Red Hat OpenShift Container Storage
4.8

Deploying and managing OpenShift Container Storage using Red Hat OpenStack Platform

How to install and manage

Last Updated: 2021-08-06
Abstract

Read this document for instructions on installing and managing Red Hat OpenShift Container Storage on Red Hat OpenStack Platform (RHOSP). Deploying and managing OpenShift Container Storage on Red Hat OpenStack Platform is a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

CHAPTER 7. HOW TO USE DEDICATED WORKER NODES FOR RED HAT OPENSHIFT CONTAINER STORAGE

7.1. ANATOMY OF AN INFRASTRUCTURE NODE
7.2. MACHINE SETS FOR CREATING INFRASTRUCTURE NODES
7.3. MANUAL CREATION OF INFRASTRUCTURE NODES

CHAPTER 8. SCALING STORAGE NODES

8.1. REQUIREMENTS FOR SCALING STORAGE NODES
8.2. SCALING UP STORAGE BY ADDING CAPACITY TO YOUR OPENSHIFT CONTAINER STORAGE NODES ON RED HAT OPENSTACK PLATFORM INFRASTRUCTURE
8.3. SCALING OUT STORAGE CAPACITY BY ADDING NEW NODES
8.3.1. Verifying the addition of a new node
8.3.2. Scaling up storage capacity

CHAPTER 9. MULTICLOUD OBJECT GATEWAY

9.1. ABOUT THE MULTICLOUD OBJECT GATEWAY
9.2. ACCESSING THE MULTICLOUD OBJECT GATEWAY WITH YOUR APPLICATIONS
9.2.1. Accessing the Multicloud Object Gateway from the terminal
9.2.2. Accessing the Multicloud Object Gateway from the MCG command-line interface
9.3. ALLOWING USER ACCESS TO THE MULTICLOUD OBJECT GATEWAY CONSOLE
9.4. ADDING STORAGE RESOURCES FOR HYBRID OR MULTICLOUD
9.4.1. Creating a new backing store
9.4.2. Adding storage resources for hybrid or Multicloud using the MCG command line interface
9.4.2.1. Creating an AWS-backed backingstore
9.4.2.2. Creating an IBM COS-backed backingstore
9.4.2.3. Creating an Azure-backed backingstore
9.4.2.4. Creating a GCP-backed backingstore
9.4.2.5. Creating a local Persistent Volume-backed backingstore
9.4.3. Creating an s3 compatible Multicloud Object Gateway backingstore
9.4.4. Adding storage resources for hybrid and Multicloud using the user interface
9.4.5. Creating a new bucket class
9.4.6. Editing a bucket class
9.4.7. Editing backing stores for bucket class
9.5. MANAGING NAMESPACE BUCKETS
9.5.1. Adding provider connections to the Multicloud Object Gateway
9.5.2. Adding namespace resources using the Multicloud Object Gateway
9.5.3. Adding resources to namespace buckets using the Multicloud Object Gateway
9.5.4. Amazon S3 API endpoints for objects in namespace buckets
9.5.5. Adding a namespace bucket using the Multicloud Object Gateway CLI and YAML
9.5.5.1. Adding an AWS S3 namespace bucket using YAML
9.5.5.2. Adding an IBM COS namespace bucket using YAML
9.5.5.3. Adding an AWS S3 namespace bucket using the Multicloud Object Gateway CLI
9.5.5.4. Adding an IBM COS namespace bucket using the Multicloud Object Gateway CLI
9.6. MIRRORING DATA FOR HYBRID AND MULTICLOUD BUCKETS
9.6.1. Creating bucket classes to mirror data using the MCG command-line-interface
9.6.2. Creating bucket classes to mirror data using a YAML
9.6.3. Configuring buckets to mirror data using the user interface
9.7. BUCKET POLICIES IN THE MULTICLOUD OBJECT GATEWAY
9.7.1. About bucket policies
9.7.2. Using bucket policies
9.7.3. Creating an AWS S3 user in the Multicloud Object Gateway
9.8. OBJECT BUCKET CLAIM
9.8.1. Dynamic Object Bucket Claim
<table>

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.
PROVIDING FEEDBACK ON RED HAT DOCUMENTATION

We appreciate your input on our documentation. Do let us know how we can make it better. To give feedback:

- For simple comments on specific passages:
  1. Make sure you are viewing the documentation in the Multi-page HTML format. In addition, ensure you see the Feedback button in the upper right corner of the document.
  2. Use your mouse cursor to highlight the part of text that you want to comment on.
  3. Click the Add Feedback pop-up that appears below the highlighted text.
  4. Follow the displayed instructions.

- For submitting more complex feedback, create a Bugzilla ticket:
  1. Go to the Bugzilla website.
  2. As the Component, use Documentation.
  3. Fill in the Description field with your suggestion for improvement. Include a link to the relevant part(s) of documentation.
  4. Click Submit Bug.
Red Hat OpenShift Container Storage 4.8 supports deployment on existing Red Hat OpenShift Container Platform (RHOCP) using Red Hat OpenStack Platform clusters.

**NOTE**

Both internal and external OpenShift Container Storage clusters are supported on Red Hat OpenStack Platform. See [Planning your deployment](#) for more information about deployment requirements.

To deploy OpenShift Container Storage, start with the requirements in [Preparing to deploy OpenShift Container Storage](#) chapter and then follow the appropriate deployment process for your environment:

- **Internal mode**
  - [Deploying OpenShift Container Storage on Red Hat OpenStack Platform in internal mode](#)

- **External mode**
  - [Deploying OpenShift Container Storage on Red Hat OpenStack Platform in external mode](#)
CHAPTER 1. PREPARING TO DEPLOY OPENSSHIFT CONTAINER STORAGE

Deploying OpenShift Container Storage on OpenShift Container Platform using dynamic storage devices provides you with the option to create internal cluster resources. This will result in the internal provisioning of the base services, which helps to make additional storage classes available to applications.

Before you begin the deployment of Red Hat OpenShift Container Storage, follow these steps:

1. On the external key management system (KMS),
   - Ensure that a policy with a token exists and the key value backend path in Vault is enabled. See enabled the key value backend path and policy in Vault.
   - Ensure that you are using signed certificates on your Vault servers.

2. Minimum starting node requirements [Technology Preview]
   An OpenShift Container Storage cluster will be deployed with minimum configuration when the standard deployment resource requirement is not met. See Resource requirements section in Planning guide.

1.1. ENABLING KEY VALUE BACKEND PATH AND POLICY IN VAULT

Prerequisites

- Administrator access to Vault.
- Carefully, choose a unique path name as the backend path that follows the naming convention since it cannot be changed later.

Procedure

1. Enable the Key/Value (KV) backend path in Vault.
   For Vault KV secret engine API, version 1:
   ```
   $ vault secrets enable -path=ocs kv
   ```
   For Vault KV secret engine API, version 2:
   ```
   $ vault secrets enable -path=ocs kv-v2
   ```

2. Create a policy to restrict users to perform a write or delete operation on the secret using the following commands:
   ```
   echo 'path "ocs/**" {
       capabilities = ["create", "read", "update", "delete", "list"]
   }
   path "sys/mounts" {
       capabilities = ["read"]
   }' | vault policy write ocs -
3. Create a token matching the above policy:

    $ vault token create -policy=ocs -format json
CHAPTER 2. DEPLOYING OPENSIFT CONTAINER STORAGE ON RED HAT OPENSTACK PLATFORM IN INTERNAL MODE

Deploying OpenShift Container Storage on OpenShift Container Platform in internal mode using dynamic storage devices provided by Red Hat OpenStack Platform installer-provisioned infrastructure (IPI) enables you to create internal cluster resources. This results in internal provisioning of the base services, which helps to make additional storage classes available to applications.

Ensure that you have addressed the requirements in Preparing to deploy OpenShift Container Storage chapter before proceeding with the below steps for deploying using dynamic storage devices:

1. Install the Red Hat OpenShift Container Storage Operator.
2. Create the OpenShift Container Storage Cluster Service

2.1. INSTALLING RED HAT OPENSIFT CONTAINER STORAGE OPERATOR

Prerequisites

- Access to an OpenShift Container Platform cluster using an account with cluster-admin and Operator installation permissions.
- You have at least three worker nodes in the Red Hat OpenShift Container Platform cluster.
- For additional resource requirements, see Planning your deployment.

NOTE

- When you need to override the cluster-wide default node selector for OpenShift Container Storage, you can use the following command in command line interface to specify a blank node selector for the openshift-storage namespace (create openshift-storage namespace in this case):

  ```bash
  $ oc annotate namespace openshift-storage openshift.io/node-selector=
  ``

- Taint a node as infra to ensure only Red Hat OpenShift Container Storage resources are scheduled on that node. This helps you save on subscription costs. For more information, see How to use dedicated worker nodes for Red Hat OpenShift Container Storage chapter in Managing and Allocating Storage Resources guide.

Procedure

1. Navigate in the web console to the click Operators → OperatorHub.
2. Scroll or type a keyword into the Filter by keyword box to search for OpenShift Container Storage Operator.
3. Click Install on the OpenShift Container Storage operator page.
4. On the Install Operator page, the following required options are selected by default:
   a. Update Channel as **stable-4.8**.
   b. Installation Mode as **A specific namespace on the cluster**
   c. Installed Namespace as **Operator recommended namespace openshift-storage**. If Namespace **openshift-storage** does not exist, it will be created during the operator installation.
   d. Select **Approval Strategy** as **Automatic** or **Manual**.
   e. Click **Install**.
      If you select **Automatic** updates, then the Operator Lifecycle Manager (OLM) automatically upgrades the running instance of your Operator without any intervention.
      If you selected **Manual** updates, then the OLM creates an update request. As a cluster administrator, you must then manually approve that update request to have the Operator updated to the new version.

**Verification steps**

Verify that the **OpenShift Container Storage** Operator shows a green tick indicating successful installation.

**Next steps**

- Create an OpenShift Container Storage cluster.

For information, see [Creating an OpenShift Container Storage Cluster Service in internal mode](#).

### 2.2. Creating an OpenShift Container Storage Cluster Service in Internal Mode

Use this procedure to create an OpenShift Container Storage Cluster Service after you install the OpenShift Container Storage operator.

**Prerequisites**

- The OpenShift Container Storage operator must be installed from the Operator Hub. For more information, see [Installing OpenShift Container Storage Operator using the Operator Hub](#).

**Procedure**

1. Log into the OpenShift Web Console.
2. Click **Operators** → **Installed Operators** to view all the installed operators.
   Ensure that the **Project** selected is **openshift-storage**.
3. Click **OpenShift Container Storage** > **Create Instance** link of Storage Cluster.
4. **Select Mode** is set to **Internal** by default.
5. Select **Capacity and nodes**
   a. Select **Storage Class**. By default, it is set to **standard**.
b. Select **Requested Capacity** from the drop down list. It is set to **2 TiB** by default. You can use the drop down to modify the capacity value.

**NOTE**

Once you select the initial storage capacity, cluster expansion is performed only using the selected usable capacity (3 times of raw storage).

c. In the **Select Nodes** section, select at least three available nodes. For cloud platforms with multiple availability zones, ensure that the Nodes are spread across different Locations/availability zones.

If the nodes selected do not match the OpenShift Container Storage cluster requirement of an aggregated 30 CPUs and 72 GiB of RAM, a minimal cluster will be deployed. For minimum starting node requirements, see Resource requirements section in Planning guide.

d. Click **Next**.

6. (Optional) Set **Security and network** configuration

a. Select the **Enable encryption** checkbox to encrypt block and file storage.

b. Choose any one or both **Encryption level**

   - **Cluster-wide encryption** to encrypt the entire cluster (block and file).
   - **Storage class encryption** to create encrypted persistent volume (block only) using encryption enabled storage class.

c. Select the **Connect to an external key management service** checkbox. This is optional for cluster-wide encryption.

   i. **Key Management Service Provider** is set to **Vault** by default.

   ii. Enter Vault **Service Name**, host **Address** of Vault server ("https://<hostname or ip>"), **Port number** and **Token**.

   iii. Expand **Advanced Settings** to enter additional settings and certificate details based on your Vault configuration:

      A. Enter the Key Value secret path in **Backend Path** that is dedicated and unique to OpenShift Container Storage.

      B. (Optional) Enter **TLS Server Name** and **Vault Enterprise Namespace**

      C. Provide **CA Certificate**, **Client Certificate** and **Client Private Key** by uploading the respective PEM encoded certificate file.

      D. Click **Save**.

7. Select **Default** (SDN) if you are using a single network or **Custom** (Multus) Network if you plan on using multiple network interfaces.

   a. Select a **Public Network Interface** from drop down.

   b. Select a **Cluster Network Interface** from drop down.
NOTE

If only using one additional network interface select the single NetworkAttachmentDefinition (i.e. ocs-public-cluster) for the Public Network Interface and leave the Cluster Network Interface blank.

8. Click Next.

9. Review the configuration details. To modify any configuration settings, click Back to go back to the previous configuration page.

10. Click Create.

11. Edit the configmap if Vault Key/Value (KV) secret engine API, version 2 is used for cluster-wide encryption with Key Management System (KMS).
   
   a. On the OpenShift Web Console, navigate to Workloads → ConfigMaps
   
   b. To view the KMS connection details, click ocs-kms-connection-details.
   
   c. Edit the configmap.
      
      i. Click Action menu (⋮) → Edit ConfigMap
      
      ii. Set the VAULT_BACKEND parameter to v2.

     ```yaml
kind: ConfigMap
apiVersion: v1
metadata:
  name: ocs-kms-connection-details
[...]
data:
  KMS_PROVIDER: vault
  KMS_SERVICE_NAME: vault
[...]
VAULT_BACKEND: v2
[...]
```

   iii. Click Save.

Verification steps

1. On the storage cluster details page, the storage cluster name displays a green tick next to it to indicate that the cluster was created successfully.

2. Verify that the final Status of the installed storage cluster shows as Phase: Ready with a green tick mark.
   
   - Click Operators → Installed Operators → Storage Cluster link to view the storage cluster installation status.
   
   - Alternatively, when you are on the Operator Details tab, you can click on the Storage Cluster tab to view the status.
   
   - To verify that OpenShift Container Storage is successfully installed, see Verifying your OpenShift Container Storage installation.
2.3. VERIFYING OPENSIXFT CONTAINER STORAGE DEPLOYMENT

Use this section to verify that OpenShift Container Storage is deployed correctly.

2.3.1. Verifying the state of the pods

To determine if OpenShift Container storage is deployed successfully, you can verify that the pods are in **Running** state.

Procedure

1. Click **Workloads → Pods** from the left pane of the OpenShift Web Console.

2. Select **openshift-storage** from the **Project** drop down list. For more information on the expected number of pods for each component and how it varies depending on the number of nodes, see Table 2.1, “Pods corresponding to OpenShift Container storage cluster”.

3. Verify that the following pods are in running and completed state by clicking on the **Running** and the **Completed** tabs:

<table>
<thead>
<tr>
<th>Component</th>
<th>Corresponding pods</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenShift Container Storage Operator</td>
<td><em>ocs-operator-</em> (1 pod on any worker node)</td>
</tr>
<tr>
<td></td>
<td><em>ocs-metrics-exporter-</em></td>
</tr>
<tr>
<td>Rook-ceph Operator</td>
<td><strong>rook-ceph-operator-</strong>*</td>
</tr>
<tr>
<td></td>
<td>(1 pod on any worker node)</td>
</tr>
<tr>
<td>Multicloud Object Gateway</td>
<td><em>noobaa-operator-</em> (1 pod on any worker node)</td>
</tr>
<tr>
<td></td>
<td><em>noobaa-core-</em> (1 pod on any storage node)</td>
</tr>
<tr>
<td></td>
<td><em>nooba-db-</em> (1 pod on any storage node)</td>
</tr>
<tr>
<td></td>
<td><em>noobaa-endpoint-</em> (1 pod on any storage node)</td>
</tr>
<tr>
<td>MON</td>
<td><strong>rook-ceph-mon-</strong>*</td>
</tr>
<tr>
<td></td>
<td>(3 pods distributed across storage nodes)</td>
</tr>
<tr>
<td>MGR</td>
<td><strong>rook-ceph-mgr-</strong>*</td>
</tr>
<tr>
<td></td>
<td>(1 pod on any storage node)</td>
</tr>
</tbody>
</table>
## 2.3.2. Verifying the OpenShift Container Storage cluster is healthy

1. Click **Storage → Overview** from the left pane of the OpenShift Web Console and click the **Block and File** tab.

2. In the **Status card**, verify that **Storage Cluster** and **Data Resiliency** has a green tick mark.

3. In the **Details card**, verify that the cluster information is displayed.

For more information on the health of the OpenShift Container Storage cluster using the Block and File dashboard, see [Monitoring OpenShift Container Storage](#).

## 2.3.3. Verifying the Multicloud Object Gateway is healthy

1. Click **Storage → Overview** from the left pane of the OpenShift Web Console and click the **Object** tab.

2. In the **Status card**, verify that both **Object Service** and **Data Resiliency** are in **Ready** state (green tick).
3. In the Details card, verify that the Multicloud Object Gateway information is displayed.

For more information on the health of the OpenShift Container Storage cluster using the object service dashboard, see Monitoring OpenShift Container Storage.

2.3.4. Verifying that the OpenShift Container Storage specific storage classes exist

To verify the storage classes exists in the cluster:

1. Click Storage → Storage Classes from the left pane of the OpenShift Web Console.

2. Verify that the following storage classes are created with the OpenShift Container Storage cluster creation:
   - ocs-storagecluster-ceph-rbd
   - ocs-storagecluster-cephfs
   - openshift-storage.noobaa.io

2.4. UNINSTALLING OPENSHIFT CONTAINER STORAGE IN INTERNAL MODE

2.4.1. Uninstalling OpenShift Container Storage in Internal mode

Use the steps in this section to uninstall OpenShift Container Storage.

Uninstall Annotations

Annotations on the Storage Cluster are used to change the behavior of the uninstall process. To define the uninstall behavior, the following two annotations have been introduced in the storage cluster:

- uninstall.ocs.openshift.io/cleanup-policy: delete
- uninstall.ocs.openshift.io/mode: graceful

The below table provides information on the different values that can used with these annotations:

<table>
<thead>
<tr>
<th>Annotation</th>
<th>Value</th>
<th>Default</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>cleanup-policy</td>
<td>delete</td>
<td>Yes</td>
<td>Rook cleans up the physical drives and the DataDirHostPath</td>
</tr>
<tr>
<td>cleanup-policy</td>
<td>retain</td>
<td>No</td>
<td>Rook does not clean up the physical drives and the DataDirHostPath</td>
</tr>
</tbody>
</table>

Red Hat OpenShift Container Storage 4.8 Deploying and managing OpenShift Container Storage using Red Hat OpenStack Platform
<table>
<thead>
<tr>
<th>Annotation</th>
<th>Value</th>
<th>Default</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>graceful</td>
<td>Yes</td>
<td>Rook and NooBaa pauses the uninstall process until the PVCs and the OBCs are removed by the administrator/user</td>
</tr>
<tr>
<td>mode</td>
<td>forced</td>
<td>No</td>
<td>Rook and NooBaa proceeds with uninstall even if PVCs/OBCs provisioned using Rook and NooBaa exist respectively.</td>
</tr>
</tbody>
</table>

You can change the cleanup policy or the uninstall mode by editing the value of the annotation by using the following commands:

```
$ oc annotate storagecluster ocs-storagecluster uninstall.ocs.openshift.io/cleanup-policy="retain" --overwrite
storagecluster.ocs.openshift.io/ocs-storagecluster annotated
```

```
$ oc annotate storagecluster ocs-storagecluster uninstall.ocs.openshift.io/mode="forced" --overwrite
storagecluster.ocs.openshift.io/ocs-storagecluster annotated
```

**Prerequisites**

- Ensure that the OpenShift Container Storage cluster is in a healthy state. The uninstall process can fail when some of the pods are not terminated successfully due to insufficient resources or nodes. In case the cluster is in an unhealthy state, contact Red Hat Customer Support before uninstalling OpenShift Container Storage.

- Ensure that applications are not consuming persistent volume claims (PVCs) or object bucket claims (OBCs) using the storage classes provided by OpenShift Container Storage.

- If any custom resources (such as custom storage classes, cephblockpools) were created by the admin, they must be deleted by the admin after removing the resources which consumed them.

**Procedure**

1. Delete the volume snapshots that are using OpenShift Container Storage.
   a. List the volume snapshots from all the namespaces.
      
      ```
      $ oc get volumesnapshot --all-namespaces
      ```
   b. From the output of the previous command, identify and delete the volume snapshots that are using OpenShift Container Storage.
$ oc delete volumesnapshot <VOLUME-SNAPSHOT-NAME> -n <NAMESPACE>

2. Delete PVCs and OBCs that are using OpenShift Container Storage.
   In the default uninstall mode (graceful), the uninstaller waits till all the PVCs and OBCs that use
   OpenShift Container Storage are deleted.

If you wish to delete the Storage Cluster without deleting the PVCs beforehand, you may set
the uninstall mode annotation to “forced” and skip this step. Doing so will result in orphan PVCs
and OBCs in the system.

   a. Delete OpenShift Container Platform monitoring stack PVCs using OpenShift Container
      Storage.
      For more information, see Removing monitoring stack from OpenShift Container Storage

   b. Delete OpenShift Container Platform Registry PVCs using OpenShift Container Storage.
      For more information, see Removing OpenShift Container Platform registry from
      OpenShift Container Storage

   c. Delete OpenShift Container Platform logging PVCs using OpenShift Container Storage.
      For more information, see Removing the cluster logging operator from OpenShift
      Container Storage

   d. Delete other PVCs and OBCs provisioned using OpenShift Container Storage.

       • Given below is a sample script to identify the PVCs and OBCs provisioned using
         OpenShift Container Storage. The script ignores the PVCs that are used internally by
         OpenShift Container Storage.

       ```bash
#!/bin/bash

RBD_PROVISIONER="openshift-storage.rbd.csi.ceph.com"
CEPHFS_PROVISIONER="openshift-storage.cephfs.csi.ceph.com"
NOOBAA_PROVISIONER="openshift-storage.noobaa.io/obc"
RGW_PROVISIONER="openshift-storage.ceph.rook.io/bucket"

NOOBAA_DB_PVC="noobaa-db"
NOOBAA_BACKINGSTORE_PVC="noobaa-default-backing-store-noobaa-pvc"

# Find all the OCS StorageClasses
OCS_STORAGECLASSES=$(oc get storageclasses | grep -e "$RBD_PROVISIONER" -e "$CEPHFS_PROVISIONER" -e "$NOOBAA_PROVISIONER" -e "$RGW_PROVISIONER" | awk '{print $1}')

# List PVCs in each of the StorageClasses
for SC in $OCS_STORAGECLASSES
   do
      echo
      "=====================================================================
      ==
      "$SC StorageClass PVCs and OBCs"
      echo
      "=====================================================================
      =="
      oc get pvc --all-namespaces --no-headers 2>/dev/null | grep $SC | grep -v -e "$NOOBAA_DB_PVC" -e "$NOOBAA_BACKINGSTORE_PVC"
      done
```
```bash
oc get obc --all-namespaces --no-headers 2>/dev/null | grep $SC
done

NOTE
Omit `RGW_PROVISIONER` for cloud platforms.

- Delete the OBCs.
  ```bash
  $ oc delete obc <obc name> -n <project name>
  ```
- Delete the PVCs.
  ```bash
  $ oc delete pvc <pvc name> -n <project-name>
  ```

NOTE
Ensure that you have removed any custom backing stores, bucket classes, etc., created in the cluster.

3. Delete the Storage Cluster object and wait for the removal of the associated resources.

```bash
$ oc delete -n openshift-storage storagecluster --all --wait=true
```

4. Check for cleanup pods if the `uninstall.ocs.openshift.io/cleanup-policy` was set to `delete` (default) and ensure that their status is `Completed`.

```bash
$ oc get pods -n openshift-storage | grep -i cleanup
NAME                                READY   STATUS      RESTARTS   AGE
cluster-cleanup-job-<xx>         0/1     Completed   0          8m35s
cluster-cleanup-job-<yy>       0/1     Completed   0          8m35s
cluster-cleanup-job-<zz>       0/1     Completed   0          8m35s
```

5. Confirm that the directory `/var/lib/rook` is now empty. This directory will be empty only if the `uninstall.ocs.openshift.io/cleanup-policy` annotation was set to `delete` (default).

```bash
$ for i in $(oc get node -l cluster.ocs.openshift.io/openshift-storage= -o jsonpath='{{.items[*].metadata.name }}'); do oc debug node/${i} -- chroot /host ls -l /var/lib/rook; done
```

6. If encryption was enabled at the time of install, remove `dm-crypt` managed `device-mapper` mapping from OSD devices on all the OpenShift Container Storage nodes.

   a. Create a `debug` pod and `chroot` to the host on the storage node.
      ```bash
      $ oc debug node/<node name>
      $ chroot /host
      ```

   b. Get Device names and make note of the OpenShift Container Storage devices.
      ```bash
      $ dmsetup ls
      ocs-deviceset-0-data-0-57snx-block-dmcrypt (253:1)
      ```
c. Remove the mapped device.

```bash
$ cryptsetup luksClose --debug --verbose ocs-deviceset-0-data-0-57snx-block-dmcrypt
```

**NOTE**

If the above command gets stuck due to insufficient privileges, run the following commands:

- Press **CTRL+Z** to exit the above command.
- Find PID of the process which was stuck.
  ```bash
  $ ps -ef | grep crypt
  ```
- Terminate the process using **kill** command.
  ```bash
  $ kill -9 <PID>
  ```
- Verify that the device name is removed.
  ```bash
  $ dmsetup ls
  ```

7. Delete the namespace and wait till the deletion is complete. You will need to switch to another project if `openshift-storage` is the active project. For example:

```bash
$ oc project default
$ oc delete project openshift-storage --wait=true --timeout=5m
```

The project is deleted if the following command returns a NotFound error.

```bash
$ oc get project openshift-storage
```

**NOTE**

While uninstalling OpenShift Container Storage, if **namespace** is not deleted completely and remains in **Terminating** state, perform the steps in **Troubleshooting and deleting remaining resources during Uninstall** to identify objects that are blocking the namespace from being terminated.

8. Unlabel the storage nodes.

