CHAPTER 1. SUPPORT OVERVIEW

Red Hat offers cluster administrators tools for gathering data for your cluster, monitoring, and troubleshooting.

1.1. GET SUPPORT

Get support: Visit the Red Hat Customer Portal to review knowledge base articles, submit a support case, and review additional product documentation and resources.

1.2. REMOTE HEALTH MONITORING ISSUES

Remote health monitoring issues: Red Hat OpenShift Service on AWS collects telemetry and configuration data about your cluster and reports it to Red Hat by using the Telemeter Client and the Insights Operator. Red Hat uses this data to understand and resolve issues in connected cluster. Red Hat OpenShift Service on AWS collects data and monitors health using the following:

- **Telemetry**: The Telemetry Client gathers and uploads the metrics values to Red Hat every four minutes and thirty seconds. Red Hat uses this data to:
  - Monitor the clusters.
  - Roll out Red Hat OpenShift Service on AWS upgrades.
  - Improve the upgrade experience.

- **Insight Operator**: By default, Red Hat OpenShift Service on AWS installs and enables the Insight Operator, which reports configuration and component failure status every two hours. The Insight Operator helps to:
  - Identify potential cluster issues proactively.
  - Provide a solution and preventive action in Red Hat OpenShift Cluster Manager.

You can review telemetry information.

If you have enabled remote health reporting, Use Insights to identify issues. You can optionally disable remote health reporting.

1.3. TROUBLESHOOTING ISSUES

A cluster administrator can monitor and troubleshoot the following Red Hat OpenShift Service on AWS component issues:

- **Node issues**: A cluster administrator can verify and troubleshoot node-related issues by reviewing the status, resource usage, and configuration of a node. You can query the following:
  - Kubelet’s status on a node.
  - Cluster node journal logs.

- **Operator issues**: A cluster administrator can do the following to resolve Operator issues:
  - Verify Operator subscription status.
  - Check Operator pod health.
Gather Operator logs.

- **Pod issues**: A cluster administrator can troubleshoot pod-related issues by reviewing the status of a pod and completing the following:
  - Review pod and container logs.
  - Start debug pods with root access.

- **Storage issues**: A multi-attach storage error occurs when the mounting volume on a new node is not possible because the failed node cannot unmount the attached volume. A cluster administrator can do the following to resolve multi-attach storage issues:
  - Enable multiple attachments by using RWX volumes.
  - Recover or delete the failed node when using an RWO volume.

- **Monitoring issues**: A cluster administrator can follow the procedures on the troubleshooting page for monitoring. If the metrics for your user-defined projects are unavailable or if Prometheus is consuming a lot of disk space, check the following:
  - Investigate why user-defined metrics are unavailable.
  - Determine why Prometheus is consuming a lot of disk space.

- **Logging issues**: A cluster administrator can follow the procedures in the "Support" and "Troubleshooting logging" sections to resolve logging issues:
  - Viewing the status of the Red Hat OpenShift Logging Operator.
  - Viewing the status of logging subsystem components.
  - Troubleshooting logging alerts.
  - Collecting information about your logging environment by using the `oc adm must-gather` command.

- **OpenShift CLI (oc) issues**: Investigate OpenShift CLI (oc) issues by increasing the log level.
CHAPTER 2. MANAGING YOUR CLUSTER RESOURCES

You can apply global configuration options in Red Hat OpenShift Service on AWS. Operators apply these configuration settings across the cluster.

2.1. INTERACTING WITH YOUR CLUSTER RESOURCES

You can interact with cluster resources by using the OpenShift CLI (oc) tool in Red Hat OpenShift Service on AWS. The cluster resources that you see after running the `oc api-resources` command can be edited.

Prerequisites

- You have access to the cluster as a user with the `dedicated-admin` role.
- You have access to the web console or you have installed the `oc` CLI tool.

Procedure

1. To see which configuration Operators have been applied, run the following command:

   ```bash
   $ oc api-resources -o name | grep config.openshift.io
   ```

2. To see what cluster resources you can configure, run the following command:

   ```bash
   $ oc explain <resource_name>.config.openshift.io
   ```

3. To see the configuration of custom resource definition (CRD) objects in the cluster, run the following command:

   ```bash
   $ oc get <resource_name>.config -o yaml
   ```

4. To edit the cluster resource configuration, run the following command:

   ```bash
   $ oc edit <resource_name>.config -o yaml
   ```
CHAPTER 3. GETTING SUPPORT

3.1. GETTING SUPPORT

If you experience difficulty with a procedure described in this documentation, or with Red Hat OpenShift Service on AWS in general, visit the Red Hat Customer Portal.

