics JAXB’s "Code first" approach.

This data format relies on Woodstox (especially for features like pretty printing), a fast and efficient XML processor.

```
from("activemq:My.Queue").unmarshal().jacksonxml().to("mqseries:Another.Queue");
```

156.1. JACKSONXML OPTIONS

The JacksonXML dataformat supports 15 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlMapper</td>
<td>String</td>
<td></td>
<td>Lookup and use the existing XmlMapper with the given id.</td>
</tr>
<tr>
<td>prettyPrint</td>
<td>false</td>
<td>Boolean</td>
<td>To enable pretty printing output nicely formatted. Is by default false.</td>
</tr>
<tr>
<td>unmarshalTypeName</td>
<td>String</td>
<td></td>
<td>Class name of the java type to use when unmarshalling</td>
</tr>
<tr>
<td>jsonView</td>
<td>Class&lt;&gt;</td>
<td></td>
<td>When marshalling a POJO to JSON you might want to exclude certain fields from the JSON output. With Jackson you can use JSON views to accomplish this. This option is to refer to the class which has JsonView annotations</td>
</tr>
<tr>
<td>include</td>
<td>String</td>
<td></td>
<td>If you want to marshal a pojo to JSON, and the pojo has some fields with null values. And you want to skip these null values, you can set this option to NOT_NULL</td>
</tr>
<tr>
<td>allowJmsType</td>
<td>false</td>
<td>Boolean</td>
<td>Used for JMS users to allow the JMSType header from the JMS spec to specify a FQN classname to use to unmarshal to.</td>
</tr>
<tr>
<td>collectionTypeName</td>
<td>String</td>
<td></td>
<td>Refers to a custom collection type to lookup in the registry to use. This option should rarely be used, but allows to use different collection types than java.util.Collection based as default.</td>
</tr>
<tr>
<td>Name</td>
<td>Default</td>
<td>Java Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>useList</td>
<td>false</td>
<td>Boolean</td>
<td>To unmarshal to a List of Map or a List of Pojo.</td>
</tr>
<tr>
<td>enableJaxbAnnotationModule</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to enable the JAXB annotations module when using jackson. When enabled then JAXB annotations can be used by Jackson.</td>
</tr>
<tr>
<td>moduleClassNames</td>
<td>String</td>
<td></td>
<td>To use custom Jackson modules com.fasterxml.jackson.databind.Module specified as a String with FQN class names. Multiple classes can be separated by comma.</td>
</tr>
<tr>
<td>moduleRefs</td>
<td>String</td>
<td></td>
<td>To use custom Jackson modules referred from the Camel registry. Multiple modules can be separated from comma.</td>
</tr>
<tr>
<td>enableFeatures</td>
<td>String</td>
<td></td>
<td>Set of features to enable on the Jackson com.fasterxml.jackson.databind.ObjectMapper. The features should be a name that matches a enum from com.fasterxml.jackson.databind.SerializationFeature, com.fasterxml.jackson.databind.DeserializationFeature, or com.fasterxml.jackson.databind.MapperFeature. Multiple features can be separated by comma.</td>
</tr>
<tr>
<td>disableFeatures</td>
<td>String</td>
<td></td>
<td>Set of features to disable on the Jackson com.fasterxml.jackson.databind.ObjectMapper. The features should be a name that matches a enum from com.fasterxml.jackson.databind.SerializationFeature, com.fasterxml.jackson.databind.DeserializationFeature, or com.fasterxml.jackson.databind.MapperFeature. Multiple features can be separated by comma.</td>
</tr>
<tr>
<td>allowUnmarshallType</td>
<td>false</td>
<td>Boolean</td>
<td>If enabled then Jackson is allowed to attempt to use the CamelJacksonUnmarshalType header during the unmarshalling. This should only be enabled when desired to be used.</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

156.1.1. Using Jackson XML in Spring DSL

When using Data Format in Spring DSL you need to declare the data formats first. This is done in the DataFormats XML tag.

```
<dataFormats>
  <!-- here we define a Xml data format with the id jack and that it should use the TestPojo as
```
the class type when doing unmarshal. The unmarshalTypeName is optional, if not provided Camel will use a Map as the type -->

```xml
<jaxonxml id="jack"
unmarshalTypeName="org.apache.camel.component.jacksonxml.TestPojo"/>
</dataFormats>
```

And then you can refer to this id in the route:

```xml
<route>
  <from url="direct:back"/>
  <unmarshal ref="jack"/>
  <to url="mock:reverse"/>
</route>
```

### 156.2. EXCLUDING POJO FIELDS FROM MARSHALLING

When marshalling a POJO to XML you might want to exclude certain fields from the XML output. With Jackson you can use JSON views to accomplish this. First create one or more marker classes.

Use the marker classes with the @JsonView annotation to include/exclude certain fields. The annotation also works on getters.

Finally use the Camel JacksonXMLDataFormat to marshall the above POJO to XML.

Note that the weight field is missing in the resulting XML:

```xml
<pojo age="30" weight="70"/>
```

### 156.3. INCLUDE/EXCLUDE FIELDS USING THE JSONVIEW ATTRIBUTE WITH `JACKSONXML` DATAFORMAT

As an example of using this attribute you can instead of:

```java
JacksonXMLDataFormat ageViewFormat = new JacksonXMLDataFormat(TestPojoView.class, Views.Age.class);
from("direct:inPojoAgeView").marshal(ageViewFormat);
```

Directly specify your JSON view inside the Java DSL as:

```java
from("direct:inPojoAgeView").marshal().jacksonxml(TestPojoView.class, Views.Age.class);
```

And the same in XML DSL:

```xml
<from url="direct:inPojoAgeView"/>
<marshal>
  <jaxonxml unmarshalTypeName="org.apache.camel.component.jacksonxml.TestPojoView"
jsonView="org.apache.camel.component.jacksonxml.Views$Age"/>
</marshal>
```
156.4. SETTING SERIALIZATION INCLUDE OPTION

If you want to marshal a pojo to XML, and the pojo has some fields with null values. And you want to skip these null values, then you need to set either an annotation on the pojo,

```java
@JsonInclude(Include.NON_NULL)
public class MyPojo {
    ...
}
```

But this requires you to include that annotation in your pojo source code. You can also configure the Camel JacksonXMLDataFormat to set the include option, as shown below:

```java
JacksonXMLDataFormat format = new JacksonXMLDataFormat();
format.setInclude("NON_NULL");
```

Or from XML DSL you configure this as

```xml
<dataFormats>
    <jacksonxml id="jacksonxml" include="NOT_NULL"/>
</dataFormats>
```

156.5. UNMARSHALLING FROM XML TO POJO WITH DYNAMIC CLASS NAME

If you use jackson to unmarshal XML to POJO, then you can now specify a header in the message that indicate which class name to unmarshal to.

The header has key **CamelJacksonUnmarshalType** if that header is present in the message, then Jackson will use that as FQN for the POJO class to unmarshal the XML payload as.

For JMS end users there is the JMSType header from the JMS spec that indicates that also. To enable support for JMSType you would need to turn that on, on the jackson data format as shown:

```java
JacksonDataFormat format = new JacksonDataFormat();
format.setAllowJmsType(true);
```

Or from XML DSL you configure this as

```xml
<dataFormats>
    <jacksonxml id="jacksonxml" allowJmsType="true"/>
</dataFormats>
```

156.6. UNMARSHALLING FROM XML TO LIST<MAP> OR LIST<POJO>

If you are using Jackson to unmarshal XML to a list of map/pojo, you can now specify this by setting `useLists="true"` or use the `org.apache.camel.component.jacksonxml.ListJacksonXMLDataFormat`. For example with Java you can do as shown below:

```java
JacksonXMLDataFormat format = new ListJacksonXMLDataFormat();
// or
JacksonXMLDataFormat format = new JacksonXMLDataFormat();
```
And if you use XML DSL then you configure to use list using `useList` attribute as shown below:

```xml
<dataFormats>
  <jacksonxml id="jack" useList="true"/>
</dataFormats>
```

And you can specify the pojo type also

```xml
<dataFormats>
  <jacksonxml id="jack" useList="true" unmarshalTypeName="com.foo.MyPojo"/>
</dataFormats>
```

### 156.7. USING CUSTOM JACKSON MODULES

You can use custom Jackson modules by specifying the class names of those using the `moduleClassNames` option as shown below.

```xml
<dataFormats>
  <jacksonxml id="jack" useList="true" unmarshalTypeName="com.foo.MyPojo"
              moduleClassNames="com.foo.MyModule,com.foo.MyOtherModule"/>
</dataFormats>
```

When using `moduleClassNames` then the custom Jackson modules are not configured, by created using default constructor and used as-is. If a custom module needs any custom configuration, then an instance of the module can be created and configured, and then use `modulesRefs` to refer to the module as shown below:

```xml
<bean id="myJacksonModule" class="com.foo.MyModule">
  ... // configure the module as you want
</bean>
```

```xml
<dataFormats>
  <jacksonxml id="jacksonxml" useList="true" unmarshalTypeName="com.foo.MyPojo"
              modulesRefs="myJacksonModule"/>
</dataFormats>
```

Multiple modules can be specified separated by comma, such as `modulesRefs="myJacksonModule,myOtherModule"`

### 156.8. ENABLING OR DISABLE FEATURES USING JACKSON

Jackson has a number of features you can enable or disable, which its ObjectMapper uses. For example to disable failing on unknown properties when marshalling, you can configure this using the `disableFeatures`:

```xml
<dataFormats>
  <jacksonxml id="jacksonxml" unmarshalTypeName="com.foo.MyPojo"
              disableFeatures="FAIL_ON_UNKNOWN_PROPERTIES"/>
</dataFormats>
```
You can disable multiple features by separating the values using comma. The values for the features must be the name of the enums from Jackson from the following enum classes:

- `com.fasterxml.jackson.databind.SerializationFeature`
- `com.fasterxml.jackson.databind.DeserializationFeature`
- `com.fasterxml.jackson.databind.MapperFeature`

To enable a feature use the `enableFeatures` options instead.

From Java code you can use the type safe methods from camel-jackson module:

```java
JacksonDataFormat df = new JacksonDataFormat(MyPojo.class);
df.disableFeature(DeserializationFeature.FAIL_ON_UNKNOWN_PROPERTIES);
df.disableFeature(DeserializationFeature.FAIL_ON_NULL_FOR_PRIMITIVES);
```

### 156.9. CONVERTING MAPS TO POJO USING JACKSON

Jackson `ObjectMapper` can be used to convert maps to POJO objects. Jackson component comes with the data converter that can be used to convert `java.util.Map` instance to non-String, non-primitive and non-Number objects.

```java
Map<String, Object> invoiceData = new HashMap<String, Object>();
invoiceData.put("netValue", 500);
producerTemplate.sendBody("direct:mapToInvoice", invoiceData);
...
// Later in the processor
Invoice invoice = exchange.getIn().getBody(Invoice.class);
```

If there is a single `ObjectMapper` instance available in the Camel registry, it will used by the converter to perform the conversion. Otherwise the default mapper will be used.

### 156.10. FORMATTED XML MARSHALLING (PRETTY-PRINTING)

Using the `prettyPrint` option one can output a well formatted XML while marshalling:

```xml
<dataFormats>
  <jacksonxml id="jack" prettyPrint="true"/>
</dataFormats>
```

And in Java DSL:

```java
from("direct:inPretty").marshal().jacksonxml(true);
```

Please note that there are 5 different overloaded `jacksonxml()` DSL methods which support the `prettyPrint` option in combination with other settings for `unmarshalType`, `jsonView` etc.

### 156.11. DEPENDENCIES

To use Jackson XML in your camel routes you need to add the dependency on `camel-jacksonxml` which implements this data format.
If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jacksonxml</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```
CHAPTER 157. JASYPT COMPONENT

Available as of Camel 2.5

Jasypt is a simplified encryption library which makes encryption and decryption easy. Camel integrates with Jasypt to allow sensitive information in Properties files to be encrypted. By dropping camel-jasypt on the classpath those encrypted values will automatically be decrypted on-the-fly by Camel. This ensures that human eyes can’t easily spot sensitive information such as usernames and passwords.

If you are using Maven, you need to add the following dependency to your pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-jasypt</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

If you are using an Apache Karaf container, you need to add the following dependency to your pom.xml for this component:

```xml
<dependency>
    <groupId>org.apache.karaf.jaas</groupId>
    <artifactId>org.apache.karaf.jaas.jasypt</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

157.1. TOOLING

The Jasypt component provides a little command line tooling to encrypt or decrypt values.

The console output the syntax and which options it provides:

Apache Camel Jasypt takes the following options

- `-h` or `-help` = Displays the help screen
- `-c` or `-command <command>` = Command either encrypt or decrypt
- `-p` or `-password <password>` = Password to use
- `-i` or `-input <input>` = Text to encrypt or decrypt
- `-a` or `-algorithm <algorithm>` = Optional algorithm to use

For example to encrypt the value `tiger` you run with the following parameters. In the apache camel kit, you cd into the lib folder and run the following java cmd, where `<CAMEL_HOME>` is where you have downloaded and extract the Camel distribution.

```
$ cd <CAMEL_HOME>/lib
$ java -jar camel-jasypt-2.5.0.jar -c encrypt -p secret -i tiger
```

Which outputs the following result

```
Encrypted text: qaEEacuW7BUti8LcMgyjKw==
```
This means the encrypted representation qaEEacuW7BUti8LcMgyjKw== can be decrypted back to **tiger** if you know the master password which was **secret**. If you run the tool again then the encrypted value will return a different result. But decrypting the value will always return the correct original value.

So you can test it by running the tooling using the following parameters:

```bash
$ cd <CAMEL_HOME>/lib
$ java -jar camel-jasypt-2.5.0.jar -c decrypt -p secret -i qaEEacuW7BUti8LcMgyjKw==
```

Which outputs the following result:

Decrypted text: tiger

The idea is then to use those encrypted values in your Properties files. Notice how the password value is encrypted and the value has the tokens surrounding **ENC(value here)**

**TIP**

When running jasypt tooling, if you come across `java.lang.NoClassDefFoundError: org/jasypt/encryption/pbe/StandardPBEStringEncryptor` this means you have to include jasypt7.2.jar in your classpath. Example of adding jar to classpath may be copying jasypt7.2.jar to `$JAVA_HOME/jre/lib/ext` if you are going to run as `java -jar ...`. The latter may be adding jasypt7.2.jar to classpath using `-cp`, in that case you should provide main class to execute as eg: `java -cp jasypt-1.9.2.jar:camel-jasypt-2.18.2.jar org.apache.camel.component.jasypt.Main -c encrypt -p secret -i tiger`

### 157.2. URI OPTIONS

The options below are exclusive for the Jasypt component.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>null</td>
<td>String</td>
<td>Specifies the master password to use for decrypting. This option is mandatory. See below for more details.</td>
</tr>
<tr>
<td>algorithm</td>
<td>null</td>
<td>String</td>
<td>Name of an optional algorithm to use.</td>
</tr>
</tbody>
</table>

### 157.3. PROTECTING THE MASTER PASSWORD

The master password used by Jasypt must be provided, so that it’s capable of decrypting the values. However having this master password out in the open may not be an ideal solution. Therefore you could for example provide it as a JVM system property or as a OS environment setting. If you decide to do so then the `password` option supports prefixes which dictates this. `sysenv:` means to lookup the OS system environment with the given key. `sys:` means to lookup a JVM system property.

For example you could provided the password before you start the application

```bash
$ export CAMEL_ENCRYPTION_PASSWORD=secret
```
Then start the application, such as running the start script.

When the application is up and running you can unset the environment

```
$ unset CAMEL_ENCRYPTION_PASSWORD
```

The `password` option is then a matter of defining as follows:
`password=sysenv:CAMEL_ENCRYPTION_PASSWORD`.

### 157.4. EXAMPLE WITH JAVA DSL

In Java DSL you need to configure Jasypt as a `JasyptPropertiesParser` instance and set it on the `Properties` component as show below:

The properties file `myproperties.properties` then contain the encrypted value, such as shown below. Notice how the password value is encrypted and the value has the tokens surrounding `ENC(value here)`

### 157.5. EXAMPLE WITH SPRING XML

In Spring XML you need to configure the `JasyptPropertiesParser` which is shown below. Then the Camel `Properties` component is told to use `jasypt` as the properties parser, which means Jasypt has its chance to decrypt values looked up in the properties.