```bash
$ oc label nodes --all cluster.ocs.openshift.io/openshift-storage-
$ oc label nodes --all topology.rook.io/rack-
```

9. Remove the OpenShift Container Storage taint if the nodes were tainted.

```bash
$ oc adm taint nodes --all node.ocs.openshift.io/storage-
```
10. Confirm all PVs provisioned using OpenShift Container Storage are deleted. If there is any PV left in the Released state, delete it.

   $ oc get pv
   $ oc delete pv <pv name>

11. Delete the Multicloud Object Gateway storageclass.

   $ oc delete storageclass openshift-storage.noobaa.io --wait=true --timeout=5m

   $ oc delete crd backingstores.noobaa.io bucketclasses.noobaa.io
   cephblockpools.ceph.rook.io cephclusters.ceph.rook.io cephfilesystems.ceph.rook.io
   cephnfses.ceph.rook.io cephobjectstores.ceph.rook.io cephobjectstoreusers.ceph.rook.io
   noobaas.noobaa.io ocsinitializations.ocs.openshift.io storageclusters.ocs.openshift.io
   cephclients.ceph.rook.io cephobjectrealmss.ceph.rook.io cephobjectzonegroups.ceph.rook.io
   cephobjectzones.ceph.rook.io cephrookmirrors.ceph.rook.io --wait=true --timeout=5m

13. To ensure that OpenShift Container Storage is uninstalled completely, on the OpenShift Container Platform Web Console,
   a. Click Storage.
   b. Verify that Overview no longer appears under Storage.

2.4.1.1. Removing monitoring stack from OpenShift Container Storage

Use this section to clean up the monitoring stack from OpenShift Container Storage.

The PVCs that are created as a part of configuring the monitoring stack are in the openshift-monitoring namespace.

Prerequisites

- PVCs are configured to use OpenShift Container Platform monitoring stack.
  For information, see configuring monitoring stack.

Procedure

1. List the pods and PVCs that are currently running in the openshift-monitoring namespace.

   $ oc get pod,pvc -n openshift-monitoring

   NAME                          READY STATUS    RESTARTS AGE
   pod/alertmanager-main-0       3/3   Running 0 8d
   pod/alertmanager-main-1       3/3   Running 0 8d
   pod/alertmanager-main-2       3/3   Running 0 8d
   pod/cluster-monitoring-
   operator-84457656d-pkrxm      1/1   Running 0 8d
   pod/grafana-79ccf6689f-2ll28  2/2   Running 0 8d
   pod/kube-state-metrics-
   7d86fb966-rvd9w               3/3   Running 0 8d
   pod/node-exporter-25894       2/2   Running 0 8d
   pod/node-exporter-4dsd7       2/2   Running 0 8d
2. Edit the monitoring **configmap**.

   ```bash
   $ oc -n openshift-monitoring edit configmap cluster-monitoring-config
   ```

3. Remove any **config** sections that reference the OpenShift Container Storage storage classes as shown in the following example and save it.

   **Before editing**
apiVersion: v1
data:
  config.yaml: |
  alertmanagerMain:
    volumeClaimTemplate:
      metadata:
        name: my-alertmanager-claim
      spec:
        resources:
          requests:
            storage: 40Gi
        storageClassName: ocs-storagecluster-ceph-rbd
  prometheusK8s:
    volumeClaimTemplate:
      metadata:
        name: my-prometheus-claim
      spec:
        resources:
          requests:
            storage: 40Gi
        storageClassName: ocs-storagecluster-ceph-rbd

kind: ConfigMap
metadata:
  creationTimestamp: "2019-12-02T07:47:29Z"
  name: cluster-monitoring-config
  namespace: openshift-monitoring
  resourceVersion: "22110"
  selfLink: /api/v1/namespaces/openshift-monitoring/configmaps/cluster-monitoring-config
  uid: fd6d988b-14d7-11ea-84ff-066035b9efa8

After editing
In this example, `alertmanagerMain` and `prometheusK8s` monitoring components are using the OpenShift Container Storage PVCs.

4. Delete relevant PVCs. Make sure you delete all the PVCs that are consuming the storage classes.

   ```
   $ oc delete -n openshift-monitoring pvc <pvc-name> --wait=true --timeout=5m
   ```

2.4.1.2. Removing OpenShift Container Platform registry from OpenShift Container Storage

Use this section to clean up OpenShift Container Platform registry from OpenShift Container Storage. If you want to configure an alternative storage, see image registry

The PVCs that are created as a part of configuring OpenShift Container Platform registry are in the `openshift-image-registry` namespace.

**Prerequisites**

- The image registry should have been configured to use an OpenShift Container Storage PVC.

**Procedure**

1. Edit the `configs.imageregistry.operator.openshift.io` object and remove the content in the `storage` section.

   ```
   $ oc edit configs.imageregistry.operator.openshift.io
   ```

   Before editing
In this example, the PVC is called `registry-cephfs-rwx-pvc`, which is now safe to delete.

2. Delete the PVC.

   ```bash
   $ oc delete pvc <pvc-name> -n openshift-image-registry --wait=true --timeout=5m
   ```

2.4.1.3. Removing the cluster logging operator from OpenShift Container Storage

Use this section to clean up the cluster logging operator from OpenShift Container Storage.

The PVCs that are created as a part of configuring cluster logging operator are in the `openshift-logging` namespace.

Prerequisites

- The cluster logging instance should have been configured to use OpenShift Container Storage PVCs.

Procedure

1. Remove the `ClusterLogging` instance in the namespace.

   ```bash
   $ oc delete clusterlogging instance -n openshift-logging --wait=true --timeout=5m
   ```

   The PVCs in the `openshift-logging` namespace are now safe to delete.

2. Delete PVCs.
$ oc delete pvc <pvc-name> -n openshift-logging --wait=true --timeout=5m
CHAPTER 3. DEPLOYING OPENSHIFT CONTAINER STORAGE ON RED HAT OPENSTACK PLATFORM IN EXTERNAL MODE

Red Hat OpenShift Container Storage can use an externally hosted Red Hat Ceph Storage (RHCS) cluster as the storage provider on Red Hat OpenStack Platform. See Planning your deployment for more information.

For instructions regarding how to install a RHCS 4 cluster, see Installation guide.

Follow these steps to deploy OpenShift Container Storage in external mode:

1. Install the OpenShift Container Storage Operator.
2. Create the OpenShift Container Storage Cluster Service.

3.1. INSTALLING RED HAT OPENSIFT CONTAINER STORAGE OPERATOR

Prerequisites

- Access to an OpenShift Container Platform cluster using an account with cluster-admin and Operator installation permissions.
- You have at least three worker nodes in the Red Hat OpenShift Container Platform cluster.
- For additional resource requirements, see Planning your deployment.

NOTE

- When you need to override the cluster-wide default node selector for OpenShift Container Storage, you can use the following command in command line interface to specify a blank node selector for the openshift-storage namespace (create openshift-storage namespace in this case):

  $ oc annotate namespace openshift-storage openshift.io/node-selector=

- Taint a node as infra to ensure only Red Hat OpenShift Container Storage resources are scheduled on that node. This helps you save on subscription costs. For more information, see How to use dedicated worker nodes for Red Hat OpenShift Container Storage chapter in Managing and Allocating Storage Resources guide.

Procedure

1. Navigate in the web console to the click Operators → OperatorHub.
2. Scroll or type a keyword into the Filter by keyword box to search for OpenShift Container Storage Operator.
3. Click Install on the OpenShift Container Storage operator page.
4. On the **Install Operator** page, the following required options are selected by default:

   a. Update Channel as **stable-4.8**.
   
   b. Installation Mode as **A specific namespace on the cluster**
   
   c. Installed Namespace as **Operator recommended namespace openshift-storage**. If Namespace **openshift-storage** does not exist, it will be created during the operator installation.
   
   d. Select **Approval Strategy** as **Automatic** or **Manual**.
   
   e. Click **Install**.
   
   If you select **Automatic** updates, then the Operator Lifecycle Manager (OLM) automatically upgrades the running instance of your Operator without any intervention.
   
   If you selected **Manual** updates, then the OLM creates an update request. As a cluster administrator, you must then manually approve that update request to have the Operator updated to the new version.

**Verification steps**

Verify that the **OpenShift Container Storage** Operator shows a green tick indicating successful installation.

**Next steps**

- Create an OpenShift Container Storage cluster.

For information, see [Creating an OpenShift Container Storage Cluster service for external mode](#).

### 3.2. CREATING AN OPENSIGHT CONTAINER STORAGE CLUSTER SERVICE FOR EXTERNAL MODE

You need to create a new OpenShift Container Storage cluster service after you install OpenShift Container Storage operator on OpenShift Container Platform deployed on Red Hat OpenStack platform.

**Prerequisites**

- Ensure the OpenShift Container Platform version is 4.8 or above before deploying OpenShift Container Storage 4.8.

- OpenShift Container Storage operator must be installed. For more information, see [Installing OpenShift Container Storage Operator using the Operator Hub](#).

- Red Hat Ceph Storage version 4.2z1 or later is required for the external cluster. For more information, see [this knowledge base article on Red Hat Ceph Storage releases and corresponding Ceph package versions](#). If you have updated the Red Hat Ceph Storage cluster from a version lower than 4.1.1 to the latest release and is not a freshly deployed cluster, you must manually set the application type for CephFS pool on the Red Hat Ceph Storage cluster to enable CephFS PVC creation in external mode.

For more details, see [Troubleshooting CephFS PVC creation in external mode](#).
- Red Hat Ceph Storage must have Ceph Dashboard installed and configured. For more information, see Ceph Dashboard installation and access.

- Red Hat recommends that the external Red Hat Ceph Storage cluster has the PG Autoscaler enabled. For more information, see The placement group autoscaler section in the Red Hat Ceph Storage documentation.

- The external Ceph cluster should have an existing RBD pool pre-configured for use. If it does not exist, contact your Red Hat Ceph Storage administrator to create one before you move ahead with OpenShift Container Storage deployment. Red Hat recommends to use a separate pool for each OpenShift Container Storage cluster.

**Procedure**

1. Click **Operators → Installed Operators** to view all the installed operators. Ensure that the **Project** selected is **openshift-storage**.

2. Click **OpenShift Container Storage → Create Instance** link of Storage Cluster.

3. Select **Mode** as **External**. By default, Internal is selected as deployment mode.

**Figure 3.1. Connect to external cluster section on Create Storage Cluster form**

4. In the Connect to external cluster section, click on the **Download Script** link to download the python script for extracting Ceph cluster details.

5. For extracting the Red Hat Ceph Storage (RHCS) cluster details, contact the RHCS administrator to run the downloaded python script on a Red Hat Ceph Storage node with **admin key**.
a. Run the following command on the RHCS node to view the list of available arguments.

```bash
# python3 ceph-external-cluster-details-exporter.py --help
```

**IMPORTANT**

Use `python` instead of `python3` if the Red Hat Ceph Storage 4.x cluster is deployed on Red Hat Enterprise Linux 7.x (RHEL 7.x) cluster.

**NOTE**

You can also run the script from inside a MON container (containerized deployment) or from a MON node (rpm deployment).

b. To retrieve the external cluster details from the RHCS cluster, run the following command

```bash
# python3 ceph-external-cluster-details-exporter.py  
--rbd-data-pool-name <rbd block pool name> [optional arguments]
```

For example:

```bash
```

In the above example,

- **--rbd-data-pool-name** is a mandatory parameter used for providing block storage in OpenShift Container Storage.

- **--rgw-endpoint** is optional. Provide this parameter if object storage is to be provisioned through Ceph Rados Gateway for OpenShift Container Storage. Provide the endpoint in the following format: `<ip_address>:<port>`

- **--monitoring-endpoint** is optional. It is the IP address of the active `ceph-mgr` reachable from the OpenShift Container Platform cluster. If not provided, the value is automatically populated.

- **--monitoring-endpoint-port** is optional. It is the port associated with the `ceph-mgr` Prometheus exporter specified by `--monitoring-endpoint`. If not provided, the value is automatically populated.

- **--run-as-user** is an optional parameter used for providing a name for the Ceph user which is created by the script. If this parameter is not specified, a default user name `client.healthchecker` is created. The permissions for the new user are set as:

  - caps: [mgr] allow command config
  - caps: [mon] allow r, allow command quorum_status, allow command version
  - caps: [osd] allow rwx pool=RGW_POOL_PREFIX.rgw.meta, allow r pool=RGW_POOL_PREFIX.rgw.root, allow rw pool=RGW_POOL_PREFIX.rgw.control, allow rx pool=RGW_POOL_PREFIX.rgw.log, allow x pool=RGW_POOL_PREFIX.rgw.buckets.index
Example of JSON output generated using the python script:

```json
[{
"name": "rook-ceph-mon-endpoints", "kind": "ConfigMap", "data": {
"data": "xxx.xxx.xxx.xxx:xxxx", "maxMonId": "0", "mapping": "{}"},
"name": "rook-ceph-mon", "kind": "Secret", "data": {"admin-secret": "admin-secret", "fsid": "<fs-id>",
"mon-secret": "mon-secret"},
"name": "rook-ceph-operator-creds", "kind": "Secret", "data": {"userID": "client.healthchecker", "userKey": "<user-key>"},
"name": "rook-csi-rbd-node", "kind": "Secret", "data": {"userID": "csi-rbd-node",
"userKey": "<user-key>"},
"name": "ceph-rbd", "kind": "StorageClass", "data": {"pool": "ceph-rbd"},
"name": "monitoring-endpoint", "kind": "CephCluster", "data": {"MonitoringEndpoint": "xxx.xxx.xxx.xxx", "MonitoringPort": "xxxx"},
"name": "rook-csi-rbd-provisioner", "kind": "Secret", "data": {"userID": "csi-rbd-provisioner",
"userKey": "<user-key>"},
"name": "rook-csi-cephfs-provisioner", "kind": "Secret", "data": {"adminID": "csi-cephfs-provisioner", "adminKey": "<admin-key>"},
"name": "rook-csi-cephfs-node", "kind": "Secret", "data": {"adminID": "csi-cephfs-node", "adminKey": "<admin-key>"},
"name": "cephfs", "kind": "StorageClass", "data": {"fsName": "cephfs", "pool": "cephfs_data"},
"name": "ceph-rgw", "kind": "StorageClass", "data": {"endpoint": "xxx.xxx.xxx.xxx:xxxx", "poolPrefix": "default"}]
```

c. Save the JSON output to a file with .json extension

**NOTE**

For OpenShift Container Storage to work seamlessly, ensure that the parameters (RGW endpoint, CephFS details, RBD pool, and so on) to be uploaded using the JSON file remains unchanged on the RHCS external cluster after the storage cluster creation.

6. Click **External cluster metadata** → **Browse** to select and upload the JSON file.

The content of the JSON file is populated and displayed in the text box.

**Figure 3.2. Json file content**

7. Click **Create**.

The Create button is enabled only after you upload the .json file.

**Verification steps**
1. Verify that the final **Status** of the installed storage cluster shows as **Phase: Ready** with a green tick mark.
   - Click **Operators → Installed Operators → Storage Cluster** link to view the storage cluster installation status.
   - Alternatively, when you are on the Operator **Details** tab, you can click on the **Storage Cluster** tab to view the status.

2. To verify that OpenShift Container Storage, pods and StorageClass are successfully installed, see Verifying your external mode OpenShift Container Storage installation.

### 3.3. VERIFYING YOUR OPENSHEET CONTAINER STORAGE INSTALLATION FOR EXTERNAL MODE

Use this section to verify that OpenShift Container Storage is deployed correctly.

#### 3.3.1. Verifying the state of the pods

1. Click **Workloads → Pods** from the left pane of the OpenShift Web Console.

2. Select **openshift-storage** from the **Project** drop down list. For more information on the expected number of pods for each component and how it varies depending on the number of nodes, see Table 3.1, ”Pods corresponding to OpenShift Container Storage components”

3. Verify that the following pods are in running state:

   **Table 3.1. Pods corresponding to OpenShift Container Storage components**

<table>
<thead>
<tr>
<th>Component</th>
<th>Corresponding pods</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenShift Container Storage Operator</td>
<td>• ocs-operator-* (1 pod on any worker node)</td>
</tr>
<tr>
<td></td>
<td>• ocs-metrics-exporter-*</td>
</tr>
<tr>
<td>Rook-ceph Operator</td>
<td>rook-ceph-operator-*</td>
</tr>
<tr>
<td></td>
<td>(1 pod on any worker node)</td>
</tr>
<tr>
<td>Multicloud Object Gateway</td>
<td>• noobaa-operator-* (1 pod on any worker node)</td>
</tr>
<tr>
<td></td>
<td>• noobaa-core-* (1 pod on any worker node)</td>
</tr>
<tr>
<td></td>
<td>• nooba-db-* (1 pod on any worker node)</td>
</tr>
<tr>
<td></td>
<td>• noobaa-endpoint-* (1 pod on any worker node)</td>
</tr>
</tbody>
</table>
### 3.3.2. Verifying that the OpenShift Container Storage cluster is healthy

- Click **Storage → Overview** from the left pane of the OpenShift Web Console and click **Block** and **File** tab.

- In the **Status card**, verify that **Storage Cluster** has a green tick mark.

- In the **Details card**, verify that the cluster information is displayed as follows:

  **Service Name**
  - OpenShift Container Storage

  **Cluster Name**
  - ocs-external-storagecluster

  **Provider**
  - OpenStack

  **Mode**
  - External

  **Version**
  - ocs-operator-4.8.0

For more information on the health of OpenShift Container Storage cluster using the Block and File dashboard, see [Monitoring OpenShift Container Storage](#).

### 3.3.3. Verifying that the Multicloud Object Gateway is healthy

- Click **Storage → Overview** from the left pane of the OpenShift Web Console and click the **Object** tab.

- In the **Status card**, verify that both **Object Service** and **Data Resiliency** are in **Ready** state (green tick).
In the Details card, verify that the MCG information is displayed appropriately as follows:

- **Service Name**
  - OpenShift Container Storage

- **System Name**
  - Multicloud Object Gateway
  - RADOS Object Gateway

- **Provider**
  - OpenStack

- **Version**
  - ocs-operator-4.8.0

**NOTE**

The RADOS Object Gateway is only listed in case RADOS Object Gateway endpoint details were included while deploying OpenShift Container Storage in external mode.

For more information on the health of OpenShift Container Storage cluster using the object dashboard, see [Monitoring OpenShift Container Storage](#).

### 3.3.4. Verifying that the storage classes are created and listed

- Click **Storage → Storage Classes** from the left pane of the OpenShift Web Console.

- Verify that the following storage classes are created with the OpenShift Container Storage cluster creation:
  - `ocs-external-storagecluster-ceph-rbd`
  - `ocs-external-storagecluster-ceph-rgw`
  - `ocs-external-storagecluster-cephfs`
  - `openshift-storage.noobaa.io`
3.3.5. Verifying that Ceph cluster is connected

Run the following command to verify if the OpenShift Container Storage cluster is connected to the external Red Hat Ceph Storage cluster.

```bash
$ oc get cephcluster -n openshift-storage
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>DATADIRHOSTPATH</th>
<th>MONCOUNT</th>
<th>AGE</th>
<th>PHASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ocs-external-storagecluster-cephcluster</td>
<td></td>
<td></td>
<td>31m15s</td>
<td>Connected</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>HEALTH_OK</td>
</tr>
</tbody>
</table>

3.3.6. Verifying that storage cluster is ready

Run the following command to verify if the storage cluster is ready and the **External** option is set to true.

```bash
$ oc get storagecluster -n openshift-storage
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>AGE</th>
<th>PHASE</th>
<th>EXTERNAL</th>
<th>CREATED AT</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>ocs-external-storagecluster</td>
<td>31m15s</td>
<td>Ready</td>
<td>true</td>
<td>2021-02-29T20:43:04Z</td>
<td>4.8.0</td>
</tr>
</tbody>
</table>

3.4. UNINSTALLING OPENSHIFT CONTAINER STORAGE IN EXTERNAL MODE

3.4.1. Uninstalling OpenShift Container Storage in External mode

Use the steps in this section to uninstall OpenShift Container Storage. Uninstalling OpenShift Container Storage does not remove the RBD pool from the external cluster, or uninstall the external Red Hat Ceph Storage cluster.

**Uninstall Annotations**

Annotations on the Storage Cluster are used to change the behavior of the uninstall process. To define the uninstall behavior, the following two annotations have been introduced in the storage cluster:

- `uninstall.ocs.openshift.io/cleanup-policy: delete`
- `uninstall.ocs.openshift.io/mode: graceful`
NOTE

The `uninstall.ocs.openshift.io/cleanup-policy` is not applicable for external mode.

The below table provides information on the different values that can be used with these annotations:

<table>
<thead>
<tr>
<th>Annotation</th>
<th>Value</th>
<th>Default</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>cleanup-policy</td>
<td>delete</td>
<td>Yes</td>
<td>Rook cleans up the physical drives and the DataDirHostPath</td>
</tr>
<tr>
<td>cleanup-policy</td>
<td>retain</td>
<td>No</td>
<td>Rook does not clean up the physical drives and the DataDirHostPath</td>
</tr>
<tr>
<td>mode</td>
<td>graceful</td>
<td>Yes</td>
<td>Rook and NooBaa pauses the uninstall process until the PVCs and the OBCs are removed by the administrator/user</td>
</tr>
<tr>
<td>mode</td>
<td>forced</td>
<td>No</td>
<td>Rook and NooBaa proceeds with uninstall even if PVCs/OBCs provisioned using Rook and NooBaa exist respectively</td>
</tr>
</tbody>
</table>

You can change the uninstall mode by editing the value of the annotation by using the following commands:

```bash
$ oc annotate storagecluster ocs-external-storagecluster uninstall.ocs.openshift.io/mode="forced" --overwrite storagecluster.ocs.openshift.io/ocs-external-storagecluster annotated
```

Prerequisites

- Ensure that the OpenShift Container Storage cluster is in a healthy state. The uninstall process can fail when some of the pods are not terminated successfully due to insufficient resources or nodes. In case the cluster is in an unhealthy state, contact Red Hat Customer Support before uninstalling OpenShift Container Storage.

- Ensure that applications are not consuming persistent volume claims (PVCs) or object bucket claims (OBCs) using the storage classes provided by OpenShift Container Storage.

Procedure

1. Delete the volume snapshots that are using OpenShift Container Storage.
a. List the volume snapshots from all the namespaces

```
$ oc get volumesnapshot --all-namespaces
```

b. From the output of the previous command, identify and delete the volume snapshots that are using OpenShift Container Storage.

```
$ oc delete volumesnapshot <VOLUME-SNAPSHOT-NAME> -n <NAMESPACE>
```

2. Delete PVCs and OBCs that are using OpenShift Container Storage.

   In the default uninstall mode (graceful), the uninstaller waits till all the PVCs and OBCs that use OpenShift Container Storage are deleted.

   If you wish to delete the Storage Cluster without deleting the PVCs beforehand, you may set the uninstall mode annotation to "forced" and skip this step. Doing so will result in orphan PVCs and OBCs in the system.

      See [Removing monitoring stack from OpenShift Container Storage](#)

   b. Delete OpenShift Container Platform Registry PVCs using OpenShift Container Storage.

      [Removing OpenShift Container Platform registry from OpenShift Container Storage](#)

   c. Delete OpenShift Container Platform logging PVCs using OpenShift Container Storage.

      [Removing the cluster logging operator from OpenShift Container Storage](#)

   d. Delete other PVCs and OBCs provisioned using OpenShift Container Storage.

      Given below is a sample script to identify the PVCs and OBCs provisioned using OpenShift Container Storage. The script ignores the PVCs and OBCs that are used internally by OpenShift Container Storage.

```bash
#!/bin/bash

RBD_PROVISIONER="openshift-storage.rbd.csi.ceph.com"
CEPHFS_PROVISIONER="openshift-storage.cephfs.csi.ceph.com"
NOOBAA_PROVISIONER="openshift-storage.noobaa.io/obc"
RGW_PROVISIONER="openshift-storage.ceph.rook.io/bucket"

NOOBAA_DB_PVC="noobaa-db"
NOOBAA_BACKINGSTORE_PVC="noobaa-default-backing-store-noobaa-pvc"

# Find all the OCS StorageClasses
OCS_STORAGECLASSES=$(oc get storageclasses | grep -e "$RBD_PROVISIONER" -e "$CEPHFS_PROVISIONER" -e "$NOOBAA_PROVISIONER" -e "$RGW_PROVISIONER" | awk '{print $1}')

# List PVCs in each of the StorageClasses
for SC in $OCS_STORAGECLASSES
doi
    echo
    echo "==============================================================="
doecho
    echo "$SC StorageClass PVCs and OBCs"
```
```
echo "====================================================================
==
oc get pvc --all-namespaces --no-headers 2>/dev/null | grep $SC | grep -v -e 
"$NOOBAADBPVC" -e "$NOOBAABACKINGSTORE_PVC" 
oc get obc --all-namespaces --no-headers 2>/dev/null | grep $SC 
edone

- Delete the OBCs.
  $ oc delete obc <obc name> -n <project name>

- Delete the PVCs.
  $ oc delete pvc <pvc name> -n <project-name>

Ensure that you have removed any custom backing stores, bucket classes, etc., created in the cluster.

3. Delete the Storage Cluster object and wait for the removal of the associated resources.
   $ oc delete -n openshift-storage storagecluster --all --wait=true

4. Delete the namespace and wait until the deletion is complete. You will need to switch to another project if openshift-storage is the active project. For example:
   $ oc project default
   $ oc delete project openshift-storage --wait=true --timeout=5m

   The project is deleted if the following command returns a **NotFound** error.
   $ oc get project openshift-storage

   **NOTE**

   While uninstalling OpenShift Container Storage, if the namespace is not deleted completely and remains in **Terminating** state, perform the steps in **Troubleshooting and deleting remaining resources during Uninstall** to identify objects that are blocking the namespace from being terminated.

