How to review applicable advisories and affected systems and remediate using Ansible playbooks

Red Hat Customer Content Services
Abstract

This document demonstrates how to review applicable advisories and affected systems in your environment and perform remediation using Ansible playbooks.

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.
PROVIDING FEEDBACK ON RED HAT HYBRID CLOUD CONSOLE DOCUMENTATION

We appreciate your input on our documentation. Please let us know how we could make it better. To do so, create a Bugzilla ticket:

1. Go to the Bugzilla website.
2. As the Component, use Documentation.
3. Fill in the Description field with your suggestion for improvement. Include a link to the relevant part(s) of documentation.
4. Click Submit Bug.
CHAPTER 1. OVERVIEW

Patch leverages Red Hat software and management automation expertise to enable consistent patch workflows for Red Hat Enterprise Linux (RHEL) systems across the open hybrid cloud. It provides a single canonical view of applicable advisories across all of your deployments, whether that be Red Hat Satellite, hosted Red Hat Subscription Management (RHSM), or the public cloud.

Using Patch you can:

- see all of the applicable Red Hat advisories for your RHEL systems checking into Insights
- patch any system with one or more advisories by using Ansible playbooks via Remediations

NOTE

- Configure Role Based Access Control (RBAC) in Insights for Red Hat Enterprise Linux > Settings > User Access.
- See User Access Configuration Guide for Role-based Access Control (RBAC) for more information about this feature and example use cases.
CHAPTER 2. REVIEWING AND FILTERING APPLICABLE ADVISORIES AND SYSTEMS IN THE INVENTORY

You can see all of the applicable advisories for systems checking into Insights for Red Hat Enterprise Linux.

Procedure

2. You can also search for advisories by name using the search box, and filter advisories by:
   a. Type - Security, Bugfix, Enhancement, Unknown
   b. Publish date - Last 7 days, 30 days, 90 days, Last year, or More than 1 year ago

3. Navigate to Red Hat Enterprise Linux > Patch > Systems to see a list of affected systems you can patch with applicable advisories. You can also search for specific systems using the search box.
CHAPTER 3. SYSTEM PATCHING USING ANSIBLE PLAYBOOKS VIA REMEDIATIONS

The following steps demonstrate the patching workflow via the Advisories tab:

**Procedure**

2. Click the advisory you want to apply to affected systems. You will see a description of the advisory, a link to view packages and errata at access.redhat.com, and a list of affected systems. The total number of applicable advisories of each type (Security, Bugfix, Enhancement) against each system are also displayed. As a bulk operation, you can click the options menu located next to a system, then click **Apply all applicable advisories** to patch the system with all applicable advisories at once.

3. Alternatively, select the system(s) you want to patch with this particular advisory, then click **Remediate**.

4. On the Remediate with Ansible page, you can choose to modify an existing Playbook or create a new one to remediate with Ansible. Accordingly, select **Existing Playbook** and the playbook name from the drop-down list, then click **Next**. Or, select **Create new Playbook** and enter a name for your playbook, then click **Next**.

5. You will then see a summary of the action and resolution. Your system will auto reboot by default. If you desire to disable this functionality, click on the blue link that states "turn off auto reboot." Click **Submit**.

6. On the left navigation, click on **Remediations**.

7. Click on the playbook name to see the playbook details, or simply select and click **Download playbook**.

The following steps demonstrate the patching workflow via the Systems tab:

1. Click the Systems tab to see a list of affected systems. As a bulk operation, you can click the options menu located next to a system, then click **Apply all applicable advisories** to patch the system with all applicable advisories at once.

2. Alternatively, click the system you want to patch. You will see the system details and a list of applicable advisories for remediation, along with additional details such as the advisory publish date, type, and synopsis. Select the advisories you want to apply to the system, then click **Remediate**.

3. On the Remediate with Ansible page, you can either modify an existing Playbook or create a new one to remediate with Ansible. Accordingly, click **Existing Playbook** and select the playbook name from the drop-down list, then click **Next**. Or, click **Create new Playbook**, enter a name for your playbook, then click **Next**.

4. You will then see a summary of the action and resolution. Your system will auto reboot by default. If you desire to disable this functionality, click on the blue link that states "turn off auto reboot." Click **Submit**.

5. On the left navigation, click on **Remediations**.
6. Click on the playbook name to see the playbook details, or simply select and click Download playbook.

**IMPORTANT**

Review and test any recommended actions and the playbook, and if you deem appropriate, deploy on your systems running Red Hat software. Red Hat is not responsible for any adverse outcomes related to these recommendations or Playbooks.