```xml
<bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
    <property name="password" value="secret"/>
</bean>

<bean id="properties" class="org.apache.camel.component.properties.PropertiesComponent">
    <property name="location" value="classpath:org/apache/camel/component/jasypt/myproperties.properties"/>
    <property name="propertiesParser" ref="jasypt"/>
</bean>

<camelContext xmlns="http://camel.apache.org/schema/spring">
    <!-- define the camel properties placeholder, and let it leverage jasypt -->
    <propertyPlaceholder id="properties" location="classpath:org/apache/camel/component/jasypt/myproperties.properties" propertiesParserRef="jasypt"/>
</camelContext>
```
In Blueprint XML you need to configure the `JasyptPropertiesParser` which is shown below. Then the Camel `Properties` component is told to use `jasypt` as the properties parser, which means Jasypt has its chance to decrypt values looked up in the properties.

```xml
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
    xsi:schemaLocation="http://www.osgi.org/xmlns/blueprint/v1.0.0
    http://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

    <cm:property-placeholder id="myblue" persistent-id="mypersistent">
        <!-- list some properties for this test -->
        <cm:default-properties>
            <cm:property name="cool.result" value="mock:{{cool.password}}"/>
            <cm:property name="cool.password" value="ENC(bsW9uV37gQ0QHFr7KO3Ww==)"/>
        </cm:default-properties>
    </cm:property-placeholder>

    <!-- define the jasypt properties parser with the given password to be used -->
    <bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
        <property name="password" value="secret"/>
    </bean>

    <camelContext xmlns="http://camel.apache.org/schema/blueprint">
        <!-- define the camel properties placeholder, and let it leverage jasypt -->
        <propertyPlaceholder id="properties"
            location="blueprint:myblue"
            propertiesParserRef="jasypt"/>

        <route>
            <from uri="direct:start"/>
            <to uri="{{cool.result}}"/>
        </route>
    </camelContext>
</blueprint>
```

The `Properties` component can also be inlined inside the `<camelContext>` tag which is shown below. Notice how we use the `propertiesParserRef` attribute to refer to Jasypt.

```xml
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
    xsi:schemaLocation="http://www.osgi.org/xmlns/blueprint/v1.0.0
    http://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

    <!-- define the jasypt properties parser with the given password to be used -->
</blueprint>
```
<bean id="jasypt" class="org.apache.camel.component.jasypt.JasyptPropertiesParser">
  <property name="password" value="secret"/>
</bean>

<camelContext xmlns="http://camel.apache.org/schema/blueprint">
 <!-- define the camel properties placeholder, and let it leverage jasypt -->
 <propertyPlaceholder id="properties" location="classpath:org/apache/camel/component/jasypt/myproperties.properties" propertiesParserRef="jasypt"/>

 <route>
   <from uri="direct:start"/>
   <to uri="{{cool.result}}"/>
 </route>
</camelContext>
</blueprint>

- Security
- Properties
- Encrypted passwords in ActiveMQ - ActiveMQ has a similar feature as this camel-jasypt component
CHAPTER 158. JAXB DATAFORMAT

Available as of Camel version 1.0

JAXB is a Data Format which uses the JAXB2 XML marshalling standard which is included in Java 6 to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

158.1. OPTIONS

The JAXB dataformat supports 18 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contextPath</td>
<td>String</td>
<td></td>
<td>Package name where your JAXB classes are located.</td>
</tr>
<tr>
<td>schema</td>
<td>String</td>
<td></td>
<td>To validate against an existing schema. Your can use the prefix classpath:, file: or http: to specify how the resource should by resolved. You can separate multiple schema files by using the <code>,</code> character.</td>
</tr>
<tr>
<td>schemaSeverityLevel</td>
<td>0</td>
<td>Integer</td>
<td>Sets the schema severity level to use when validating against a schema. This level determines the minimum severity error that triggers JAXB to stop continue parsing. The default value of 0 (warning) means that any error (warning, error or fatal error) will trigger JAXB to stop. There are the following three levels: 0=warning, 1=error, 2=fatal error.</td>
</tr>
<tr>
<td>prettyPrint</td>
<td>false</td>
<td>Boolean</td>
<td>To enable pretty printing output nicely formatted. Is by default false.</td>
</tr>
<tr>
<td>objectFactory</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to allow using ObjectFactory classes to create the POJO classes during marshalling. This only applies to POJO classes that has not been annotated with JAXB and providing jaxb.index descriptor files.</td>
</tr>
<tr>
<td>ignoreJAXBElement</td>
<td>false</td>
<td>Boolean</td>
<td>Whether to ignore JAXBElement elements - only needed to be set to false in very special use-cases.</td>
</tr>
<tr>
<td>mustBeJAXBElement</td>
<td>false</td>
<td>Boolean</td>
<td>Whether marhsalling must be java objects with JAXB annotations. And if not then it fails. This option can be set to false to relax that, such as when the data is already in XML format.</td>
</tr>
<tr>
<td>filterNonXmlChars</td>
<td>false</td>
<td>Boolean</td>
<td>To ignore non xml characters and replace them with an empty space.</td>
</tr>
<tr>
<td>encoding</td>
<td>String</td>
<td></td>
<td>To overrule and use a specific encoding</td>
</tr>
</tbody>
</table>
For example the following uses a named DataFormat of `jaxb` which is configured with a number of Java package names to initialize the JAXBContext.

```java
DataFormat jaxb = new JaxbDataFormat("com.acme.model");
from("activemq:My.Queue").unmarshal(jaxb).to("mqseries:Another.Queue");
```
You can if you prefer use a named reference to a data format which can then be defined in your Registry such as via your Spring XML file. e.g.

```java
from("activemq:My.Queue").
    unmarshal("myJaxbDataType").
    to("mqseries:Another.Queue");
```

### 158.3. USING SPRING XML

The following example shows how to use JAXB to unmarshal using Spring configuring the jaxb data type

This example shows how to configure the data type just once and reuse it on multiple routes.

**Multiple context paths**

It is possible to use this data format with more than one context path. You can specify context path using : as separator, for example `com.mycompany:com.mycompany2`. Note that this is handled by JAXB implementation and might change if you use different vendor than RI.

### 158.4. PARTIAL MARSHALLING/UNMARSHALLING

This feature is new to Camel 2.2.0.

JAXB 2 supports marshalling and unmarshalling XML tree fragments. By default JAXB looks for `@XmlRootElement` annotation on given class to operate on whole XML tree. This is useful but not always - sometimes generated code does not have `@XmlRootElement` annotation, sometimes you need unmarshall only part of tree.

In that case you can use partial unmarshalling. To enable this behaviours you need set property `partClass`. Camel will pass this class to JAXB’s unmarshaller. If `JaxbConstants.JAXB_PART_CLASS` is set as one of headers, (even if partClass property is set on DataFormat), the property on DataFormat is surpassed and the one set in the headers is used.

For marshalling you have to add `partNamespace` attribute with QName of destination namespace. Example of Spring DSL you can find above. If `JaxbConstants.JAXB_PART_NAMESPACE` is set as one of headers, (even if partNamespace property is set on DataFormat), the property on DataFormat is surpassed and the one set in the headers is used. While setting `partNamespace` through `JaxbConstants.JAXB_PART_NAMESPACE`, please note that you need to specify its value `{[namespaceUri]}[localPart]`

```java
... .setHeader(JaxbConstants.JAXB_PART_NAMESPACE, simple(" {http://www.camel.apache.org/jaxb/example/address/1}address") );
... 
```

### 158.5. FRAGMENT

This feature is new to Camel 2.8.0.

JaxbDataFormat has new property fragment which can set the the `Marshaller.JAXB_FRAGMENT` encoding property on the JAXB Marshall. If you don’t want the JAXB Marshall to generate the XML declaration, you can set this option to be true. The default value of this property is false.

### 158.6. IGNORING THE NONXML CHARACTER
This feature is new to Camel 2.2.0. JaxbDataFromat supports to ignore the NonXML Character, you just need to set the filterNonXmlChars property to be true, JaxbDataFormat will replace the NonXML character with " " when it is marshaling or unmarshaling the message. You can also do it by setting the Exchange property Exchange.FILTER_NON_XML_CHARS.

<table>
<thead>
<tr>
<th>Filtering in use</th>
<th>JDK 1.5</th>
<th>JDK 1.6+</th>
</tr>
</thead>
<tbody>
<tr>
<td>StAX API and implementation</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

| Filtering not in use     | StAX API only | No            |

This feature has been tested with Woodstox 3.2.9 and Sun JDK 1.6 StAX implementation.

New for Camel 2.12.1
JAXBDataFormat now allows you to customize the XMLStreamWriter used to marshal the stream to XML. Using this configuration, you can add your own stream writer to completely remove, escape, or replace non-xml characters.

JAXBDataFormat customWriterFormat = new JAXBDataFormat("org.apache.camel.foo.bar");
customWriterFormat.setXmlStreamWriterWrapper(new TestXmlStreamWriter());

The following example shows using the Spring DSL and also enabling Camel’s NonXML filtering:

```xml
<bean id="testXmlStreamWriterWrapper" class="org.apache.camel.jaxb.TestXmlStreamWriter"/>
<jaxb:filterNonXmlChars="true" contextPath="org.apache.camel.foo.bar" xmlStreamWriterWrapper="#testXmlStreamWriterWrapper" />
```

158.7. WORKING WITH THE OBJECTFACTORY

If you use XJC to create the java class from the schema, you will get an ObjectFactory for you JAXB context. Since the ObjectFactory uses JAXBElement to hold the reference of the schema and element instance value, jaxbDataformat will ignore the JAXBElement by default and you will get the element instance value instead of the JAXBElement object form the unmarshaled message body. If you want to get the JAXBElement object form the unmarshaled message body, you need to set the JAXBDataFormat object’s ignoreJAXBElement property to be false.

158.8. SETTING ENCODING

You can set the encoding option to use when marshalling. Its the Marshaller.JAXB_ENCODING encoding property on the JAXB Marshaller.
You can setup which encoding to use when you declare the JAXB data format. You can also provide the
encoding in the Exchange property `Exchange.CHARSET_NAME`. This property will overrule the encoding set on the JAXB data format.

In this Spring DSL we have defined to use **iso-8859-1** as the encoding:

### 158.9. CONTROLLING NAMESPACE PREFIX MAPPING

**Available as of Camel 2.11**

When marshalling using **JAXB** or **SOAP** then the JAXB implementation will automatic assign namespace prefixes, such as ns2, ns3, ns4 etc. To control this mapping, Camel allows you to refer to a map which contains the desired mapping.

Notice this requires having JAXB-RI 2.1 or better (from SUN) on the classpath, as the mapping functionality is dependent on the implementation of JAXB, whether its supported.

For example in Spring XML we can define a Map with the mapping. In the mapping file below, we map SOAP to use soap as prefix. While our custom namespace "http://www.mycompany.com/foo/2" is not using any prefix.

```xml
<util:map id="myMap">
  <entry key="http://www.w3.org/2003/05/soap-envelope" value="soap"/>
  <!-- we dont want any prefix for our namespace -->
  <entry key="http://www.mycompany.com/foo/2" value=""/>
</util:map>
```

To use this in **JAXB** or **SOAP** you refer to this map, using the `namespacePrefixRef` attribute as shown below. Then Camel will lookup in the Registry a `java.util.Map` with the id "myMap", which was what we defined above.

```xml
<marshal>
  <soapjaxb version="1.2" contextPath="com.mycompany.foo" namespacePrefixRef="myMap"/>
</marshal>
```

### 158.10. SCHEMA VALIDATION

**Available as of Camel 2.11**

The JAXB Data Format supports validation by marshalling and unmarshalling from/to XML. Your can use the prefix `classpath`, `file` or `http` to specify how the resource should be resolved. You can separate multiple schema files by using the ',' character.

**Known issue**

Camel 2.11.0 and 2.11.1 has a known issue by validation multiple `Exchange's in parallel. See CAMEL-6630. This is fixed with Camel 2.11.2/2.12.0.

Using the Java DSL, you can configure it in the following way:

```java
JaxbDataFormat jaxbDataFormat = new JaxbDataFormat();
jaxbDataFormat.setContextPath(Person.class.getPackage().getName());
jaxbDataFormat.setSchema("classpath:person.xsd,classpath:address.xsd");
```

You can do the same using the XML DSL:
Camel will create and pool the underlying `SchemaFactory` instances on the fly, because the `SchemaFactory` shipped with the JDK is not thread safe. However, if you have a `SchemaFactory` implementation which is thread safe, you can configure the JAXB data format to use this one:

```java
JaxbDataFormat jaxbDataFormat = new JaxbDataFormat();
jaxbDataFormat.setSchemaFactory(thradSafeSchemaFactory);
```

### 158.11. SCHEMA LOCATION

**Available as of Camel 2.14**

The JAXB Data Format supports to specify the SchemaLocation when marshaling the XML.

Using the Java DSL, you can configure it in the following way:

```java
JaxbDataFormat jaxbDataFormat = new JaxbDataFormat();
jaxbDataFormat.setContextPath(Person.class.getPackage().getName());
jaxbDataFormat.setSchemaLocation("schema/person.xsd");
```

You can do the same using the XML DSL:

```xml
<marshal>
  <jaxb id="jaxb" schemaLocation="schema/person.xsd"/>
</marshal>
```

### 158.12. MARSHAL DATA THAT IS ALREADY XML

**Available as of Camel 2.14.1**

The JAXB marshaller requires that the message body is JAXB compatible, eg its a JAXBElement, eg a java instance that has JAXB annotations, or extend JAXBElement. There can be situations where the message body is already in XML, eg from a String type. There is a new option `mustBeJAXBElement` you can set to false, to relax this check, so the JAXB marshaller only attempts to marshal JAXBElements (`javax.xml.bind.JAXBIntrospector#isElement returns true`). And in those situations the marshaller fallbacks to marshal the message body as-is.

### 158.13. DEPENDENCIES

To use JAXB in your camel routes you need to add the a dependency on `camel-jaxb` which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jaxb</artifactId>
</dependency>
```
<version>x.x.x</version>
</dependency>
CHAPTER 159. JBOSS DATA GRID COMPONENT

159.1. RED HAT JBOSS DATA GRID COMPONENT WITH APACHE CAMEL

Using Camel with Red Hat JBoss Data Grid and Red Hat JBoss Fuse simplifies integration in large enterprise applications by providing a wide variety of transports and APIs that add connectivity.

JBoss Data Grid provides support for caching on Camel routes in JBoss Fuse, partially replacing Ehcache. JBoss Data Grid is supported as an embedded cache (local or clustered) or as a remote cache in a Camel route.

For more information about running the Red Hat JBoss Data Grid with Apache Camel, see Introducing Red Hat JBoss Data Grid.
CHAPTER 160. JCACHE COMPONENT

Available as of Camel version 2.17

The jcache component enables you to perform caching operations using JSR107/JCache as cache implementation.