5. Confirm all PVs provisioned using OpenShift Container Storage are deleted. If there is any PV left in the **Released** state, delete it.
   $ oc get pv
   $ oc delete pv <pv name>

6. Delete the Multicloud Object Gateway storageclass.
   $ oc delete storageclass openshift-storage.noobaa.io --wait=true --timeout=5m
```
3. DEPLOYING OPENSFIGHT CONTAINER STORAGE ON RED HAT OPENSTACK PLATFORM IN EXTERNAL MODE

7. Remove **CustomResourceDefinitions**.

   ```
   $ oc delete crd backingstores.noobaa.io bucketclasses.noobaa.io cephblockpools.ceph.rook.io cephclusters.ceph.rook.io cephfilesystems.ceph.rook.io cephnfses.ceph.rook.io cephobjectstores.ceph.rook.io cephobjectstoreusers.ceph.rook.io noobaas.noobaa.io ocsinitializations.ocs.openshift.io storageclusters.ocs.openshift.io cephclients.ceph.rook.io cephobjectrealms.ceph.rook.io cephobjectzonegroups.ceph.rook.io cephobjectzones.ceph.rook.io cephhrbdmirrors.ceph.rook.io --wait=true --timeout=5m
   ```

8. To ensure that OpenShift Container Storage is uninstalled completely, on the OpenShift Container Platform Web Console,

   a. Click **Storage**.

   b. Verify that **Overview** no longer appears under **Storage**.

### 3.4.2. Removing monitoring stack from OpenShift Container Storage

Use this section to clean up the monitoring stack from OpenShift Container Storage.

The PVCs that are created as a part of configuring the monitoring stack are in the **openshift-monitoring** namespace.

**Prerequisites**

- PVCs are configured to use OpenShift Container Platform monitoring stack.
  For information, see configuring monitoring stack.

**Procedure**

1. List the pods and PVCs that are currently running in the **openshift-monitoring** namespace.

   ```
   $ oc get pod,pvc -n openshift-monitoring
   NAME                           READY   STATUS    RESTARTS   AGE
   pod/alertmanager-main-0         3/3     Running   0          8d
   pod/alertmanager-main-1         3/3     Running   0          8d
   pod/alertmanager-main-2         3/3     Running   0          8d
   pod/cluster-monitoring-operator-84457656d-pkrxm 1/1     Running   0          8d
   pod/grafana-79ccf6689f-2iil2    2/2     Running   0          8d
   pod/kube-state-metrics-7d86f96b96-rvd9w 3/3     Running   0          8d
   pod/node-exporter-25894         2/2     Running   0          8d
   pod/node-exporter-4dsd7         2/2     Running   0          8d
   pod/node-exporter-6p4zc         2/2     Running   0          8d
   pod/node-exporter-bjivg         2/2     Running   0          8d
   pod/node-exporter-4j4ts         2/2     Running   0          6d18h
   pod/node-exporter-k856s         2/2     Running   0          6d18h
   pod/node-exporter-rflgn         2/2     Running   0          8d
   pod/node-exporter-rmb5m         2/2     Running   0          6d18h
   pod/node-exporter-zj7kx         2/2     Running   0          8d
   pod/openshift-state-metrics-59dbd4f654-4clgn 3/3     Running   0          8d
   pod/prometheus-adapter-5df5865596-k8dzn 1/1     Running   0          7d23h
   ```
pod/prometheus-adapter-5df5865596-n2gj9  1/1  Running 0  7d23h
pod/prometheus-k8s-0  6/6  Running 1  8d
pod/prometheus-k8s-1  6/6  Running 1  8d
pod/prometheus-operator-55cfb858c9-c4zd9  1/1  Running 0  6d21h
pod/telemeter-client-78fc8fc97d-2rgfp  3/3  Running 0  8d

NAME                              STATUS   VOLUME                                      CAPACITY   ACCESS MODES   STORAGECLASS                  AGE

2. Edit the monitoring configmap.

```bash
$ oc -n openshift-monitoring edit configmap cluster-monitoring-config
```

3. Remove any config sections that reference the OpenShift Container Storage storage classes as shown in the following example and save it.

```
Before editing
```
apiVersion: v1
data:
  config.yaml: |
    alertmanagerMain:
      volumeClaimTemplate:
        metadata:
          name: my-alertmanager-claim
        spec:
          resources:
            requests:
              storage: 40Gi
              storageClassName: ocs-external-storagecluster-ceph-rbd
    prometheusK8s:
      volumeClaimTemplate:
        metadata:
          name: my-prometheus-claim
        spec:
          resources:
            requests:
              storage: 40Gi
              storageClassName: ocs-external-storagecluster-ceph-rbd
kind: ConfigMap
metadata:
  creationTimestamp: "2019-12-02T07:47:29Z"
  name: cluster-monitoring-config
  namespace: openshift-monitoring
  resourceVersion: "22110"
  selfLink: /api/v1/namespaces/openshift-monitoring/configmaps/cluster-monitoring-config
  uid: fd6d988b-14d7-11ea-84ff-066035b9efa8
In this example, `alertmanagerMain` and `prometheusK8s` monitoring components are using the OpenShift Container Storage PVCs.

4. List the pods consuming the PVC.

In this example, the `alertmanagerMain` and `prometheusK8s` pods that were consuming the PVCs are in the **Terminating** state. You can delete the PVCs once these pods are no longer using OpenShift Container Storage PVC.

```bash
$ oc get pod,pvc -n openshift-monitoring
```

</tbody>
</table>
5. Delete relevant PVCs. Make sure you delete all the PVCs that are consuming the storage classes.

```bash
$ oc delete -n openshift-monitoring pvc <pvc-name> --wait=true --timeout=5m
```

### 3.4.3. Removing OpenShift Container Platform registry from OpenShift Container Storage

Use this section to clean up OpenShift Container Platform registry from OpenShift Container Storage. If you want to configure an alternative storage, see [image registry](#).

The PVCs that are created as a part of configuring OpenShift Container Platform registry are in the `openshift-image-registry` namespace.

**Prerequisites**

- The image registry should have been configured to use an OpenShift Container Storage PVC.

**Procedure**

1. Edit the `configs.imageregistry.operator.openshift.io` object and remove the content in the `storage` section.

   ```bash
   $ oc edit configs.imageregistry.operator.openshift.io
   ```

   **Before editing**
In this example, the PVC is called `registry-cephfs-rwx-pvc`, which is now safe to delete.

2. Delete the PVC.

   ```bash
   $ oc delete pvc <pvc-name> -n openshift-image-registry --wait=true --timeout=5m
   ```

3.4.4. Removing the cluster logging operator from OpenShift Container Storage

Use this section to clean up the cluster logging operator from OpenShift Container Storage.

The PVCs that are created as a part of configuring cluster logging operator are in the `openshift-logging` namespace.

**Prerequisites**

- The cluster logging instance should have been configured to use OpenShift Container Storage PVCs.

**Procedure**

1. Remove the `ClusterLogging` instance in the namespace.

   ```bash
   $ oc delete clusterlogging instance -n openshift-logging --wait=true --timeout=5m
   ```

   The PVCs in the `openshift-logging` namespace are now safe to delete.

2. Delete PVCs.
$ oc delete pvc <pvc-name> -n openshift-logging --wait=true --timeout=5m
CHAPTER 4. STORAGE CLASSES AND STORAGE POOLS

The OpenShift Container Storage operator installs a default storage class depending on the platform in use. This default storage class is owned and controlled by the operator and it cannot be deleted or modified. However, you can create a custom storage class if you want the storage class to have a different behavior.

You can create multiple storage pools which map to storage classes that provide the following features:

- Enable applications with their own high availability to use persistent volumes with two replicas, potentially improving application performance.
- Save space for persistent volume claims using storage classes with compression enabled.

**NOTE**

Multiple storage classes and multiple pools are not supported for *external mode* OpenShift Container Storage clusters.

**NOTE**

With a minimal cluster of a single device set, only two new storage classes can be created. Every storage cluster expansion allows two new additional storage classes.

4.1. CREATING STORAGE CLASSES AND POOLS

You can create a storage class using an existing pool or you can create a new pool for the storage class while creating it.

**Prerequisites**

- Ensure that you are logged into the OpenShift Container Platform web console and OpenShift Container Storage cluster is in **Ready** state.

**Procedure**

1. Click **Storage → Storage Classes**.
2. Click **Create Storage Class**.
3. Enter the storage class **Name** and **Description**.
4. Select either **Delete** or **Retain** for the Reclaim Policy. By default, **Delete** is selected.
5. Select RBD Provisioner which is the plugin used for provisioning the persistent volumes.
6. Select an existing **Storage Pool** from the list or create a new pool.

**Create new pool**

a. Click **Create New Pool**

b. Enter **Pool name**

c. Choose **2-way-Replication** or **3-way-Replication** as the Data Protection Policy.
d. Select **Enable compression** if you need to compress the data. Enabling compression can impact application performance and might prove ineffective when data to be written is already compressed or encrypted.

e. Click **Create** to create the new storage pool.

f. Click **Finish** after the pool is created.

7. (Optional) Select **Enable Encryption** checkbox.

8. Click **Create** to create the storage class.

### 4.2. CREATING A STORAGE CLASS FOR PERSISTENT VOLUME ENCRYPTION

Use the following procedure to create an encryption enabled storage class using an external key management system (KMS) for persistent volume encryption. Persistent volume encryption is only available for RBD PVs.

**Prerequisites**

- The OpenShift Container Storage cluster is in **Ready** state.

- On the external key management system (KMS),
  - Ensure that a policy with a token exists and the key value backend path in Vault is enabled. See [Enabling key value and policy in Vault](#).
  - Ensure that you are using signed certificates on your Vault servers.

- Create a secret in the tenant’s namespace as follows:
  - On the OpenShift Container Platform web console, navigate to **Workloads → Secrets**
  - Click **Create → Key/value secret**
  - Enter **Secret Name** as *ceph-csi-kms-token*.
  - Enter **Key** as *token*.
  - Enter **Value**. It is the token from Vault. You can either click **Browse** to select and upload the file containing the token or enter the token directly in the text box.
  - Click **Create**.

**NOTE**

The token can be deleted only after all the encrypted PVCs using the *ceph-csi-kms-token* have been deleted.

**Procedure**

1. Navigate to **Storage → Storage Classes**.

2. Click **Create Storage Class**
3. Enter the storage class Name and Description.

4. Select either Delete or Retain for the Reclaim Policy. By default, Delete is selected.

5. Select RBD Provisioner openshift-storage.rbd.csi.ceph.com which is the plugin used for provisioning the persistent volumes.

6. Select Storage Pool where the volume data will be stored from the list or create a new pool.

7. Select Enable Encryption checkbox.
   a. Key Management Service Provider is set to Vault by default.
   b. Enter Vault Service Name, host Address of Vault server ('https://<hostname or ip>'), and Port number.
   c. Expand Advanced Settings to enter additional settings and certificate details based on your Vault configuration.
      i. Enter the key value secret path in Backend Path that is dedicated and unique to OpenShift Container Storage.
      ii. (Optional) Enter TLS Server Name and Vault Enterprise Namespace
      iii. Provide CA Certificate, Client Certificate and Client Private Key by uploading the respective PEM encoded certificate file.
      iv. Click Save.
   d. Click Connect.

8. Review external key management service Connection details. To modify the information, click Change connection details and edit the fields.

9. Click Create.

**IMPORTANT**

Red Hat works with the technology partners to provide this documentation as a service to the customers. However, Red Hat does not provide support for the Hashicorp product. For technical assistance with this product, contact Hashicorp.

**Next steps**

- The storage class can be used to create encrypted persistent volumes. For more information, see managing persistent volume claims.
You can use OpenShift Container Storage to provide storage for OpenShift Container Platform services such as image registry, monitoring, and logging.

The process for configuring storage for these services depends on the infrastructure used in your OpenShift Container Storage deployment.

**WARNING**

Always ensure that you have plenty of storage capacity for these services. If the storage for these critical services runs out of space, the cluster becomes inoperable and very difficult to recover.

Red Hat recommends configuring shorter curation and retention intervals for these services. See Configuring the Curator schedule and the Modifying retention time for Prometheus metrics data sub section of Configuring persistent storage in the OpenShift Container Platform documentation for details.

If you do run out of storage space for these services, contact Red Hat Customer Support.

### 5.1. CONFIGURING IMAGE REGISTRY TO USE OPENSHIFT CONTAINER STORAGE

OpenShift Container Platform provides a built in Container Image Registry which runs as a standard workload on the cluster. A registry is typically used as a publication target for images built on the cluster as well as a source of images for workloads running on the cluster.

**WARNING**

This process does not migrate data from an existing image registry to the new image registry. If you already have container images in your existing registry, back up your registry before you complete this process, and re-register your images when this process is complete.

**Prerequisites**

- You have administrative access to OpenShift Web Console.
- OpenShift Container Storage Operator is installed and running in the `openshift-storage` namespace. In OpenShift Web Console, click Operators → Installed Operators to view installed operators.
- Image Registry Operator is installed and running in the `openshift-image-registry` namespace. In OpenShift Web Console, click `Administration → Cluster Settings → Cluster Operators` to view cluster operators.

- A storage class with provisioner `openshift-storage.cephfs.csi.ceph.com` is available. In OpenShift Web Console, click `Storage → Storage Classes` to view available storage classes.

Procedure

1. Create a Persistent Volume Claim for the Image Registry to use.
   a. In the OpenShift Web Console, click `Storage → Persistent Volume Claims`
   b. Set the `Project` to `openshift-image-registry`.
   c. Click `Create Persistent Volume Claim`
      i. From the list of available storage classes retrieved above, specify the `Storage Class` with the provisioner `openshift-storage.cephfs.csi.ceph.com`.
      ii. Specify the Persistent Volume Claim `Name`, for example, `ocs4registry`.
      iii. Specify an `Access Mode` of `Shared Access (RWX)`.
      iv. Specify a `Size` of at least 100 GB.
      v. Click `Create`.
         Wait until the status of the new Persistent Volume Claim is listed as `Bound`.

2. Configure the cluster’s Image Registry to use the new Persistent Volume Claim.
   a. Click `Administration → Custom Resource Definitions`
   b. Click the `Config` custom resource definition associated with the `imageregistry.operator.openshift.io` group.
   c. Click the `Instances` tab.
   d. Beside the cluster instance, click the `Action Menu ( ⋮ ) → Edit Config`.
   e. Add the new Persistent Volume Claim as persistent storage for the Image Registry.
      i. Add the following under `spec:`; replacing the existing `storage:` section if necessary.

```
storage:
pvc:
  claim: <new-pvc-name>
```

For example:

```
storage:
pvc:
  claim: ocs4registry
```

ii. Click `Save`.

3. Verify that the new configuration is being used.
a. Click Workloads → Pods.

b. Set the Project to openshift-image-registry.

c. Verify that the new image-registry-* pod appears with a status of Running, and that the previous image-registry-* pod terminates.

d. Click the new image-registry-* pod to view pod details.

e. Scroll down to Volumes and verify that the registry-storage volume has a Type that matches your new Persistent Volume Claim, for example, ocs4registry.

5.2. CONFIGURING MONITORING TO USE OPENSSHIFT CONTAINER STORAGE

OpenShift Container Storage provides a monitoring stack that comprises of Prometheus and Alert Manager.

Follow the instructions in this section to configure OpenShift Container Storage as storage for the monitoring stack.

IMPORTANT

Monitoring will not function if it runs out of storage space. Always ensure that you have plenty of storage capacity for monitoring.

Red Hat recommends configuring a short retention interval for this service. See the Modifying retention time for Prometheus metrics data of Monitoring guide in the OpenShift Container Platform documentation for details.

Prerequisites

- You have administrative access to OpenShift Web Console.
- OpenShift Container Storage Operator is installed and running in the openshift-storage namespace. In the OpenShift Web Console, click Operators → Installed Operators to view installed operators.
- Monitoring Operator is installed and running in the openshift-monitoring namespace. In the OpenShift Web Console, click Administration → Cluster Settings → Cluster Operators to view cluster operators.
- A storage class with provisioner openshift-storage.rbd.csi.ceph.com is available. In the OpenShift Web Console, click Storage → Storage Classes to view available storage classes.

Procedure

1. In the OpenShift Web Console, go to Workloads → Config Maps.
2. Set the Project dropdown to openshift-monitoring.
3. Click Create Config Map.
4. Define a new cluster-monitoring-config Config Map using the following example.
Replace the content in angle brackets (<, >) with your own values, for example, retention: 24h or storage: 40Gi.

Replace the `storageClassName` with the `storageclass` that uses the provisioner `openshift-storage.rbd.csi.ceph.com`. In the example given below the name of the `storageclass` is `ocs-storagecluster-ceph-rbd`.

**Example cluster-monitoring-config Config Map**

```yaml
apiVersion: v1
kind: ConfigMap
metadata:
  name: cluster-monitoring-config
  namespace: openshift-monitoring
data:
  config.yaml: |
    prometheusK8s:
      retention: <time to retain monitoring files, e.g. 24h>
      volumeClaimTemplate:
        metadata:
          name: ocs-prometheus-claim
        spec:
          storageClassName: ocs-storagecluster-ceph-rbd
          resources:
            requests:
              storage: <size of claim, e.g. 40Gi>
    alertmanagerMain:
      volumeClaimTemplate:
        metadata:
          name: ocs-alertmanager-claim
        spec:
          storageClassName: ocs-storagecluster-ceph-rbd
          resources:
            requests:
              storage: <size of claim, e.g. 40Gi>
```

5. Click **Create** to save and create the Config Map.

**Verification steps**

1. Verify that the Persistent Volume Claims are bound to the pods.
   a. Go to **Storage → Persistent Volume Claims**
   b. Set the **Project** dropdown to **openshift-monitoring**.
   c. Verify that 5 Persistent Volume Claims are visible with a state of **Bound**, attached to three `alertmanager-main-*` pods, and two `prometheus-k8s-*` pods.

   Monitoring storage created and bound
2. Verify that the new `alertmanager-main-*` pods appear with a state of **Running**.
   a. Go to Workloads → Pods.
   b. Click the new `alertmanager-main-*` pods to view the pod details.
   c. Scroll down to Volumes and verify that the volume has a **Type**, `ocs-alertmanager-claim` that matches one of your new Persistent Volume Claims, for example, `ocs-alertmanager-claim-alertmanager-main-0`.

3. Verify that the new `prometheus-k8s-*` pods appear with a state of **Running**.
   a. Click the new `prometheus-k8s-*` pods to view the pod details.
   b. Scroll down to Volumes and verify that the volume has a **Type**, `ocs-prometheus-claim` that matches one of your new Persistent Volume Claims, for example, `ocs-prometheus-claim-prometheus-k8s-0`.

---

5.3. CLUSTER LOGGING FOR OPENSHIFT CONTAINER STORAGE
You can deploy cluster logging to aggregate logs for a range of OpenShift Container Platform services. For information about how to deploy cluster logging, see Deploying cluster logging.

Upon initial OpenShift Container Platform deployment, OpenShift Container Storage is not configured by default and the OpenShift Container Platform cluster will solely rely on default storage available from the nodes. You can edit the default configuration of OpenShift logging (ElasticSearch) to be backed by OpenShift Container Storage to have OpenShift Container Storage backed logging (Elasticsearch).

**IMPORTANT**

Always ensure that you have plenty of storage capacity for these services. If you run out of storage space for these critical services, the logging application becomes inoperable and very difficult to recover.

Red Hat recommends configuring shorter curation and retention intervals for these services. See Cluster logging curator in the OpenShift Container Platform documentation for details.

If you run out of storage space for these services, contact Red Hat Customer Support.

### 5.3.1 Configuring persistent storage

You can configure a persistent storage class and size for the Elasticsearch cluster using the storage class name and size parameters. The Cluster Logging Operator creates a Persistent Volume Claim for each data node in the Elasticsearch cluster based on these parameters. For example:

```yaml
spec:
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 3
      storage:
        storageClassName: "ocs-storagecluster-ceph-rbd"
        size: "200G"
```

This example specifies that each data node in the cluster will be bound to a Persistent Volume Claim that requests 200GiB of ocs-storagecluster-ceph-rbd storage. Each primary shard will be backed by a single replica. A copy of the shard is replicated across all the nodes and are always available and the copy can be recovered if at least two nodes exist due to the single redundancy policy. For information about Elasticsearch replication policies, see Elasticsearch replication policy in About deploying and configuring cluster logging.

**NOTE**

Omission of the storage block will result in a deployment backed by default storage. For example:

```yaml
spec:
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 3
      storage: {}
```
For more information, see Configuring cluster logging.

5.3.2. Configuring cluster logging to use OpenShift Container Storage

Follow the instructions in this section to configure OpenShift Container Storage as storage for the OpenShift cluster logging.

**NOTE**

You can obtain all the logs when you configure logging for the first time in OpenShift Container Storage. However, after you uninstall and reinstall logging, the old logs are removed and only the new logs are processed.

**Prerequisites**

- You have administrative access to OpenShift Web Console.
- OpenShift Container Storage Operator is installed and running in the `openshift-storage` namespace.
- Cluster logging Operator is installed and running in the `openshift-logging` namespace.

**Procedure**

1. Click **Administration → Custom Resource Definitions** from the left pane of the OpenShift Web Console.

2. On the Custom Resource Definitions page, click **ClusterLogging**.

3. On the Custom Resource Definition Overview page, select **View Instances** from the Actions menu or click the **Instances** Tab.

4. On the Cluster Logging page, click **Create Cluster Logging**. You might have to refresh the page to load the data.

5. In the YAML, replace the `storageClassName` with the `storageclass` that uses the provisioner `openshift-storage.rbd.csi.ceph.com`. In the example given below the name of the `storageclass` is `ocs-storagecluster-ceph-rbd`:

```yaml
apiVersion: "logging.openshift.io/v1"
kind: "ClusterLogging"
metadata:
  name: "instance"
  namespace: "openshift-logging"
spec:
  managementState: "Managed"
  logStore:
    type: "elasticsearch"
    elasticsearch:
      nodeCount: 3
    storage:
      storageClassName: ocs-storagecluster-ceph-rbd
      size: 200G # Change as per your requirement
      redundancyPolicy: "SingleRedundancy"
  visualization:
```
type: "kibana"
kibana:
  replicas: 1
curation:
  type: "curator"
curator:
    schedule: "30 3 * * *"
collection:
  logs:
    type: "fluentd"
    fluentd: {}

If you have tainted the OpenShift Container Storage nodes, you must add toleration to enable scheduling of the daemonset pods for logging.

spec:
  [...]  
collection:
  logs:
    fluentd:
      tolerations:
      - effect: NoSchedule
        key: node.ocs.openshift.io/storage
        value: 'true'
type: fluentd

6. Click Save.

Verification steps

1. Verify that the Persistent Volume Claims are bound to the elasticsearch pods.
   a. Go to Storage → Persistent Volume Claims
   b. Set the Project dropdown to openshift-logging.
   c. Verify that Persistent Volume Claims are visible with a state of Bound, attached to elasticsearch-* pods.

   Figure 5.1. Cluster logging created and bound

2. Verify that the new cluster logging is being used.
   a. Click Workload → Pods
b. Set the Project to `openshift-logging`.

c. Verify that the new `elasticsearch-*` pods appear with a state of `Running`.

d. Click the new `elasticsearch-*` pod to view pod details.

e. Scroll down to `Volumes` and verify that the `elasticsearch` volume has a `Type` that matches your new Persistent Volume Claim, for example, `elasticsearch-elasticsearch-cdm-9r624biv-3`.

f. Click the Persistent Volume Claim name and verify the storage class name in the `PersistentVolumeClaim Overview` page.

**NOTE**

Make sure to use a shorter curator time to avoid PV full scenario on PVs attached to Elasticsearch pods.

You can configure Curator to delete Elasticsearch data based on retention settings. It is recommended that you set the following default index data retention of 5 days as a default.

```
config.yaml:
  openshift-storage:
    delete:
      days: 5
```

For more details, see [Curation of Elasticsearch Data](#).

**NOTE**

To uninstall the cluster logging backed by Persistent Volume Claim, use the procedure removing the cluster logging operator from OpenShift Container Storage in the uninstall chapter of the respective deployment guide.
CHAPTER 6. BACKING OPENSHIFT CONTAINER PLATFORM APPLICATIONS WITH OPENSHIFT CONTAINER STORAGE

You cannot directly install OpenShift Container Storage during the OpenShift Container Platform installation. However, you can install OpenShift Container Storage on an existing OpenShift Container Platform by using the Operator Hub and then configure the OpenShift Container Platform applications to be backed by OpenShift Container Storage.

Prerequisites

- OpenShift Container Platform is installed and you have administrative access to OpenShift Web Console.
- OpenShift Container Storage is installed and running in the openshift-storage namespace.

Procedure

1. In the OpenShift Web Console, perform one of the following:
   - Click Workloads → Deployments.
     In the Deployments page, you can do one of the following:
       - Select any existing deployment and click Add Storage option from the Action menu (⋮).
       - Create a new deployment and then add storage.
         i. Click Create Deployment to create a new deployment.
         ii. Edit the YAML based on your requirement to create a deployment.
         iii. Click Create.
         iv. Select Add Storage from the Actions drop down menu on the top right of the page.
   - Click Workloads → Deployment Configs
     In the Deployment Configs page, you can do one of the following:
       - Select any existing deployment and click Add Storage option from the Action menu (⋮).
       - Create a new deployment and then add storage.
         i. Click Create Deployment Config to create a new deployment.
         ii. Edit the YAML based on your requirement to create a deployment.
         iii. Click Create.
         iv. Select Add Storage from the Actions drop down menu on the top right of the page.

2. In the Add Storage page, you can choose one of the following options:
   - Click the Use existing claim option and select a suitable PVC from the drop down list.
• Click the **Create new claim** option.
  
a. Select the appropriate **CephFS** or **RBD** storage class from the **Storage Class** drop down list.
  
b. Provide a name for the Persistent Volume Claim.
  
c. Select ReadWriteOnce (RWO) or ReadWriteMany (RWX) access mode.

**NOTE**

ReadOnlyMany (ROX) is deactivated as it is not supported.

  
d. Select the size of the desired storage capacity.

**NOTE**

You can expand the block PVs but cannot reduce the storage capacity after the creation of Persistent Volume Claim.

3. Specify the mount path and subpath (if required) for the mount path volume inside the container.

4. Click **Save**.

**Verification steps**

1. Depending on your configuration, perform one of the following:

   • Click **Workloads** → **Deployments**.

   • Click **Workloads** → **Deployment Configs**

2. Set the Project as required.

3. Click the deployment for which you added storage to display the deployment details.

4. Scroll down to **Volumes** and verify that your deployment has a **Type** that matches the Persistent Volume Claim that you assigned.

5. Click the Persistent Volume Claim name and verify the storage class name in the Persistent Volume Claim Overview page.
CHAPTER 7. HOW TO USE DEDICATED WORKER NODES FOR RED HAT OPENSHIFT CONTAINER STORAGE

Using infrastructure nodes to schedule Red Hat OpenShift Container Storage resources saves on Red Hat OpenShift Container Platform subscription costs. Any Red Hat OpenShift Container Platform (RHOCP) node that has an *infra* node-role label requires an OpenShift Container Storage subscription, but not an RHOCP subscription.

It is important to maintain consistency across environments with or without Machine API support. Because of this, it is highly recommended in all cases to have a special category of nodes labeled as either worker or infra or have both roles. See the Section 7.3, “Manual creation of infrastructure nodes” section for more information.

7.1. ANATOMY OF AN INFRASTRUCTURE NODE

Infrastructure nodes for use with OpenShift Container Storage have a few attributes. The *infra* node-role label is required to ensure the node does not consume RHOCP entitlements. The *infra* node-role label is responsible for ensuring only OpenShift Container Storage entitlements are necessary for the nodes running OpenShift Container Storage.

- Labeled with `node-role.kubernetes.io/infra`

Adding an OpenShift Container Storage taint with a *NoSchedule* effect is also required so that the *infra* node will only schedule OpenShift Container Storage resources.

- Tainted with `node.ocs.openshift.io/storage="true"

The label identifies the RHOCOp node as an *infra* node so that RHOCOp subscription cost is not applied. The taint prevents non OpenShift Container Storage resources to be scheduled on the tainted nodes.

Example of the taint and labels required on infrastructure node that will be used to run OpenShift Container Storage services:

```yaml
spec:
taints:
  - effect: NoSchedule
    key: node.ocs.openshift.io/storage
    value: "true"
metadata:
  creationTimestamp: null
labels:
  node-role.kubernetes.io/worker: ""
  node-role.kubernetes.io/infra: ""
  cluster.ocs.openshift.io/openshift-storage: ""
```

7.2. MACHINE SETS FOR CREATING INFRASTRUCTURE NODES

If the Machine API is supported in the environment, then labels should be added to the templates for the Machine Sets that will be provisioning the infrastructure nodes. Avoid the anti-pattern of adding labels manually to nodes created by the machine API. Doing so is analogous to adding labels to pods created by a deployment. In both cases, when the pod/node fails, the replacement pod/node will not have the appropriate labels.
NOTE

In EC2 environments, you will need three machine sets, each configured to provision infrastructure nodes in a distinct availability zone (such as us-east-2a, us-east-2b, us-east-2c). Currently, OpenShift Container Storage does not support deploying in more than three availability zones.

The following Machine Set template example creates nodes with the appropriate taint and labels required for infrastructure nodes. This will be used to run OpenShift Container Storage services.