From the Customer Portal, you can:

- Search or browse through the Red Hat Knowledgebase of articles and solutions relating to Red Hat products.
- Submit a support case to Red Hat Support.
- Access other product documentation.

To identify issues with your cluster, you can use Insights in OpenShift Cluster Manager Hybrid Cloud Console. Insights provides details about issues and, if available, information on how to solve a problem.

If you have a suggestion for improving this documentation or have found an error, submit a Jira issue for the most relevant documentation component. Please provide specific details, such as the section name and Red Hat OpenShift Service on AWS version.

3.2. ABOUT THE RED HAT KNOWLEDGEBASE

The Red Hat Knowledgebase provides rich content aimed at helping you make the most of Red Hat’s products and technologies. The Red Hat Knowledgebase consists of articles, product documentation, and videos outlining best practices on installing, configuring, and using Red Hat products. In addition, you can search for solutions to known issues, each providing concise root cause descriptions and remedial steps.

3.3. SEARCHING THE RED HAT KNOWLEDGEBASE

In the event of an Red Hat OpenShift Service on AWS issue, you can perform an initial search to determine if a solution already exists within the Red Hat Knowledgebase.

Prerequisites

- You have a Red Hat Customer Portal account.

Procedure

2. Click Search.
3. In the search field, input keywords and strings relating to the problem, including:
   - Red Hat OpenShift Service on AWS components (such as etcd)
   - Related procedure (such as installation)
   - Warnings, error messages, and other outputs related to explicit failures
4. Click the **Enter** key.

5. Optional: Select the **Red Hat OpenShift Service on AWS** product filter.

6. Optional: Select the **Documentation** content type filter.

### 3.4. SUBMITTING A SUPPORT CASE

**Prerequisites**

- You have access to the cluster as a user with the **cluster-admin** role.
- You have access to the cluster as a user with the **dedicated-admin** role.
- You have installed the OpenShift CLI (**oc**).
- You have a Red Hat Customer Portal account.
- You have a Red Hat Standard or Premium subscription.

**Procedure**

2. Click **Get support**.

3. On the **Cases** tab of the **Customer Support** page:
   
   a. Optional: Change the pre-filled account and owner details if needed.

   b. Select the appropriate category for your issue, such as **Bug or Defect**, and click **Continue**.

4. Enter the following information:

   a. In the **Summary** field, enter a concise but descriptive problem summary and further details about the symptoms being experienced, as well as your expectations.

   b. Select **Red Hat OpenShift Service on AWS** from the **Product** drop-down menu.

5. Review the list of suggested Red Hat Knowledgebase solutions for a potential match against the problem that is being reported. If the suggested articles do not address the issue, click **Continue**.

6. Review the updated list of suggested Red Hat Knowledgebase solutions for a potential match against the problem that is being reported. The list is refined as you provide more information during the case creation process. If the suggested articles do not address the issue, click **Continue**.

7. Ensure that the account information presented is as expected, and if not, amend accordingly.

8. Check that the autofilled Red Hat OpenShift Service on AWS Cluster ID is correct. If it is not, manually obtain your cluster ID.

   - To manually obtain your cluster ID using the Red Hat OpenShift Service on AWS web console:
     
     a. Navigate to **Home → Overview**.
b. Find the value in the **Cluster ID** field of the **Details** section.

- Alternatively, it is possible to open a new support case through the Red Hat OpenShift Service on AWS web console and have your cluster ID autofilled.
  a. From the toolbar, navigate to (?) **Help → Open Support Case**.
  b. The **Cluster ID** value is autofilled.

- To obtain your cluster ID using the OpenShift CLI (**oc**), run the following command:

  ```bash
  $ oc get clusterversion -o jsonpath='{.items[].spec.clusterID}"
  ```

9. Complete the following questions where prompted and then click **Continue**:

- What are you experiencing? What are you expecting to happen?
- Define the value or impact to you or the business.
- Where are you experiencing this behavior? What environment?
- When does this behavior occur? Frequency? Repeatedly? At certain times?