160.1. URI FORMAT

\[\text{jcache:cacheName}\[?\text{options}\]]

160.2. URI OPTIONS

The JCache endpoint is configured using URI syntax:

\[\text{jcache:cacheName}\]

with the following path and query parameters:

160.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheName</td>
<td>Required The name of the cache</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

160.2.2. Query Parameters (22 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheConfiguration (common)</td>
<td>A Configuration for the Cache</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>cacheConfigurationProperties (common)</td>
<td>The Properties for the javax.cache.spi.CachingProvider to create the CacheManager</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td>cachingProvider (common)</td>
<td>The fully qualified class name of the javax.cache.spi.CachingProvider</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>configurationUri (common)</td>
<td>An implementation specific URI for the CacheManager</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>managementEnabled (common)</td>
<td>Whether management gathering is enabled</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td>readThrough</td>
<td>If read-through caching should be used</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>statisticsEnabled</td>
<td>Whether statistics gathering is enabled</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>storeByValue</td>
<td>If cache should use store-by-value or store-by-reference semantics</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>writeThrough</td>
<td>If write-through caching should be used</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>filteredEvents</td>
<td>Events a consumer should filter. If using filteredEvents option, then eventFilters one will be ignored</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>oldValueRequired</td>
<td>if the old value is required for events</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous</td>
<td>if the the event listener should block the thread causing the event</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>eventFilters</td>
<td>The CacheEntryEventFilter. If using eventFilters option, then filteredEvents one will be ignored</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>action</td>
<td>To configure using a cache operation by default. If an operation in the message header, then the operation from the header takes precedence.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
The JCache component supports 5 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cachingProvider</td>
<td>The fully qualified class name of the javax.cache.spi.CachingProvider</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>cacheConfiguration</td>
<td>A Configuration for the Cache</td>
<td></td>
<td>Configuration</td>
</tr>
<tr>
<td>cacheConfigurationProperties</td>
<td>The Properties for the javax.cache.spi.CachingProvider to create the CacheManager</td>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td>configurationUri</td>
<td>An implementation specific URI for the CacheManager</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>resolvePropertyPlaceholders</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>
CHAPTER 161. JCLOUDS COMPONENT

Available as of Camel version 2.9

This component allows interaction with cloud provider key-value engines (blobstores) and compute services. The component uses jclouds which is a library that provides abstractions for blobstores and compute services.

**ComputeService** simplifies the task of managing machines in the cloud. For example, you can use ComputeService to start 5 machines and install your software on them. **BlobStore** simplifies dealing with key-value providers such as Amazon S3. For example, BlobStore can give you a simple Map view of a container.

The camel jclouds component allows you to use both abstractions, as it specifies two types of endpoint the JcloudsBlobStoreEndpoint and the JcloudsComputeEndpoint. You can have both producers and consumers on a blobstore endpoint but you can only have producers on compute endpoints.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jclouds</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

161.1. CONFIGURING THE COMPONENT

The camel jclouds component will make use of multiple jclouds blobstores and compute services as long as they are passed to the component during initialization. The component accepts a list of blobstores and compute services. Here is how it can be configured.

```xml
<bean id="jclouds" class="org.apache.camel.component.jclouds.JcloudsComponent">
  <property name="computeServices">
    <list>
      <ref bean="computeService"/>
    </list>
  </property>
  <property name="blobStores">
    <list>
      <ref bean="blobStore"/>
    </list>
  </property>
</bean>

<bean id="blobStoreContextFactory" class="org.jclouds.blobstore.BlobStoreContextFactory"/>

<bean id="blobStoreContext" factory-bean="blobStoreContextFactory" factory-method="createContext">
  <constructor-arg name="provider" value="PROVIDER_NAME"/>
  <constructor-arg name="identity" value="IDENTITY"/>
  <constructor-arg name="credential" value="CREDENTIAL"/>
</bean>
```
As you can see the component is capable of handling multiple blobstores and compute services. The actual implementation that will be used by each endpoint is specified by passing the provider inside the URI.

### 161.2. JCLOUDS OPTIONS

```xml
<jclouds:blobstore:[provider id][?options]
<jclouds:compute:[provider id][?options]
```

The **provider id** is the name of the cloud provider that provides the target service (e.g. aws-s3 or aws_ec2).

You can append query options to the URI in the following format, `?option=value&option=value&…`

### 161.3. BLOBSTORE URI OPTIONS

The JClouds component supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>blobStores (common)</td>
<td>To use the given BlobStore which must be configured when using blobstore.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>computeServices (common)</td>
<td>To use the given ComputeService which must be configured when use compute.</td>
<td></td>
<td>List</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The JClouds endpoint is configured using URI syntax:

```xml
<jclouds:command:providerId
```
with the following path and query parameters:

### 161.3.1. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>Required What command to execute such as blobstore or compute.</td>
<td></td>
<td>JcloudsCommand</td>
</tr>
<tr>
<td>providerId</td>
<td>Required The name of the cloud provider that provides the target service (e.g. aws-s3 or aws_ec2).</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 161.3.2. Query Parameters (15 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>blobName</td>
<td>The name of the blob.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>container</td>
<td>The name of the blob container.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>directory</td>
<td>An optional directory name to use</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
--- | --- | --- | ---
**group** *(compute)* | The group that will be assigned to the newly created node. Values depend on the actual cloud provider. |  | **String**
**hardwareId** *(compute)* | The hardware that will be used for creating a node. Values depend on the actual cloud provider. |  | **String**
**imageId** *(compute)* | The imageId that will be used for creating a node. Values depend on the actual cloud provider. |  | **String**
**locationId** *(compute)* | The location that will be used for creating a node. Values depend on the actual cloud provider. |  | **String**
**nodeId** *(compute)* | The id of the node that will run the script or destroyed. |  | **String**
**nodeState** *(compute)* | To filter by node status to only select running nodes etc. |  | **String**
**operation** *(compute)* | Specifies the type of operation that will be performed to the blobstore. |  | **String**
**user** *(compute)* | The user on the target node that will run the script. |  | **String**

You can have as many of these options as you like.

```text
ejclouds:blobstore:aws-s3?
    operation=CamelJcloudsGet&container=mycontainer&blobName=someblob
```

For producer endpoint you can override all of the above URI options by passing the appropriate headers to the message.

### 161.3.3. Message Headers for blobstore

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CamelJcloudsOperation</strong></td>
<td>The operation to be performed on the blob. The valid options are <em>PUT</em> <em>GET</em></td>
</tr>
<tr>
<td><strong>CamelJcloudsContainer</strong></td>
<td>The name of the blob container.</td>
</tr>
</tbody>
</table>
161.4. BLOBSTORE USAGE SAMPLES

161.4.1. Example 1: Putting to the blob

This example will show you how you can store any message inside a blob using the jclouds component.

```java
from("direct:start")
  .to("jclouds:blobstore:aws-s3" +
    "?operation=PUT" +
    "&container=mycontainer" +
    "&blobName=myblob");
```

In the above example you can override any of the URI parameters with headers on the message. Here is how the above example would look like using xml to define our route.

```xml
<route>
  <from uri="direct:start"/>
  <to uri="jclouds:blobstore:aws-s3?operation=PUT&container=mycontainer&blobName=myblob"/>
</route>
```

161.4.2. Example 2: Getting/Reading from a blob

This example will show you how you can read the content of a blob using the jclouds component.

```java
from("direct:start")
  .to("jclouds:blobstore:aws-s3" +
    "?operation=GET" +
    "&container=mycontainer" +
    "&blobName=myblob");
```

In the above example you can override any of the URI parameters with headers on the message. Here is how the above example would look like using xml to define our route.

```xml
<route>
  <from uri="direct:start"/>
  <to uri="jclouds:blobstore:aws-s3?operation=GET&container=mycontainer"/>
</route>
```

161.4.3. Example 3: Consuming a blob
This example will consume all blob that are under the specified container. The generated exchange will contain the payload of the blob as body.

```java
from("jclouds:blobstore:aws-s3" +
"?container=mycontainer")
.to("direct:next");
```

You can achieve the same goal by using xml, as you can see below.

```xml
<route>
    <from uri="jclouds:blobstore:aws-s3?operation=GET&container=mycontainer&blobName=myblob"/>
    <to uri="direct:next"/>
</route>
```

```java
jclouds:compute:aws-ec2?
    operation=CamelJcloudsCreateNode&imageId=AMI_XXXXX&locationId=eu-west-1&group=mygroup
```

## 161.5. COMPUTE USAGE SAMPLES

Below are some examples that demonstrate the use of jclouds compute producer in java dsl and spring/blueprint xml.

### 161.5.1. Example 1: Listing the available images.

```java
from("jclouds:compute:aws-ec2" +
"&operation=CamelJCloudsListImages")
.to("direct:next");
```

This will create a message that will contain the list of images inside its body. You can also do the same using xml.

```xml
<route>
    <from uri="jclouds:compute:aws-ec2?operation=CamelJCloudsListImages"/>
    <to uri="direct:next"/>
</route>
```

### 161.5.2. Example 2: Create a new node.

```java
from("direct:start").
to("jclouds:compute:aws-ec2" +
"?operation=CamelJcloudsCreateNode" +
"&imageId=AMI_XXXXX" +
"&locationId=XXXXX" +
"&group=myGroup");
```

This will create a new node on the cloud provider. The out message in this case will be a set of metadata that contains information about the newly created node (e.g. the ip, hostname etc). Here is the same using spring xml.

```xml
<route>
    <from uri="direct:start"/>
</route>
```
161.5.3. Example 3: Run a shell script on running node.

```xml
<to uri="jclouds:compute:aws-ec2?
operation=CamelJcloudsCreateNode&imageId=AMI_XXXXX&locationId=XXXXX&group=myGroup"/>
</route>
```

The sample above will retrieve the body of the in message, which is expected to contain the shell script to be executed. Once the script is retrieved, it will be sent to the node for execution under the specified user (**in order case ubuntu**). The target node is specified using its nodeId. The nodeId can be retrieved either upon the creation of the node, it will be part of the resulting metadata or by a executing a LIST_NODES operation.

**Note** This will require that the compute service that will be passed to the component, to be initialized with the appropriate jclouds ssh capable module (**e.g. jsch** or **sshj**).

Here is the same using spring xml.

```xml
<route>
    <from uri="direct:start"/>
    <to uri="jclouds:compute:aws-ec2?operation=CamelJcloudsListNodes&?
nodeName=10&user=ubuntu"/>
</route>
```

CHAPTER 162. JCR COMPONENT

Available as of Camel version 1.3

The jcr component allows you to add/read nodes to/from a JCR compliant content repository (for example, Apache Jackrabbit) with its producer, or register an EventListener with the consumer.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jcr</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

162.1. URI FORMAT

```
jcr://user:password@repository/path/to/node
```

Consumer added

From Camel 2.10 onwards you can use consumer as an EventListener in JCR or a producer to read a node by identifier.

162.2. USAGE

The repository element of the URI is used to look up the JCR Repository object in the Camel context registry.

162.2.1. JCR Options

The JCR component has no options.

The JCR endpoint is configured using URI syntax:

```
jcr:host/base
```

with the following path and query parameters:

162.2.2. Path Parameters (2 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Required Name of the javax.jcr.Repository to lookup from the Camel registry to be used.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>base</td>
<td>Get the base node when accessing the repository</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>
### 162.2.3. Query Parameters (14 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>deep</strong> (common)</td>
<td>When isDeep is true, events whose associated parent node is at absPath or within its subgraph are received.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>eventTypes</strong> (common)</td>
<td>eventTypes (a combination of one or more event types encoded as a bit mask value such as javax.jcr.observation.Event.NODE_ADDED, javax.jcr.observation.Event.NODE_REMOVED, etc.).</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><strong>nodeTypeNames</strong> (common)</td>
<td>When a comma separated nodeTypeName list string is set, only events whose associated parent node has one of the node types (or a subtype of one of the node types) in this list will be received.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td><strong>noLocal</strong> (common)</td>
<td>If noLocal is true, then events generated by the session through which the listener was registered are ignored. Otherwise, they are not ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>password</strong> (common)</td>
<td>Password for login</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td><strong>sessionLiveCheck Interval</strong> (common)</td>
<td>Interval in milliseconds to wait before each session live checking The default value is 60000 ms.</td>
<td>60000</td>
<td>long</td>
</tr>
<tr>
<td><strong>sessionLiveCheck IntervalOn Start</strong> (common)</td>
<td>Interval in milliseconds to wait before the first session live checking. The default value is 3000 ms.</td>
<td>3000</td>
<td>long</td>
</tr>
<tr>
<td><strong>username</strong> (common)</td>
<td>Username for login</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td><strong>uuids</strong> (common)</td>
<td>When a comma separated uuid list string is set, only events whose associated parent node has one of the identifiers in the comma separated uuid list will be received.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td><strong>workspaceName</strong> (common)</td>
<td>The workspace to access. If it’s not specified then the default one will be used</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
bridgeErrorHandler (consumer)

Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.

false boolean

exceptionHandler (consumer)

To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.

ExceptionHandler

exchangePattern (consumer)

Sets the exchange pattern when the consumer creates an exchange.

ExchangePattern

synchronous (advanced)

Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).

false boolean

Please note that the JCR Producer used message properties instead of message headers in Camel versions earlier than 2.12.3. See https://issues.apache.org/jira/browse/CAMEL-7067 for more details.

162.3. EXAMPLE

The snippet below creates a node named node under the /home/test node in the content repository. One additional property is added to the node as well: my.contents.property which will contain the body of the message being sent.

```camel-lang
from("direct:a").setHeader(JcrConstants.JCR_NODE_NAME, constant("node")).
.setHeader("my.contents.property", body()).
to("jcr://user:pass@repository/home/test");
```

The following code will register an EventListener under the path import-application/inbox for Event.NODE_ADDED and Event.NODE_REMOVED events (event types 1 and 2, both masked as 3) and listening deep for all the children.

```camel-lang
<route>
  <from uri="jcr://user:pass@repository/import-application/inbox?eventTypes=3&deep=true"/>
  <to uri="direct:execute-import-application"/>
</route>
```

• Component
• Endpoint
• Getting Started
CHAPTER 163. JDBC COMPONENT

Available as of Camel version 1.2

The jdbc component enables you to access databases through JDBC, where SQL queries (SELECT) and operations (INSERT, UPDATE, etc) are sent in the message body. This component uses the standard JDBC API, unlike the SQL Component component, which uses spring-jdbc.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jdbc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

This component can only be used to define producer endpoints, which means that you cannot use the JDBC component in a from() statement.

### 163.1. URI FORMAT

```
jdbc:dataSourceName[?options]
```

This component only supports producer endpoints.