```yaml
template:
  metadata:
    creationTimestamp: null
  labels:
    machine.openshift.io/cluster-api-cluster: kb-s25vf
    machine.openshift.io/cluster-api-machine-role: worker
    machine.openshift.io/cluster-api-machine-type: worker
    machine.openshift.io/cluster-api-machineset: kb-s25vf-infra-us-west-2a
  spec:
    taints:
      - effect: NoSchedule
        key: node.ocs.openshift.io/storage
        value: "true"
    metadata:
      creationTimestamp: null
      labels:
        node-role.kubernetes.io/infra: ""
        cluster.ocs.openshift.io/openshift-storage: ""
```

7.3. MANUAL CREATION OF INFRASTRUCTURE NODES

Only when the Machine API is not supported in the environment should labels be directly applied to nodes. Manual creation requires that at least 3 RHOCP worker nodes are available to schedule OpenShift Container Storage services, and that these nodes have sufficient CPU and memory resources. To avoid the RHOCP subscription cost, the following is required:

```bash
oc label node <node> node-role.kubernetes.io/infra=""
oc label node <node> cluster.ocs.openshift.io/openshift-storage=""
```

Adding a **NoSchedule** OpenShift Container Storage taint is also required so that the **infra** node will only schedule OpenShift Container Storage resources and repel any other non-OpenShift Container Storage workloads.

```bash
oc adm taint node <node> node.ocs.openshift.io/storage="true":NoSchedule
```
WARNING

Do not remove the node-role node-role.kubernetes.io/worker=""

The removal of the `node-role.kubernetes.io/worker=""` can cause issues unless changes are made both to the OpenShift scheduler and to MachineConfig resources.

If already removed, it should be added again to each `infra` node. Adding node-role `node-role.kubernetes.io/infra=""` and OpenShift Container Storage taint is sufficient to conform to entitlement exemption requirements.
CHAPTER 8. SCALING STORAGE NODES

To scale the storage capacity of OpenShift Container Storage, you can do either of the following:

- **Scale up storage nodes** - Add storage capacity to the existing OpenShift Container Storage worker nodes
- **Scale out storage nodes** - Add new worker nodes containing storage capacity

### 8.1. REQUIREMENTS FOR SCALING STORAGE NODES

Before you proceed to scale the storage nodes, refer to the following sections to understand the node requirements for your specific Red Hat OpenShift Container Storage instance:

- **Platform requirements**
- **Storage device requirements**
  - Dynamic storage devices
  - Capacity planning

---

**WARNING**

Always ensure that you have plenty of storage capacity.

If storage ever fills completely, it is not possible to add capacity or delete or migrate content away from the storage to free up space. Completely full storage is very difficult to recover.

Capacity alerts are issued when cluster storage capacity reaches 75% (near-full) and 85% (full) of total capacity. Always address capacity warnings promptly, and review your storage regularly to ensure that you do not run out of storage space.

If you do run out of storage space completely, contact Red Hat Customer Support.

---

### 8.2. SCALING UP STORAGE BY ADDING CAPACITY TO YOUR OPENSOURCE CONTAINER STORAGE NODES ON RED HAT OPENSTACK PLATFORM INFRASTRUCTURE

Use this procedure to add storage capacity and performance to your configured Red Hat OpenShift Container Storage worker nodes.

**Prerequisites**

- A running OpenShift Container Storage Platform.
- Administrative privileges on the OpenShift Web Console.
To scale using a storage class other than the one provisioned during deployment, first define an additional storage class. See Creating a storage class for details.

Procedure

1. Log in to the OpenShift Web Console.

2. Click on Operators → Installed Operators.

3. Click OpenShift Container Storage Operator.

4. Click Storage Cluster tab.

5. The visible list should have only one item. Click (⋮) on the far right to extend the options menu.

6. Select Add Capacity from the options menu.

7. Select the Storage Class.
   The storage class should be set to standard if you are using the default storage class generated during deployment. If you have created other storage classes, select whichever is appropriate.
   The Raw Capacity field shows the size set during storage class creation. The total amount of storage consumed is three times this amount, because OpenShift Container Storage uses a replica count of 3.

8. Click Add and wait for the cluster state to change to Ready.

Verification steps

- Navigate to Overview → Block and File tab, then check the Raw Capacity breakdown card. Note that the capacity increases based on your selections.

  NOTE
  The raw capacity does not take replication into account and shows the full capacity.

- Verify that the new OSDs and their corresponding new PVCs are created.
  - To view the state of the newly created OSDs:
    a. Click Workloads → Pods from the OpenShift Web Console.
    b. Select openshift-storage from the Project drop-down list.
  - To view the state of the PVCs:
    a. Click Storage → Persistent Volume Claims from the OpenShift Web Console.
    b. Select openshift-storage from the Project drop-down list.

- (Optional) If cluster-wide encryption is enabled on the cluster, verify that the new OSD devices are encrypted.
  a. Identify the node(s) where the new OSD pod(s) are running.

    $ oc get -o=custom-columns=NODE:.spec.nodeName pod/<OSD pod name>
For example:
```
oc get -o=custom-columns=NODE:.spec.nodeName pod/rook-ceph-osd-0-544db49d7f-qrgqm
```

b. For each of the nodes identified in previous step, do the following:

i. Create a debug pod and open a chroot environment for the selected host(s).
```
$ oc debug node/<node name>
$ chroot /host
```

ii. Run “lsblk” and check for the “crypt” keyword beside the `ocs-deviceset` name(s)
```
$ lsblk
```

**IMPORTANT**

Cluster reduction is not currently supported, regardless of whether reduction would be done by removing nodes or OSDs.

### 8.3. SCALING OUT STORAGE CAPACITY BY ADDING NEW NODES

To scale out storage capacity, you need to perform the following:

- Add a new node to increase the storage capacity when existing worker nodes are already running at their maximum supported OSDs, which is the increment of 3 OSDs of the capacity selected during initial configuration.

- Verify that the new node is added successfully

- Scale up the storage capacity after the node is added

**Prerequisites**

- You must be logged into OpenShift Container Platform (RHOC) cluster.

**Procedure**

1. Navigate to **Compute → Machine Sets**.
2. On the machine set where you want to add nodes, select **Edit Machine Count**.
3. Add the amount of nodes, and click **Save**.
4. Click **Compute → Nodes** and confirm if the new node is in **Ready** state.
5. Apply the OpenShift Container Storage label to the new node.
   a. For the new node, **Action menu ( ⋮ ) → Edit Labels**.
   b. Add `cluster.ocs.openshift.io/openshift-storage` and click **Save**.
NOTE

It is recommended to add 3 nodes each in different zones. You must add 3 nodes and perform this procedure for all of them.

Verification steps

- To verify that the new node is added, see Verifying the addition of a new node.

8.3.1. Verifying the addition of a new node

1. Execute the following command and verify that the new node is present in the output:

   ```bash
   $ oc get nodes --show-labels | grep cluster.ocs.openshift.io/openshift-storage= | cut -d' ' -f1
   ```

2. Click Workloads → Pods, confirm that at least the following pods on the new node are in Running state:
   - csi-cephfsplugin-*
   - csi-rbdplugin-*

8.3.2. Scaling up storage capacity

After you add a new node to OpenShift Container Storage, you must scale up the storage capacity as described in Scaling up storage by adding capacity.
CHAPTER 9. MULTICLOUD OBJECT GATEWAY

9.1. ABOUT THE MULTICLOUD OBJECT GATEWAY

The Multicloud Object Gateway (MCG) is a lightweight object storage service for OpenShift, allowing users to start small and then scale as needed on-premise, in multiple clusters, and with cloud-native storage.

9.2. ACCESSING THE MULTICLOUD OBJECT GATEWAY WITH YOUR APPLICATIONS

You can access the object service with any application targeting AWS S3 or code that uses AWS S3 Software Development Kit (SDK). Applications need to specify the MCG endpoint, an access key, and a secret access key. You can use your terminal or the MCG CLI to retrieve this information.

Prerequisites

- A running OpenShift Container Storage Platform
- Download the MCG command-line interface for easier management:
  
  ```
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ```

  **NOTE**
  Specify the appropriate architecture for enabling the repositories using subscription manager. For instance,
  
  - For IBM Power Systems, use the following command:
    
    ```
    # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-ppc64le-rpms
    ```
  
  - For IBM Z infrastructure, use the following command:
    
    ```
    # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
    ```
  
  - Alternatively, you can install the `mcg` package from the OpenShift Container Storage RPMs found at Download RedHat OpenShift Container Storage page.

  **NOTE**
  Choose the correct Product Variant according to your architecture.

You can access the relevant endpoint, access key, and secret access key two ways:

- **Section 9.2.1, “Accessing the Multicloud Object Gateway from the terminal”**
- **Section 9.2.2, “Accessing the Multicloud Object Gateway from the MCG command-line interface”**
9.2.1. Accessing the Multicloud Object Gateway from the terminal

Procedure

Run the `describe` command to view information about the MCG endpoint, including its access key (`AWS_ACCESS_KEY_ID` value) and secret access key (`AWS_SECRET_ACCESS_KEY` value):

```
# oc describe noobaa -n openshift-storage
```

The output will look similar to the following:

```
Name: noobaa
Namespace: openshift-storage
Labels: <none>
Annotations: <none>
API Version: noobaa.io/v1alpha1
Kind: NooBaa
Metadata:
  Generation: 1
  Resource Version: 6718822
  Self Link: /apis/noobaa.io/v1alpha1/namespaces/openshift-storage/noobaas/noobaa
  UID: 019cfb4a-b21d-11e9-9a02-06c8de012f9e
Spec:
  Status:
    Accounts:
      Admin:
        Secret Ref:
          Name: noobaa-admin
          Namespace: openshift-storage
        Actual Image: noobaa/noobaa-core:4.0
        Observed Generation: 1
        Phase: Ready
    Readme:

Welcome to NooBaa!
-----------------
Welcome to NooBaa!
-----------------
NooBaa Core Version:
NooBaa Operator Version:

Lets get started:

1. Connect to Management console:

   Read your mgmt console login information (email & password) from secret: "noobaa-admin".
   `kubectl get secret noobaa-admin -n openshift-storage -o json | jq '.data|map_values(@base64d)'`

   Open the management console service - take External IP/DNS or Node Port or use port forwarding:
   `kubectl port-forward -n openshift-storage service/noobaa-mgmt 11443:443 &
   open https://localhost:11443`
2. Test S3 client:

```bash
kubectl port-forward -n openshift-storage service/s3 10443:443 &

NOOBAA_ACCESS_KEY=$(kubectl get secret noobaa-admin -n openshift-storage -o json | jq -r '.data.AWS_ACCESS_KEY_ID|@base64d')

NOOBAA_SECRET_KEY=$(kubectl get secret noobaa-admin -n openshift-storage -o json | jq -r '.data.AWS_SECRET_ACCESS_KEY|@base64d')

alias s3='AWS_ACCESS_KEY_ID=$NOOBAA_ACCESS_KEY
AWS_SECRET_ACCESS_KEY=$NOOBAA_SECRET_KEY aws --endpoint https://localhost:10443 --no-verify-ssl s3'

s3 ls
```

Services:
- Service Mgmt:
  - https://a3406079515be11eaa3b70683061451e-1194613580.us-east-2.elb.amazonaws.com:443

  - Internal IP: https://172.30.235.12:443
  - Node Ports:
    - https://10.0.142.103:31385
  - Pod Ports:
    - https://10.131.0.19:8443

- serviceS3:
  - External DNS: https://s3-openshift-storage.apps.mycluster-cluster.qe.rh-ocs.com
  - https://a340f4e1315be11eaa3b70683061451e-943168195.us-east-2.elb.amazonaws.com:443
  - Internal DNS: https://s3.openshift-storage.svc:443
  - Internal IP: https://172.30.86.41:443
  - Node Ports:
    - https://10.0.142.103:31011
  - Pod Ports:
    - https://10.131.0.19:6443

1. access key (AWS_ACCESS_KEY_ID value)
2. secret access key (AWS_SECRET_ACCESS_KEY value)
3. MCG endpoint

**NOTE**

The output from the `oc describe noobaa` command lists the internal and external DNS names that are available. When using the internal DNS, the traffic is free. The external DNS uses Load Balancing to process the traffic, and therefore has a cost per hour.
9.2.2. Accessing the Multicloud Object Gateway from the MCG command-line interface

Prerequisites

- Download the MCG command-line interface:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ```

  **NOTE**
  Specify the appropriate architecture for enabling the repositories using subscription manager. For instance,

  - For IBM Power Systems, use the following command:
    ```bash
    # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-ppc64le-rpms
    ```
  - For IBM Z infrastructure, use the following command:
    ```bash
    # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
    ```

Procedure

Run the `status` command to access the endpoint, access key, and secret access key:

```bash
noobaa status -n openshift-storage
```

The output will look similar to the following:

```
INFO[0000] Namespace: openshift-storage
INFO[0000]
INFO[0000] CRD Status:
INFO[0004] Exists: CustomResourceDefinition "objectbucketclaims.objectbucket.io"

#-----------------#
#- Bucket Claims -#
#-----------------#

No OBC's found.

1. endpoint
2. access key
3. secret access key

You now have the relevant endpoint, access key, and secret access key in order to connect to your applications.

Example 9.1. Example

If AWS S3 CLI is the application, the following command will list buckets in OpenShift Container Storage:

```
AWS_ACCESS_KEY_ID=<AWS_ACCESS_KEY_ID>
AWS_SECRET_ACCESS_KEY=<AWS_SECRET_ACCESS_KEY>
aws --endpoint <ENDPOINT> --no-verify-ssl s3 ls
```

9.3. ALLOWING USER ACCESS TO THE MULTICLOUD OBJECT GATEWAY CONSOLE

To allow access to the Multicloud Object Gateway Console to a user, ensure that the user meets the following conditions:

- User is in `cluster-admins` group.
- User is in `system:cluster-admins` virtual group.

Prerequisites
A running OpenShift Container Storage Platform.

Procedure

1. Enable access to the Multicloud Object Gateway console. Perform the following steps once on the cluster:
   a. Create a `cluster-admins` group.
      
      ```
      # oc adm groups new cluster-admins
      ```
   b. Bind the group to the `cluster-admin` role.
      
      ```
      # oc adm policy add-cluster-role-to-group cluster-admin cluster-admins
      ```

2. Add or remove users from the `cluster-admins` group to control access to the Multicloud Object Gateway console.
   - To add a set of users to the `cluster-admins` group:
      
      ```
      # oc adm groups add-users cluster-admins <user-name> <user-name> <user-name>...
      ```
      where `<user-name>` is the name of the user to be added.

      **NOTE**
      If you are adding a set of users to the `cluster-admins` group, you do not need to bind the newly added users to the cluster-admin role to allow access to the OpenShift Container Storage dashboard.

   - To remove a set of users from the `cluster-admins` group:
      
      ```
      # oc adm groups remove-users cluster-admins <user-name> <user-name> <user-name>...
      ```
      where `<user-name>` is the name of the user to be removed.

Verification steps

1. On the OpenShift Web Console, login as a user with access permission to Multicloud Object Gateway Console.
2. Navigate to Storage → Overview → Object tab → select the Multicloud Object Gateway link.
3. On the Multicloud Object Gateway Console, login as the same user with access permission.
4. Click Allow selected permissions.

9.4. ADDING STORAGE RESOURCES FOR HYBRID OR MULTICLOUD

9.4.1. Creating a new backing store

Use this procedure to create a new backing store in OpenShift Container Storage.
Prerequisites

- Administrator access to OpenShift.

Procedure

1. Click **Operators → Installed Operators** from the left pane of the OpenShift Web Console to view the installed operators.

2. Click **OpenShift Container Storage** Operator.

3. On the OpenShift Container Storage Operator page, scroll right and click the **Backing Store** tab.

4. Click **Create Backing Store**.

5. On the Create New Backing Store page, perform the following:
   a. Enter a **Backing Store Name**.
   b. Select a **Provider**.
   c. Select a **Region**.
   d. Enter an **Endpoint**. This is optional.
   e. Select a **Secret** from drop down list, or create your own secret. Optionally, you can **Switch to Credentials** view which lets you fill in the required secrets. For more information on creating an OCP secret, see the section **Creating the secret** in the OpenShift Container Platform documentation.

   Each backingstore requires a different secret. For more information on creating the secret for a particular backingstore, see the Section 9.4.2, “Adding storage resources for hybrid or Multicloud using the MCG command line interface” and follow the procedure for the addition of storage resources using a YAML.
NOTE

This menu is relevant for all providers except Google Cloud and local PVC.

f. Enter **Target bucket**. The target bucket is a container storage that is hosted on the remote cloud service. It allows you to create a connection that tells MCG that it can use this bucket for the system.

6. Click **Create Backing Store**.

**Verification steps**

1. Click **Operators → Installed Operators**.
2. Click **OpenShift Container Storage Operator**.
3. Search for the new backing store or click **Backing Store** tab to view all the backing stores.

## 9.4.2. Adding storage resources for hybrid or Multicloud using the MCG command line interface

The Multicloud Object Gateway (MCG) simplifies the process of spanning data across cloud provider and clusters.

You must add a backing storage that can be used by the MCG.

Depending on the type of your deployment, you can choose one of the following procedures to create a backing storage:

- For creating an AWS-backed backingstore, see Section 9.4.2.1, “Creating an AWS-backed backingstore”
- For creating an IBM COS-backed backingstore, see Section 9.4.2.2, “Creating an IBM COS-backed backingstore”
- For creating an Azure-backed backingstore, see Section 9.4.2.3, “Creating an Azure-backed backingstore”
- For creating a GCP-backed backingstore, see Section 9.4.2.4, “Creating a GCP-backed backingstore”
- For creating a local Persistent Volume-backed backingstore, see Section 9.4.2.5, “Creating a local Persistent Volume-backed backingstore”

For VMware deployments, skip to Section 9.4.3, ”Creating an s3 compatible Multicloud Object Gateway backingstore” for further instructions.

### 9.4.2.1. Creating an AWS-backed backingstore

**Prerequisites**

- Download the Multicloud Object Gateway (MCG) command-line interface:

```
# subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
# yum install mcg
```
NOTE

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance, in case of IBM Z infrastructure use the following command:

```
# subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
```

- Alternatively, you can install the **mcg** package from the OpenShift Container Storage RPMs found here [https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages](https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages)

NOTE

Choose the correct Product Variant according to your architecture.

Procedure

1. From the MCG command-line interface, run the following command:

   ```
   noobaa backingstore create <backingstore_name> --access-key=<AWS ACCESS KEY> --secret-key=<AWS SECRET ACCESS KEY> --target-bucket <bucket-name>
   ```

   a. Replace `<backingstore_name>` with the name of the backingstore.

   b. Replace `<AWS ACCESS KEY>` and `<AWS SECRET ACCESS KEY>` with an AWS access key ID and secret access key you created for this purpose.

   c. Replace `<bucket-name>` with an existing AWS bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

   The output will be similar to the following:

   ```
   INFO[0001]  Exists: NooBaa "noobaa"
   INFO[0002]  Created: BackingStore "aws-resource"
   INFO[0002]  Created: Secret "backing-store-secret-aws-resource"
   ```

You can also add storage resources using a YAML:

1. Create a secret with the credentials:

   ```yaml
   apiVersion: v1
   kind: Secret
   metadata:
     name: <backingstore-secret-name>
   type: Opaque
   data:
     AWS_ACCESS_KEY_ID: <AWS ACCESS KEY ID ENCODED IN BASE64>
     AWS_SECRET_ACCESS_KEY: <AWS SECRET ACCESS KEY ENCODED IN BASE64>
   ```

   a. You must supply and encode your own AWS access key ID and secret access key using Base64, and use the results in place of `<AWS ACCESS KEY ID ENCODED IN BASE64>` and `<AWS SECRET ACCESS KEY ENCODED IN BASE64>`.  

b. Replace `<backingstore-secret-name>` with a unique name.

2. Apply the following YAML for a specific backing store:

```yaml
apiVersion: noobaa.io/v1alpha1
kind: BackingStore
metadata:
  finalizers:
  - noobaa.io/finalizer
labels:
  app: noobaa
  name: bs
  namespace: openshift-storage
spec:
  awsS3:
    secret:
      name: `<backingstore-secret-name>`
      namespace: noobaa
      targetBucket: `<bucket-name>`
    type: aws-s3
```

a. Replace `<bucket-name>` with an existing AWS bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

b. Replace `<backingstore-secret-name>` with the name of the secret created in the previous step.

### 9.4.2.2. Creating an IBM COS-backed backingstore

**Prerequisites**

- Download the Multicloud Object Gateway (MCG) command-line interface:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ```

**NOTE**

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance,

- For IBM Power Systems, use the following command:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-ppc64le-rpms
  ```

- For IBM Z infrastructure, use the following command:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
  ```

- Alternatively, you can install the `mcg` package from the OpenShift Container Storage RPMs found here [https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages](https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages)
Choose the correct Product Variant according to your architecture.

