Remediating Configuration Issues Using Advisor and Ansible Playbooks

Create playbooks in Advisor to run with your Ansible workflow
Create playbooks in Advisor to run with your Ansible workflow
Abstract

Create Ansible Playbooks to automate remediation of issues identified by the Advisor service. Providing Feedback: If you have a suggestion to improve this documentation, or find an error, submit a Bugzilla report at http://bugzilla.redhat.com. Select the Cloud Software Services (cloud.redhat.com) product and use the Documentation component.

CHAPTER 1. ADVISOR SERVICE REMEDIATIONS OVERVIEW

The Advisor service helps you resolve issues on Red Hat Enterprise Linux (RHEL) systems by providing resolution steps for each recommendation, tailored to each system. You can then remediate issues manually or create Ansible Playbooks to automate resolution procedures.
CHAPTER 2. MANUALLY REMEDIATING ADVISOR RECOMMENDATIONS

The Advisor service provides users with the steps to resolve issues manually for each rule + system pairing.

Procedure

1. Navigate to the Advisor service > Systems page and log in if necessary.

2. Locate and select the system on which to resolve the recommendations.

3. Locate and select the recommendation to resolve.

4. Expand the description, scroll past Detected issues, and view the specific Steps to resolve the recommendation on that system.

5. Follow the Steps to resolve to remediate the issue on the system.
CHAPTER 3. CREATING ANSIBLE PLAYBOOKS TO AUTOMATE REMEDIATIONS

Advisor service users can create Ansible Playbooks to automate the remediation of recommendations.

NOTE

Look for an Ansible icon, which indicates whether there is a playbook available for a specific rule + system pairing. A blue Ansible icon indicates that a playbook is available. A grey icon with a line through it indicates that a playbook is not available.

The following procedure creates a playbook to remediate an individual recommendation on systems impacted by it.

Procedure

1. Navigate to Advisor service > Recommendations and log in if necessary.
2. Locate and click on the recommendation to resolve.
3. In the Affected systems list, check the box next to each system you want to add to the playbook.
4. Click Remediate.
5. Select whether to add the remediations to an existing or new playbook and take the following action:
   a. Click Existing Playbook and select the desired playbook from the dropdown list, OR
   b. Click Create new Playbook and add a playbook name.
   c. Click Next.
6. Review the information in the summary.
   a. Scroll to the bottom of the summary and toggle Auto Reboot if available and desired.
   b. Click Create.
7. Select Remediations in the Red Hat Insights services menu.
8. Locate the playbook you just created and check the box next to it.
9. Download the playbook using the Download playbook link.

3.1. CREATING ANSIBLE PLAYBOOKS TO REMEDIATION MULTIPLE RECOMMENDATIONS ON AN INDIVIDUAL SYSTEM

Advisor service users can create Ansible Playbooks to automate the remediation of recommendations.
NOTE

Look for an Ansible icon, which indicates whether there is a playbook available for a specific rule + system pairing. A blue Ansible icon indicates that a playbook is available. A grey icon with a line through it indicates that a playbook is not available.

Procedure

1. Navigate to Advisor service > Systems and log in if necessary.
2. Locate and select the system for which to create the playbook.
3. Click the check box next to each recommendation you want to resolve.
4. Click Remediate.
5. Select whether to add the remediations to an existing or new playbook and take the following action:
   a. Click Existing Playbook and select the desired playbook from the dropdown list, OR
   b. Click Create new Playbook and add a playbook name.
   c. Click Next.
6. Review the information in the summary.
   a. Scroll to the bottom of the summary and toggle Auto Reboot if available and desired.
   b. Click Create.