You can append query options to the URI in the following format, `?option=value&option=value&...`

### 163.2. OPTIONS

The JDBC component supports 2 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSource (producer)</td>
<td>To use the DataSource instance instead of looking up the data source by name from the registry.</td>
<td></td>
<td>DataSource</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The JDBC endpoint is configured using URI syntax:

```
jdbc:dataSourceName
```

with the following path and query parameters:

### 163.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSourceName</td>
<td><strong>Required</strong> Name of DataSource to lookup in the Registry.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

### 163.2.2. Query Parameters (13 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowNamedParameters (producer)</td>
<td>Whether to allow using named parameters in the queries.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>outputClass (producer)</td>
<td>Specify the full package and class name to use as conversion when outputType=SelectOne or SelectList.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>outputType (producer)</td>
<td>Determines the output the producer should use.</td>
<td>Select List</td>
<td>JdbcOutputType</td>
</tr>
<tr>
<td>parameters (producer)</td>
<td>Optional parameters to the java.sql.Statement. For example to set maxRows, fetchSize etc.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>readSize (producer)</td>
<td>The default maximum number of rows that can be read by a polling query. The default value is 0.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td>resetAutoCommit (producer)</td>
<td>Camel will set the autoCommit on the JDBC connection to be false, commit the change after executed the statement and reset the autoCommit flag of the connection at the end, if the resetAutoCommit is true. If the JDBC connection doesn’t support to reset the autoCommit flag, you can set the resetAutoCommit flag to be false, and Camel will not try to reset the autoCommit flag. When used with XA transactions you most likely need to set it to false so that the transaction manager is in charge of committing this tx.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>transacted (producer)</td>
<td>Whether transactions are in use.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useGetBytesForBlob (producer)</td>
<td>To read BLOB columns as bytes instead of string data. This may be needed for certain databases such as Oracle where you must read BLOB columns as bytes.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>---------</td>
<td>------</td>
</tr>
<tr>
<td>useHeadersAsParameters (producer)</td>
<td>Set this option to true to use the prepareStatementStrategy with named parameters. This allows to define queries with named placeholders, and use headers with the dynamic values for the query placeholders.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useJDBC4ColumnNameAndLabelSemantics (producer)</td>
<td>Sets whether to use JDBC 4 or JDBC 3.0 or older semantic when retrieving column name. JDBC 4.0 uses columnLabel to get the column name where as JDBC 3.0 uses both columnName or columnLabel. Unfortunately JDBC drivers behave differently so you can use this option to work out issues around your JDBC driver if you get problem using this component. This option is default true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>beanRowMapper (advanced)</td>
<td>To use a custom org.apache.camel.component.jdbc.BeanRowMapper when using outputClass. The default implementation will lower case the row names and skip underscores, and dashes. For example CUST_ID is mapped as custId.</td>
<td>BeanRowMapper</td>
<td></td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 163.3. RESULT

By default the result is returned in the OUT body as an `ArrayList<HashMap<String, Object>>`. The `List` object contains the list of rows and the `Map` objects contain each row with the `String` key as the column name. You can use the option `outputType` to control the result.

**Note:** This component fetches `ResultSetMetaData` to be able to return the column name as the key in the `Map`.

#### 163.3.1. Message Headers
163.4. GENERATED KEYS

Available as of Camel 2.10

If you insert data using SQL INSERT, then the RDBMS may support auto generated keys. You can instruct the JDBC producer to return the generated keys in headers. To do that set the header CamelRetrieveGeneratedKeys=true. Then the generated keys will be provided as headers with the keys listed in the table above.

You can see more details in this unit test.

Using generated keys does not work with together with named parameters.

163.5. USING NAMED PARAMETERS

Available as of Camel 2.12
In the given route below, we want to get all the projects from the projects table. Notice the SQL query has 2 named parameters, :?lic and :?min. Camel will then lookup these parameters from the message headers. Notice in the example above we set two headers with constant value for the named parameters:

```
from("direct:projects")
  .setHeader("lic", constant("ASF"))
  .setHeader("min", constant(123))
  .setBody("select * from projects where license = :?lic and id > :?min order by id")
  .to("jdbc:myDataSource?useHeadersAsParameters=true")
```

You can also store the header values in a `java.util.Map` and store the map on the headers with the key `CamelJdbcParameters`.

### 163.6. SAMPLES

In the following example, we fetch the rows from the customer table.

First we register our datasource in the Camel registry as `testdb`:

Then we configure a route that routes to the JDBC component, so the SQL will be executed. Note how we refer to the `testdb` datasource that was bound in the previous step:

Or you can create a `DataSource` in Spring like this:

We create an endpoint, add the SQL query to the body of the IN message, and then send the exchange. The result of the query is returned in the OUT body:

If you want to work on the rows one by one instead of the entire ResultSet at once you need to use the Splitter EIP such as:

In Camel 2.13.x or older

In Camel 2.14.x or newer

```
from("direct:hello")
  // here we split the data from the testdb into new messages one by one
  // so the mock endpoint will receive a message per row in the table
  // the StreamList option allows to stream the result of the query without creating a List of rows
  // and notice we also enable streaming mode on the splitter
  .to("jdbc:testdb?outputType=StreamList")
  .split(body()).streaming()
  .to("mock:result");
```

### 163.7. SAMPLE - POLLING THE DATABASE EVERY MINUTE

If we want to poll a database using the JDBC component, we need to combine it with a polling scheduler such as the `Timer` or `Quartz` etc. In the following example, we retrieve data from the database every 60 seconds:

```
from("timer://foo?period=60000").setBody(constant("select * from customer")).to("jdbc:testdb").to("activemq:queue:customers");
```
163.8. SAMPLE - MOVE DATA BETWEEN DATA SOURCES

A common use case is to query for data, process it and move it to another data source (ETL operations). In the following example, we retrieve new customer records from the source table every hour, filter/transform them and move them to a destination table:

```java
from("timer://MoveNewCustomersEveryHour?period=3600000")
  .setBody(constant("select * from customer where create_time > (sysdate-1/24)"))
  .to("jdbc:testdb")
  .split(body())
  .process(new MyCustomerProcessor()) //filter/transform results as needed
  .setBody(simple("insert into processed_customer values('${body[ID]}','${body[NAME]}')"))
  .to("jdbc:testdb");
```

163.9. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
- SQL
The *jetty* component provides HTTP-based endpoints for consuming and producing HTTP requests. That is, the Jetty component behaves as a simple Web server. Jetty can also be used as a http client which means you can also use it with Camel as a producer.

**Stream**

The *assert* call appears in this example, because the code is part of an unit test. Jetty is stream based, which means the input it receives is submitted to Camel as a stream. That means you will only be able to read the content of the stream once.

If you find a situation where the message body appears to be empty or you need to access the Exchange.HTTP_RESPONSE_CODE data multiple times (e.g.: doing multicasting, or redelivery error handling), you should use Stream caching or convert the message body to a *String* which is safe to be re-read multiple times.

Maven users will need to add the following dependency to their *pom.xml* for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jetty</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

**164.1. URI FORMAT**

```
jetty:http://hostname[:port][/resourceUri][?options]
```

You can append query options to the URI in the following format, *?option=value&option=value&...*

**164.2. OPTIONS**

The Jetty 9 component supports 33 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
</table>

---

**WARNING**

The producer is deprecated - do not use. We only recommend using jetty as consumer (eg from jetty)
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>sslKeyPassword</strong> (security)</td>
<td>The key password, which is used to access the certificate's key entry in the keystore (this is the same password that is supplied to the keystore command's -keypass option).</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>sslPassword</strong> (security)</td>
<td>The ssl password, which is required to access the keystore file (this is the same password that is supplied to the keystore command's -storepass option).</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>keystore</strong> (security)</td>
<td>Specifies the location of the Java keystore file, which contains the Jetty server's own X.509 certificate in a key entry.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>errorHandler</strong> (advanced)</td>
<td>This option is used to set the ErrorHandler that Jetty server uses.</td>
<td></td>
<td>ErrorHandler</td>
</tr>
<tr>
<td><strong>sslSocketConnectors</strong> (security)</td>
<td>A map which contains per port number specific SSL connectors.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td><strong>socketConnectors</strong> (security)</td>
<td>A map which contains per port number specific HTTP connectors. Uses the same principle as sslSocketConnectors.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td><strong>httpClientMinThreads</strong> (producer)</td>
<td>To set a value for minimum number of threads in HttpClient thread pool. Notice that both a min and max size must be configured.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>httpClientMaxThreads</strong> (producer)</td>
<td>To set a value for maximum number of threads in HttpClient thread pool. Notice that both a min and max size must be configured.</td>
<td></td>
<td>Integer</td>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>jettyHttpBinding (advanced)</td>
<td>To use a custom org.apache.camel.component.jetty.JettyHttpBinding, which are used to customize how a response should be written for the producer.</td>
<td></td>
<td>JettyHttpBinding</td>
</tr>
<tr>
<td>httpBinding (advanced)</td>
<td>Not to be used - use JettyHttpBinding instead.</td>
<td></td>
<td>HttpBinding</td>
</tr>
<tr>
<td>httpConfiguration (advanced)</td>
<td>Jetty component does not use HttpConfiguration.</td>
<td></td>
<td>HttpConfiguration</td>
</tr>
<tr>
<td>mbContainer (advanced)</td>
<td>To use a existing configured org.eclipse.jetty.jmx.MBeanContainer if JMX is enabled that Jetty uses for registering mbeans.</td>
<td></td>
<td>MBeanContainer</td>
</tr>
<tr>
<td>sslSocketConnectorProperties (security)</td>
<td>A map which contains general SSL connector properties.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>socketConnectorProperties (security)</td>
<td>A map which contains general HTTP connector properties. Uses the same principle as sslSocketConnectorProperties.</td>
<td></td>
<td>Map</td>
</tr>
<tr>
<td>continuationTimeout (consumer)</td>
<td>Allows to set a timeout in millis when using Jetty as consumer (server). By default Jetty uses 30000. You can use a value of = 0 to never expire. If a timeout occurs then the request will be expired and Jetty will return back a http error 503 to the client. This option is only in use when using Jetty with the Asynchronous Routing Engine.</td>
<td>30000</td>
<td>Long</td>
</tr>
<tr>
<td>useContinuation (consumer)</td>
<td>Whether or not to use Jetty continuations for the Jetty Server.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>sslContextParameters (security)</td>
<td>To configure security using SSLContextParameters</td>
<td></td>
<td>SSLContextParameters</td>
</tr>
<tr>
<td>useGlobalSslContextParameters (security)</td>
<td>Enable usage of global SSL context parameters</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>responseBufferSize (common)</td>
<td>Allows to configure a custom value of the response buffer size on the Jetty connectors.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>requestBufferSize (common)</td>
<td>Allows to configure a custom value of the request buffer size on the Jetty connectors.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------</td>
</tr>
<tr>
<td>requestHeaderSize (common)</td>
<td>Allows to configure a custom value of the request header size on the Jetty connectors.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>responseHeaderSize (common)</td>
<td>Allows to configure a custom value of the response header size on the Jetty connectors.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>proxyHost (proxy)</td>
<td>To use a http proxy to configure the hostname.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>proxyPort (proxy)</td>
<td>To use a http proxy to configure the port number.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>useXForwardedFor Header (common)</td>
<td>To use the X-Forwarded-For header in HttpServletRequest.getRemoteAddr.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>sendServerVersion (consumer)</td>
<td>If the option is true, jetty server will send the date header to the client which sends the request. NOTE please make sure there is no any other camel-jetty endpoint is share the same port, otherwise this option may not work as expected.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>allowJavaSerializedObject (advanced)</td>
<td>Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>headerFilterStrategy (filter)</td>
<td>To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>resolveProperty Placeholders (advanced)</td>
<td>Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.</td>
<td>true</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The Jetty 9 endpoint is configured using URI syntax:

```
jetty:httpUri
```

with the following path and query parameters:

### 164.2.1. Path Parameters (1 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>httpUri</strong></td>
<td><strong>Required</strong> The url of the HTTP endpoint to call.</td>
<td></td>
<td>URI</td>
</tr>
</tbody>
</table>

### 164.2.2. Query Parameters (54 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>chunked</strong> (common)</td>
<td>If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>disableStreamCache</strong> (common)</td>
<td>Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to false when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>enableMultipartFilter</strong> (common)</td>
<td>Whether Jetty org.eclipse.jetty.servlets.MultipartFilter is enabled or not. You should set this value to false when bridging endpoints, to ensure multipart requests is proxied/bridged as well.</td>
<td>false</td>
<td>boolean</td>

</table>
### 164.3. MESSAGE HEADERS

Camel uses the same message headers as the HTTP component. From Camel 2.2, it also uses (Exchange.HTTP_CHUNKED,CamelHttpChunked) header to turn on or turn off the chunked encoding on the camel-jetty consumer.

Camel also populates all request.parameter and request.headers. For example, given a client request with the URL, `http://myserver/myserver?orderid=123`, the exchange will contain a header named `orderid` with the value 123.

Starting with Camel 2.2.0, you can get the request.parameter from the message header not only from Get Method, but also other HTTP method.

### 164.4. USAGE

The Jetty component supports both consumer and producer endpoints. Another option for producing to other HTTP endpoints, is to use the HTTP Component.

### 164.5. PRODUCER EXAMPLE

#### WARNING

The producer is deprecated - do not use. We only recommend using jetty as consumer (eg from jetty)

The following is a basic example of how to send an HTTP request to an existing HTTP endpoint.

in Java DSL

```
from("direct:start").to("jetty://http://www.google.com");
```

or in Spring XML

```xml
<camel:jetty uri="http://www.google.com"/>
```
164.6. CONSUMER EXAMPLE

In this sample we define a route that exposes a HTTP service at 
http://localhost:8080/myapp/myservice:

Usage of localhost

When you specify localhost in a URL, Camel exposes the endpoint only on the local TCP/IP network interface, so it cannot be accessed from outside the machine it operates on.

If you need to expose a Jetty endpoint on a specific network interface, the numerical IP address of this interface should be used as the host. If you need to expose a Jetty endpoint on all network interfaces, the 0.0.0.0 address should be used.

To listen across an entire URI prefix, see How do I let Jetty match wildcards .

If you actually want to expose routes by HTTP and already have a Servlet, you should instead refer to the Servlet Transport.

Our business logic is implemented in the MyBookService class, which accesses the HTTP request contents and then returns a response.

Note: The assert call appears in this example, because the code is part of an unit test.

The following sample shows a content-based route that routes all requests containing the URI parameter, one, to the endpoint, mock:one, and all others to mock:other.

So if a client sends the HTTP request, http://serverUri?one=hello, the Jetty component will copy the HTTP request parameter, one to the exchange’s in.header. We can then use the simple language to route exchanges that contain this header to a specific endpoint and all others to another. If we used a language more powerful than Simple (such as OGNL) we could also test for the parameter value and do routing based on the header value as well.

164.7. SESSION SUPPORT

The session support option, sessionSupport, can be used to enable a HttpSession object and access the session object while processing the exchange. For example, the following route enables sessions:

The myCode Processor can be instantiated by a Spring bean element:

Where the processor implementation can access the HttpSession as follows:

public void process(Exchange exchange) throws Exception {

164.8. SSL SUPPORT (HTTPS)

Using the JSSE Configuration Utility

As of Camel 2.8, the Jetty component supports SSL/TLS configuration through the Camel JSSE Configuration Utility. This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the Jetty component.

Programmatic configuration of the component

```java
HttpSession session = exchange.getIn(HttpMessage.class).getRequest().getSession();
...
```

```java
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

JettyComponent jettyComponent = getContext().getComponent("jetty", JettyComponent.class);
jettyComponent.setSslContextParameters(scp);
```

Spring DSL based configuration of endpoint

```xml
<camel:sslContextParameters id="sslContextParameters">
    <camel:keyManagers keyPassword="keyPassword">
        <camel:keyStore resource="/users/home/server/keystore.jks" password="keystorePassword"/>
    </camel:keyManagers>
</camel:sslContextParameters>

<to uri="jetty:https://127.0.0.1/mail/?sslContextParameters=#sslContextParameters"/>
```

Configuring Jetty Directly

Jetty provides SSL support out of the box. To enable Jetty to run in SSL mode, simply format the URI with the https:// prefix—for example:

```xml
<from uri="jetty:https://0.0.0.0/myapp/myservice"/>
```

Jetty also needs to know where to load your keystore from and what passwords to use in order to load the correct SSL certificate. Set the following JVM System Properties:
until Camel 2.2

- `jetty.ssl.keystore` specifies the location of the Java keystore file, which contains the Jetty server’s own X.509 certificate in a key entry. A key entry stores the X.509 certificate (effectively, the public key) and also its associated private key.

- `jetty.ssl.password` the store password, which is required to access the keystore file (this is the same password that is supplied to the `keystore` command’s `-storepass` option).