Procedure

1. From the MCG command-line interface, run the following command:

```bash
noobaa backingstore create ibm-cos <backingstore_name> --access-key=<IBM ACCESS KEY> --secret-key=<IBM SECRET ACCESS KEY> --endpoint=<IBM COS ENDPOINT> --target-bucket <bucket-name>
```

   a. Replace `<backingstore_name>` with the name of the backingstore.

   b. Replace `<IBM ACCESS KEY>`, `<IBM SECRET ACCESS KEY>`, `<IBM COS ENDPOINT>` with an IBM access key ID, secret access key and the appropriate regional endpoint that corresponds to the location of the existing IBM bucket. To generate the above keys on IBM cloud, you must include HMAC credentials while creating the service credentials for your target bucket.

   c. Replace `<bucket-name>` with an existing IBM bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

   The output will be similar to the following:

   ```
   INFO[0001] Exists: NooBaa "noobaa"
   INFO[0002] Created: BackingStore "ibm-resource"
   INFO[0002] Created: Secret "backing-store-secret-ibm-resource"
   ``

   You can also add storage resources using a YAML:

   1. Create a secret with the credentials:

   ```yaml
   apiVersion: v1
   kind: Secret
   metadata:
     name: <backingstore-secret-name>
     type: Opaque
   data:
     IBM_COS_ACCESS_KEY_ID: <IBM COS ACCESS KEY ID ENCODED IN BASE64>
     IBM_COS_SECRET_ACCESS_KEY: <IBM COS SECRET ACCESS KEY ENCODED IN BASE64>
   ```

   a. You must supply and encode your own IBM COS access key ID and secret access key using Base64, and use the results in place of `<IBM COS ACCESS KEY ID ENCODED IN BASE64>` and `<IBM COS SECRET ACCESS KEY ENCODED IN BASE64>`.

   b. Replace `<backingstore-secret-name>` with a unique name.

   2. Apply the following YAML for a specific backing store:

   ```yaml
   apiVersion: noobaa.io/v1alpha1
   kind: BackingStore
   metadata:
   ```
- noobaa.io/finalizer
labels:
  app: noobaa
name: bs
namespace: openshift-storage
spec:
  ibmCos:
    endpoint: <endpoint>
  secret:
    name: <backingstore-secret-name>
    namespace: openshift-storage
    targetBucket: <bucket-name>
type: ibm-cos

a. Replace `<bucket-name>` with an existing IBM COS bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

b. Replace `<endpoint>` with a regional endpoint that corresponds to the location of the existing IBM bucket name. This argument tells Multicloud Object Gateway which endpoint to use for its backing store, and subsequently, data storage and administration.

c. Replace `<backingstore-secret-name>` with the name of the secret created in the previous step.

9.4.2.3. Creating an Azure-backed backingstore

Prerequisites

- Download the Multicloud Object Gateway (MCG) command-line interface:

  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg

  NOTE

  Specify the appropriate architecture for enabling the repositories using subscription manager. For instance, in case of IBM Z infrastructure use the following command:

  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms

- Alternatively, you can install the `mcg` package from the OpenShift Container Storage RPMs found here https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages

  NOTE

  Choose the correct Product Variant according to your architecture.

Procedure

1. From the MCG command-line interface, run the following command:
noobaa backingstore create azure-blob <backingstore_name> --account-key=<AZURE ACCOUNT KEY> --account-name=<AZURE ACCOUNT NAME> --target-blob-container <blob container name>

a. Replace `<backingstore_name>` with the name of the backingstore.

b. Replace `<AZURE ACCOUNT KEY>` and `<AZURE ACCOUNT NAME>` with an AZURE account key and account name you created for this purpose.

c. Replace `<blob container name>` with an existing Azure blob container name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration. The output will be similar to the following:

```
INFO[0001]  Exists: NooBaa "noobaa"
INFO[0002]  Created: BackingStore "azure-resource"
INFO[0002]  Created: Secret "backing-store-secret-azure-resource"
```

You can also add storage resources using a YAML:

1. Create a secret with the credentials:

```yaml
apiVersion: v1
kind: Secret
metadata:
  name: <backingstore-secret-name>
  type: Opaque
data:
  AccountName: <AZURE ACCOUNT NAME ENCODED IN BASE64>
  AccountKey: <AZURE ACCOUNT KEY ENCODED IN BASE64>
```

a. You must supply and encode your own Azure Account Name and Account Key using Base64, and use the results in place of `<AZURE ACCOUNT NAME ENCODED IN BASE64>` and `<AZURE ACCOUNT KEY ENCODED IN BASE64>`.

b. Replace `<backingstore-secret-name>` with a unique name.

2. Apply the following YAML for a specific backing store:

```yaml
apiVersion: noobaa.io/v1alpha1
kind: BackingStore
metadata:
  finalizers:
  - noobaa.io/finalizer
labels:
  app: noobaa
name: bs
namespace: openshift-storage
spec:
  azureBlob:
    secret:
      name: <backingstore-secret-name>
      namespace: openshift-storage
    targetBlobContainer: <blob-container-name>
type: azure-blob
```
9.4.2.4. Creating a GCP-backed backingstore

**Prerequisites**

- Download the Multicloud Object Gateway (MCG) command-line interface:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ``

  **NOTE**
  Specify the appropriate architecture for enabling the repositories using subscription manager. For instance, in case of IBM Z infrastructure use the following command:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
  ``

- Alternatively, you can install the `mcg` package from the OpenShift Container Storage RPMs found here [https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages](https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages)

  **NOTE**
  Choose the correct Product Variant according to your architecture.

**Procedure**

1. From the MCG command-line interface, run the following command:

   ```bash
   noobaa backingstore create google-cloud-storage <backingstore_name> --private-key-json-file=<PATH TO GCP PRIVATE KEY JSON FILE> --target-bucket <GCP bucket name>
   ```

   a. Replace `<backingstore_name>` with the name of the backingstore.

   b. Replace `<PATH TO GCP PRIVATE KEY JSON FILE>` with a path to your GCP private key created for this purpose.

   c. Replace `<GCP bucket name>` with an existing GCP object storage bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

   The output will be similar to the following:

   ```bash
   INFO[0001]  Exists: NooBaa "noobaa"
   INFO[0002]  Created: BackingStore "google-gcp"
   INFO[0002]  Created: Secret "backing-store-google-cloud-storage-gcp"
   ```
You can also add storage resources using a YAML:

1. Create a secret with the credentials:

   ```yaml
   apiVersion: v1
   kind: Secret
   metadata:
     name: <backingstore-secret-name>
   type: Opaque
   data:
     GoogleServiceAccountPrivateKeyJson: <GCP PRIVATE KEY ENCODED IN BASE64>
   ```

   a. You must supply and encode your own GCP service account private key using Base64, and use the results in place of `<GCP PRIVATE KEY ENCODED IN BASE64>`.

   b. Replace `<backingstore-secret-name>` with a unique name.

2. Apply the following YAML for a specific backing store:

   ```yaml
   apiVersion: noobaa.io/v1alpha1
   kind: BackingStore
   metadata:
     finalizers: 
     - noobaa.io/finalizer
   labels:
     app: noobaa
     name: bs
   namespace: openshift-storage
   spec:
     googleCloudStorage:
       secret:
         name: <backingstore-secret-name>
         namespace: openshift-storage
       targetBucket: <target bucket>
     type: google-cloud-storage
   ```

   a. Replace `<target bucket>` with an existing Google storage bucket. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

   b. Replace `<backingstore-secret-name>` with the name of the secret created in the previous step.

9.4.2.5. Creating a local Persistent Volume-backed backingstore

**Prerequisites**

- Download the Multicloud Object Gateway (MCG) command-line interface:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ```
NOTE

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance, in case of IBM Z infrastructure use the following command:

```
# subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
```

- Alternatively, you can install the **mcg** package from the OpenShift Container Storage RPMs found here [https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages](https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/packages)

NOTE

Choose the correct Product Variant according to your architecture.

Procedure

1. From the MCG command-line interface, run the following command:

   ```
   noobaa backingstore create pv-pool <backingstore_name> --num-volumes=<NUMBER OF VOLUMES> --pv-size-gb=<VOLUME SIZE> --storage-class=<LOCAL STORAGE CLASS>
   ```

   a. Replace `<backingstore_name>` with the name of the backing store.

   b. Replace `<NUMBER OF VOLUMES>` with the number of volumes you would like to create.

   c. Replace `<VOLUME SIZE>` with the required size, in GB, of each volume

   d. Replace `<LOCAL STORAGE CLASS>` with the local storage class, recommended to use `ocs-storagecluster-ceph-rbd`

   The output will be similar to the following:

   ```
   INFO[0001] Exists: NooBaa "noobaa"
   INFO[0002] Exists: BackingStore "local-mcg-storage"
   ```

You can also add storage resources using a YAML:

1. Apply the following YAML for a specific backing store:

   ```
   apiVersion: noobaa.io/v1alpha1
   kind: BackingStore
   metadata:
     finalizers:
     - noobaa.io/finalizer
   labels:
     app: noobaa
   name: <backingstore_name>
   namespace: openshift-storage
   spec:
     pvPool:
       numVolumes: <NUMBER OF VOLUMES>
     resources:
       requests:
   ```
storage: <VOLUME SIZE>
storageClass: <LOCAL STORAGE CLASS>
type: pv-pool

a. Replace `<backingstore_name>` with the name of the backingstore.

b. Replace `<NUMBER OF VOLUMES>` with the number of volumes you would like to create.

c. Replace `<VOLUME SIZE>` with the required size, in GB, of each volume. Note that the letter G should remain

d. Replace `<LOCAL STORAGE CLASS>` with the local storage class, recommended to use ocs-storagecluster-ceph-rbd

9.4.3. Creating an s3 compatible Multicloud Object Gateway backingstore

The Multicloud Object Gateway can use any S3 compatible object storage as a backing store, for example, Red Hat Ceph Storage’s RADOS Gateway (RGW). The following procedure shows how to create an S3 compatible Multicloud Object Gateway backing store for Red Hat Ceph Storage’s RADOS Gateway. Note that when RGW is deployed, Openshift Container Storage operator creates an S3 compatible backingstore for Multicloud Object Gateway automatically.

Procedure

1. From the Multicloud Object Gateway (MCG) command-line interface, run the following NooBaa command:

   ```
   noobaa backingstore create s3-compatible rgw-resource --access-key=<RGW ACCESS KEY> --secret-key=<RGW SECRET KEY> --target-bucket=<bucket-name> --endpoint=http://rook-ceph-rgw-ocs-storagecluster-cephobjectstore.openshift-storage.svc.cluster.local:80
   ```

a. To get the `<RGW ACCESS KEY>` and `<RGW SECRET KEY>`, run the following command using your RGW user secret name:

   ```
   oc get secret <RGW USER SECRET NAME> -o yaml
   ```

b. Decode the access key ID and the access key from Base64 and keep them.

c. Replace `<RGW USER ACCESS KEY>` and `<RGW USER SECRET ACCESS KEY>` with the appropriate, decoded data from the previous step.

d. Replace `<bucket-name>` with an existing RGW bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

   The output will be similar to the following:

   ```
   INFO[0001] Exists: NooBaa "noobaa"
   INFO[0002] Created: BackingStore "rgw-resource"
   INFO[0002] Created: Secret "backing-store-secret-rgw-resource"
   ```

You can also create the backingstore using a YAML:

1. Create a CephObjectStore user. This also creates a secret containing the RGW credentials:
apiVersion: ceph.rook.io/v1
kind: CephObjectStoreUser
metadata:
  name: <RGW-Username>
  namespace: openshift-storage
spec:
  store: ocs-storagecluster-cephobjectstore
displayName: "<Display-name>"

a. Replace `<RGW-Username>` and `<Display-name>` with a unique username and display name.

2. Apply the following YAML for an S3-Compatible backing store:

```yaml
apiVersion: noobaa.io/v1alpha1
kind: BackingStore
metadata:
  finalizers:
  - noobaa.io/finalizer
  labels:
    app: noobaa
    name: <backingstore-name>
    namespace: openshift-storage
spec:
  s3Compatible:
    secret:
      name: <backingstore-secret-name>
      namespace: openshift-storage
    signatureVersion: v4
    targetBucket: <RGW-bucket-name>
type: s3-compatible
```

a. Replace `<backingstore-secret-name>` with the name of the secret that was created with `CephObjectStore` in the previous step.

b. Replace `<bucket-name>` with an existing RGW bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

### 9.4.4. Adding storage resources for hybrid and Multicloud using the user interface

**Procedure**

1. In your OpenShift Storage console, click **Storage → Overview → Object tab → Multicloud Object Gateway** link.

2. Select the **Resources** tab in the left, highlighted below. From the list that populates, select **Add Cloud Resource**.
3. Select **Add new connection**

![Add Cloud Resource](image1)

4. Select the relevant native cloud provider or S3 compatible option and fill in the details.

![Add Cloud Connection](image2)

5. Select the newly created connection and map it to the existing bucket.
6. Repeat these steps to create as many backing stores as needed.

NOTE
Resources created in NooBaa UI cannot be used by OpenShift UI or MCG CLI.

9.4.5. Creating a new bucket class

Bucket class is a CRD representing a class of buckets that defines tiering policies and data placements for an Object Bucket Class (OBC).

Use this procedure to create a bucket class in OpenShift Container Storage.

Procedure

1. Click **Operators → Installed Operators** from the left pane of the OpenShift Web Console to view the installed operators.

2. Click **OpenShift Container Storage** Operator.

3. On the OpenShift Container Storage Operator page, scroll right and click the **Bucket Class** tab.

4. Click **Create Bucket Class**.

5. On the Create new Bucket Class page, perform the following:
   a. Enter a **Bucket Class Name** and click **Next**.
b. In Placement Policy, select **Tier 1 - Policy Type** and click **Next**. You can choose either one of the options as per your requirements.

- **Spread** allows spreading of the data across the chosen resources.

- **Mirror** allows full duplication of the data across the chosen resources.

- Click **Add Tier** to add another policy tier.

**Figure 9.3. Tier 1 - Policy Type selection page**

---

c. Select at least one **Backing Store** resource from the available list if you have selected **Tier 1 - Policy Type as Spread** and click **Next**. Alternatively, you can also create a new backing store.
Figure 9.4. Tier 1 - Backing Store selection page

NOTE

You need to select at least 2 backing stores when you select Policy Type as Mirror in previous step.

a. Review and confirm Bucket Class settings.

b. Click Create Bucket Class.

**Verification steps**

1. Click Operators → Installed Operators.

2. Click OpenShift Container Storage Operator.

3. Search for the new Bucket Class or click Bucket Class tab to view all the Bucket Classes.

**9.4.6. Editing a bucket class**

Use the following procedure to edit the bucket class components through the YAML file by clicking the edit button on the Openshift web console.

**Prerequisites**

- Administrator access to OpenShift.
Procedure

1. Log into the OpenShift Web Console.

2. Click Operators → Installed Operators.

3. Click OpenShift Container Storage Operator.

4. On the OpenShift Container Storage Operator page, scroll right and click the Bucket Class tab.

5. Click on the action menu (⋮) next to the Bucket class you want to edit.

6. Click Edit Bucket Class.

7. You are redirected to the YAML file, make the required changes in this file and click Save.

9.4.7. Editing backing stores for bucket class

Use the following procedure to edit an existing Multicloud Object Gateway bucket class to change the underlying backing stores used in a bucket class.

Prerequisites

- Administrator access to OpenShift Web Console.
- A bucket class.
- Backing stores.

Procedure

1. Click Operators → Installed Operators to view the installed operators.

2. Click OpenShift Container Storage Operator.

3. Click the Bucket Class tab.

4. Click on the action menu (⋮) next to the Bucket class you want to edit.

5. Click Edit Bucket Class Resources.

6. On the Edit Bucket Class Resources page, edit the bucket class resources either by adding a backing store to the bucket class or by removing a backing store from the bucket class. You can also edit bucket class resources created with one or two tiers and different placement policies.
To add a backing store to the bucket class, select the name of the backing store.

To remove a backing store from the bucket class, clear the name of the backing store.

7. Click **Save**.

### 9.5. MANAGING NAMESPACE BUCKETS

Namespace buckets let you connect data repositories on different providers together, so you can interact with all of your data through a single unified view. Add the object bucket associated with each provider to the namespace bucket, and access your data through the namespace bucket to see all of your object buckets at once. This lets you write to your preferred storage provider while reading from multiple other storage providers, greatly reducing the cost of migrating to a new storage provider.

1. **Connect your providers to the Multicloud Object Gateway**.
2. **Create a namespace resource for each of your providers** so they can be added to a namespace bucket.
3. **Add your namespace resources to a namespace bucket** and configure the bucket to read from and write to the appropriate namespace resources.

You can interact with objects in a namespace bucket using the S3 API. See [S3 API endpoints for objects in namespace buckets](#) for more information.

**NOTE**

A namespace bucket can only be used if its write target is available and functional.

### 9.5.1. Adding provider connections to the Multicloud Object Gateway

You need to add connections for each of your providers so that the Multicloud Object Gateway has access to the provider.

**Prerequisites**

- Administrative access to the OpenShift Console.
Procedure

1. In the OpenShift Console, click Storage → Overview and click the Object tab.

2. Click Multicloud Object Gateway and log in if prompted.

3. Click Accounts and select an account to add the connection to.

4. Click My Connections.

5. Click Add Connection.
   a. Enter a Connection Name.
   b. Your cloud provider is shown in the Service dropdown by default. Change the selection to use a different provider.
   c. Your cloud provider’s default endpoint is shown in the Endpoint field by default. Enter an alternative endpoint if required.
   d. Enter your Access Key for this cloud provider.
   e. Enter your Secret Key for this cloud provider.
   f. Click Save.

9.5.2. Adding namespace resources using the Multicloud Object Gateway

Add existing storage to Multicloud Storage Gateway as namespace resources so that they can be included in namespace buckets for a unified view of existing storage targets, such as Amazon Web Services S3 buckets, Microsoft Azure blobs, and IBM Cloud Object Storage buckets.

Prerequisites

- Administrative access to the OpenShift Console.
- Target connections (providers) are already added to the Multicloud Object Gateway. See Section 9.5.1, “Adding provider connections to the Multicloud Object Gateway” for details.

Procedure

1. In the OpenShift Console, click Storage → Overview and click on the Object tab.

2. Click Multicloud Storage Gateway and log in if prompted.

3. Click Resources, and click the Namespace Resources tab.

4. Click Create Namespace Resource
   a. In Target Connection, select the connection to be used for this namespace’s storage provider.
      If you need to add a new connection, click Add New Connection and enter your provider details; see Section 9.5.1, “Adding provider connections to the Multicloud Object Gateway” for more information.
   b. In Target Bucket, select the name of the bucket to use as a target.
c. Enter a **Resource Name** for your namespace resource.

d. Click **Create**.

**Verification**

- Verify that the new resource is listed with a green check mark in the **State** column, and 0 buckets in the **Connected Namespace Buckets** column.

### 9.5.3. Adding resources to namespace buckets using the Multicloud Object Gateway

Add namespace resources to namespace buckets for a unified view of your storage across various providers. You can also configure read and write behaviour so that only one provider accepts new data, while all providers allow existing data to be read.

**Prerequisites**

- Ensure that all namespace resources you want to handle in a bucket have been added to the Multicloud Object Gateway: [Adding namespace resources using the Multicloud Object Gateway](#).

**Procedure**

1. In the OpenShift Console, click **Storage → Overview** and click the **Object** tab.

2. Click **Multicloud Object Gateway** and log in if prompted.

3. Click **Buckets**, and click on the **Namespace Buckets** tab.

4. Click **Create Namespace Bucket**

   a. On the **Choose Name** tab, specify a **Name** for the namespace bucket and click **Next**.

   b. On the **Set Placement** tab:

      i. Under **Read Policy**, select the checkbox for each namespace resource that the namespace bucket should read data from.

      ii. Under **Write Policy**, specify which namespace resource the namespace bucket should write data to.

      iii. Click **Next**.

   c. Do not make changes on the **Set Caching Policy** tab in a production environment. This tab is provided as a Development Preview and is subject to support limitations.

   d. Click **Create**.

**Verification**

- Verify that the namespace bucket is listed with a green check mark in the **State** column, the expected number of read resources, and the expected write resource name.

### 9.5.4. Amazon S3 API endpoints for objects in namespace buckets

You can interact with objects in namespace buckets using the Amazon Simple Storage Service (S3) API.
Red Hat OpenShift Container Storage 4.6 onwards supports the following namespace bucket operations:

- ListObjectVersions
- ListObjects
- PutObject
- CopyObject
- ListParts
- CreateMultipartUpload
- CompleteMultipartUpload
- UploadPart
- UploadPartCopy
- AbortMultipartUpload
- GetObjectAcl
- GetObject
- HeadObject
- DeleteObject
- DeleteObjects

See the Amazon S3 API reference documentation for the most up-to-date information about these operations and how to use them.

Additional resources

- Amazon S3 REST API Reference
- Amazon S3 CLI Reference

9.5.5. Adding a namespace bucket using the Multicloud Object Gateway CLI and YAML

For more information about namespace buckets, see Managing namespace buckets.

Depending on the type of your deployment and whether you want to use YAML or the Multicloud Object Gateway CLI, choose one of the following procedures to add a namespace bucket:

- Adding an AWS S3 namespace bucket using YAML
- Adding an IBM COS namespace bucket using YAML
- Adding an AWS S3 namespace bucket using the Multicloud Object Gateway CLI
- Adding an IBM COS namespace bucket using the Multicloud Object Gateway CLI
9.5.5.1. Adding an AWS S3 namespace bucket using YAML

**Prerequisites**

- A running OpenShift Container Storage Platform
- Access to the Multicloud Object Gateway, see Chapter 2, Accessing the Multicloud Object Gateway with your applications

**Procedure**

1. Create a secret with the credentials:

   ```yaml
   apiVersion: v1
   kind: Secret
   metadata:
     name: <namespacestore-secret-name>
     type: Opaque
   data:
     AWS_ACCESS_KEY_ID: <AWS ACCESS KEY ID ENCODED IN BASE64>
     AWS_SECRET_ACCESS_KEY: <AWS SECRET ACCESS KEY ENCODED IN BASE64>
   ```

   a. You must supply and encode your own AWS access key ID and secret access key using Base64, and use the results in place of `<AWS ACCESS KEY ID ENCODED IN BASE64>` and `<AWS SECRET ACCESS KEY ENCODED IN BASE64>`.
   
   b. Replace `<namespacestore-secret-name>` with a unique name.

2. Create a NamespaceStore resource using OpenShift Custom Resource Definitions (CRDs). A NamespaceStore represents underlying storage to be used as a read or write target for the data in the Multicloud Object Gateway namespace buckets. To create a NamespaceStore resource, apply the following YAML:

   ```yaml
   apiVersion: noobaa.io/v1alpha1
   kind: NamespaceStore
   metadata:
     finalizers:
     - noobaa.io/finalizer
     labels:
       app: noobaa
     name: <resource-name>
     namespace: openshift-storage
   spec:
     awsS3:
       secret:
         name: <namespacestore-secret-name>
         namespace: <namespace-secret>
       targetBucket: <target-bucket>
       type: aws-s3
   ```

   a. Replace `<resource-name>` with the name you want to give to the resource.
   
   b. Replace `<namespacestore-secret-name>` with the secret created in step 1.
   
   c. Replace `<namespace-secret>` with the namespace where the secret can be found.
d. Replace `<target-bucket>` with the target bucket you created for the NamespaceStore.

3. Create a namespace bucket class that defines a namespace policy for the namespace buckets. The namespace policy requires a type of either `single` or `multi`.

- A namespace policy of type `single` requires the following configuration:
  ```yaml
  apiVersion: noobaa.io/v1alpha1
  kind: BucketClass
  metadata:
    labels:
      app: noobaa
      name: `<my-bucket-class>`
      namespace: openshift-storage
  spec:
    namespacePolicy:
      type: Single
      resource: `<resource>`
  
  Replace `<my-bucket-class>` with a unique namespace bucket class name.
  Replace `<resource>` with the name of a single namespace-store that will define the read and write target of the namespace bucket.

- A namespace policy of type `multi` requires the following configuration:
  ```yaml
  apiVersion: noobaa.io/v1alpha1
  kind: BucketClass
  metadata:
    labels:
      app: noobaa
      name: `<my-bucket-class>`
      namespace: openshift-storage
  spec:
    namespacePolicy:
      type: Multi
      multi:
        writeResource: `<write-resource>`
        readResources:
        - `<read-resources>`
        - `<read-resources>`
  
  Replace `<my-bucket-class>` with a unique bucket class name.
  Replace `<write-resource>` with the name of a single namespace-store that will define the write target of the namespace bucket.
  Replace `<read-resources>` with a list of the names of the namespace-stores that will define the read targets of the namespace bucket.

4. Apply the following YAML to create a bucket using an Object Bucket Class (OBC) resource that uses the bucket class defined in step 2.

```yaml
apiVersion: objectbucket.io/v1alpha1
kind: ObjectBucketClaim
```
NOTE

For IBM Power Systems and IBM Z infrastructure use `storageClassName` as `openshift-storage.noobaa.io`

a. Replace `<my-bucket-class>` with the bucket class created in the previous step.

Once the OBC is provisioned by the operator, a bucket is created in the Multicloud Object Gateway, and the operator creates a Secret and ConfigMap with the same name of the OBC on the same namespace of the OBC.

9.5.5.2. Adding an IBM COS namespace bucket using YAML

Prerequisites

- A running OpenShift Container Storage Platform
- Access to the Multicloud Object Gateway, see Chapter 2, Accessing the Multicloud Object Gateway with your applications

Procedure

1. Create a secret with the credentials:

   ```yaml
   apiVersion: v1
   kind: Secret
   metadata:
     name: <namespacestore-secret-name>
   type: Opaque
   data:
     IBM_COS_ACCESS_KEY_ID: <IBM COS ACCESS KEY ID ENCODED IN BASE64>
     IBM_COS_SECRET_ACCESS_KEY: <IBM COS SECRET ACCESS KEY ENCODED IN BASE64>
   ```

   a. You must supply and encode your own IBM COS access key ID and secret access key using Base64, and use the results in place of `<IBM COS ACCESS KEY ID ENCODED IN BASE64>` and `<IBM COS SECRET ACCESS KEY ENCODED IN BASE64>`.

   b. Replace `<namespacestore-secret-name>` with a unique name.

2. Create a NamespaceStore resource using OpenShift Custom Resource Definitions (CRDs). A NamespaceStore represents underlying storage to be used as a read or write target for the data in the Multicloud Object Gateway namespace buckets. To create a NamespaceStore resource, apply the following YAML:

   ```yaml
   metadata:
     name: <resource-name>
     namespace: openshift-storage
   spec:
     generateBucketName: <my-bucket>
     storageClassName: noobaa.noobaa.io
     additionalConfig:
       bucketclass: <my-bucket-class>
   ```
apiVersion: noobaa.io/v1alpha1
kind: NamespaceStore
metadata:
  finalizers:
  - noobaa.io/finalizer
labels:
  app: noobaa
  name: bs
  namespace: openshift-storage
spec:
  s3Compatible:
    endpoint: <IBM COS ENDPOINT>
  secret:
    name: <namespacestore-secret-name>
    namespace: <namespace-secret>
  signatureVersion: v2
  targetBucket: <target-bucket>
  type: ibm-cos

a. Replace `<IBM COS ENDPOINT>` with the appropriate IBM COS endpoint.
b. Replace `<namespacestore-secret-name>` with the secret created in step 1.
c. Replace `<namespace-secret>` with the namespace where the secret can be found.
d. Replace `<target-bucket>` with the target bucket you created for the NamespaceStore.

3. Create a namespace bucket class that defines a namespace policy for the namespace buckets. The namespace policy requires a type of either `single` or `multi`.
   - A namespace policy of type `single` requires the following configuration:

```
apiVersion: noobaa.io/v1alpha1
kind: BucketClass
metadata:
  labels:
    app: noobaa
    name: <my-bucket-class>
    namespace: openshift-storage
spec:
  namespacePolicy:
    type:
      single:
        resource: <resource>
```

Replace `<my-bucket-class>` with a unique namespace bucket class name.
Replace `<resource>` with a the name of a single namespace-store that will define the read and write target of the namespace bucket.

- A namespace policy of type `multi` requires the following configuration:

```
apiVersion: noobaa.io/v1alpha1
kind: BucketClass
metadata:
  labels:
```
app: noobaa
name: <my-bucket-class>
namespace: openshift-storage
spec:
namespacePolicy:
type: Multi
multi:
  writeResource: <write-resource>
readResources:
- <read-resources>
- <read-resources>

Replace `<my-bucket-class>` with a unique bucket class name.

Replace `<write-resource>` with the name of a single namespace-store that will define the write target of the namespace bucket.

Replace `<read-resources>` with a list of the names of namespace-stores that will define the read targets of the namespace bucket.

4. Apply the following YAML to create a bucket using an Object Bucket Class (OBC) resource that uses the bucket class defined in step 2.