10. Upload relevant diagnostic data files and click **Continue**. It is recommended to include data gathered using the **oc adm must-gather** command as a starting point, plus any issue specific data that is not collected by that command.

11. Input relevant case management details and click **Continue**.

12. Preview the case details and click **Submit**.

### 3.5. ADDITIONAL RESOURCES

- For details about identifying issues with your cluster, see **Using Insights to identify issues with your cluster**.
CHAPTER 4. REMOTE HEALTH MONITORING WITH CONNECTED CLUSTERS

4.1. ABOUT REMOTE HEALTH MONITORING

Red Hat OpenShift Service on AWS collects telemetry and configuration data about your cluster and reports it to Red Hat by using the Telemeter Client and the Insights Operator. The data that is provided to Red Hat enables the benefits outlined in this document.

A cluster that reports data to Red Hat through Telemetry and the Insights Operator is considered a connected cluster.

Telemetry is the term that Red Hat uses to describe the information being sent to Red Hat by the Red Hat OpenShift Service on AWS Telemeter Client. Lightweight attributes are sent from connected clusters to Red Hat to enable subscription management automation, monitor the health of clusters, assist with support, and improve customer experience.

The Insights Operator gathers Red Hat OpenShift Service on AWS configuration data and sends it to Red Hat. The data is used to produce insights about potential issues that a cluster might be exposed to. These insights are communicated to cluster administrators on OpenShift Cluster Manager Hybrid Cloud Console.

More information is provided in this document about these two processes.

Telemetry and Insights Operator benefits

Telemetry and the Insights Operator enable the following benefits for end-users:

- **Enhanced identification and resolution of issues** Events that might seem normal to an end-user can be observed by Red Hat from a broader perspective across a fleet of clusters. Some issues can be more rapidly identified from this point of view and resolved without an end-user needing to open a support case or file a Jira issue.

- **Advanced release management** Red Hat OpenShift Service on AWS offers the candidate, fast, and stable release channels, which enable you to choose an update strategy. The graduation of a release from fast to stable is dependent on the success rate of updates and on the events seen during upgrades. With the information provided by connected clusters, Red Hat can improve the quality of releases to stable channels and react more rapidly to issues found in the fast channels.

- **Targeted prioritization of new features and functionality** The data collected provides insights about which areas of Red Hat OpenShift Service on AWS are used most. With this information, Red Hat can focus on developing the new features and functionality that have the greatest impact for our customers.

- **A streamlined support experience**. You can provide a cluster ID for a connected cluster when creating a support ticket on the Red Hat Customer Portal. This enables Red Hat to deliver a streamlined support experience that is specific to your cluster, by using the connected information. This document provides more information about that enhanced support experience.

- **Predictive analytics**. The insights displayed for your cluster on OpenShift Cluster Manager Hybrid Cloud Console are enabled by the information collected from connected clusters. Red Hat is investing in applying deep learning, machine learning, and artificial intelligence
automation to help identify issues that Red Hat OpenShift Service on AWS clusters are exposed to.

On Red Hat OpenShift Service on AWS, remote health reporting is always enabled. You cannot opt out of it.

4.1.1. About Telemetry

Telemetry sends a carefully chosen subset of the cluster monitoring metrics to Red Hat. The Telemeter Client fetches the metrics values every four minutes and thirty seconds and uploads the data to Red Hat. These metrics are described in this document.

This stream of data is used by Red Hat to monitor the clusters in real-time and to react as necessary to problems that impact our customers. It also allows Red Hat to roll out Red Hat OpenShift Service on AWS upgrades to customers to minimize service impact and continuously improve the upgrade experience.

This debugging information is available to Red Hat Support and Engineering teams with the same restrictions as accessing data reported through support cases. All connected cluster information is used by Red Hat to help make Red Hat OpenShift Service on AWS better and more intuitive to use.