- `jetty.ssl.keypassword` the key password, which is used to access the certificate’s key entry in the keystore (this is the same password that is supplied to the `keystore` command’s `-keypass` option).

from Camel 2.3 onwards

- `org.eclipse.jetty.ssl.keystore` specifies the location of the Java keystore file, which contains the Jetty server’s own X.509 certificate in a key entry. A key entry stores the X.509 certificate (effectively, the public key) and also its associated private key.

- `org.eclipse.jetty.ssl.password` the store password, which is required to access the keystore file (this is the same password that is supplied to the `keystore` command’s `-storepass` option).

- `org.eclipse.jetty.ssl.keypassword` the key password, which is used to access the certificate’s key entry in the keystore (this is the same password that is supplied to the `keystore` command’s `-keypass` option).

For details of how to configure SSL on a Jetty endpoint, read the following documentation at the Jetty Site: [http://docs.codehaus.org/display/JETTY/How+to+configure+SSL](http://docs.codehaus.org/display/JETTY/How+to+configure+SSL)

Some SSL properties aren’t exposed directly by Camel, however Camel does expose the underlying SslSocketConnector, which will allow you to set properties like `needClientAuth` for mutual authentication requiring a client certificate or `wantClientAuth` for mutual authentication where a client doesn’t need a certificate but can have one. There’s a slight difference between the various Camel versions:

**Up to Camel 2.2**

```xml
<bean id="jetty" class="org.apache.camel.component.jetty.JettyHttpComponent">
  <property name="sslSocketConnectors">
    <map>
      <entry key="8043">
        <bean class="org.mortbay.jetty.security.SslSocketConnector">
          <property name="password" value="...">
          <property name="keyPassword" value="...">
          <property name="keystore" value="...">
          <property name="needClientAuth" value="...">
          <property name="truststore" value="...">
          </bean>
        </entry>
      </map>
    </property>
  </bean>
</bean>
```

**Camel 2.3, 2.4**

```xml
<bean id="jetty" class="org.apache.camel.component.jetty.JettyHttpComponent">
  <property name="sslSocketConnectors">
  </property>
</bean>
```
*From Camel 2.5 we switch to use SslSelectChannelConnector*

```xml
<map>
  <entry key="8043">
    <bean class="org.eclipse.jetty.server.ssl.SslSocketConnector">
      <property name="password" value="...">
      </property>
      <property name="keyPassword" value="...">
      </property>
      <property name="keystore" value="...">
      </property>
      <property name="needClientAuth" value="...">
      </property>
      <property name="truststore" value="...">
      </property>
    </bean>
  </entry>
</map>
```

The value you use as keys in the above map is the port you configure Jetty to listen on.

### 164.8.1. Configuring general SSL properties

**Available as of Camel 2.5**

Instead of a per port number specific SSL socket connector (as shown above) you can now configure general properties which applies for all SSL socket connectors (which is not explicit configured as above with the port number as entry).

```xml
<bean id="jetty" class="org.apache.camel.component.jetty.JettyHttpComponent">
  <property name="sslSocketConnectors">
    <map>
      <entry key="8043">
        <bean class="org.eclipse.jetty.server.ssl.SslSelectChannelConnector">
          <property name="password" value="...">
          </property>
          <property name="keyPassword" value="...">
          </property>
          <property name="keystore" value="...">
          </property>
          <property name="needClientAuth" value="...">
          </property>
          <property name="truststore" value="...">
          </property>
        </bean>
      </entry>
    </map>
  </property>
</bean>
```
164.8.2. How to obtain reference to the X509Certificate

Jetty stores a reference to the certificate in the HttpServletRequest which you can access from code as follows:

```java
HttpServletRequest req = exchange.getIn().getBody(HttpServletRequest.class);
X509Certificate cert = (X509Certificate) req.getAttribute("javax.servlet.request.X509Certificate")
```

164.8.3. Configuring general HTTP properties

Available as of Camel 2.5

Instead of a per port number specific HTTP socket connector (as shown above) you can now configure general properties which applies for all HTTP socket connectors (which is not explicit configured as above with the port number as entry).

```xml
<bean id="jetty" class="org.apache.camel.component.jetty.JettyHttpComponent">
  <property name="socketConnectorProperties">
    <map>
      <entry key="acceptors" value="4"/>
      <entry key="maxIdleTime" value="300000"/>
    </map>
  </property>
</bean>
```

164.8.4. Obtaining X-Forwarded-For header with HttpServletRequest.getRemoteAddr()

If the HTTP requests are handled by an Apache server and forwarded to jetty with mod_proxy, the original client IP address is in the X-Forwarded-For header and the HttpServletRequest.getRemoteAddr() will return the address of the Apache proxy.

Jetty has a forwarded property which takes the value from X-Forwarded-For and places it in the HttpServletRequest remoteAddr property. This property is not available directly through the endpoint configuration but it can be easily added using the socketConnectors property:

```xml
<bean id="jetty" class="org.apache.camel.component.jetty.JettyHttpComponent">
  <property name="socketConnectors">
    <map>
      <entry key="8080">
        <bean class="org.eclipse.jetty.server.nio.SelectChannelConnector">
          <property name="forwarded" value="true"/>
        </bean>
      </entry>
    </map>
  </property>
</bean>
```

This is particularly useful when an existing Apache server handles TLS connections for a domain and proxies them to application servers internally.

164.9. DEFAULT BEHAVIOR FOR RETURNING HTTP STATUS CODES
The default behavior of HTTP status codes is defined by the `org.apache.camel.component.http.DefaultHttpBinding` class, which handles how a response is written and also sets the HTTP status code.

If the exchange was processed successfully, the 200 HTTP status code is returned. If the exchange failed with an exception, the 500 HTTP status code is returned, and the stacktrace is returned in the body. If you want to specify which HTTP status code to return, set the code in the `Exchange.HTTP_RESPONSE_CODE` header of the OUT message.

### 164.10. CUSTOMIZING HTTPBINDING

By default, Camel uses the `org.apache.camel.component.http.DefaultHttpBinding` to handle how a response is written. If you like, you can customize this behavior either by implementing your own `HttpBinding` class or by extending `DefaultHttpBinding` and overriding the appropriate methods.

The following example shows how to customize the `DefaultHttpBinding` in order to change how exceptions are returned:

We can then create an instance of our binding and register it in the Spring registry as follows:

```xml
<bean id="mybinding" class="com.mycompany.MyHttpBinding"/>
```

And then we can reference this binding when we define the route:

```xml
<route>
  <from uri="jetty:http://0.0.0.0:8080/myapp/myservice?httpBindingRef=mybinding"/>
  <to uri="bean:doSomething"/>
</route>
```

### 164.11. JETTY HANDLERS AND SECURITY CONFIGURATION

You can configure a list of Jetty handlers on the endpoint, which can be useful for enabling advanced Jetty security features. These handlers are configured in Spring XML as follows:

```xml
<bean id="userRealm" class="org.mortbay.jetty.plus.jaas.JAASUserRealm">
  <property name="name" value="tracker-users"/>
  <property name="loginModuleName" value="ldaploginmodule"/>
</bean>

<bean id="constraint" class="org.mortbay.jetty.security.Constraint">
  <property name="name" value="BASIC"/>
  <property name="roles" value="tracker-users"/>
  <property name="authenticate" value="true"/>
</bean>

<bean id="constraintMapping" class="org.mortbay.jetty.security.ConstraintMapping">
  <property name="constraint" ref="constraint"/>
  <property name="pathSpec" value="/"/>
</bean>

<bean id="securityHandler" class="org.mortbay.jetty.security.SecurityHandler">
  <property name="userRealm" ref="userRealm"/>
  <property name="constraintMappings" ref="constraintMapping"/>
</bean>
```
And from Camel 2.3 onwards you can configure a list of Jetty handlers as follows:

```xml
<-- Jetty Security handling -->
<bean id="constraint" class="org.eclipse.jetty.http.security.Constraint">
  <property name="name" value="BASIC"/>
  <property name="roles" value="tracker-users"/>
  <property name="authenticate" value="true"/>
</bean>

<bean id="constraintMapping" class="org.eclipse.jetty.security.ConstraintMapping">
  <property name="constraint" ref="constraint"/>
  <property name="pathSpec" value="/"/>
</bean>

<bean id="securityHandler" class="org.eclipse.jetty.security.ConstraintSecurityHandler">
  <property name="authenticator">
    <bean class="org.eclipse.jetty.security.authentication.BasicAuthenticator"/>
  </property>
  <property name="constraintMappings">
    <list>
      <ref bean="constraintMapping"/>
    </list>
  </property>
</bean>
```

You can then define the endpoint as:

```xml
from("jetty:http://0.0.0.0:9080/myservice?handlers=securityHandler")
```

If you need more handlers, set the `handlers` option equal to a comma-separated list of bean IDs.

### 164.12. HOW TO RETURN A CUSTOM HTTP 500 REPLY MESSAGE

You may want to return a custom reply message when something goes wrong, instead of the default reply message Camel Jetty replies with. You could use a custom `HttpBinding` to be in control of the message mapping, but often it may be easier to use Camel's Exception Clause to construct the custom reply message. For example as show here, where we return `Dude something went wrong` with HTTP error code 500:

### 164.13. MULTI-PART FORM SUPPORT

From Camel 2.3.0, camel-jetty support to multipart form post out of box. The submitted form-data are mapped into the message header. Camel-jetty creates an attachment for each uploaded file. The file name is mapped to the name of the attachment. The content type is set as the content type of the attachment file name. You can find the example here.

Note: `getName()` functions as shown below in versions 2.5 and higher. In earlier versions you receive the temporary file name for the attachment instead.

### 164.14. JETTY JMX SUPPORT

From Camel 2.3.0, camel-jetty supports the enabling of Jetty's JMX capabilities at the component and endpoint level with the endpoint configuration taking priority. Note that JMX must be enabled within the Camel context in order to enable JMX support in this component as the component provides Jetty with
a reference to the MBeanServer registered with the Camel context. Because the camel-jetty component caches and reuses Jetty resources for a given protocol/host/port pairing, this configuration option will only be evaluated during the creation of the first endpoint to use a protocol/host/port pairing. For example, given two routes created from the following XML fragments, JMX support would remain enabled for all endpoints listening on "https://0.0.0.0".

```
<from uri="jetty:https://0.0.0.0/myapp/myservice1/?enableJmx=true"/>
```

```
<from uri="jetty:https://0.0.0.0/myapp/myservice2/?enableJmx=false"/>
```

The camel-jetty component also provides for direct configuration of the Jetty MBeanContainer. Jetty creates MBean names dynamically. If you are running another instance of Jetty outside of the Camel context and sharing the same MBeanServer between the instances, you can provide both instances with a reference to the same MBeanContainer in order to avoid name collisions when registering Jetty MBeans.

CHAPTER 165. JGROUPS COMPONENT

Available as of Camel version 2.13

JGroups is a toolkit for reliable multicast communication. The `jgroups:` component provides exchange of messages between Camel infrastructure and JGroups clusters.

Maven users will need to add the following dependency to their `pom.xml` for this component.

```xml
<dependency>
  <groupId>org.apache-extras.camel-extra</groupId>
  <artifactId>camel-jgroups</artifactId>
  <!-- use the same version as your Camel core version -->
  <version>x.y.z</version>
</dependency>
```

Starting from the Camel 2.13.0, JGroups component has been moved from Camel Extra under the umbrella of the Apache Camel. If you are using Camel 2.13.0 or higher, please use the following POM entry instead.

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jgroups</artifactId>
  <!-- use the same version as your Camel core version -->
  <version>x.y.z</version>
</dependency>
```

165.1. URI FORMAT

`jgroups:clusterName[?options]`

Where `clusterName` represents the name of the JGroups cluster the component should connect to.

165.2. OPTIONS

The JGroups component supports 4 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel (common)</td>
<td>Channel to use</td>
<td></td>
<td>JChannel</td>
</tr>
<tr>
<td>channelProperties (common)</td>
<td>Specifies configuration properties of the JChannel used by the endpoint.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>enableViewMessages (consumer)</td>
<td>If set to true, the consumer endpoint will receive org.jgroups.View messages as well (not only org.jgroups.Message instances). By default only regular messages are consumed by the endpoint.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
### resolveProperty Placeholders (advanced)

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

Default: `true`  
Type: `boolean`

---

The JGroups endpoint is configured using URI syntax:

```
jgroups:clusterName
```

with the following path and query parameters:

#### 165.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>clusterName</td>
<td>Required The name of the JGroups cluster the component should connect to.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

#### 165.2.2. Query Parameters (6 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>channelProperties (common)</td>
<td>Specifies configuration properties of the JChannel used by the endpoint.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler (consumer)</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>enableViewMessages (consumer)</td>
<td>If set to true, the consumer endpoint will receive org.jgroups.View messages as well (not only org.jgroups.Message instances). By default only regular messages are consumed by the endpoint.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>---------------</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 165.3. HEADERS

<table>
<thead>
<tr>
<th>Header</th>
<th>Constant</th>
<th>Since version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JGROUPOPS_ORIGINAL_MESSAGE</td>
<td>JGroupsEndpoint.HEADER_JGROUPS_ORIGINAL_MESSAGE</td>
<td>2.13.0</td>
<td>The original <code>org.jgroups.Message</code> instance from which the body of the consumed message has been extracted.</td>
</tr>
<tr>
<td>JGROUPOPS_SRC</td>
<td><code>JGroupsEndpoint.</code>HEADER_JGROUPS_SRC</td>
<td>2.10.0</td>
<td><strong>Consumer</strong>: The <code>org.jgroups.Address</code> instance extracted by <code>org.jgroups.Message</code>.getSrc() method of the consumed message. <strong>Producer</strong>: The custom source <code>org.jgroups.Address</code> of the message to be sent.</td>
</tr>
<tr>
<td>JGROUPOPS_DEST</td>
<td><code>JGroupsEndpoint.</code>HEADER_JGROUPS_DEST</td>
<td>2.10.0</td>
<td><strong>Consumer</strong>: The <code>org.jgroups.Address</code> instance extracted by <code>org.jgroups.Message</code>.getDest() method of the consumed message. <strong>Producer</strong>: The custom destination <code>org.jgroups.Address</code> of the message to be sent.</td>
</tr>
</tbody>
</table>
# Usage

Using **jgroups** component on the consumer side of the route will capture messages received by the **JChannel** associated with the endpoint and forward them to the Camel route. JGroups consumer processes incoming messages **asynchronously**.

```java
// Capture messages from cluster named
// 'clusterName' and send them to Camel route.
from("jgroups:clusterName").to("seda:queue");
```

Using **jgroups** component on the producer side of the route will forward body of the Camel exchanges to the **JChannel** instance managed by the endpoint.

```java
// Send message to the cluster named 'clusterName'
from("direct:start").to("jgroups:clusterName");
```

## 165.4. PREDEFINED FILTERS

Starting from version **2.13.0** of Camel, JGroups component comes with predefined filters factory class named **JGroupsFilters**.

If you would like to consume only view changes notifications sent to coordinator of the cluster (and ignore these sent to the "slave" nodes), use the **JGroupsFilters.dropNonCoordinatorViews()** filter. This filter is particularly useful when you want a single Camel node to become the master in the cluster, because messages passing this filter notifies you when given node has become a coordinator of the cluster. The snippet below demonstrates how to collect only messages received by the master node.