```yaml
apiVersion: objectbucket.io/v1alpha1
kind: ObjectBucketClaim
metadata:
  name: <resource-name>
  namespace: openshift-storage
spec:
generateBucketName: <my-bucket>
storageClassName: noobaa.noobaa.io
additionalConfig:
  bucketclass: <my-bucket-class>
```

**NOTE**

For IBM Power Systems and IBM Z infrastructure use `storageClassName` as `openshift-storage.noobaa.io`

a. Replace `<my-bucket-class>` with the bucket class created in the previous step.

Once the OBC is provisioned by the operator, a bucket is created in the Multicloud Object Gateway, and the operator creates a Secret and ConfigMap with the same name of the OBC on the same namespace of the OBC.

### 9.5.5.3. Adding an AWS S3 namespace bucket using the Multicloud Object Gateway CLI

**Prerequisites**

- A running OpenShift Container Storage Platform
- Access to the Multicloud Object Gateway, see Chapter 2, *Accessing the Multicloud Object Gateway with your applications*
Download the Multicloud Object Gateway command-line interface:

```
# subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
# yum install mcg
```

NOTE

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance, in case of IBM Z infrastructure use the following command:

```
# subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
```

Alternatively, you can install the mcg package from the OpenShift Container Storage RPMs found here [https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/package](https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/package).

NOTE

Choose the correct Product Variant according to your architecture.

Procedure

1. Create a NamespaceStore resource. A NamespaceStore represents an underlying storage to be used as a read or write target for the data in Multicloud Object Gateway namespace buckets. From the MCG command-line interface, run the following command:

```
noobaa namespacestore create aws-s3 <namespacestore> --access-key <AWS ACCESS KEY> --secret-key <AWS SECRET ACCESS KEY> --target-bucket <bucket-name>
```

   a. Replace `<namespacestore>` with the name of the NamespaceStore.

   b. Replace `<AWS ACCESS KEY>` and `<AWS SECRET ACCESS KEY>` with an AWS access key ID and secret access key you created for this purpose.

   c. Replace `<bucket-name>` with an existing AWS bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

2. Create a namespace bucket class that defines a namespace policy for the namespace buckets. The namespace policy requires a type of either `single` or `multi`.

   - Run the following command to create a namespace bucket class with a namespace policy of type `single`:

```
noobaa bucketclass create <resource-name> single <my-bucket-class> --resource <resource>
```

   Replace `<resource-name>` with the name you want to give the resource.

   Replace `<my-bucket-class>` with a unique bucket class name.

   Replace `<resource>` with a single namespace-store that will define the read and write target of the namespace bucket.
Run the following command to create a namespace bucket class with a namespace policy of type `multi`:

```
noobaa bucketclass create <resource-name> multi <my-bucket-class> --write-resource <write-resource> --read-resources <read-resources>
```

Replace `<resource-name>` with the name you want to give the resource.

Replace `<my-bucket-class>` with a unique bucket class name.

Replace `<write-resource>` with a single namespace-store that will define the write target of the namespace bucket.

Replace `<read-resources>` with a list of namespace-stores separated by commas that will define the read targets of the namespace bucket.

3. Run the following command to create a bucket using an Object Bucket Class (OBC) resource that uses the bucket class defined in step 2.

```
noobaa obc create <bucket-name> -n openshift-storage my-app --bucketclass <custom-bucket-class>
```

a. Replace `<bucket-name>` with a bucket name of your choice.

b. Replace `<custom-bucket-class>` with the name of the bucket class created in step 2.

Once the OBC is provisioned by the operator, a bucket is created in the Multicloud Object Gateway, and the operator creates a Secret and ConfigMap with the same name of the OBC on the same namespace of the OBC.

### 9.5.5.4. Adding an IBM COS namespace bucket using the Multicloud Object Gateway CLI

#### Prerequisites

- A running OpenShift Container Storage Platform
- Access to the Multicloud Object Gateway, see Chapter 2, Accessing the Multicloud Object Gateway with your applications
- Download the Multicloud Object Gateway command-line interface:

  ```
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ```
NOTE

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance,

- For IBM Power Systems, use the following command:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-ppc64le-rpms
  ```

- For IBM Z infrastructure, use the following command:

  ```bash
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
  ```

Alternatively, you can install the mcg package from the OpenShift Container Storage RPMs found here https://access.redhat.com/downloads/content/547/ver=4/rhel--8/4/x86_64/package.

NOTE

Choose the correct Product Variant according to your architecture.

Procedure

1. Create a NamespaceStore resource. A NamespaceStore represents an underlying storage to be used as a read or write target for the data in Multicloud Object Gateway namespace buckets. From the MCG command-line interface, run the following command:

   ```bash
   noobaa namespacestore create ibm-cos <namespacestore> --endpoint <IBM COS ENDPOINT> --access-key <IBM ACCESS KEY> --secret-key <IBM SECRET ACCESS KEY> --target-bucket <bucket-name>
   ```

   a. Replace `<namespacestore>` with the name of the NamespaceStore.

   b. Replace `<IBM ACCESS KEY>`, `<IBM SECRET ACCESS KEY>`, `<IBM COS ENDPOINT>` with an IBM access key ID, secret access key and the appropriate regional endpoint that corresponds to the location of the existing IBM bucket.

   c. Replace `<bucket-name>` with an existing IBM bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

2. Create a namespace bucket class that defines a namespace policy for the namespace buckets. The namespace policy requires a type of either `single` or `multi`.

   - Run the following command to create a namespace bucket class with a namespace policy of type `single`:

     ```bash
     noobaa bucketclass create <resource-name> single <my-bucket-class> --resource <resource>
     ```

     Replace `<resource-name>` with the name you want to give the resource.

     Replace `<my-bucket-class>` with a unique bucket class name.
Replace `<resource>` with a single namespace-store that will define the read and write target of the namespace bucket.

- Run the following command to create a namespace bucket class with a namespace policy of type `multi`:

  ```shell
  noobaa bucketclass create <resource-name> multi <my-bucket-class> --write-resource <write-resource> --read-resources <read-resources>
  ```

  Replace `<resource-name>` with the name you want to give the resource.

  Replace `<my-bucket-class>` with a unique bucket class name.

  Replace `<write-resource>` with a single namespace-store that will define the write target of the namespace bucket.

  Replace `<read-resources>` with a list of namespace-stores separated by commas that will define the read targets of the namespace bucket.

3. Run the following command to create a bucket using an Object Bucket Class (OBC) resource that uses the bucket class defined in step 2.

  ```shell
  noobaa obc create <bucket-name> -n openshift-storage my-app --bucketclass <custom-bucket-class>
  ```

  a. Replace `<bucket-name>` with a bucket name of your choice.

  b. Replace `<custom-bucket-class>` with the name of the bucket class created in step 2.

Once the OBC is provisioned by the operator, a bucket is created in the Multicloud Object Gateway, and the operator creates a Secret and ConfigMap with the same name of the OBC on the same namespace of the OBC.

### 9.6. MIRRORING DATA FOR HYBRID AND MULTICLOUD BUCKETS

The Multicloud Object Gateway (MCG) simplifies the process of spanning data across cloud provider and clusters.

**Prerequisites**

- You must first add a backing storage that can be used by the MCG, see Section 9.4, “Adding storage resources for hybrid or Multicloud”.

Then you create a bucket class that reflects the data management policy, mirroring.

**Procedure**

You can set up mirroring data three ways:

- Section 9.6.1, “Creating bucket classes to mirror data using the MCG command-line-interface”

- Section 9.6.2, “Creating bucket classes to mirror data using a YAML”

- Section 9.6.3, “Configuring buckets to mirror data using the user interface”
9.6.1. Creating bucket classes to mirror data using the MCG command-line-interface

1. From the MCG command-line interface, run the following command to create a bucket class with a mirroring policy:

   ```
   $ noobaa bucketclass create mirror-to-aws --backingstores=azure-resource,aws-resource --placement Mirror
   ```

2. Set the newly created bucket class to a new bucket claim, generating a new bucket that will be mirrored between two locations:

   ```
   $ noobaa obc create mirrored-bucket --bucketclass=mirror-to-aws
   ```

9.6.2. Creating bucket classes to mirror data using a YAML

1. Apply the following YAML. This YAML is a hybrid example that mirrors data between local Ceph storage and AWS:

   ```yaml
   apiVersion: noobaa.io/v1alpha1
   kind: BucketClass
   metadata:
     name: hybrid-class
     labels:
       app: noobaa
   spec:
     placementPolicy:
       tiers:
         - tier:
           mirrors:
             - mirror:
               spread:
                 - cos-east-us
             - mirror:
               spread:
                 - noobaa-test-bucket-for-ocp201907291921-11247_resource
   ```

2. Add the following lines to your standard Object Bucket Claim (OBC):

   ```yaml
   additionalConfig:
     bucketclass: mirror-to-aws
   ```

   For more information about OBCs, see Section 9.8, "Object Bucket Claim".

9.6.3. Configuring buckets to mirror data using the user interface

1. In your OpenShift Storage console, Click Storage → Overview → Object tab → Multicloud Object Gateway link.

2. On the NooBaa page, click the buckets icon on the left side. You will see a list of your buckets:
3. Click the bucket you want to update.

4. Click Edit Tier 1 Resources

5. Select Mirror and check the relevant resources you want to use for this bucket. In the following example, we mirror data between on prem Ceph RGW to AWS:
6. Click **Save**.

**NOTE**
Resources created in NooBaa UI cannot be used by OpenShift UI or MCG CLI.

9.7. BUCKET POLICIES IN THE MULTICLOUD OBJECT GATEWAY

OpenShift Container Storage supports AWS S3 bucket policies. Bucket policies allow you to grant users access permissions for buckets and the objects in them.

9.7.1. About bucket policies

Bucket policies are an access policy option available for you to grant permission to your AWS S3 buckets and objects. Bucket policies use JSON-based access policy language. For more information about access policy language, see [AWS Access Policy Language Overview](#).

9.7.2. Using bucket policies

**Prerequisites**

- A running OpenShift Container Storage Platform
- Access to the Multicloud Object Gateway, see Section 9.2, “Accessing the Multicloud Object Gateway with your applications”

**Procedure**

To use bucket policies in the Multicloud Object Gateway:

1. Create the bucket policy in JSON format. See the following example:

   ```json
   {
     "Version": "NewVersion",
     "Statement": [
       {
         "Sid": "Example",
         
   ```
"Effect": "Allow",
"Principal": [
    "john.doe@example.com"
],
"Action": [
    "s3:GetObject"
],
"Resource": [
    "arn:aws:s3:::john_bucket"
]
}
}

There are many available elements for bucket policies. For details on these elements and examples of how they can be used, see AWS Access Policy Language Overview.

For more examples of bucket policies, see AWS Bucket Policy Examples.

Instructions for creating S3 users can be found in Section 9.7.3, “Creating an AWS S3 user in the Multicloud Object Gateway”.

2. Using AWS S3 client, use the put-bucket-policy command to apply the bucket policy to your S3 bucket:

```
# aws --endpoint ENDPOINT --no-verify-ssl s3api put-bucket-policy --bucket MyBucket --policy BucketPolicy
```

Replace `ENDPOINT` with the S3 endpoint

Replace `MyBucket` with the bucket to set the policy on

Replace `BucketPolicy` with the bucket policy JSON file

Add `--no-verify-ssl` if you are using the default self signed certificates

For example:

```
# aws --endpoint https://s3-openshift-storage.apps.gogo44.noobaa.org --no-verify-ssl s3api put-bucket-policy -bucket MyBucket --policy file://BucketPolicy
```

For more information on the put-bucket-policy command, see the AWS CLI Command Reference for put-bucket-policy.

**NOTE**

The principal element specifies the user that is allowed or denied access to a resource, such as a bucket. Currently, Only NooBaa accounts can be used as principals. In the case of object bucket claims, NooBaa automatically create an account `obc-account. <generated bucket name>@noobaa.io`

**NOTE**

Bucket policy conditions are not supported.
9.7.3. Creating an AWS S3 user in the Multicloud Object Gateway

Prerequisites

- A running OpenShift Container Storage Platform
- Access to the Multicloud Object Gateway, see Section 9.2, “Accessing the Multicloud Object Gateway with your applications”

Procedure

1. In your OpenShift Storage console, navigate to Storage → Overview → Object tab → select the Multicloud Object Gateway link:

2. Under the Accounts tab, click Create Account

3. Select S3 Access Only, provide the Account Name, for example, john.doe@example.com. Click Next:
4. Select S3 default placement, for example, noobaa-default-backing-store. Select Buckets Permissions. A specific bucket or all buckets can be selected. Click Create:
9.8. OBJECT BUCKET CLAIM

An Object Bucket Claim can be used to request an S3 compatible bucket backend for your workloads.

You can create an Object Bucket Claim three ways:

- Section 9.8.1, “Dynamic Object Bucket Claim”
- Section 9.8.2, “Creating an Object Bucket Claim using the command line interface”
- Section 9.8.3, “Creating an Object Bucket Claim using the OpenShift Web Console”

An object bucket claim creates a new bucket and an application account in NooBaa with permissions to the bucket, including a new access key and secret access key. The application account is allowed to access only a single bucket and can’t create new buckets by default.

9.8.1. Dynamic Object Bucket Claim

Similar to Persistent Volumes, you can add the details of the Object Bucket claim to your application’s YAML, and get the object service endpoint, access key, and secret access key available in a configuration map and secret. It is easy to read this information dynamically into environment variables of your application.
Procedure

1. Add the following lines to your application YAML:

   ```yaml
   apiVersion: objectbucket.io/v1alpha1
   kind: ObjectBucketClaim
   metadata:
     name: <obc-name>
   spec:
     generateBucketName: <obc-bucket-name>
     storageClassName: openshift-storage.noobaa.io
   ```

   These lines are the Object Bucket Claim itself.

   a. Replace `<obc-name>` with a unique Object Bucket Claim name.

   b. Replace `<obc-bucket-name>` with a unique bucket name for your Object Bucket Claim.

2. You can add more lines to the YAML file to automate the use of the Object Bucket Claim. The example below is the mapping between the bucket claim result, which is a configuration map with data and a secret with the credentials. This specific job will claim the Object Bucket from NooBaa, which will create a bucket and an account.

   ```yaml
   apiVersion: batch/v1
   kind: Job
   metadata:
     name: testjob
   spec:
     template:
       spec:
         restartPolicy: OnFailure
         containers:
           - image: <your application image>
             name: test
             env:
               - name: BUCKET_NAME
                 valueFrom:
                   configMapKeyRef:
                     name: <obc-name>
                     key: BUCKET_NAME
               - name: BUCKET_HOST
                 valueFrom:
                   configMapKeyRef:
                     name: <obc-name>
                     key: BUCKET_HOST
               - name: BUCKET_PORT
                 valueFrom:
                   configMapKeyRef:
                     name: <obc-name>
                     key: BUCKET_PORT
               - name: AWS_ACCESS_KEY_ID
                 valueFrom:
                   secretKeyRef:
                     name: <obc-name>
                     key: AWS_ACCESS_KEY_ID
               - name: AWS_SECRET_ACCESS_KEY
                 valueFrom:
                   secretKeyRef:
                     name: <obc-name>
                     key: AWS_SECRET_ACCESS_KEY
   ```
valueFrom:
  secretKeyRef:
    name: <obc-name>
    key: AWS_SECRET_ACCESS_KEY

a. Replace all instances of <obc-name> with your Object Bucket Claim name.
b. Replace <your application image> with your application image.

3. Apply the updated YAML file:

   # oc apply -f <yaml.file>

   a. Replace <yaml.file> with the name of your YAML file.

4. To view the new configuration map, run the following:

   # oc get cm <obc-name>

   a. Replace obc-name with the name of your Object Bucket Claim. You can expect the following environment variables in the output:

   - **BUCKET_HOST** - Endpoint to use in the application
   - **BUCKET_PORT** - The port available for the application
     - The port is related to the BUCKET_HOST. For example, if the BUCKET_HOST is https://my.example.com, and the BUCKET_PORT is 443, the endpoint for the object service would be https://my.example.com:443.
   - **BUCKET_NAME** - Requested or generated bucket name
   - **AWS_ACCESS_KEY_ID** - Access key that is part of the credentials
   - **AWS_SECRET_ACCESS_KEY** - Secret access key that is part of the credentials

9.8.2. Creating an Object Bucket Claim using the command line interface

When creating an Object Bucket Claim using the command-line interface, you get a configuration map and a Secret that together contain all the information your application needs to use the object storage service.

**Prerequisites**

- Download the MCG command-line interface:

  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
NOTE

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance,

- For IBM Power Systems, use the following command:
  
  ```
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-ppc64le-rpms
  ```

- For IBM Z infrastructure, use the following command:
  
  ```
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
  ```

Procedure

1. Use the command-line interface to generate the details of a new bucket and credentials. Run the following command:

   ```
   # noobaa obc create <obc-name> -n openshift-storage
   ```

   Replace `<obc-name>` with a unique Object Bucket Claim name, for example, `myappobc`.

   Additionally, you can use the `--app-namespace` option to specify the namespace where the Object Bucket Claim configuration map and secret will be created, for example, `myapp-namespace`.

   Example output:

   ```
   INFO[0001] Created: ObjectBucketClaim "test21obc"
   ```

   The MCG command-line-interface has created the necessary configuration and has informed OpenShift about the new OBC.

2. Run the following command to view the Object Bucket Claim:

   ```
   # oc get obc -n openshift-storage
   ```

   Example output:

   ```
   NAME   STORAGE-CLASS                 PHASE   AGE
   test21obc openshift-storage.noobaa.io Bound  38s
   ```

3. Run the following command to view the YAML file for the new Object Bucket Claim:

   ```
   # oc get obc test21obc -o yaml -n openshift-storage
   ```

   Example output:

   ```
   apiVersion: objectbucket.io/v1alpha1
   kind: ObjectBucketClaim
   metadata:
     creationTimestamp: "2019-10-24T13:30:07Z"
   finalizers:
   ```
4. Inside of your `openshift-storage` namespace, you can find the configuration map and the secret to use this Object Bucket Claim. The CM and the secret have the same name as the Object Bucket Claim. To view the secret:

```bash
# oc get -n openshift-storage secret test21obc -o yaml
```

Example output:

```
apiVersion: v1
kind: Secret
metadata:
  creationTimestamp: "2019-10-24T13:30:07Z"
  finalizers:
  - objectbucket.io/finalizer
labels:
  app: noobaa
  bucket-provisioner: openshift-storage.noobaa.io-obc
  noobaa-domain: openshift-storage.noobaa.io
  name: test21obc
namespace: openshift-storage
ownerReferences:
- apiVersion: objectbucket.io/v1alpha1
  blockOwnerDeletion: true
  controller: true
  kind: ObjectBucketClaim
  name: test21obc
uid: 64f04cba-f662-11e9-bc3c-0295250841af
resourceVersion: "40751"
```

Example output:

```
apiVersion: v1
data:
  AWS_ACCESS_KEY_ID: c0M0R2xVanF3ODR3bHBkVV94cmY=
  AWS_SECRET_ACCESS_KEY: Wi9kcFluSWxHRzlWaFlzNk1hc0xma2JXcjM1MVhqa051SIBlxeXpmOQ==
kind: Secret
metadata:
  creationTimestamp: "2019-10-24T13:30:07Z"
finalizers:
  - objectbucket.io/finalizer
labels:
  app: noobaa
  bucket-provisioner: openshift-storage.noobaa.io-obc
  noobaa-domain: openshift-storage.noobaa.io
  name: test21obc
namespace: openshift-storage
ownerReferences:
- apiVersion: objectbucket.io/v1alpha1
  blockOwnerDeletion: true
  controller: true
  kind: ObjectBucketClaim
  name: test21obc
uid: 64f04cba-f662-11e9-bc3c-0295250841af
resourceVersion: "40751"
```
The secret gives you the S3 access credentials.

5. To view the configuration map:

```
# oc get -n openshift-storage cm test21obc -o yaml
```

Example output:

```
apiVersion: v1
data:
  BUCKET_HOST: 10.0.171.35
  BUCKET_NAME: test21obc-933348a6-e267-4f82-82f1-e59bf4fe3bb4
  BUCKET_PORT: "31242"
  BUCKET_REGION: ""
  BUCKET_SUBREGION: ""
kind: ConfigMap
metadata:
  creationTimestamp: "2019-10-24T13:30:07Z"
finalizers:
- objectbucket.io/finalizer
labels:
  app: noobaa
  bucket-provisioner: openshift-storage.noobaa.io-obc
  noobaa-domain: openshift-storage.noobaa.io
name: test21obc
namespace: openshift-storage
ownerReferences:
- apiVersion: objectbucket.io/v1alpha1
  blockOwnerDeletion: true
  controller: true
  kind: ObjectBucketClaim
  name: test21obc
  uid: 64f04cba-f662-11e9-bc3c-0295250841af
resourceVersion: "40752"
selfLink: /api/v1/namespaces/openshift-storage/configmaps/test21obc
uid: 651c6501-f662-11e9-9094-0a5305de57bb
```

The configuration map contains the S3 endpoint information for your application.

### 9.8.3. Creating an Object Bucket Claim using the OpenShift Web Console

You can create an Object Bucket Claim (OBC) using the OpenShift Web Console.

**Prerequisites**

- Administrative access to the OpenShift Web Console.

- In order for your applications to communicate with the OBC, you need to use the configmap and secret. For more information about this, see Section 9.8.1, "Dynamic Object Bucket Claim".
Procedure

1. Log into the OpenShift Web Console.

2. On the left navigation bar, click **Storage → Object Bucket Claims**.

3. Click **Create Object Bucket Claim**

4. Enter a name for your object bucket claim and select the appropriate storage class based on your deployment, internal or external, from the dropdown menu:

   **Internal mode**

   Project: openshift-storage

   ```
   Create Object Bucket Claim
   
   Object Bucket Claim Name
   my-object-bucket
   If not provided, a generic name will be generated.

   Storage Class
   Select storage class
   
   Select storage class
   
   No default storage class
   
   ocs-storagecluster-ceph-rgw
   openshift-storage.ceph.rocky.io/bucket
   openshift-storage.noobaa.io
   openshift-storage.noobaa.io/bucket
   ```

   The following storage classes, which were created after deployment, are available for use:

   - **ocs-storagecluster-ceph-rgw** uses the Ceph Object Gateway (RGW)
   - **openshift-storage.noobaa.io** uses the Multicloud Object Gateway

   **External mode**
The following storage classes, which were created after deployment, are available for use:

- **ocs-external-storagecluster-ceph-rgw** uses the Ceph Object Gateway (RGW)
- **openshift-storage.noobaa.io** uses the Multicloud Object Gateway

**NOTE**

The RGW OBC storage class is only available with fresh installations of OpenShift Container Storage version 4.5. It does not apply to clusters upgraded from previous OpenShift Container Storage releases.

5. Click **Create**. Once you create the OBC, you are redirected to its detail page:
9.9. CACHING POLICY FOR OBJECT BUCKETS

A cache bucket is a namespace bucket with a hub target and a cache target. The hub target is an S3 compatible large object storage bucket. The cache bucket is the local Multicloud Object Gateway bucket. You can create a cache bucket that caches an AWS bucket or an IBM COS bucket.

**IMPORTANT**

Cache buckets are a Technology Preview feature. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information, see Technology Preview Features Support Scope.

- AWS S3
- IBM COS

9.9.1. Creating an AWS cache bucket

**Prerequisites**

- Download the Multicloud Object Gateway (MCG) command-line interface:

  ```sh
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
  ```
NOTE

Specify the appropriate architecture for enabling the repositories using subscription manager. For instance, in case of IBM Z infrastructure use the following command:

```bash
# subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
```

Alternatively, you can install the mcg package from the OpenShift Container Storage RPMs found here [https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/package](https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/package).

NOTE

Choose the correct Product Variant according to your architecture.

Procedure

1. Create a NamespaceStore resource. A NamespaceStore represents an underlying storage to be used as a read or write target for the data in Multicloud Object Gateway namespace buckets. From the MCG command-line interface, run the following command:

   ```bash
   noobaa namespacestore create aws-s3 <namespacestore> --access-key <AWS ACCESS KEY> --secret-key <AWS SECRET ACCESS KEY> --target-bucket <bucket-name>
   ```

   a. Replace `<namespacestore>` with the name of the namespacestore.

   b. Replace `<AWS ACCESS KEY>` and `<AWS SECRET ACCESS KEY>` with an AWS access key ID and secret access key you created for this purpose.

   c. Replace `<bucket-name>` with an existing AWS bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

   You can also add storage resources by applying a YAML. First create a secret with credentials:

   ```yaml
   apiVersion: v1
   kind: Secret
   metadata:
     name: <namespacestore-secret-name>
   type: Opaque
   data:
     AWS_ACCESS_KEY_ID: <AWS ACCESS KEY ID ENCODED IN BASE64>
     AWS_SECRET_ACCESS_KEY: <AWS SECRET ACCESS KEY ENCODED IN BASE64>
   ```

   You must supply and encode your own AWS access key ID and secret access key using Base64, and use the results in place of `<AWS ACCESS KEY ID ENCODED IN BASE64>` and `<AWS SECRET ACCESS KEY ENCODED IN BASE64>`.

   Replace `<namespacestore-secret-name>` with a unique name.

   Then apply the following YAML:
apiVersion: noobaa.io/v1alpha1
kind: NamespaceStore
metadata:
  - noobaa.io/finalizer
  labels:
    app: noobaa
  name: <namespacestore>
namespace: openshift-storage
spec:
  awsS3:
    secret:
      name: <namespacestore-secret-name>
    namespace: <namespace-secret>
targetBucket: <target-bucket>
type: aws-s3

d. Replace `<namespacestore>` with a unique name.
e. Replace `<namespacestore-secret-name>` with the secret created in the previous step.
f. Replace `<namespace-secret>` with the namespace used to create the secret in the previous step.
g. Replace `<target-bucket>` with the AWS S3 bucket you created for the namespacestore.

2. Run the following command to create a bucket class:

    noobaa bucketclass create namespace-bucketclass cache <my-cache-bucket-class> --backingstores <backing-store> --hub-resource <namespacestore>

a. Replace `<my-cache-bucket-class>` with a unique bucket class name.
b. Replace `<backing-store>` with the relevant backing store. You can list one or more backingstores separated by commas in this field.
c. Replace `<namespacestore>` with the namespacestore created in the previous step.

3. Run the following command to create a bucket using an Object Bucket Claim resource that uses the bucket class defined in step 2.

    noobaa obc create <my-bucket-claim> my-app --bucketclass <custom-bucket-class>

a. Replace `<my-bucket-claim>` with a unique name.
b. Replace `<custom-bucket-class>` with the name of the bucket class created in step 2.

9.9.2. Creating an IBM COS cache bucket

Prerequisites

- Download the Multicloud Object Gateway (MCG) command-line interface:
  
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-x86_64-rpms
  # yum install mcg
Specify the appropriate architecture for enabling the repositories using subscription manager. For instance,

- For IBM Power Systems, use the following command:

  ```
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-ppc64le-rpms
  ```

- For IBM Z infrastructure, use the following command:

  ```
  # subscription-manager repos --enable=rh-ocs-4-for-rhel-8-s390x-rpms
  ```

Alternatively, you can install the mcg package from the OpenShift Container Storage RPMs found here https://access.redhat.com/downloads/content/547/ver=4/rhel---8/4/x86_64/package.

Choose the correct Product Variant according to your architecture.

Procedure

1. Create a NamespaceStore resource. A NamespaceStore represents an underlying storage to be used as a read or write target for the data in Multicloud Object Gateway namespace buckets. From the MCG command-line interface, run the following command:

   ```
   noobaa namespacestore create ibm-cos <namespacestore> --endpoint <IBM COS ENDPOINT> --access-key <IBM ACCESS KEY> --secret-key <IBM SECRET ACCESS KEY> --target-bucket <bucket-name>
   ```

   a. Replace `<namespacestore>` with the name of the NamespaceStore.

   b. Replace `<IBM ACCESS KEY>`, `<IBM SECRET ACCESS KEY>`, `<IBM COS ENDPOINT>` with an IBM access key ID, secret access key and the appropriate regional endpoint that corresponds to the location of the existing IBM bucket.

   c. Replace `<bucket-name>` with an existing IBM bucket name. This argument tells Multicloud Object Gateway which bucket to use as a target bucket for its backing store, and subsequently, data storage and administration.

You can also add storage resources by applying a YAML. First, Create a secret with the credentials:

```yaml
apiVersion: v1
kind: Secret
metadata:
  name: <namespacestore-secret-name>
  type: Opaque

data:
  IBM_COS_ACCESS_KEY_ID: <IBM COS ACCESS KEY ID ENCODED IN BASE64>
  IBM_COS_SECRET_ACCESS_KEY: <IBM COS SECRET ACCESS KEY ENCODED IN BASE64>
```
You must supply and encode your own IBM COS access key ID and secret access key using Base64, and use the results in place of `<IBM COS ACCESS KEY ID ENCODED IN BASE64>` and `<IBM COS SECRET ACCESS KEY ENCODED IN BASE64>`.

Replace `<namespacestore-secret-name>` with a unique name.

Then apply the following YAML:

```yaml
apiVersion: noobaa.io/v1alpha1
kind: NamespaceStore
metadata:
  finalizers:
  - noobaa.io/finalizer
  labels:
    app: noobaa
    name: <namespacestore>
    namespace: openshift-storage
spec:
  s3Compatible:
    endpoint: <IBM COS ENDPOINT>
  secret:
    name: <backingstore-secret-name>
    namespace: <namespace-secret>
    signatureVersion: v2
  targetBucket: <target-bucket>
  type: ibm-cos
```

d. Replace `<namespacestore>` with a unique name.

e. Replace `<IBM COS ENDPOINT>` with the appropriate IBM COS endpoint.

f. Replace `<backingstore-secret-name>` with the secret created in the previous step.

g. Replace `<namespace-secret>` with the namespace used to create the secret in the previous step.

h. Replace `<target-bucket>` with the AWS S3 bucket you created for the namespacestore.

2. Run the following command to create a bucket class:

```bash
noobaa bucketclass create namespace-bucketclass cache <my-bucket-class> --backingstores <backing-store> --hubResource <namespacestore>
```

a. Replace `<my-bucket-class>` with a unique bucket class name.

b. Replace `<backing-store>` with the relevant backing store. You can list one or more backingstores separated by commas in this field.

c. Replace `<namespacestore>` with the namespacestore created in the previous step.

3. Run the following command to create a bucket using an Object Bucket Claim resource that uses the bucket class defined in step 2.

```bash
noobaa obc create <my-bucket-claim> my-app --bucketclass <custom-bucket-class>
```

a. Replace `<my-bucket-claim>` with a unique name.
b. Replace `<custom-bucket-class>` with the name of the bucket class created in step 2.

9.10. SCALING MULTICLOUD OBJECT GATEWAY PERFORMANCE BY ADDING ENDPOINTS

The Multicloud Object Gateway performance may vary from one environment to another. In some cases, specific applications require faster performance which can be easily addressed by scaling S3 endpoints.

The Multicloud Object Gateway resource pool is a group of NooBaa daemon containers that provide two types of services enabled by default:

- Storage service
- S3 endpoint service

9.10.1. S3 endpoints in the Multicloud Object Gateway

The S3 endpoint is a service that every Multicloud Object Gateway provides by default that handles the heavy lifting data digestion in the Multicloud Object Gateway. The endpoint service handles the inline data chunking, deduplication, compression, and encryption, and it accepts data placement instructions from the Multicloud Object Gateway.

9.10.2. Scaling with storage nodes

Prerequisites

- A running OpenShift Container Storage cluster on OpenShift Container Platform with access to the Multicloud Object Gateway.

A storage node in the Multicloud Object Gateway is a NooBaa daemon container attached to one or more Persistent Volumes and used for local object service data storage. NooBaa daemons can be deployed on Kubernetes nodes. This can be done by creating a Kubernetes pool consisting of StatefulSet pods.

Procedure

1. In the Multicloud Object Gateway user interface, from the **Overview** page, click **Add Storage Resources**:
2. In the window, click **Deploy Kubernetes Pool**

3. In the **Create Pool** step create the target pool for the future installed nodes.
4. In the **Configure** step, configure the number of requested pods and the size of each PV. For each new pod, one PV is be created.

5. In the **Review** step, you can find the details of the new pool and select the deployment method you wish to use: local or external deployment. If local deployment is selected, the Kubernetes nodes will deploy within the cluster. If external deployment is selected, you will be provided with a YAML file to run externally.
6. All nodes will be assigned to the pool you chose in the first step, and can be found under Resources → Storage resources → Resource name:

![Resource list with pools and nodes](image)

9.11. AUTOMATIC SCALING OF MULTICLOUD OBJECT GATEWAY ENDPOINTS

As of OpenShift Container Storage version 4.6, the number of MultiCloud Object Gateway endpoints scale automatically when the load on the MultiCloud Object Gateway S3 service increases or decreases. OpenShift Container storage 4.6 clusters are deployed with one active MultiCloud Object Gateway endpoint. Each MultiCloud Object Gateway endpoint pod is configured by default with 1 CPU and 2Gi memory request, with limits matching the request. When the CPU load on the endpoint crosses over an 80% usage threshold for a consistent period of time, a second endpoint is deployed lowering the load on the first endpoint. When the average CPU load on both endpoints falls below the 80% threshold for a consistent period of time, one of the endpoints is deleted. This feature improves performance and serviceability of the MultiCloud Object Gateway.
CHAPTER 10. MANAGING PERSISTENT VOLUME CLAIMS

10.1. CONFIGURING APPLICATION PODS TO USE OPENSIFT CONTAINER STORAGE

Follow the instructions in this section to configure OpenShift Container Storage as storage for an application pod.

Prerequisites

- You have administrative access to OpenShift Web Console.
- OpenShift Container Storage Operator is installed and running in the `openshift-storage` namespace. In OpenShift Web Console, click `Operators` → `Installed Operators` to view installed operators.
- The default storage classes provided by OpenShift Container Storage are available. In OpenShift Web Console, click `Storage` → `Storage Classes` to view default storage classes.

Procedure

1. Create a Persistent Volume Claim (PVC) for the application to use.
   a. In OpenShift Web Console, click `Storage` → `Persistent Volume Claims`
   b. Set the `Project` for the application pod.
   c. Click `Create Persistent Volume Claim`
      i. Specify a `Storage Class` provided by OpenShift Container Storage.
      ii. Specify the PVC `Name`, for example, `myclaim`.
      iii. Select the required `Access Mode`.
      iv. For Rados Block Device (RBD), if the `Access mode` is ReadWriteOnce (RWO), select the required `Volume mode`. The default volume mode is `Filesystem`.
      v. Specify a `Size` as per application requirement.
      vi. Click `Create` and wait until the PVC is in `Bound` status.

2. Configure a new or existing application pod to use the new PVC.
   - For a new application pod, perform the following steps:
      i. Click `Workloads` → `Pods`.
      ii. Create a new application pod.
      iii. Under the `spec` section, add `volume:` section to add the new PVC as a volume for the application pod.

```yaml
volumes:
  - name: <volume_name>
persistentVolumeClaim:
```
claimName: <pvc_name>

For example:

volumes:
  - name: mypd
persistentVolumeClaim:
    claimName: myclaim

For an existing application pod, perform the following steps:

i. Click Workloads → Deployment Configs.

ii. Search for the required deployment config associated with the application pod.

iii. Click on its Action menu (⋮) → Edit Deployment Config.

iv. Under the spec: section, add volume: section to add the new PVC as a volume for the application pod and click Save.

volumes:
  - name: <volume_name>
persistentVolumeClaim:
    claimName: <pvc_name>

For example:

volumes:
  - name: mypd
    persistentVolumeClaim:
      claimName: myclaim

3. Verify that the new configuration is being used.

   a. Click Workloads → Pods.

   b. Set the Project for the application pod.

   c. Verify that the application pod appears with a status of Running.

   d. Click the application pod name to view pod details.

   e. Scroll down to Volumes section and verify that the volume has a Type that matches your new Persistent Volume Claim, for example, myclaim.

10.2. VIEWING PERSISTENT VOLUME CLAIM REQUEST STATUS

Use this procedure to view the status of a PVC request.

Prerequisites

- Administrator access to OpenShift Container Storage.

Procedure

Red Hat OpenShift Container Storage 4.8 Deploying and managing OpenShift Container Storage using Red Hat O
1. Log in to OpenShift Web Console.

2. Click Storage → Persistent Volume Claims

3. Search for the required PVC name by using the Filter textbox. You can also filter the list of PVCs by Name or Label to narrow down the list.

4. Check the Status column corresponding to the required PVC.

5. Click the required Name to view the PVC details.

### 10.3. REVIEWING PERSISTENT VOLUME CLAIM REQUEST EVENTS

Use this procedure to review and address Persistent Volume Claim (PVC) request events.

**Prerequisites**

- Administrator access to OpenShift Web Console.

**Procedure**

1. Log in to OpenShift Web Console.

2. Click Storage → Overview → Block and File

3. Locate the Inventory card to see the number of PVCs with errors.

4. Click Storage → Persistent Volume Claims

5. Search for the required PVC using the Filter textbox.

6. Click on the PVC name and navigate to Events

7. Address the events as required or as directed.

### 10.4. EXPANDING PERSISTENT VOLUME CLAIMS

OpenShift Container Storage 4.6 onwards has the ability to expand Persistent Volume Claims providing more flexibility in the management of persistent storage resources.

Expansion is supported for the following Persistent Volumes:

- PVC with ReadWriteOnce (RWO) and ReadWriteMany (RWX) access that is based on Ceph File System (CephFS) for volume mode **Filesystem**.

- PVC with ReadWriteOnce (RWO) access that is based on Ceph RADOS Block Devices (RBDs) with volume mode **Filesystem**.

- PVC with ReadWriteOnce (RWO) access that is based on Ceph RADOS Block Devices (RBDs) with volume mode **Block**.

**NOTE**

PVC expansion is not supported for OSD, MON and encrypted PVCs.
Prerequisites

- Administrator access to OpenShift Web Console.

Procedure

1. In OpenShift Web Console, navigate to Storage → Persistent Volume Claims.
2. Click the Action Menu (⋮) next to the Persistent Volume Claim you want to expand.
3. Click Expand PVC:

4. Select the new size of the Persistent Volume Claim, then click Expand:

   **Expand Persistent Volume Claim**

   Increase the capacity of claim `db-noobaa-db-0`. This can be a time-consuming process.

   **Size**

   | 50 | GiB |  

5. To verify the expansion, navigate to the PVC’s details page and verify the Capacity field has the correct size requested.

   **NOTE**

   When expanding PVCs based on Ceph RADOS Block Devices (RBDs), if the PVC is not already attached to a pod the Condition type is `FileSystemResizePending` in the PVC’s details page. Once the volume is mounted, filesystem resize succeeds and the new size is reflected in the Capacity field.

10.5. DYNAMIC PROVISIONING
10.5.1. About dynamic provisioning

The StorageClass resource object describes and classifies storage that can be requested, as well as provides a means for passing parameters for dynamically provisioned storage on demand. StorageClass objects can also serve as a management mechanism for controlling different levels of storage and access to the storage. Cluster Administrators (cluster-admin) or Storage Administrators (storage-admin) define and create the StorageClass objects that users can request without needing any intimate knowledge about the underlying storage volume sources.

The OpenShift Container Storage persistent volume framework enables this functionality and allows administrators to provision a cluster with persistent storage. The framework also gives users a way to request those resources without having any knowledge of the underlying infrastructure.

Many storage types are available for use as persistent volumes in OpenShift Container Storage. While all of them can be statically provisioned by an administrator, some types of storage are created dynamically using the built-in provider and plug-in APIs.

10.5.2. Dynamic provisioning in OpenShift Container Storage

Red Hat OpenShift Container Storage is software-defined storage that is optimised for container environments. It runs as an operator on OpenShift Container Platform to provide highly integrated and simplified persistent storage management for containers.

OpenShift Container Storage supports a variety of storage types, including:

- Block storage for databases
- Shared file storage for continuous integration, messaging, and data aggregation
- Object storage for archival, backup, and media storage

Version 4 uses Red Hat Ceph Storage to provide the file, block, and object storage that backs persistent volumes, and Rook.io to manage and orchestrate provisioning of persistent volumes and claims. NooBaa provides object storage, and its Multicloud Gateway allows object federation across multiple cloud environments (available as a Technology Preview).

In OpenShift Container Storage 4, the Red Hat Ceph Storage Container Storage Interface (CSI) driver for RADOS Block Device (RBD) and Ceph File System (CephFS) handles the dynamic provisioning requests. When a PVC request comes in dynamically, the CSI driver has the following options:

- Create a PVC with ReadWriteOnce (RWO) and ReadWriteMany (RWX) access that is based on Ceph RBDs with volume mode Block
- Create a PVC with ReadWriteOnce (RWO) access that is based on Ceph RBDs with volume mode Filesystem
- Create a PVC with ReadWriteOnce (RWO) and ReadWriteMany (RWX) access that is based on CephFS for volume mode Filesystem

The judgment of which driver (RBD or CephFS) to use is based on the entry in the storageclass.yaml file.

10.5.3. Available dynamic provisioning plug-ins
OpenShift Container Storage provides the following provisioner plug-ins, which have generic implementations for dynamic provisioning that use the cluster’s configured provider’s API to create new storage resources:

<table>
<thead>
<tr>
<th>Storage type</th>
<th>Provisioner plug-in name</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenStack Cinder</td>
<td>kubernetes.io/cinder</td>
<td>For dynamic provisioning when using multiple clusters in different zones, tag each node with Key=kubernetes.io/cluster/&lt;cluster_name&gt;,Value=&lt;cluster_id&gt; where &lt;cluster_name&gt; and &lt;cluster_id&gt; are unique per cluster.</td>
</tr>
<tr>
<td>AWS Elastic Block Store (EBS)</td>
<td>kubernetes.io/aws-ebs</td>
<td>Dynamic provisioning is accomplished through the EFS provisioner pod and not through a provisioner plug-in.</td>
</tr>
<tr>
<td>AWS Elastic File System (EFS)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Azure Disk</td>
<td>kubernetes.io/azure-disk</td>
<td></td>
</tr>
<tr>
<td>Azure File</td>
<td>kubernetes.io/azure-file</td>
<td>The persistent-volume-binder ServiceAccount requires permissions to create and get Secrets to store the Azure storage account and keys.</td>
</tr>
<tr>
<td>GCE Persistent Disk (gcePD)</td>
<td>kubernetes.io/gce-pd</td>
<td>In multi-zone configurations, it is advisable to run one OpenShift Container Storage cluster per GCE project to avoid PVs from being created in zones where no node in the current cluster exists.</td>
</tr>
<tr>
<td>VMware vSphere</td>
<td>kubernetes.io/vsphere-volume</td>
<td></td>
</tr>
<tr>
<td>Red Hat Virtualization</td>
<td>csi.ovirt.org</td>
<td></td>
</tr>
</tbody>
</table>

**IMPORTANT**

Any chosen provisioner plug-in also requires configuration for the relevant cloud, host, or third-party provider as per the relevant documentation.
CHAPTER 11. VOLUME SNAPSHOTS

A volume snapshot is the state of the storage volume in a cluster at a particular point in time. These snapshots help to use storage more efficiently by not having to make a full copy each time and can be used as building blocks for developing an application.

You can create multiple snapshots of the same persistent volume claim (PVC). For CephFS, you can create up to 100 snapshots per PVC. For RADOS Block Device (RBD), you can create up to 512 snapshots per PVC.

**NOTE**

You cannot schedule periodic creation of snapshots.

11.1. CREATING VOLUME SNAPSHOTS

You can create a volume snapshot either from the Persistent Volume Claim (PVC) page or the Volume Snapshots page.

**Prerequisites**

- For a consistent snapshot, the PVC should be in **Bound** state and not be in use. Ensure to stop all IO before taking the snapshot.

**NOTE**

OpenShift Container Storage only provides crash consistency for a volume snapshot of a PVC if a pod is using it. For application consistency, be sure to first tear down a running pod to ensure consistent snapshots or use any quiesce mechanism provided by the application to ensure it.

**Procedure**

**From the Persistent Volume Claims page**

1. Click **Storage → Persistent Volume Claims** from the OpenShift Web Console.

2. To create a volume snapshot, do one of the following:
   - Beside the desired PVC, click Action menu (⋯) → **Create Snapshot**
   - Click on the PVC for which you want to create the snapshot and click **Actions → Create Snapshot**.

3. Enter a **Name** for the volume snapshot.

4. Choose the **Snapshot Class** from the drop-down list.

5. Click **Create**. You will be redirected to the Details page of the volume snapshot that is created.

**From the Volume Snapshots page**

1. Click **Storage → Volume Snapshots** from the OpenShift Web Console.
2. In the Volume Snapshots page, click Create Volume Snapshot.

3. Choose the required Project from the drop-down list.

4. Choose the Persistent Volume Claim from the drop-down list.

5. Enter a Name for the snapshot.

6. Choose the Snapshot Class from the drop-down list.

7. Click Create. You will be redirected to the Details page of the volume snapshot that is created.

**Verification steps**

- Go to the Details page of the PVC and click the Volume Snapshots tab to see the list of volume snapshots. Verify that the new volume snapshot is listed.

- Click Storage → Volume Snapshots from the OpenShift Web Console. Verify that the new volume snapshot is listed.

- Wait for the volume snapshot to be in Ready state.

### 11.2. RESTORING VOLUME SNAPSHOTs

When you restore a volume snapshot, a new Persistent Volume Claim (PVC) gets created. The restored PVC is independent of the volume snapshot and the parent PVC.

You can restore a volume snapshot from either the Persistent Volume Claim page or the Volume Snapshots page.

**Procedure**

**From the Persistent Volume Claims page**

You can restore volume snapshot from the Persistent Volume Claims page only if the parent PVC is present.

1. Click Storage → Persistent Volume Claims from the OpenShift Web Console.

2. Click on the PVC name with the volume snapshot to restore a volume snapshot as a new PVC.

3. In the Volume Snapshots tab, click the Action menu (⋮) next to the volume snapshot you want to restore.

4. Click Restore as new PVC.

5. Enter a name for the new PVC.

6. Select the Storage Class name.
NOTE

For Rados Block Device (RBD), you must select a storage class with the same pool as that of the parent PVC. Restoring the snapshot of an encrypted PVC using a storage class where encryption is not enabled and vice versa is not supported.

7. Select the **Access Mode** of your choice.

**IMPORTANT**

The ReadOnlyMany (ROX) access mode is a Developer Preview feature and is subject to Developer Preview support limitations. Developer Preview releases are not intended to be run in production environments and are not supported through the Red Hat Customer Portal case management system. If you need assistance with ReadOnlyMany feature, reach out to the ocs-devpreview@redhat.com mailing list and a member of the Red Hat Development Team will assist you as quickly as possible based on availability and work schedules. See Creating a clone or restoring a snapshot with the new readonly access mode to use the ROX access mode.

8. (Optional) For RBD, select **Volume mode**.

9. Click **Restore**. You are redirected to the new PVC details page.

**From the Volume Snapshots page**

1. Click **Storage → Volume Snapshots** from the OpenShift Web Console.

2. In the **Volume Snapshots** tab, click the Action menu (⋮) next to the volume snapshot you want to restore.

3. Click **Restore as new PVC**

4. Enter a name for the new PVC.

5. Select the **Storage Class** name.

**NOTE**

For Rados Block Device (RBD), you must select a storage class with the same pool as that of the parent PVC. Restoring the snapshot of an encrypted PVC using a storage class where encryption is not enabled and vice versa is not supported.

6. Select the **Access Mode** of your choice.
**IMPORTANT**

The ReadOnlyMany (ROX) access mode is a Developer Preview feature and is subject to Developer Preview support limitations. Developer Preview releases are not intended to be run in production environments and are not supported through the Red Hat Customer Portal case management system. If you need assistance with ReadOnlyMany feature, reach out to the ocs-devpreview@redhat.com mailing list and a member of the Red Hat Development Team will assist you as quickly as possible based on availability and work schedules. See Creating a clone or restoring a snapshot with the new readonly access mode to use the ROX access mode.

7. (Optional) For RBD, select **Volume mode**.

8. Click **Restore**. You are redirected to the new PVC details page.

**Verification steps**

- Click **Storage → Persistent Volume Claims** from the OpenShift Web Console and confirm that the new PVC is listed in the **Persistent Volume Claims** page.

- Wait for the new PVC to reach **Bound** state.

### 11.3. DELETING VOLUME SNAPSHOTS

**Prerequisites**

- For deleting a volume snapshot, the volume snapshot class which is used in that particular volume snapshot should be present.

**Procedure**

**From Persistent Volume Claims page**

1. Click **Storage → Persistent Volume Claims** from the OpenShift Web Console.

2. Click on the PVC name which has the volume snapshot that needs to be deleted.

3. In the **Volume Snapshots** tab, beside the desired volume snapshot, click Action menu (…) → **Delete Volume Snapshot**

**From Volume Snapshots page**

1. Click **Storage → Volume Snapshots** from the OpenShift Web Console.

2. In the **Volume Snapshots** page, beside the desired volume snapshot click Action menu (…) → **Delete Volume Snapshot**

**Verification steps**

- Ensure that the deleted volume snapshot is not present in the **Volume Snapshots** tab of the PVC details page.
• Click **Storage → Volume Snapshots** and ensure that the deleted volume snapshot is not listed.
CHAPTER 12. VOLUME CLONING

A clone is a duplicate of an existing storage volume that is used as any standard volume. You create a clone of a volume to make a point in time copy of the data. A persistent volume claim (PVC) cannot be cloned with a different size. You can create up to 512 clones per PVC for both CephFS and RADOS Block Device (RBD).

12.1. CREATING A CLONE

Prerequisites

- Source PVC must be in **Bound** state and must not be in use.

**NOTE**

Do not create a clone of a PVC if a Pod is using it. Doing so might cause data corruption because the PVC is not quiesced (paused).

Procedure

1. Click **Storage** → **Persistent Volume Claims** from the OpenShift Web Console.

2. To create a clone, do one of the following:
   - Beside the desired PVC, click Action menu (⋮) → **Clone PVC**.
   - Click on the PVC that you want to clone and click **Actions** → **Clone PVC**.

3. Enter a **Name** for the clone.

4. Select the access mode of your choice.

   **IMPORTANT**

   The ReadOnlyMany (ROX) access mode is a Developer Preview feature and is subject to Developer Preview support limitations. Developer Preview releases are not intended to be run in production environments and are not supported through the Red Hat Customer Portal case management system. If you need assistance with ReadOnlyMany feature, reach out to the ocs-devpreview@redhat.com mailing list and a member of the Red Hat Development Team will assist you as quickly as possible based on availability and work schedules. See Creating a clone or restoring a snapshot with the new readonly access mode to use the ROX access mode.

5. Click **Clone**. You are redirected to the new PVC details page.

6. Wait for the cloned PVC status to become **Bound**.

   The cloned PVC is now available to be consumed by the pods. This cloned PVC is independent of its dataSource PVC.
CHAPTER 13. REPLACING STORAGE NODES

You can choose one of the following procedures to replace storage nodes:

- Section 13.1, “Replacing operational nodes on Red Hat OpenStack Platform installer-provisioned infrastructure”
- Section 13.2, “Replacing failed nodes on Red Hat OpenStack Platform installer-provisioned infrastructure”

13.1. REPLACING OPERATIONAL NODES ON RED HAT OPENSTACK PLATFORM INSTALLER-PROVISIONED INFRASTRUCTURE

Use this procedure to replace an operational node on Red Hat OpenStack Platform installer-provisioned infrastructure (IPI).

Procedure

1. Log in to OpenShift Web Console and click Compute → Nodes.
2. Identify the node that needs to be replaced. Take a note of its Machine Name.
3. Mark the node as unschedulable using the following command:

   ```bash
   $ oc adm cordon <node_name>
   ```

4. Drain the node using the following command:

   ```bash
   $ oc adm drain <node_name> --force --delete-local-data --ignore-daemonsets
   ```

   **IMPORTANT**
   
   This activity may take at least 5-10 minutes or more. Ceph errors generated during this period are temporary and are automatically resolved when the new node is labeled and functional.

5. Click Compute → Machines. Search for the required machine.
6. Besides the required machine, click the Action menu ( ⋮ ) → Delete Machine.
7. Click Delete to confirm the machine deletion. A new machine is automatically created.
8. Wait for new machine to start and transition into Running state.

   **IMPORTANT**
   
   This activity may take at least 5-10 minutes or more.

9. Click Compute → Nodes, confirm if the new node is in Ready state.
10. Apply the OpenShift Container Storage label to the new node using any one of the following:

    **From User interface**
a. For the new node, click Action Menu (⋮) → Edit Labels

b. Add `cluster.ocs.openshift.io/openshift-storage` and click Save.

From Command line interface

- Execute the following command to apply the OpenShift Container Storage label to the new node:

