Red Hat OpenShift Local 2.29

Release notes and known issues

Highlighted features and identified problems in Red Hat OpenShift Local 2.29
Red Hat OpenShift Local 2.29 Release notes and known issues

Highlighted features and identified problems in Red Hat OpenShift Local 2.29

Fabrice Flore-Thebault
ffloret@redhat.com
Abstract

This document lists and briefly describes new and improved features of Red Hat OpenShift Local 2.29. It also contains information about potential problems you may encounter while using the software. Where possible, workarounds are described for identified issues.

    2.2.3. Unexpected behavior when run outside %WINDIR% .............................. 9
    2.2.4. Red Hat OpenShift Local expects FullLanguage support in PowerShell ... 9
    2.2.5. The crc oc-env command does not work with special characters in %PATH% 9
  2.3. Issues on macOS  ......................................................................................... 9
    2.3.1. The OpenShift preset is failing on macOS 12.x  ...................................... 9
    2.3.2. Hibernation causes VM time to desynchronize  ...................................... 9
Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our CTO Chris Wright’s message.
CHAPTER 1. RELEASE NOTES

These are the most important features and bug fixes in the Red Hat OpenShift Local 2.29 product.

1.1. COMPONENT VERSIONS

Red Hat OpenShift Local 2.29 has the following versions of the main components:

Table 1.1. Red Hat OpenShift Local, Component versions

<table>
<thead>
<tr>
<th>Component</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenShift Container Platform</td>
<td>4.14.1</td>
</tr>
<tr>
<td>OpenShift client binary (oc)</td>
<td>v4.14.1</td>
</tr>
<tr>
<td>Podman binary</td>
<td>4.4.4</td>
</tr>
</tbody>
</table>

1.2. MINIMUM SYSTEM REQUIREMENTS

Red Hat OpenShift Local has the following minimum hardware and operating system requirements.

1.2.1. Hardware requirements

Red Hat OpenShift Local is supported on these architectures:

Table 1.2. Preset and architecture compatibility

<table>
<thead>
<tr>
<th>Preset</th>
<th>AMD64</th>
<th>Intel 64</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenShift Container Platform</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>MicroShift</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>Podman container runtime</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
</tbody>
</table>

Red Hat OpenShift Local does not support nested virtualization.

Depending on the desired container runtime, Red Hat OpenShift Local requires the following system resources:

1.2.1.1. For OpenShift Container Platform

- 4 physical CPU cores
- 9 GB of free memory
- 35 GB of storage space
1.2.1. For MicroShift

- 2 physical CPU cores
- 4 GB of free memory
- 35 GB of storage space

**NOTE**

The OpenShift Container Platform and MicroShift presets require these minimum resources to run in the Red Hat OpenShift Local instance. Some workloads might require more resources. To assign more resources to the Red Hat OpenShift Local instance, see Configuring the instance.

1.2.1.3. For the Podman container runtime

- 2 physical CPU cores
- 2 GB of free memory
- 35 GB of storage space

1.2.2. Operating system requirements

Red Hat OpenShift Local requires the following minimum version of a supported operating system:

1.2.2.1. Requirements on Microsoft Windows

- On Microsoft Windows, Red Hat OpenShift Local requires the Windows 10 Fall Creators Update (version 1709) or later. Red Hat OpenShift Local does not work on earlier versions of Microsoft Windows. Microsoft Windows 10 Home Edition is not supported.

1.2.2.2. Requirements on macOS

- On macOS, Red Hat OpenShift Local requires macOS 11 Big Sur or later. Red Hat OpenShift Local does not work on earlier versions of macOS.

1.2.2.3. Requirements on Linux

- On Linux, Red Hat OpenShift Local is supported only on the latest two Red Hat Enterprise Linux/CentOS 8 and 9 minor releases and on the latest two stable Fedora releases.
- When using Red Hat Enterprise Linux, the machine running Red Hat OpenShift Local must be registered with the Red Hat Customer Portal.
- Ubuntu 18.04 LTS or later and Debian 10 or later are not supported and might require manual set up of the host machine.
- See Required software packages to install the required packages for your Linux distribution.

1.3. CHANGES AND IMPROVEMENTS

These are some notable changes introduced in Red Hat OpenShift Local 2.29.
1.4. NOTABLE ENHANCEMENTS

- You can use Red Hat OpenShift Local for development and testing purposes.

- Red Hat OpenShift Local installs on your computer one of these presets:
  
  **openshift**
  
  A minimal, preconfigured OpenShift Container Platform 4.14 cluster.

  **microshift**
  
  MicroShift.

  **podman**
  
  Podman container runtime.

- The preset runs in a Red Hat Enterprise Linux virtual machine, on the native hypervisor, on these platforms:
  
  - Linux
  
  - macOS
  
  - Microsoft Windows 10

1.5. TECHNOLOGY PREVIEW

Support for these features falls under the Technology Preview Features Support Scope.

- Red Hat OpenShift Local 2.29 includes the ability to create a custom bundle based on the currently running cluster with the `crc bundle generate` command. This command, its parameters, and behavior might change in incompatible ways in future releases.

1.6. NOTABLE CHANGES

- Red Hat OpenShift Local 2.29 provides OpenShift Container Platform 4.14.1 in the embedded OpenShift preset (**openshift**).