4.1.1.1. Information collected by Telemetry

The following information is collected by Telemetry:

4.1.1.1.1. System information

- Version information, including the Red Hat OpenShift Service on AWS cluster version and installed update details that are used to determine update version availability
- Update information, including the number of updates available per cluster, the channel and image repository used for an update, update progress information, and the number of errors that occur in an update
- The unique random identifier that is generated during an installation
- Configuration details that help Red Hat Support to provide beneficial support for customers, including node configuration at the cloud infrastructure level, hostnames, IP addresses, Kubernetes pod names, namespaces, and services
- The Red Hat OpenShift Service on AWS framework components installed in a cluster and their condition and status
- Events for all namespaces listed as "related objects" for a degraded Operator
- Information about degraded software
- Information about the validity of certificates
- The name of the provider platform that Red Hat OpenShift Service on AWS is deployed on and the data center location

4.1.1.2. Sizing Information

- Sizing information about clusters, machine types, and machines, including the number of CPU cores and the amount of RAM used for each
- The number of etcd members and the number of objects stored in the etcd cluster
- Number of application builds by build strategy type

## 4.1.1.3. Usage information

- Usage information about components, features, and extensions
- Usage details about Technology Previews and unsupported configurations

Telemetry does not collect identifying information such as usernames or passwords. Red Hat does not intend to collect personal information. If Red Hat discovers that personal information has been inadvertently received, Red Hat will delete such information. To the extent that any telemetry data constitutes personal data, please refer to the Red Hat Privacy Statement for more information about Red Hat’s privacy practices.

## 4.1.1.2. User Telemetry

Red Hat collects anonymized user data from your browser. This anonymized data includes what pages, features, and resource types that the user of all clusters with enabled telemetry uses.

Other considerations:

- User events are grouped as a SHA-1 hash.
- User's IP address is saved as 0.0.0.0.
- User names and IP addresses are never saved as separate values.

**Additional resources**

- See Showing data collected by Telemetry for details about how to list the attributes that Telemetry gathers from Prometheus in Red Hat OpenShift Service on AWS.
- See the upstream cluster-monitoring-operator source code for a list of the attributes that Telemetry gathers from Prometheus.

## 4.1.2. About the Insights Operator

The Insights Operator periodically gathers configuration and component failure status and, by default, reports that data every two hours to Red Hat. This information enables Red Hat to assess configuration and deeper failure data than is reported through Telemetry.

Users of Red Hat OpenShift Service on AWS can display the report of each cluster in the Insights Advisor service on Red Hat Hybrid Cloud Console. If any issues have been identified, Insights provides further details and, if available, steps on how to solve a problem.

The Insights Operator does not collect identifying information, such as user names, passwords, or certificates. See Red Hat Insights Data & Application Security for information about Red Hat Insights data collection and controls.

Red Hat uses all connected cluster information to:

- Identify potential cluster issues and provide a solution and preventive actions in the Insights Advisor service on Red Hat Hybrid Cloud Console
• Improve Red Hat OpenShift Service on AWS by providing aggregated and critical information to product and support teams

• Make Red Hat OpenShift Service on AWS more intuitive

4.1.2.1. Information collected by the Insights Operator

The following information is collected by the Insights Operator:

• General information about your cluster and its components to identify issues that are specific to your Red Hat OpenShift Service on AWS version and environment

• Configuration files, such as the image registry configuration, of your cluster to determine incorrect settings and issues that are specific to parameters you set

• Errors that occur in the cluster components

• Progress information of running updates, and the status of any component upgrades

• Details of the platform that Red Hat OpenShift Service on AWS is deployed on, such as Amazon Web Services, and the region that the cluster is located in

• Cluster workload information transformed into discreet Secure Hash Algorithm (SHA) values, which allows Red Hat to assess workloads for security and version vulnerabilities without disclosing sensitive details

• If an Operator reports an issue, information is collected about core Red Hat OpenShift Service on AWS pods in the openshift-* and kube-* projects. This includes state, resource, security context, volume information, and more.

Additional resources

• The Insights Operator source code is available for review and contribution. See the Insights Operator upstream project for a list of the items collected by the Insights Operator.

4.1.3. Understanding Telemetry and Insights Operator data flow

The Telemeter Client collects selected time series data from the Prometheus API. The time series data is uploaded to api.openshift.com every four minutes and thirty seconds for processing.

The Insights Operator gathers selected data from the Kubernetes API and the Prometheus API into an archive. The archive is uploaded to OpenShift Cluster Manager Hybrid Cloud Console every two hours for processing. The Insights Operator also downloads the latest Insights analysis from OpenShift Cluster Manager Hybrid Cloud Console. This is used to populate the Insights status pop-up that is included in the Overview page in the Red Hat OpenShift Service on AWS web console.

All of the communication with Red Hat occurs over encrypted channels by using Transport Layer Security (TLS) and mutual certificate authentication. All of the data is encrypted in transit and at rest.