  ```
  $ oc label node <new_node_name> cluster.ocs.openshift.io/openshift-storage=""
  ```

**Verification steps**

1. Execute the following command and verify that the new node is present in the output:

  ```
  $ oc get nodes --show-labels | grep cluster.ocs.openshift.io/openshift-storage= |cut -d' ' -f1
  ```

2. Click Workloads → Pods, confirm that at least the following pods on the new node are in Running state:
   - `csi-cephfsplugin-*`
   - `csi-rbdplugin-*`

3. Verify that all other required OpenShift Container Storage pods are in Running state.

4. Verify that new OSD pods are running on the replacement node.

   ```
   $ oc get pods -o wide -n openshift-storage| egrep -i new-node-name | egrep osd
   ```

5. (Optional) If cluster-wide encryption is enabled on the cluster, verify that the new OSD devices are encrypted.

   For each of the new nodes identified in previous step, do the following:
   a. Create a debug pod and open a chroot environment for the selected host(s).

      ```
      $ oc debug node/<node name>
      $ chroot /host
      ```

   b. Run “lsblk” and check for the “crypt” keyword beside the `ocs-deviceset` name(s)

      ```
      $ lsblk
      ```

6. If verification steps fail, contact Red Hat Support.

---

13.2. REPLACING FAILED NODES ON RED HAT OPENSTACK PLATFORM INSTALLER-PROVISIONED INFRASTRUCTURE

Perform this procedure to replace a failed node which is not operational on Red Hat OpenStack Platform installer-provisioned infrastructure (IPI) for OpenShift Container Storage.

**Procedure**
1. Log in to OpenShift Web Console and click **Compute → Nodes**.

2. Identify the faulty node and click on its **Machine Name**.

3. Click **Actions → Edit Annotations**, and click **Add More**.

4. Add **machine.openshift.io/exclude-node-draining** and click **Save**.

5. Click **Actions → Delete Machine**, and click **Delete**.

6. A new machine is automatically created, wait for new machine to start.

   **IMPORTANT**
   
   This activity may take at least 5-10 minutes or more. Ceph errors generated during this period are temporary and are automatically resolved when the new node is labeled and functional.

7. Click **Compute → Nodes**, confirm if the new node is in **Ready** state.

8. Apply the OpenShift Container Storage label to the new node using any one of the following:

   - **From User interface**
     a. For the new node, click **Action Menu (⋮) → Edit Labels**
     b. Add **cluster.ocs.openshift.io/openshift-storage** and click **Save**.

   - **From Command line interface**
     - Execute the following command to apply the OpenShift Container Storage label to the new node:

       ```bash
       $ oc label node <new_node_name> cluster.ocs.openshift.io/openshift-storage=""
       ```

9. [Optional]: If the failed Red Hat OpenStack Platform instance is not removed automatically, terminate the instance from Red Hat OpenStack Platform console.

**Verification steps**

1. Execute the following command and verify that the new node is present in the output:

   ```bash
   $ oc get nodes --show-labels | grep cluster.ocs.openshift.io/openshift-storage | cut -d' ' -f1
   ```

2. Click **Workloads → Pods**, confirm that at least the following pods on the new node are in **Running** state:

   - **csi-cephfsplugin-***
   - **csi-rbdplugin-***

3. Verify that all other required OpenShift Container Storage pods are in **Running** state.

4. Verify that new OSD pods are running on the replacement node.
5. (Optional) If cluster-wide encryption is enabled on the cluster, verify that the new OSD devices are encrypted.
   For each of the new nodes identified in previous step, do the following:
   
a. Create a debug pod and open a chroot environment for the selected host(s).
   
   ```
   $ oc debug node/<node name>
   $ chroot /host
   ```

b. Run “lsblk” and check for the “crypt” keyword beside the `ocs-deviceset` name(s)

   ```
   $ lsblk
   ```

6. If verification steps fail, [contact Red Hat Support](https://example.com).
CHAPTER 14. REPLACING STORAGE DEVICES

14.1. REPLACING OPERATIONAL OR FAILED STORAGE DEVICES ON RED HAT OPENSTACK PLATFORM INSTALLER-PROVISIONED INFRASTRUCTURE

Use this procedure to replace storage device in OpenShift Container Storage which is deployed on Red Hat OpenStack Platform. This procedure helps to create a new Persistent Volume Claim (PVC) on a new volume and remove the old object storage device (OSD).

Procedure

1. Identify the OSD that needs to be replaced and the OpenShift Container Platform node that has the OSD scheduled on it.

   $ oc get -n openshift-storage pods -l app=rook-ceph-osd -o wide

   Example output:

   rook-ceph-osd-0-6d77d6c7c6-m8xj6 0/1 CrashLoopBackOff 0 24h 10.129.0.16
   compute-2 <none> <none>
   rook-ceph-osd-1-85d99f95f-2svc7 1/1 Running 0 24h 10.128.2.24 compute-0 <none> <none>
   rook-ceph-osd-2-6c66c0db977-tp542 1/1 Running 0 24h 10.130.0.18 compute-1 <none> <none>

   In this example, rook-ceph-osd-0-6d77d6c7c6-m8xj6 needs to be replaced and compute-2 is the OpenShift Container platform node on which the OSD is scheduled.

   **NOTE**

   If the OSD to be replaced is healthy, the status of the pod will be **Running**.

2. Scale down the OSD deployment for the OSD to be replaced.

   $ osd_id_to_remove=0
   $ oc scale -n openshift-storage deployment rook-ceph-osd-$(osd_id_to_remove) --replicas=0

   where, osd_id_to_remove is the integer in the pod name immediately after the rook-ceph-osd prefix. In this example, the deployment name is rook-ceph-osd-0.

   Example output:

   deployment.extensions/rook-ceph-osd-0 scaled

3. Verify that the rook-ceph-osd pod is terminated.

   $ oc get -n openshift-storage pods -l ceph-osd-id=$(osd_id_to_remove)

   Example output:
No resources found.

NOTE

If the **rook-ceph-osd** pod is in **terminating** state, use the **force** option to delete the pod.

```
$ oc delete pod rook-ceph-osd-0-6d77d6c7c6-m8xj6 --force --grace-period=0
```

Example output:

```
warning: Immediate deletion does not wait for confirmation that the running resource has been terminated. The resource may continue to run on the cluster indefinitely.
pod "rook-ceph-osd-0-6d77d6c7c6-m8xj6" force deleted
```

4. Incase, the persistent volume associated with the failed OSD fails, get the failed persistent volumes details and delete them using the following commands:

```
$ oc get pv
$ oc delete pv <failed-pv-name>
```

5. Remove the old OSD from the cluster so that a new OSD can be added.
   a. Delete any old **ocs-osd-removal** jobs.
      
      ```
      $ oc delete -n openshift-storage job ocs-osd-removal-$\{osd_id_to_remove\}
      ```
      
      Example output:
      
      ```
      job.batch "ocs-osd-removal-0" deleted
      ```

   b. Change to the **openshift-storage** project.
      
      ```
      $ oc project openshift-storage
      ```

   c. Remove the old OSD from the cluster.
      
      ```
      $ oc process -n openshift-storage ocs-osd-removal -p
      FAILED_OSD_IDS=$\{osd_id_to_remove\} |oc create -n openshift-storage -f -
      ```

      You can remove more than one OSD by adding comma separated OSD IDs in the command. (For example: FAILED_OSD_IDS=0,1,2)
6. Verify that the OSD is removed successfully by checking the status of the `ocs-osd-removal` pod. A status of `Completed` confirms that the OSD removal job succeeded.

   ```bash
   $ oc get pod -l job-name=ocs-osd-removal-$osd_id_to_remove -n openshift-storage
   ```

   **NOTE**
   
   If `ocs-osd-removal` fails and the pod is not in the expected `Completed` state, check the pod logs for further debugging. For example:

   ```bash
   $ oc logs -l job-name=ocs-osd-removal-$osd_id_to_remove -n openshift-storage --tail=-1
   ```

7. If encryption was enabled at the time of install, remove `dm-crypt` managed `device-mapper` mapping from the OSD devices that are removed from the respective OpenShift Container Storage nodes.

   a. Get PVC name(s) of the replaced OSD(s) from the logs of `ocs-osd-removal-job` pod:

   ```bash
   $ oc logs -l job-name=ocs-osd-removal-job -n openshift-storage --tail=-1 | egrep -i "pvc|deviceset"
   ```
   
   For example:

   ```plaintext
   2021-05-12 14:31:34.666000 I | cephosd: removing the OSD PVC "ocs-deviceset-xxxx-xxx-xxx-xxx"
   ```

   b. For each of the nodes identified in step #1, do the following:

   i. Create a `debug` pod and `chroot` to the host on the storage node.

   ```bash
   $ oc debug node/<node name>
   $ chroot /host
   ```

   ii. Find relevant device name based on the PVC names identified in the previous step

   ```bash
   sh-4.4# dmsetup ls| grep <pvc name>
   ocs-deviceset-xxx-xxx-xxx-xxx-block-dmcrypt (253:0)
   ```

   iii. Remove the mapped device.

   ```bash
   $ cryptsetup luksClose --debug --verbose ocs-deviceset-xxx-xxx-xxx-xxx-block-dmcrypt
   ```
NOTE

If the above command gets stuck due to insufficient privileges, run the following commands:

- Press **CTRL+Z** to exit the above command.
- Find PID of the process which was stuck.
  
  ```bash
  $ ps -ef | grep crypt
  ```
- Terminate the process using **kill** command.
  
  ```bash
  $ kill -9 <PID>
  ```
- Verify that the device name is removed.
  
  ```bash
  $ dmsetup ls
  ```

8. Delete the **ocs-osd-removal** job.

```bash
$ oc delete -n openshift-storage job ocs-osd-removal-${osd_id_to_remove}
```

Example output:

```
job.batch "ocs-osd-removal-0" deleted
```

**Verification steps**

1. Verify that there is a new OSD running.

```bash
$ oc get -n openshift-storage pods -l app=rook-ceph-osd
```

Example output:

```
rook-ceph-osd-0-5f7f4747d4-snshw                                  1/1     Running     0          4m47s
rook-ceph-osd-1-85d99fb95f-2svc7                                  1/1     Running     0          1d20h
rook-ceph-osd-2-6c66cdb977-jp542                                  1/1     Running     0          1d20h
```

2. Verify that there is a new PVC created which is in **Bound** state.

```bash
$ oc get -n openshift-storage pvc
```

Example output:

```
NAME                           STATUS   VOLUME                                     CAPACITY   ACCESS
MODES   STORAGECLASS                  AGE
db-noobaa-db-0                 Bound    pvc-b44ebb5e-3c67-4000-998e-304752deb5a7   50Gi
RWO            ocs-storagecluster-ceph-rbd   6d
ocs-deviceset-0-data-0-gwb5l Bound    pvc-bea680cd-7278-463d-a4f6-3eb5d3d0defe
512Gi RWO            standard                      94s
ocs-deviceset-1-data-0-w9pjmi Bound    pvc-01aded83-6ef1-42d1-a32e-6ca0964b96d4
```
3. (Optional) If cluster-wide encryption is enabled on the cluster, verify that the new OSD devices are encrypted.
   
a. Identify the node(s) where the new OSD pod(s) are running.
   
   $ oc get -o=custom-columns=NODE:.spec.nodeName pod/<OSD pod name>

   For example:
   
   oc get -o=custom-columns=NODE:.spec.nodeName pod/rook-ceph-osd-0-544db49d7f-qrgqm

   b. For each of the nodes identified in previous step, do the following:

      i. Create a debug pod and open a chroot environment for the selected host(s).

         $ oc debug node/<node name>
         $ chroot /host

      ii. Run “lsblk” and check for the “crypt” keyword beside the `ocs-deviceset` name(s)

         $ lsblk

4. Log in to OpenShift Web Console and view the storage dashboard.

**Figure 14.1. OSD status in OpenShift Container Platform storage dashboard after device replacement**

**Status**

- OCS Cluster
- Data Resiliency

No persistent storage alerts
CHAPTER 15. UPDATING OPENSIFT CONTAINER STORAGE

15.1. OVERVIEW OF THE OPENSIFT CONTAINER STORAGE UPDATE PROCESS

You can upgrade Red Hat OpenShift Container Storage and its components, either between minor releases like 4.7 and 4.8, or between batch updates like 4.8.0 and 4.8.1.

You need to upgrade the different parts of OpenShift Container Storage in a specific order.

1. Update OpenShift Container Platform according to the Updating clusters documentation for OpenShift Container Platform.

2. Update OpenShift Container Storage.
   a. To prepare a disconnected environment for updates see Operators guide to using Operator Lifecycle Manager on restricted networks to be able to update Openshift Container Storage as well as Local Storage Operator when in use.
   b. Update the OpenShift Container Storage operator using the appropriate process for your setup:
      • Update OpenShift Container Storage in internal mode

Update considerations

Review the following important considerations before you begin.

• Red Hat recommends using the same version of Red Hat OpenShift Container Platform with Red Hat OpenShift Container Storage. See the Interoperability Matrix for more information about supported combinations of OpenShift Container Platform and OpenShift Container Storage.

• The Local Storage Operator is fully supported only when the Local Storage Operator version matches the Red Hat OpenShift Container Platform version.

15.2. PREPARING TO UPDATE IN A DISCONNECTED ENVIRONMENT

When your Red Hat OpenShift Container Storage environment is not directly connected to the internet, some additional configuration is required to provide the Operator Lifecycle Manager (OLM) with alternatives to the default Operator Hub and image registries.

See the OpenShift Container Platform documentation for more general information: Updating an Operator catalog image.

To configure your cluster for disconnected update:

1. Configure authentication for an alternative registry.

2. Build and mirror the Red Hat operator catalog.

3. Creating Operator imageContentSourcePolicy

4. Updating redhat-operator catalogsource

When these steps are complete, Continue with update as usual.
15.2.1. Adding mirror registry authentication details

Prerequisites

- Verify that your existing disconnected cluster uses OpenShift Container Platform 4.3 or higher.
- Verify that you have an `oc client` version of 4.4 or higher.
- Prepare a mirror host with a mirror registry. See Preparing your mirror host for details.

Procedure

1. Log in to the OpenShift Container Platform cluster using the `cluster-admin` role.

2. Locate your `auth.json` file.
   This file is generated when you use podman or docker to log in to a registry. It is located in one of the following locations:
   - `~/.docker/auth.json`
   - `/run/user/<UID>/containers/auth.json`
   - `/var/run/containers/<UID>/auth.json`

3. Obtain your unique Red Hat registry pull secret and paste it into your `auth.json` file. It will look something like this.

   ```json
   {
      "auths": {
        "cloud.openshift.com": {
          "auth": "*****************",
          "email": "user@example.com"
        },
        "quay.io": {
          "auth": "*****************",
          "email": "user@example.com"
        },
        "registry.connect.redhat.com": {
          "auth": "*****************",
          "email": "user@example.com"
        },
        "registry.redhat.io": {
          "auth": "*****************",
          "email": "user@example.com"
        }
      }  
   }
   
   ```

4. Export environment variables with the appropriate details for your setup.

   ```bash
   $ export AUTH_FILE="<location_of_auth.json>"
   $ export MIRROR_REGISTRY_DNS="<your_registry_url>:<port>"
   
   ```

5. Use `podman` to log in to the mirror registry and store the credentials in the `${AUTH_FILE}`.
$ podman login ${MIRROR_REGISTRY_DNS} --tls-verify=false --authfile ${AUTH_FILE}

This adds the mirror registry to the auth.json file.

```
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "***************",
      "email": "user@example.com"
    },
    "quay.io": {
      "auth": "***************",
      "email": "user@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "***************",
      "email": "user@example.com"
    },
    "registry.redhat.io": {
      "auth": "***************",
      "email": "user@example.com"
    },
    "<mirror_registry>": {
      "auth": "***************",
    }
  }
}
```

15.2.2. Building and mirroring the Red Hat operator catalog

Follow this process on a host that has access to Red Hat registries to create a mirror of those registries.

**Prerequisites**

- Run these commands as a cluster administrator.
- Be aware that mirroring the redhat-operator catalog can take hours to complete, and requires substantial available disk space on the mirror host.

**Procedure**

1. Build the catalog for redhat-operators.
   Set --from to the ose-operator-registry base image using the tag that matches the target OpenShift Container Platform cluster major and minor version.

   ```bash
   $ oc adm catalog build --appregistry-org redhat-operators \
   --from=registry.redhat.io/openshift4/ose-operator-registry:v4.7 \
   --to=${MIRROR_REGISTRY_DNS}/olm/redhat-operators:v2 \
   --registry-config=${AUTH_FILE} \
   --filter-by-os="linux/amd64" --insecure
   ```
NOTE

For IBM Power Systems and IBM Z infrastructure specify value of filter-by-os as linux/ppc64le, and linux/s390x respectively.

2. Mirror the catalog for **redhat-operators**.
   This is a long operation and can take 1-5 hours. Make sure there is 100 GB available disk space on the mirror host.

   ```bash
   $ oc adm catalog mirror ${MIRROR_REGISTRY_DNS}/olm/redhat-operators:v2 \
   ${MIRROR_REGISTRY_DNS} --registry-config=${AUTH_FILE} --insecure
   ```

15.2.3. Creating Operator imageContentSourcePolicy

After the `oc adm catalog mirror` command is completed, the `imageContentSourcePolicy.yaml` file gets created. The output directory for this file is usually, `./[catalog image name]-manifests`). Use this procedure to add any missing entries to the `.yaml` file and apply them to cluster.

**Procedure**

1. Check the content of this file for the mirrors mapping shown as follows:

   ```yaml
   spec:
   repositoryDigestMirrors:
   - mirrors:
     source: registry.redhat.io/ocs4
   - mirrors:
     source: registry.redhat.io/rhceph
   - mirrors:
     source: registry.redhat.io/openshift4
   - mirrors:
     source: registry.redhat.io/rhscl
   ```

2. Add any missing entries to the end of the `imageContentSourcePolicy.yaml` file.

3. Apply the `imageContentSourcePolicy.yaml` file to the cluster.

   ```bash
   $ oc apply -f ./[output dir]/imageContentSourcePolicy.yaml
   ```

Once the Image Content Source Policy is updated, all the nodes (master, infra, and workers) in the cluster need to be updated and rebooted. This process is automatically handled through the Machine Config Pool operator and take up to 30 minutes although the exact elapsed time might vary based on the number of nodes in your OpenShift cluster. You can monitor the update process by using the `oc get mcp` command or the `oc get node` command.

15.2.4. Updating redhat-operator CatalogSource

**Procedure**
1. Recreate a **CatalogSource** object that references the catalog image for Red Hat operators.

**NOTE**

Make sure you have mirrored the correct catalog source with the correct version (that is, *v2*).

Save the following in a **redhat-operator-catalogsource.yaml** file, remembering to replace `<your_registry>` with your mirror registry URL:

```yaml
apiVersion: operators.coreos.com/v1alpha1
crude: CatalogSource
metadata:
  name: redhat-operators
  namespace: openshift-marketplace
spec:
  sourceType: grpc
  icon:
    base64data: PHN2ZyBpZD0iTGF5ZXJfMSIgZGF0YS1uYW1zPSJMYXllciAxIiB4bWxucz0iaHR0cDovL3d3dy55My5vcmcvMjAwMC9zdmciIHZpZXdCb3g9IjAgMCAxOTIgMTQ1Ij48ZGVmcz48c3R5bGU+
    mediatype: image/svg+xml
    image: <your_registry>/olm/redhat-operators:v2
displayName: Redhat Operators Catalog
publisher: Red Hat
```

2. Create a catalogsource using the redhat-operator-catalogsource.yaml file:

   ```bash
   $ oc apply -f redhat-operator-catalogsource.yaml
   ``

3. Verify that the new **redhat-operator** pod is running.

   ```bash
   $ oc get pod -n openshift-marketplace | grep redhat-operators
   ``

15.2.5. Continue to update
After your alternative catalog source is configured, you can continue to the appropriate update process:

- Updating OpenShift Container Storage in internal mode

### 15.3. UPDATING OPENShift CONTAINER STORAGE IN INTERNAL MODE

Use the following procedures to update your OpenShift Container Storage cluster deployed in internal mode.

#### 15.3.1. Enabling automatic updates for OpenShift Container Storage operator in internal mode

Use this procedure to enable automatic update approval for updating OpenShift Container Storage operator in OpenShift Container Platform.

**Prerequisites**

- Under **Block and File** in **Status** card, confirm that the OpenShift Container Storage cluster is healthy and data is resilient.

- Update the OpenShift Container Platform cluster to the latest stable release of version 4.8.X, see Updating Clusters.

- Switch the Red Hat OpenShift Container Storage channel from **stable-4.7** to **stable-4.8**. For details about channels, see OpenShift Container Storage upgrade channels and releases.

**NOTE**

You are required to switch channels only when you are updating minor versions (for example, updating from 4.7 to 4.8) and not when updating between batch updates of 4.8 (for example, updating from 4.8.0 to 4.8.1).

- Ensure that all OpenShift Container Storage Pods, including the operator pods, are in **Running** state in the **openshift-storage namespace**.
  To view the state of the pods, click **Workloads → Pods** from the left pane of the OpenShift Web Console. Select **openshift-storage** from the **Project** drop down list.

- Ensure that you have sufficient time to complete the OpenShift Container Storage update process, as the update time varies depending on the number of OSDs that run in the cluster.

**Procedure**

1. Log in to OpenShift Web Console.

2. Click **Operators → Installed Operators**

3. Select the **openshift-storage** project.

4. Click the OpenShift Container Storage operator name.

5. Click the **Subscription** tab and click the link under **Approval**.

6. Select **Automatic (default)** and click **Save**.
7. Perform one of the following depending on the Upgrade Status:

- **Upgrade Status shows requires approval**

  NOTE

  Upgrade status shows requires approval if the new OpenShift Container Storage version is already detected in the channel, and approval strategy was changed from Manual to Automatic at the time of update.

  a. Click on the Install Plan link.
  b. On the InstallPlan Details page, click Preview Install Plan.
  c. Review the install plan and click Approve.
  d. Wait for the Status to change from Unknown to Created.
  e. Click Operators → Installed Operators
  f. Select the openshift-storage project.
  g. Wait for the Status to change to Up to date

- **Upgrade Status does not show requires approval**

  a. Wait for the update to initiate. This may take up to 20 minutes.
  b. Click Operators → Installed Operators
  c. Select the openshift-storage project.
  d. Wait for the Status to change to Up to date

Verification steps

1. Click Storage → Overview → Block and File tab and in the Status card confirm that the OpenShift Container Storage cluster has a green tick mark indicating it is healthy.

2. Click Operators → Installed Operators → OpenShift Container Storage Operator. Under Storage Cluster, verify that the cluster service status is Ready.

  NOTE

  Once updated from OpenShift Container Storage version 4.7 to 4.8, the Version field here will still display 4.7. This is because the ocs-operator does not update the string represented in this field.

3. Ensure that all OpenShift Container Storage Pods, including the operator pods, are in Running state in the openshift-storage namespace.

   To view the state of the pods, click Workloads → Pods. Select openshift-storage from the Project drop down list.

4. If verification steps fail, contact Red Hat Support.
NOTE
The flexible scaling feature is available only in the new deployments of Red Hat OpenShift Container Storage 4.7. Storage clusters upgraded to the 4.7 version do not support flexible scaling.

Additional Resources
If you face any issues while updating OpenShift Container Storage, see the Commonly required logs for troubleshooting section in the Troubleshooting guide.

15.3.2. Manually updating OpenShift Container Storage operator in internal mode
Use this procedure to update OpenShift Container Storage operator by providing manual approval to the install plan.

Prerequisites
- Under Block and File in Status card, confirm that the OpenShift Container Storage cluster is healthy and data is resilient.
- Update the OpenShift Container Platform cluster to the latest stable release of version 4.8.X, see Updating Clusters.
- Switch the Red Hat OpenShift Container Storage channel from stable-4.7 to stable-4.8. For details about channels, see OpenShift Container Storage upgrade channels and releases.

NOTE
You are required to switch channels only when you are updating minor versions (for example, updating from 4.7 to 4.8) and not when updating between batch updates of 4.8 (for example, updating from 4.8.0 to 4.8.1).

- Ensure that all OpenShift Container Storage Pods, including the operator pods, are in Running state in the openshift-storage namespace.
  To view the state of the pods, click Workloads → Pods from the left pane of the OpenShift Web Console. Select openshift-storage from the Project drop down list.
- Ensure that you have sufficient time to complete the OpenShift Container Storage update process, as the update time varies depending on the number of OSDs that run in the cluster.

Procedure
1. Log in to OpenShift Web Console.
2. Click Operators → Installed Operators
3. Select the openshift-storage project.
4. Click the OpenShift Container Storage operator name.
5. Click the Subscription tab and click the link under Approval.
7. Wait for the **Upgrade Status** to change to **Upgrading**.

8. If the **Upgrade Status** shows **requires approval**, click on **requires approval**.

9. On the **InstallPlan Details** page, click **Preview Install Plan**.

10. Review the install plan and click **Approve**.

11. Wait for the **Status** to change from **Unknown** to **Created**.

12. Click **Operators → Installed Operators**

13. Select the **openshift-storage** project.

14. Wait for the **Status** to change to **Up to date**

**Verification steps**

1. Click **storage → Overview → Block and File** tab and in **Status** card confirm that the OpenShift Container Storage cluster has a green tick mark indicating it is healthy.

2. Click **Operators → Installed Operators → OpenShift Container Storage Operator**. Under **Storage Cluster**, verify that the cluster service status is **Ready**.

3. **NOTE**

   Once updated from OpenShift Container Storage version 4.7 to 4.8, the **Version** field here will still display 4.7. This is because the **ocs-operator** does not update the string represented in this field.

3. Ensure that all OpenShift Container Storage Pods, including the operator pods, are in **Running** state in the **openshift-storage namespace**.

   To view the state of the pods, click **Workloads → Pods** from the left pane of the OpenShift Web Console. Select **openshift-storage** from the **Project** drop down list.

4. If verification steps fail, contact Red Hat Support.

**Additional Resources**

If you face any issues while updating OpenShift Container Storage, see the **Commonly required logs for troubleshooting** section in the **Troubleshooting guide**.