```java
import static org.apache.camel.component.jgroups.JGroupsFilters.dropNonCoordinatorViews;
...
from("jgroups:clusterName?enableViewMessages=true").
    filter(dropNonCoordinatorViews()).
    to("seda:masterNodeEventsQueue");
```

## 165.5. PREDEFINED EXPRESSIONS

Starting from version **2.13.0** of Camel, JGroups component comes with predefined expressions factory class named **JGroupsExpressions**.
If you would like to create a delay that would affect the route only if the Camel context has not been started yet, use the `JGroupsExpressions.delayIfContextNotStarted(long delay)` factory method. The expression created by this factory method will return the given delay value only if the Camel context is in the state different than `started`. This expression is particularly useful if you would like to use JGroups component for keeping the singleton (master) route within the cluster. The `Control Bus start` command won’t initialize the singleton route if the Camel Context hasn’t been yet started. So you need to delay a startup of the master route, to be sure that it has been initialized after the Camel Context startup. Because such scenario can happen only during the initialization of the cluster, we don’t want to delay startup of the slave node becoming the new master – that’s why we need a conditional delay expression.

The snippet below demonstrates how to use conditional delaying with the JGroups component to delay the initial startup of the master node in the cluster.

```java
import static java.util.concurrent.TimeUnit.SECONDS;
import static org.apache.camel.component.jgroups.JGroupsExpressions.delayIfContextNotStarted;
import static org.apache.camel.component.jgroups.JGroupsFilters.dropNonCoordinatorViews;
...
from("jgroups:clusterName?enableViewMessages=true").filter(dropNonCoordinatorViews()).
threads().delay(delayIfContextNotStarted(SECONDS.toMillis(5))).
// run in separated and delayed thread. Delay only if the context hasn't been started already.
to("controlbus:route?routeId=masterRoute&action=start&async=true");
from("timer://master?repeatCount=1").routeId("masterRoute").autoStartup(false).to(masterMockUri);
```

### 165.6. EXAMPLES

#### 165.6.1. Sending (receiving) messages to (from) the JGroups cluster

In order to send message to the JGroups cluster use producer endpoint, just as demonstrated on the snippet below.

```java
from("direct:start").to("jgroups:myCluster");
...
producerTemplate.sendBody("direct:start", "msg")
```

To receive the message from the snippet above (on the same or the other physical machine) listen on the messages coming from the given cluster, just as demonstrated on the code fragment below.

```java
mockEndpoint.setExpectedMessageCount(1);
mockEndpoint.message(0).body().isEqualTo("msg");
...
from("jgroups:myCluster").to("mock:messagesFromTheCluster");
...
mockEndpoint.assertIsSatisfied();
```

#### 165.6.2. Receive cluster view change notifications

The snippet below demonstrates how to create the consumer endpoint listening to the notifications regarding cluster membership changes. By default only regular messages are consumed by the endpoint.

```java
mockEndpoint.setExpectedMessageCount(1);
```
mockEndpoint.message(0).body().isInstanceOf(org.jgroups.View.class);
...
from("jgroups:clusterName?enableViewMessages=true").to(mockEndpoint);
...
mockEndpoint.assertIsSatisfied();

165.6.3. Keeping singleton route within the cluster

The snippet below demonstrates how to keep the singleton consumer route in the cluster of Camel Contexts. As soon as the master node dies, one of the slaves will be elected as a new master and started. In this particular example we want to keep singleton jetty instance listening for the requests on address `http://localhost:8080/orders`.

```java
import static java.util.concurrent.TimeUnit.SECONDS;
import static org.apache.camel.component.jgroups.JGroupsExpressions.delayIfContextNotStarted;
import static org.apache.camel.component.jgroups.JGroupsFilters.dropNonCoordinatorViews;
...
from("jgroups:clusterName?enableViewMessages=true").
  filter(dropNonCoordinatorViews()).
  threads().delay(delayIfContextNotStarted(SECONDS.toMillis(5))). // run in separated and delayed thread. Delay only if the context hasn't been started already.
  to("controlbus:route?routeId=masterRoute&action=start&async=true");
from("jetty:http://localhost:8080/orders").routeId("masterRoute").autoStartup(false).to("jms:orders");
```
CHAPTER 166. JIBX DATAFORMAT

Available as of Camel version 2.6

JiBX is a Data Format which uses the JiBX library to marshal and unmarshal Java objects to and from XML.

```java
// lets turn Object messages into XML then send to MQSeries
from("activemq:My.Queue").marshal().jibx().to("mqseries:Another.Queue");
```

Please note that marshaling process can recognize the message type at the runtime. However while unmarshaling message from XML we need to specify target class explicitly.

```java
// lets turn XML into PurchaseOrder message
from("mqseries:Another.Queue").unmarshal().jibx(PurchaseOrder.class).to("activemq:My.Queue");
```

166.1. OPTIONS

The JiBX dataformat supports 3 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Java Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unmarshallClass</td>
<td>String</td>
<td></td>
<td>Class name to use when unmarshalling from XML to Java.</td>
</tr>
<tr>
<td>bindingName</td>
<td>String</td>
<td></td>
<td>To use a custom binding factory</td>
</tr>
<tr>
<td>contentTypeHeader</td>
<td>false</td>
<td>Boolean</td>
<td>Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc.</td>
</tr>
</tbody>
</table>

166.2. JIBX SPRING DSL

JiBX data format is also supported by Camel Spring DSL.

```xml
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">

<!-- Define data formats -->
<dataFormats>
   <jibx id="jibx" unmarshallClass="org.apache.camel.dataformat.jibx.PurchaseOrder"/>
</dataFormats>

<!-- Marshal message to XML -->
<route>
   <from uri="direct:marshal"/>
</route>
</camelContext>
```
166.3. DEPENDENCIES

To use JiBX in your camel routes you need to add the a dependency on camel-jibx which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jibx</artifactId>
  <version>2.6.0</version>
</dependency>
```
CHAPTER 167. JING COMPONENT

Available as of Camel version 1.1

The Jing component uses the Jing Library to perform XML validation of the message body using either

- RelaxNG XML Syntax
- RelaxNG Compact Syntax

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jing</artifactId>
  <version>x.x.x</version>
</dependency>
```

Note that the MSV component can also support RelaxNG XML syntax.

167.1. URI FORMAT CAMEL 2.16

```
jing:someLocalOrRemoteResource
```

From Camel 2.16 the component use jing as name, and you can use the option compactSyntax to turn on either RNG or RNC mode.

167.2. OPTIONS

The Jing component has no options.

The Jing endpoint is configured using URI syntax:

```
jing:resourceUri
```

with the following path and query parameters:

167.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceUri</td>
<td>Required URL to a local resource on the classpath or a full URL to a remote resource or resource on the file system which contains the schema to validate against.</td>
<td></td>
<td>String</td>
</tr>
</tbody>
</table>

167.2.2. Query Parameters (2 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>compactSyntax (producer)</td>
<td>Whether to validate using RelaxNG compact syntax or not. By default this is false for using RelaxNG XML Syntax (rng) And true is for using RelaxNG Compact Syntax (rnc)</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>synchronous (advanced)</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

### 167.3. EXAMPLE

The following example shows how to configure a route from the endpoint `direct:start` which then goes to one of two endpoints, either `mock:valid` or `mock:invalid` based on whether or not the XML matches the given RelaxNG Compact Syntax schema (which is supplied on the classpath).

### 167.4. SEE ALSO

- Configuring Camel
- Component
- Endpoint
- Getting Started
CHAPTER 168. JIRA COMPONENT

Available as of Camel version 2.15

The JIRA component interacts with the JIRA API by encapsulating Atlassian’s REST Java Client for JIRA. It currently provides polling for new issues and new comments. It is also able to create new issues.

Rather than webhooks, this endpoint relies on simple polling. Reasons include:

- Concern for reliability/stability
- The types of payloads we’re polling aren’t typically large (plus, paging is available in the API)
- The need to support apps running somewhere not publicly accessible where a webhook would fail

Note that the JIRA API is fairly expansive. Therefore, this component could be easily expanded to provide additional interactions.

Maven users will need to add the following dependency to their pom.xml for this component:

```xml
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-jira</artifactId>
  <version>${camel-version}</version>
</dependency>
```

168.1. URI FORMAT

```
jira://endpoint[?options]
```

168.2. JIRA OPTIONS

The JIRA component has no options.

The JIRA endpoint is configured using URI syntax:

```
jira:type
```

with the following path and query parameters:

168.2.1. Path Parameters (1 parameters):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Required Operation to perform such as create a new issue or a new comment</td>
<td></td>
<td>JIRAType</td>
</tr>
</tbody>
</table>

168.2.2. Query Parameters (9 parameters):
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>Password for login</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>serverUrl</td>
<td>Required URL to the JIRA server</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>username</td>
<td>Username for login</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>bridgeErrorHandler</td>
<td>Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>delay</td>
<td>Delay in seconds when querying JIRA using the consumer.</td>
<td>6000</td>
<td>int</td>
</tr>
<tr>
<td>jql</td>
<td>JQL is the query language from JIRA which allows you to retrieve the data you want. For example jql=project=MyProject Where MyProject is the product key in Jira.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>exceptionHandler</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>

**168.3. JQL:**

The JQL URI option is used by both consumer endpoints. Theoretically, items like "project key", etc. could be URI options themselves. However, by requiring the use of JQL, the consumers become much more flexible and powerful.

At the bare minimum, the consumers will require the following:
One important thing to note is that the newIssue consumer will automatically append "ORDER BY key desc" to your JQL. This is in order to optimize startup processing, rather than having to index every single issue in the project.

Another note is that, similarly, the newComment consumer will have to index every single issue and comment in the project. Therefore, for large projects, it's vital to optimize the JQL expression as much as possible. For example, the JIRA Toolkit Plugin includes a "Number of comments" custom field – use "Number of comments" > 0 in your query. Also try to minimize based on state (status=Open), increase the polling delay, etc. Example:

```javascript
jira://[endpoint]?[required options]&jql=project=[project key]
```

```javascript
jira://[endpoint]?[required options]&jql=RAW(project=[project key] AND status in (Open, "Coding In Progress") AND "Number of comments">0)"
```
CHAPTER 169. JMS COMPONENT

169.1. JMS COMPONENT

TIP

Using ActiveMQ

If you are using Apache ActiveMQ, you should prefer the ActiveMQ component as it has been optimized for ActiveMQ. All of the options and samples on this page are also valid for the ActiveMQ component.

NOTE

Transacted and caching

See section Transactions and Cache Levels below if you are using transactions with JMS as it can impact performance.

NOTE

Request/Reply over JMS

Make sure to read the section Request-reply over JMS further below on this page for important notes about request/reply, as Camel offers a number of options to configure for performance, and clustered environments.

This component allows messages to be sent to (or consumed from) a JMS Queue or Topic. It uses Spring’s JMS support for declarative transactions, including Spring’s JmsTemplate for sending and a MessageListenerContainer for consuming.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-jms</artifactId>
    <version>x.x.x</version>
    <!-- use the same version as your Camel core version -->
</dependency>
```

169.2. URI FORMAT

```
jms:[queue:|topic:]destinationName[?options]
```

Where `destinationName` is a JMS queue or topic name. By default, the `destinationName` is interpreted as a queue name. For example, to connect to the queue, FOO.BAR use:

```
jms:FOO.BAR
```

You can include the optional `queue:` prefix, if you prefer:

```
jms:queue:FOO.BAR
```
To connect to a topic, you must include the **topic:** prefix. For example, to connect to the topic, `Stocks.Prices`, use:

```
jms:topic:Stocks.Prices
```

You append query options to the URI using the following format, `?option=value&option=value&...`

### 169.3. NOTES

#### 169.3.1. Using ActiveMQ

The JMS component reuses Spring 2’s **JmsTemplate** for sending messages. This is not ideal for use in a non-J2EE container and typically requires some caching in the JMS provider to avoid **poor performance**.

If you intend to use **Apache ActiveMQ** as your Message Broker - which is a good choice as ActiveMQ rocks, then we recommend that you either:

- Use the ActiveMQ component, which is already optimized to use ActiveMQ efficiently
- Use the **PoolingConnectionFactory** in ActiveMQ.

#### 169.3.2. Transactions and Cache Levels

If you are consuming messages and using transactions (**transacted=true**) then the default settings for cache level can impact performance.

If you are using XA transactions then you cannot cache as it can cause the XA transaction to not work properly.

If you are **not** using XA, then you should consider caching as it speeds up performance, such as setting `cacheLevelName=CACHE_CONSUMER`.

Through Camel 2.7.x, the default setting for `cacheLevelName` is **CACHE_CONSUMER**. You will need to explicitly set `cacheLevelName=CACHE_NONE`.

In Camel 2.8 onwards, the default setting for `cacheLevelName` is **CACHE_AUTO**. This default auto detects the mode and sets the cache level accordingly to:

- **CACHE_CONSUMER** if `transacted=false`
- **CACHE_NONE** if `transacted=true`

So you can say the default setting is conservative. Consider using `cacheLevelName=CACHE_CONSUMER` if you are using non-XA transactions.

#### 169.3.3. Durable Subscriptions

If you wish to use durable topic subscriptions, you need to specify both `clientId` and `durableSubscriptionName`. The value of the `clientId` must be unique and can only be used by a single JMS connection instance in your entire network. You may prefer to use **Virtual Topics** instead to avoid this limitation. More background on durable messaging [here](#).

#### 169.3.4. Message Header Mapping
When using message headers, the JMS specification states that header names must be valid Java identifiers. So try to name your headers to be valid Java identifiers. One benefit of doing this is that you can then use your headers inside a JMS Selector (whose SQL92 syntax mandates Java identifier syntax for headers).

A simple strategy for mapping header names is used by default. The strategy is to replace any dots and hyphens in the header name as shown below and to reverse the replacement when the header name is restored from a JMS message sent over the wire. What does this mean? No more losing method names to invoke on a bean component, no more losing the filename header for the File Component, and so on.

The current header name strategy for accepting header names in Camel is as follows:

- Dots are replaced by `DOT` and the replacement is reversed when Camel consume the message
- Hyphen is replaced by `HYPHEN` and the replacement is reversed when Camel consumes the message

### 169.4. OPTIONS

You can configure many different properties on the JMS endpoint which map to properties on the JMSConfiguration POJO.

**WARNING**

**Mapping to Spring JMS**

Many of these properties map to properties on Spring JMS, which Camel uses for sending and receiving messages. So you can get more information about these properties by consulting the relevant Spring documentation.