- Red Hat OpenShift Local 2.29 provides Podman 4.4.4 in the embedded Podman container engine preset (**podman**).

- Red Hat OpenShift Local 2.29 provides MicroShift 4.14.1 in the embedded MicroShift preset (**microshift**).

- The Red Hat OpenShift Local tray app has been removed. Users who want to use a GUI with OpenShift Local should move to Podman Desktop and the OpenShift Local extension.

- Red Hat OpenShift Local shows a warning when wrong proxy settings are configured via environment variables.

- Fixed a bug where wrong proxy config would make Red Hat OpenShift Local unusable. See //github.com/crc-org/crc/issues/3690[#3690.

- Fixed a bug where Red Hat OpenShift Local would raise an error out when the **proxy-ca-file** config had a relative path, by automatically changing it to an absolute path.
CHAPTER 2. KNOWN ISSUES

Issues that users of Red Hat OpenShift Local 2.29 might have, as well as possible workarounds for these issues.

2.1. GENERAL ISSUES

Issues affecting all supported platforms.

2.1.1. Proxy settings are improperly applied to the Podman preset

Proxy settings configured by using the `crc config set` command are not used by the `podman-remote` binary embedded in Red Hat OpenShift Local when the Podman preset is in use.

2.1.2. Red Hat OpenShift Local disables metrics by default

To ensure Red Hat OpenShift Local can run on a typical notebook, Red Hat OpenShift Local disables some resource-heavy services, such as Prometheus and all the related monitoring, alerting, and telemetry functions. You can enable these features.

Procedure

1. See Configuring the instance to assign more resources
2. See Starting monitoring

You cannot disable Monitoring after enabling these features.

Workaround

To disable monitoring again:

1. Delete the virtual machine:
   
   ```
   $ crc delete
   ```
2. Create a virtual machine:
   
   ```
   $ crc start
   ```

2.1.3. Enabling many Operators requires more memory than the default

The `crc start` command assigns 9 GiB of memory to the Red Hat OpenShift Local virtual machine by default. Enabling many Operators might increase memory requirements.

Workaround

- See Configuring the instance to assign additional memory.

2.1.4. Red Hat OpenShift Local does not work when the first nameserver is IPv6

DNS resolution to the Red Hat OpenShift Local virtual machine might fail if the first `nameserver` is IPv6.
Workaround

- Specify an IPv4 nameserver when starting the Red Hat OpenShift Local virtual machine by using the -n flag:

  $ crc start -n 8.8.8.8

2.1.5. Running crc setup might give you a known error

When you run the crc setup command, you might get the following error:

Workaround

- Try running the crc setup command till the error is resolved.

2.2. ISSUES ON MICROSOFT WINDOWS

This section describes Red Hat OpenShift Local issues that affect users on a Microsoft Windows host.

2.2.1. Completing the installation after installation with the Microsoft Standard Installer (MSI)

Procedure

1. Install Red Hat OpenShift Local with the MSI installer
2. Reboot your computer
3. Run the command in Command Prompt or PowerShell:

   $ crc setup

2.2.2. The crc cleanup command might fail with a permission error

Running crc setup followed by crc cleanup without restarting your host computer between commands will cause crc cleanup to report the following error:

  Post "http://unix/clean": open \\pipe\crc-admin-helper: Access is denied.

Workaround

1. Reboot your computer
2. Run the command:

   $ crc cleanup
2.2.3. Unexpected behavior when run outside %WINDRIVE%

The Hyper-V driver will fail when you start the crc binary from a network drive.

Workaround

- Move the crc binary to a location on %WINDRIVE%. %WINDRIVE% is usually set to C:.

2.2.4. Red Hat OpenShift Local expects FullLanguage support in PowerShell

Red Hat OpenShift Local supports the ConstrainedLanguage PowerShell mode with exceptions determined by your system administrator.

2.2.5. The crc oc-env command does not work with special characters in %PATH%

On Microsoft Windows, PowerShell and Command Prompt do not use the UTF-8 encoding. Therefore, running the crc oc-env command with special characters present in the %PATH% will not accurately encode UTF-8 characters.

Workaround

- Move the crc binary to a location containing no special characters.

Additional resources

- See the Red Hat OpenShift Local Getting Started Guide for an overview of Red Hat OpenShift Local features and an introduction to OpenShift Container Platform.
- Report issues with Red Hat OpenShift Local or request features by using the OpenShift Container Platform product with the crc component on Red Hat Bugzilla.

2.3. ISSUES ON MACOS

This section describes Red Hat OpenShift Local issues that affect users on a macOS host.

2.3.1. The OpenShift preset is failing on macOS 12.x

crc start is failing on macOS 12.x and x86 architecture for openshift preset. See #3914.

2.3.2. Hibernation causes VM time to desynchronize

Time in the Red Hat OpenShift Local virtual machine can become desynchronized with the time on your host. This issue occurs if the Red Hat OpenShift Local virtual machine is running when the host machine enters hibernation.

Workaround

1. Stop the Red Hat OpenShift Local virtual machine:

   $ crc stop
2. Restart the Red Hat OpenShift Local virtual machine:

$ crc start