Access to the systems that handle customer data is controlled through multi-factor authentication and strict authorization controls. Access is granted on a need-to-know basis and is limited to required operations.

Telemetry and Insights Operator data flow
Additional resources

- See Monitoring overview for more information about the Red Hat OpenShift Service on AWS monitoring stack.

4.1.4. Additional details about how remote health monitoring data is used

The information collected to enable remote health monitoring is detailed in Information collected by Telemetry and Information collected by the Insights Operator.

As further described in the preceding sections of this document, Red Hat collects data about your use of the Red Hat Product(s) for purposes such as providing support and upgrades, optimizing performance or configuration, minimizing service impacts, identifying and remediating threats, troubleshooting, improving the offerings and user experience, responding to issues, and for billing purposes if applicable.

Collection safeguards

Red Hat employs technical and organizational measures designed to protect the telemetry and configuration data.

Sharing

Red Hat may share the data collected through Telemetry and the Insights Operator internally within Red Hat to improve your user experience. Red Hat may share telemetry and configuration data with its business partners in an aggregated form that does not identify customers to help the partners better understand their markets and their customers’ use of Red Hat offerings or to ensure the successful integration of products jointly supported by those partners.

Third parties

Red Hat may engage certain third parties to assist in the collection, analysis, and storage of the Telemetry and configuration data.

4.2. SHOWING DATA COLLECTED BY REMOTE HEALTH MONITORING

User control / enabling and disabling telemetry and configuration data collection

As an administrator, you can review the metrics collected by Telemetry and the Insights Operator.
4.2.1. Showing data collected by Telemetry

You can view the cluster and components time series data captured by Telemetry.

Prerequisites

- You have installed the OpenShift Container Platform CLI (`oc`).
- You have access to the cluster as a user with the `dedicated-admin` role.

Procedure

1. Log in to a cluster.

2. Run the following command, which queries a cluster’s Prometheus service and returns the full set of time series data captured by Telemetry:

   ```bash
   $ curl -G -k -H "Authorization: Bearer $(oc whoami -t)"
   https://$(oc get route prometheus-k8s-federate -n openshift-monitoring -o jsonpath="{.spec.host}")/federate
   --data-urlencode 'match[]=__name__=~"cluster:usage:.+"'
   --data-urlencode 'match[]=__name__=count:up0'
   --data-urlencode 'match[]=__name__=count:up1'
   --data-urlencode 'match[]=__name__=cluster_version'
   --data-urlencode 'match[]=__name__=cluster_version_available_updates'
   --data-urlencode 'match[]=__name__=cluster_version_capability'
   --data-urlencode 'match[]=__name__=cluster_operator_up'
   --data-urlencode 'match[]=__name__=cluster_operator_conditions'
   --data-urlencode 'match[]=__name__=cluster_version_payload'
   --data-urlencode 'match[]=__name__=cluster_installer'
   --data-urlencode 'match[]=__name__=cluster_infrastructure_provider'
   --data-urlencode 'match[]=__name__=cluster_feature_set'
   --data-urlencode 'match[]=__name__=instance:etcd_object_counts:sum'
   --data-urlencode 'match[]=__name__=ALERTS',alertstate="firing"
   --data-urlencode 'match[]=__name__=code:apiserver_request_total:rate:sum'

```
4.3. USING INSIGHTS TO IDENTIFY ISSUES WITH YOUR CLUSTER

Insights repeatedly analyzes the data Insights Operator sends. Users of Red Hat OpenShift Service on AWS can display the report in the Insights Advisor service on Red Hat Hybrid Cloud Console.

4.3.1. About Red Hat Insights Advisor for Red Hat OpenShift Service on AWS

You can use Insights Advisor to assess and monitor the health of your Red Hat OpenShift Service on AWS clusters. Whether you are concerned about individual clusters, or with your whole infrastructure, it is important to be aware of the exposure of your cluster infrastructure to issues that can affect service availability, fault tolerance, performance, or security.

Using cluster data collected by the Insights Operator, Insights repeatedly compares that data against a library of recommendations. Each recommendation is a set of cluster–environment conditions that can leave Red Hat OpenShift Service on AWS clusters at risk. The results of the Insights analysis are available in the Insights Advisor service on Red Hat Hybrid Cloud Console. In the Console, you can perform the following actions:

- See clusters impacted by a specific recommendation.
- Use robust filtering capabilities to refine your results to those recommendations.
- Learn more about individual recommendations, details about the risks they present, and get resolutions tailored to your individual clusters.
• Share results with other stakeholders.