### 169.4.1. Component options

The JMS component supports 80 options which are listed below.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>To use a shared JMS configuration</td>
<td></td>
<td>JmsConfiguration</td>
</tr>
<tr>
<td>(advanced)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td><code>acceptMessagesWhileStopping</code> (consumer)</td>
<td>Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>allowReplyManagerQuickStop</code> (consumer)</td>
<td>Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration.isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>acknowledgmentMode</code> (consumer)</td>
<td>The JMS acknowledgement mode defined as an Integer. Allows you to set vendor-specific extensions to the acknowledgement mode. For the regular modes, it is preferable to use the acknowledgementModeName instead.</td>
<td>true</td>
<td>int</td>
</tr>
<tr>
<td><code>eagerLoadingOfProperties</code> (consumer)</td>
<td>Enables eager loading of JMS properties as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>acknowledgmentModeName</code> (consumer)</td>
<td>The JMS acknowledgement name, which is one of: SESSION_TRANSACTED, CLIENT_ACKNOWLEDGE, AUTO_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE</td>
<td>AUTO_ACKNOWLEDGE</td>
<td>String</td>
</tr>
<tr>
<td><code>autoStartup</code> (consumer)</td>
<td>Specifies whether the consumer container should auto-startup.</td>
<td>true</td>
<td>boolean</td>

<td></td>
<td>MessageConverter</td>
</tr>
<tr>
<td>mapJmsMessage (advanced)</td>
<td>Specifies whether Camel should auto map the received JMS message to a suited payload type, such as javax.jms.TextMessage to a String etc. See section about how mapping works below for more details.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>messageIdEnabled (advanced)</td>
<td>When sending, specifies whether message IDs should be added. This is just an hint to the JMS Broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>messageTimestampEnabled (advanced)</td>
<td>Specifies whether timestamps should be enabled by default on sending messages.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>alwaysCopyMessage (producer)</td>
<td>If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set)</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useMessageIDAsCorrelationID (advanced)</td>
<td>Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>priority (producer)</td>
<td>Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The explicitQosEnabled option must also be enabled in order for this option to have any effect.</td>
<td>4</td>
<td>int</td>
</tr>
<tr>
<td>pubSubNoLocal (advanced)</td>
<td>Specifies whether to inhibit the delivery of messages published by its own connection.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>receiveTimeout (advanced)</td>
<td>The timeout for receiving messages (in milliseconds).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>recoveryInterval (advanced)</td>

<td>long</td>
</tr>
<tr>
<td>transacted (transaction)</td>
<td>Specifies whether to use transacted mode</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>lazyCreateTransactionManager (transaction)</td>
<td>If true, Camel will create a JmsTransactionManager, if there is no transactionManager injected when option transacted=true.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>transactionManager (transaction)</td>
<td>The Spring transaction manager to use.</td>
<td></td>
<td>PlatformTransactionManager</td>
</tr>
<tr>
<td>transactionName (transaction)</td>
<td>The name of the transaction to use.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>transactionTimeout (transaction)</td>
<td>The timeout value of the transaction (in seconds), if using transacted mode.</td>
<td>-1</td>
<td>int</td>
</tr>
<tr>
<td>testConnectionOn Startup (common)</td>
<td>Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>asyncStartListener (advanced)</td>
<td>Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>asyncStopListener (advanced)</td>
<td>Whether to stop the JmsConsumer message listener asynchronously, when stopping a route.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>forceSendOriginal Message (producer)</td>
<td>When using mapJmsMessage=false Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>requestTimeout (producer)</td>
<td>The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header CamelJmsRequestTimeout to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the requestTimeoutCheckerInterval option.</td>
<td>20000</td>
<td>long</td>
</tr>
<tr>
<td>requestTimeoutChecker Interval (advanced)</td>
<td>Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td>transferExchange (advanced)</td>
<td>You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferException (advanced)</td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>transferFault</td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on link org.apache.camel.Message.isFault() will be send back in the response as a JMS header with the key link JmsConstants.JMS_TRANSFER_FAULT. If the client is Camel, the returned fault flag will be set on the link org.apache.camel.Message.setFault(boolean). You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>jmsOperations</td>
<td>Allows you to use your own implementation of the org.springframework.jms.core.JmsOperations interface. Camel uses JmsTemplate as default. Can be used for testing purpose, but not used much as stated in the spring API docs.</td>
<td>JmsOperations</td>
<td></td>
</tr>
<tr>
<td>destinationResolver</td>
<td>A pluggable org.springframework.jms.support.destination.DestinationResolver that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry).</td>
<td>DestinationResolver</td>
<td></td>
</tr>
<tr>
<td>replyToType</td>
<td>Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive.</td>
<td>ReplyToType</td>
<td></td>
</tr>
<tr>
<td>preserveMessageQos</td>
<td>Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>asyncConsumer</strong> (consumer)</td>
<td>Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions).</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>allowNullBody</strong> (producer)</td>
<td>Whether to allow sending messages with no body. If this option is false and the message body is null, then a JMSException is thrown.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>includeSentJMS MessageID</strong> (producer)</td>
<td>Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>includeAllJMSX Properties</strong> (advanced)</td>
<td>Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><strong>defaultTaskExecutor Type</strong> (consumer)</td>
<td>Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring’s SimpleAsyncTaskExecutor) or ThreadPool (uses Spring’s ThreadPoolTaskExecutor with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.</td>
<td>Defaults</td>
<td>TaskExecutor Type</td>
</tr>
<tr>
<td>Name</td>

<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>jmsKeyFormatStrategy (advanced)</td>
<td>Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens ( . and - ). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the org.apache.camel.component.jms.JmsKeyFormatStrategy and refer to it using the notation.</td>
<td></td>
<td>JmsKeyFormatStrategy</td>
</tr>
<tr>
<td>allowAdditionalHeaders (producer)</td>
<td>This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>queueBrowseStrategy (advanced)</td>
<td>To use a custom QueueBrowseStrategy when browsing queues</td>
<td></td>
<td>QueueBrowseStrategy</td>
</tr>
<tr>
<td>messageCreatedStrategy (advanced)</td>
<td>To use the given MessageCreatedStrategy which are invoked when Camel creates new instances of javax.jms.Message objects when Camel is sending a JMS message.</td>
<td></td>
<td>MessageCreatedStrategy</td>
</tr>
<tr>
<td>waitForProvisionCorrelationToBeUpdatedCounter (advanced)</td>
<td>Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled.</td>
<td>50</td>
<td>int</td>
</tr>
<tr>
<td>waitForProvisionCorrelationToBeUpdatedThreadSleepingTime (advanced)</td>
<td>Interval in millis to sleep each time while waiting for provisional correlation id to be updated.</td>
<td>100</td>
<td>long</td>
</tr>
<tr>
<td>correlationProperty (producer)</td>
<td>Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of JMSCorrelationID property. This allows you to exchange messages with systems that do not correlate messages using JMSCorrelationID JMS property. If used JMSCorrelationID will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name.</td>
<td></td>
<td>String</td>
</tr>

</tr>
<tr>
<td>subscriptionDurable (consumer)</td>
<td>Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>subscriptionShared (consumer)</td>
<td>Set whether to make the subscription shared. The shared subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a shared subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with subscriptionDurable as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. Requires a JMS 2.0 compatible message broker.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>subscriptionName (consumer)</td>
<td>Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client’s JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0).</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>streamMessageType Enabled (producer)</td>
<td>Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either by sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>formatDateHeadersTo Iso8601 (producer)</td>
<td>Sets whether date headers should be formatted according to the ISO 8601 standard.</td>
<td>false</td>
<td>boolean</td>
</tr>
</tbody>
</table>
To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message.

Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders.

The JMS endpoint is configured using URI syntax:

```
jms:destinationType:destinationName
```

with the following path and query parameters:

</tr>
<tr>
<td><code>maxConcurrentConsumers</code> (consumer)</td>
<td>Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the maxMessagesPerTask option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option replyToMaxConcurrentConsumers is used to control number of concurrent consumers on the reply message listener.</td>
<td></td>
<td>int</td>
</tr>
<tr>
<td><code>replyTo</code> (consumer)</td>
<td>Provides an explicit ReplyTo destination, which overrides any incoming value of Message.getJMSReplyTo().</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>replyToPersistent</code> (consumer)</td>
<td>Specifies whether to use persistent delivery by default for replies.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>selector</code> (consumer)</td>
<td>Sets the JMS selector to use</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>subscriptionDurable</code> (consumer)</td>
<td>Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------</td>
</tr>
<tr>
<td>subscriptionName</td>
<td>Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client’s JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0).</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>subscriptionShared</td>
<td>Set whether to make the subscription shared. The shared subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a shared subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with subscriptionDurable as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. Requires a JMS 2.0 compatible message broker.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>acceptMessagesWhileStopping</td>
<td>Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>allowReplyManagerQuickStop</td>
<td>Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the link DefaultMessageListenerContainer.runningAllowed() flag to quick stop in case link JmsConfiguration.isAcceptMessagesWhileStopping() is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>consumerType (consumer)</td>
<td>The consumer type to use, which can be one of: Simple, Default, or Custom. The consumer type determines which Spring JMS listener to use. Default will use org.springframework.jms.listener.DefaultMessageListenerContainer, Simple will use org.springframework.jms.listener.SimpleMessageListenerContainer. When Custom is specified, the MessageListenerContainerFactory defined by the messageListenerContainerFactory option will determine what org.springframework.jms.listener.AbstractMessageListenerContainer to use.</td>
<td>Default</td>
<td>ConsumerType</td>
</tr>
<tr>
<td>defaultTaskExecutorType (consumer)</td>
<td>Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring’s SimpleAsyncTaskExecutor) or ThreadPool (uses Spring’s ThreadPoolTaskExecutor with optimal values – cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers.</td>
<td></td>
<td>DefaultTaskExecutorType</td>
</tr>
<tr>
<td>eagerLoadingOfProperties (consumer)</td>
<td>Enables eager loading of JMS properties and payload as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>exceptionHandler (consumer)</td>
<td>To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored.</td>
<td></td>
<td>ExceptionHandler</td>
</tr>
<tr>
<td>exchangePattern (consumer)</td>
<td>Sets the exchange pattern when the consumer creates an exchange.</td>
<td></td>
<td>ExchangePattern</td>
</tr>
<tr>
<td>exposeListenerSession (consumer)</td>
<td>Specifies whether the listener session should be exposed when consuming messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>----------------</td>
</tr>
<tr>
<td>replyToSameDestination Allowed (consumer)</td>
<td>Whether a JMS consumer is allowed to send a reply message to the same destination that the consumer is using to consume from. This prevents an endless loop by consuming and sending back the same message to itself.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>taskExecutor (consumer)</td>
<td>Allows you to specify a custom task executor for consuming messages.</td>
<td></td>
<td>TaskExecutor</td>
</tr>
<tr>
<td>deliveryMode (producer)</td>
<td>Specifies the delivery mode to be used. Possibles values are those defined by javax.jms.DeliveryMode. NON_PERSISTENT = 1 and PERSISTENT = 2.</td>
<td></td>
<td>Integer</td>
</tr>
<tr>
<td>deliveryPersistent (producer)</td>
<td>Specifies whether persistent delivery is used by default.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td>explicitQosEnabled (producer)</td>
<td>Set if the deliveryMode, priority or timeToLive qualities of service should be used when sending messages. This option is based on Spring’s JmsTemplate. The deliveryMode, priority and timeToLive options are applied to the current endpoint. This contrasts with the preserveMessageQos option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers.</td>
<td>false</td>
<td>Boolean</td>
</tr>
<tr>
<td>formatDateHeadersToIso8601 (producer)</td>
<td>Sets whether date headers should be formatted according to the ISO 8601 standard.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>preserveMessageQos (producer)</td>
<td>Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>-----------------</td>
</tr>
<tr>
<td><strong>priority</strong> <em>(producer)</em></td>
<td>Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The explicitQosEnabled option must also be enabled in order for this option to have any effect.</td>
<td>4</td>
<td>int</td>
</tr>
<tr>
<td><strong>replyToConcurrentConsumers</strong> <em>(producer)</em></td>
<td>Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td><strong>replyToMaxConcurrentConsumers</strong> <em>(producer)</em></td>
<td>Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads.</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td><strong>replyToOnTimeoutMaxConcurrentConsumers</strong> <em>(producer)</em></td>
<td>Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td><strong>replyToOverride</strong> <em>(producer)</em></td>
<td>Provides an explicit ReplyTo destination in the JMS message, which overrides the setting of replyTo. It is useful if you want to forward the message to a remote Queue and receive the reply message from the ReplyTo destination.</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td><strong>replyToType</strong> <em>(producer)</em></td>
<td>Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive.</td>
<td>ReplyToType</td>
<td></td>
</tr>
<tr>
<td><strong>requestTimeout</strong> <em>(producer)</em></td>
<td>The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header CamelJmsRequestTimeout to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the requestTimeoutCheckerInterval option.</td>
<td>20000</td>
<td>long</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>

<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td><code>timeToLive</code> (producer)</td>
<td>When sending messages, specifies the time-to-live of the message (in milliseconds).</td>
<td>-1</td>
<td>long</td>
</tr>
<tr>
<td><code>allowAdditionalHeaders</code> (producer)</td>
<td>This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix <code>JMS_IBM_MQMD_</code> containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>allowNullBody</code> (producer)</td>
<td>Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSException is thrown.</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td><code>alwaysCopyMessage</code> (producer)</td>
<td>If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set)</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td><code>correlationProperty</code> (producer)</td>
<td>Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of JMSCorrelationID property. This allows you to exchange messages with systems that do not correlate messages using JMSCorrelationID JMS property. If used JMSCorrelationID will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td><code>disableTimeToLive</code> (producer)</td>
<td>Use this option to force disabling time to live. For example when you do request/reply over JMS, then Camel will by default use the requestTimeout value as time to live on the message being sent. The problem is that the sender and receiver systems have to have their clocks synchronized, so they are in sync. This is not always so easy to archive. So you can use disableTimeToLive=true to not set a time to live value on the sent message. Then the message will not expire on the receiver system. See below in section About time to live for more details.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Default</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------</td>
<td>--------</td>
</tr>
<tr>
<td>forceSendOriginalMessage</td>
<td>When using mapJmsMessage=false Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>includeSentJMSMessageID</td>
<td>Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>replyToCacheLevelName</td>
<td>Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: CACHE_CONSUMER for exclusive or shared w/ replyToSelectorName. And CACHE_SESSION for shared without replyToSelectorName. Some JMS brokers such as IBM WebSphere may require to set the replyToCacheLevelName=CACHE_NONE to work. Note: If using temporary queues then CACHE_NONE is not allowed, and you must use a higher value such as CACHE_CONSUMER or CACHE_SESSION.</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>replyToDestinationSelectorName</td>
<td>Sets the JMS Selector using the fixed name to be used so you can filter out your own replies from the others when using a shared queue (that is, if you are not using a temporary reply queue).</td>
<td></td>
<td>String</td>
</tr>
<tr>
<td>streamMessageTypeEnabled</td>
<td>Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>allowSerializedHeaders</td>
<td>Controls whether or not to include serialized headers. Applies only when link isTransferExchange() is true. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>

<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>asyncStartListener (advanced)</td>
<td>Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>asyncStopListener (advanced)</td>
<td>Whether to stop the JmsConsumer message listener asynchronously, when stopping a route.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>destinationResolver (advanced)</td>
<td>A pluggable org.springframework.jms.support.destination.DestinationResolver that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry).</td>
<td></td>
<td>DestinationResolver</td>
</tr>
<tr>
<td>errorHandler (advanced)</td>
<td>Specifies a org.springframework.util.ErrorHandler to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using errorHandlerLoggingLevel and errorHandlerLogStackTrace options. This makes it much easier to configure, than having to code a custom errorHandler.</td>
<td></td>
<td>ErrorHandler</td>
</tr>
<tr>
<td>exceptionListener (advanced)</td>
<td>Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions.</td>
<td></td>
<td>ExceptionListener</td>
</tr>
<tr>
<td>headerFilterStrategy (advanced)</td>
<td>To use a custom HeaderFilterStrategy to filter header to and from Camel message.</td>
<td></td>
<td>HeaderFilterStrategy</td>
</tr>
<tr>
<td>idleConsumerLimit (advanced)</td>
<td>Specify the limit for the number of consumers that are allowed to be idle at any given time.</td>
<td>1</td>
<td>int</td>
</tr>
<tr>
<td>Name</td>

<tr>
<td>messageIdEnabled</td>
<td>When sending, specifies whether message IDs should be added. This is just an hint to the JMS Broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>messageListenerContainerFactory</td>
<td>Registry ID of the MessageListenerContainerFactory used to determine what org.springframework.jms.listener(AbstractMessageListenerContainer to use to consume messages. Setting this will automatically set consumerType to Custom.</td>
<td></td>
<td>MessageListener ContainerFactory</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>messageTimestampEnabled</td>
<td>Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS Broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value</td>
<td>true</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>pubSubNoLocal</td>
<td>Specifies whether to inhibit the delivery of messages published by its own connection.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>receiveTimeout</td>
<td>The timeout for receiving messages (in milliseconds).</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>recoveryInterval</td>
<td>Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds.</td>
<td>5000</td>
<td>long</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>requestTimeoutCheckerInterval</td>
<td>Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout.</td>
<td>1000</td>
<td>long</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>synchronous</td>
<td>Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported).</td>
<td>false</td>
<td>boolean</td>

<td>---------</td>
<td>------</td>
</tr>
<tr>
<td>transferException (advanced)</td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing – for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferExchange (advanced)</td>
<td>You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>transferFault (advanced)</td>
<td>If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on link org.apache.camel.MessageisFault() will be send back in the response as a JMS header with the key link JmsConstants.JMS_TRANSFER_FAULT. If the client is Camel, the returned fault flag will be set on the link org.apache.camel.MessagessetFault(boolean). You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>useMessageIDAsCorrelationID</td>
<td>Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages.</td>
<td>false</td>
<td>boolean</td>
</tr>
<tr>
<td>waitForProviderCounter</td>
<td>Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled.</td>
<td>50</td>
<td>int</td>
</tr>
</tbody>
</table>
### Name | Description | Default | Type
---|---|---|---
**waitForProvision Correlation**
**ThreadSleeping Time** *(advanced)*
 | Interval in millis to sleep each time while waiting for provisional correlation id to be updated. | 100 | long

**errorHandlerLoggingLevel** *(logging)*
 | Allows to configure the default errorHandler logging level for logging uncaught exceptions. | WARN | LoggingLevel

**errorHandlerLogStackTrace** *(logging)*
 | Allows to control whether stacktraces should be logged or not, by the default errorHandler. | true | boolean

**password** *(security)*
 | Password to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory. | | String

**username** *(security)*
 | Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory. | | String

**transacted** *(transaction)*
 | Specifies whether to use transacted mode | false | boolean

**lazyCreateTransactionManager** *(transaction)*
 | If true, Camel will create a JmsTransactionManager, if there is no transactionManager injected when option transacted=true. | true | boolean

**transactionManager** *(transaction)*
 | The Spring transaction manager to use. | PlatformTransactionManager

**transactionName** *(transaction)*
 | The name of the transaction to use. | String

**transactionTimeout** *(transaction)*
 | The timeout value of the transaction (in seconds), if using transacted mode. | -1 | int

### 169.5. MESSAGE MAPPING BETWEEN JMS AND CAMEL

When sending a JMS message, Camel converts the message body to the following JMS message types:
<table>
<thead>
<tr>
<th>Body Type</th>
<th>JMS Message</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>javax.jms.TextMessage</td>
<td></td>
</tr>
<tr>
<td>org.w3c.dom.Node</td>
<td>javax.jms.TextMessage</td>
<td>The DOM will be converted to <strong>String</strong>.</td>
</tr>
<tr>
<td>Map</td>
<td>javax.jms.MapMessage</td>
<td></td>
</tr>
<tr>
<td>java.io.Serializable</td>
<td>javax.jms.ObjectMessage</td>
<td></td>
</tr>
<tr>
<td>byte[]</td>
<td>javax.jms.BytesMessage</td>
<td></td>
</tr>
<tr>
<td>java.io.File</td>
<td>javax.jms.BytesMessage</td>
<td></td>
</tr>
<tr>
<td>java.io.Reader</td>
<td>javax.jms.BytesMessage</td>
<td></td>
</tr>
<tr>
<td>java.io.InputStream</td>
<td>javax.jms.BytesMessage</td>
<td></td>
</tr>
<tr>
<td>java.nio.ByteBuffer</td>
<td>javax.jms.BytesMessage</td>
<td></td>
</tr>
</tbody>
</table>

When receiving a JMS message, Camel converts the JMS message to the following body type:
169.5.1. Disabling auto-mapping of JMS messages

You can use the `mapJmsMessage` option to disable the auto-mapping above. If disabled, Camel will not try to map the received JMS message, but instead uses it directly as the payload. This allows you to avoid the overhead of mapping and let Camel just pass through the JMS message. For instance, it even allows you to route `javax.jms.ObjectMessage` JMS messages with classes you do not have on the classpath.

169.5.2. Using a custom MessageConverter

You can use the `messageConverter` option to do the mapping yourself in a Spring `org.springframework.jms.support.converter.MessageConverter` class.

For example, in the route below we use a custom message converter when sending a message to the JMS order queue:

```java
from("file://inbox/order").to("jms:queue:order?messageConverter=#myMessageConverter");
```

You can also use a custom message converter when consuming from a JMS destination.

169.5.3. Controlling the mapping strategy selected

You can use the `jmsMessageType` option on the endpoint URL to force a specific message type for all messages.

In the route below, we poll files from a folder and send them as `javax.jms.TextMessage` as we have forced the JMS producer endpoint to use text messages:

```java
from("file://inbox/order").to("jms:queue:order?jmsMessageType=Text");
```

You can also specify the message type to use for each message by setting the header with the key `CamelJmsMessageType`. For example:

```java
from("file://inbox/order").setHeader("CamelJmsMessageType", JmsMessageType.Text).to("jms:queue:order");
```

The possible values are defined in the `enum` class, `org.apache.camel.jms.JmsMessageType`.

169.6. MESSAGE FORMAT WHEN SENDING

The exchange that is sent over the JMS wire must conform to the JMS Message spec.
For the `exchange.in.header` the following rules apply for the header keys:

- Keys starting with `JMS` or `JMSX` are reserved.
- `exchange.in.headers` keys must be literals and all be valid Java identifiers (do not use dots in the key name).
- Camel replaces dots & hyphens and the reverse when when consuming JMS messages:
  - . is replaced by `DOT` and the reverse replacement when Camel consumes the message.
  - - is replaced by `HYPHEN` and the reverse replacement when Camel consumes the message.
- See also the option `jmsKeyFormatStrategy`, which allows use of your own custom strategy for formatting keys.

For the `exchange.in.header`, the following rules apply for the header values:

- The values must be primitives or their counter objects (such as `Integer`, `Long`, `Character`). The types, `String`, `CharSequence`, `Date`, `BigDecimal` and `BigInteger` are all converted to their `toString()` representation. All other types are dropped.

Camel will log with category `org.apache.camel.component.jms.JmsBinding` at `DEBUG` level if it drops a given header value. For example:

```
2008-07-09 06:43:04,046 [main           ] DEBUG JmsBinding
   - Ignoring non primitive header: order of class:
     org.apache.camel.component.jms.issues.DummyOrder with value: DummyOrder{orderId=333,
      itemId=4444, quantity=2}
```

### 169.7. MESSAGE FORMAT WHEN RECEIVING

Camel adds the following properties to the `Exchange` when it receives a message:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>org.apache.camel.jms.replyDestination</code></td>
<td><code>javax.jms.Destination</code></td>
<td>The reply destination.</td>
</tr>
</tbody>
</table>

Camel adds the following JMS properties to the In message headers when it receives a JMS message:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>JMSCorrelationID</code></td>
<td><code>String</code></td>
<td>The JMS correlation ID.</td>
</tr>
</tbody>
</table>
As all the above information is standard JMS you can check the JMS documentation for further details.

### 169.8. ABOUT USING CAMEL TO SEND AND RECEIVE MESSAGES AND JMSREPLYTO

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JMSDeliveryMode</td>
<td>int</td>
<td>The JMS delivery mode.</td>
</tr>
<tr>
<td>JMSDestination</td>
<td>javax.jms.Destination</td>
<td>The JMS destination.</td>
</tr>
<tr>
<td>JMSEXpiration</td>
<td>long</td>
<td>The JMS expiration.</td>
</tr>
<tr>
<td>JMSMessageID</td>
<td>String</td>
<td>The JMS unique message ID.</td>
</tr>
<tr>
<td>JMSPriority</td>
<td>int</td>
<td>The JMS priority (with 0 as the lowest priority and 9 as the highest).</td>
</tr>
<tr>
<td>JMSRedelivered</td>
<td>boolean</td>
<td>Is the JMS message redelivered.</td>
</tr>
<tr>
<td>JMSReplyTo</td>
<td>javax.jms.Destination</td>
<td>The JMS reply-to destination.</td>
</tr>
<tr>
<td>JMSTimestamp</td>
<td>long</td>
<td>The JMS timestamp.</td>
</tr>
<tr>
<td>JMSType</td>
<td>String</td>
<td>The JMS type.</td>
</tr>
<tr>
<td>JMSXGroupID</td>
<td>String</td>
<td>The JMS group ID.</td>
</tr>
</tbody>
</table>
The JMS component is complex and you have to pay close attention to how it works in some cases. So this is a short summary of some of the areas/pitfalls to look for.

When Camel sends a message using its `JMSProducer`, it checks the following conditions:

- The message exchange pattern,
- Whether a `JMSReplyTo` was set in the endpoint or in the message headers,
- Whether any of the following options have been set on the JMS endpoint: `disableReplyTo`, `preserveMessageQos`, `explicitQosEnabled`.

All this can be a tad complex to understand and configure to support your use case.

### 169.8.1. JmsProducer

The `JmsProducer` behaves as follows, depending on configuration:

<table>
<thead>
<tr>
<th>Exchange Pattern</th>
<th>Other options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>InOut</code></td>
<td>-</td>
<td>Camel will expect a reply, set a temporary <code>JMSReplyTo</code>, and after sending the message, it will start to listen for the reply message on the temporary queue.</td>
</tr>
<tr>
<td><code>InOut</code></td>
<td><code>JMSReplyTo</code> is set</td>
<td>Camel will expect a reply and, after sending the message, it will start to listen for the reply message on the specified <code>JMSReplyTo</code> queue.</td>
</tr>
<tr>
<td><code>InOnly</code></td>
<td>-</td>
<td>Camel will send the message and <strong>not</strong> expect a reply.</td>
</tr>
<tr>
<td><code>InOnly</code></td>
<td><code>JMSReplyTo</code> is set</td>
<td>By default, Camel discards the <code>JMSReplyTo</code> destination and clears the <code>JMSReplyTo</code> header before sending the message. Camel then sends the message and does <strong>not</strong> expect a reply. Camel logs this in the log at <code>WARN</code> level (changed to <code>DEBUG</code> level from Camel 2.6 onwards). You can use <code>preserveMessageQos=true</code> to instruct Camel to keep the <code>JMSReplyTo</code>. In all situations the <code>JmsProducer</code> <strong>does not</strong> expect any reply and thus continue after sending the message.</td>
</tr>
</tbody>
</table>

### 169.8.2. JmsConsumer

The `JmsConsumer` behaves as follows, depending on configuration:

<table>
<thead>
<tr>
<th>Exchange Pattern</th>
<th>Other options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>InOut</code></td>
<td>-</td>
<td>Camel will send the reply back to the <code>JMSReplyTo</code> queue.</td>
</tr>
<tr>
<td><code>InOnly</code></td>
<td>-</td>
<td>Camel will not send a reply back, as the pattern is <code>InOnly</code>.</td>
</tr>
</tbody>
</table>
This option suppresses replies.

So pay attention to the message exchange pattern set on your exchanges.

If you send a message to a JMS destination in the middle of your route you can specify the exchange pattern to use, see more at Request Reply. This is useful if you want to send an **InOnly** message to a JMS topic:

```java
from("activemq:queue:in")
 .to("bean:validateOrder")
 .to(ExchangePattern.InOnly, "activemq:topic:order")
 .to("bean:handleOrder");
```

### 169.9. REUSE ENDPOINT AND SEND TO DIFFERENT DESTINATIONS COMPUTED AT RUNTIME

If you need to send messages to a lot of different JMS destinations, it makes sense to reuse a JMS endpoint and specify the real destination in a message header. This allows Camel to reuse the same endpoint, but send to different destinations. This greatly reduces the number of endpoints created and economizes on memory and thread resources.

You can specify the destination in the following headers:

<table>
<thead>
<tr>
<th>Header</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CamelJmsDestination</td>
<td>javax.jms.Destinat</td>
<td>A destination object.</td>
</tr>
<tr>
<td></td>
<td>ion</td>
<td></td>
</tr>
<tr>
<td>CamelJmsDestinationNa</td>
<td>String</td>
<td>The destination name.</td>
</tr>
<tr>
<td>me</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For example, the following route shows how you can compute a destination at run time and use it to override the destination appearing in the JMS URL:

```java
from("file://inbox")
 .to("bean:computeDestination")
 .to("activemq:queue:dummy");
```
The queue name, dummy, is just a placeholder. It must be provided as part of the JMS endpoint URL, but it will be ignored in this example.

In the computeDestination bean, specify the real destination by setting the CamelJmsDestinationName header as follows:

```java
public void setJmsHeader(Exchange exchange) {
    String id = ....
    exchange.getIn().setHeader("CamelJmsDestinationName", "order:" + id);
}
```

Then Camel will read this header and use it as the destination instead of the one configured on the endpoint. So, in this example Camel sends the message to activemq:queue:order:2, assuming the id value was 2.

If both the CamelJmsDestination and the CamelJmsDestinationName headers are set, CamelJmsDestination takes priority. Keep in mind that the JMS producer removes both CamelJmsDestination and CamelJmsDestinationName headers from the exchange and do not propagate them to the created JMS message in order to avoid the accidental loops in the routes (in scenarios when the message will be forwarded to the another JMS endpoint).

### 169.10. CONFIGURING DIFFERENT JMS PROVIDERS

You can configure your JMS provider in Spring XML as follows:

Basically, you can configure as many JMS component instances as you wish and give them a unique name using the id attribute. The preceding example configures an activemq component. You could do the same to configure MQSeries, TibCo, BEA, Sonic and so on.

Once you have a named JMS component, you can then refer to endpoints within that component using URIs. For example for the component name, activemq, you can then refer to destinations using the URI format, activemq:[queue:|topic:]destinationName. You can use the same approach for all other JMS providers.

This works by the SpringCamelContext lazily fetching components from the spring context for the scheme name you use for Endpoint URIs and having the Component resolve the endpoint URIs.

#### 169.10.1. Using JNDI to find the ConnectionFactory

If you are using a J2EE container, you might need to look up JNDI to find the JMS ConnectionFactory rather than use the usual <bean> mechanism in Spring. You can do this using Spring’s factory bean or the new Spring XML namespace. For example:

```xml
<bean id="weblogic" class="org.apache.camel.component.jms.JmsComponent">
    <property name="connectionFactory" ref="myConnectionFactory"/>
</bean>

<jee:jndi-lookup id="myConnectionFactory" jndi-name="jms/connectionFactory"/>
```

See The jee schema in the Spring reference documentation for more details about JNDI lookup.

### 169.11. CONCURRENT CONSUMING

A common requirement with JMS is to consume messages concurrently in multiple threads in order to...
A common requirement with JMS is to consume messages concurrently in multiple threads in order to make an application more responsive. You can set the `concurrentConsumers` option to specify the number of threads servicing the JMS endpoint, as follows:

```java
from("jms:SomeQueue?concurrentConsumers=20").
   bean(MyClass.class);
```

You can configure this option in one of the following ways:

- On the `JmsComponent`,
- On the endpoint URI or,
- By invoking `setConcurrentConsumers()` directly on the `JmsEndpoint`.

**169.11. Concurrent Consuming with async consumer**

Notice that each concurrent consumer will only pickup the next available message from the JMS broker, when the current message has been fully processed. You can set the option `asyncConsumer=true` to let the consumer pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). See more details in the table on top of the page about the `asyncConsumer` option.

```java
from("jms:SomeQueue?concurrentConsumers=20&asyncConsumer=true").
   bean(MyClass.class);
```

**169.12. REQUEST-REPLY OVER JMS**

Camel supports Request Reply over JMS. In essence the MEP of the Exchange should be `InOut` when you send a message to a JMS queue.

Camel offers a number of options to configure request/reply over JMS that influence performance and clustered environments. The table below summaries the options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Performance</th>
<th>Cluster</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Temporary</strong></td>
<td>Fast</td>
<td>Yes</td>
<td>A temporary queue is used as reply queue, and automatic created by Camel. To use this do not specify a replyTo queue name. And you can optionally configure <code>replyToType=Temporary</code> to make it stand out that temporary queues are in use.</td>
</tr>
<tr>
<td><strong>Shared</strong></td>
<td>Slow</td>
<td>Yes</td>