4.3.2. Understanding Insights Advisor recommendations

Insights Advisor bundles information about various cluster states and component configurations that can negatively affect the service availability, fault tolerance, performance, or security of your clusters. This information set is called a recommendation in Insights Advisor and includes the following information:

• **Name:** A concise description of the recommendation

• **Added:** When the recommendation was published to the Insights Advisor archive

• **Category:** Whether the issue has the potential to negatively affect service availability, fault tolerance, performance, or security

• **Total risk:** A value derived from the *likelihood* that the condition will negatively affect your infrastructure, and the *impact* on operations if that were to happen

• **Clusters:** A list of clusters on which a recommendation is detected

• **Description:** A brief synopsis of the issue, including how it affects your clusters

• **Link to associated topics:** More information from Red Hat about the issue

4.3.3. Displaying potential issues with your cluster

This section describes how to display the Insights report in Insights Advisor on OpenShift Cluster Manager Hybrid Cloud Console.

Note that Insights repeatedly analyzes your cluster and shows the latest results. These results can change, for example, if you fix an issue or a new issue has been detected.

**Prerequisites**

• Your cluster is registered on OpenShift Cluster Manager Hybrid Cloud Console.

• Remote health reporting is enabled, which is the default.

• You are logged in to OpenShift Cluster Manager Hybrid Cloud Console.

**Procedure**

1. Navigate to **Advisor → Recommendations** on OpenShift Cluster Manager Hybrid Cloud Console. Depending on the result, Insights Advisor displays one of the following:

   • **No matching recommendations found** if Insights did not identify any issues.

   • A list of issues Insights has detected, grouped by risk (low, moderate, important, and critical).

   • **No clusters yet,** if Insights has not yet analyzed the cluster. The analysis starts shortly after the cluster has been installed, registered, and connected to the internet.

2. If any issues are displayed, click the > icon in front of the entry for more details.
Depending on the issue, the details can also contain a link to more information from Red Hat about the issue.

### 4.3.4. Displaying all Insights Advisor recommendations

The Recommendations view, by default, only displays the recommendations that are detected on your clusters. However, you can view all of the recommendations in the advisor archive.

**Prerequisites**

- Remote health reporting is enabled, which is the default.
- Your cluster is registered on Red Hat Hybrid Cloud Console.
- You are logged in to OpenShift Cluster Manager Hybrid Cloud Console.

**Procedure**

1. Navigate to Advisor → Recommendations on OpenShift Cluster Manager Hybrid Cloud Console.
2. Click the X icons next to the Clusters Impacted and Status filters.
   You can now browse through all of the potential recommendations for your cluster.

### 4.3.5. Advisor recommendation filters

The Insights advisor service can return a large number of recommendations. To focus on your most critical recommendations, you can apply filters to the Advisor recommendations list to remove low-priority recommendations.

By default, filters are set to only show enabled recommendations that are impacting one or more clusters. To view all or disabled recommendations in the Insights library, you can customize the filters.

To apply a filter, select a filter type and then set its value based on the options that are available in the drop-down list. You can apply multiple filters to the list of recommendations.

You can set the following filter types:

- **Name**: Search for a recommendation by name.
- **Total risk**: Select one or more values from Critical, Important, Moderate, and Low indicating the likelihood and the severity of a negative impact on a cluster.
- **Impact**: Select one or more values from Critical, High, Medium, and Low indicating the potential impact to the continuity of cluster operations.
- **Likelihood**: Select one or more values from Critical, High, Medium, and Low indicating the potential for a negative impact to a cluster if the recommendation comes to fruition.
- **Category**: Select one or more categories from Service Availability, Performance, Fault Tolerance, Security, and Best Practice to focus your attention on.
- **Status**: Click a radio button to show enabled recommendations (default), disabled recommendations, or all recommendations.
4.3.5.1. Filtering Insights advisor recommendations

As an Red Hat OpenShift Service on AWS cluster manager, you can filter the recommendations that are displayed on the recommendations list. By applying filters, you can reduce the number of reported recommendations and concentrate on your highest priority recommendations.

The following procedure demonstrates how to set and remove Category filters; however, the procedure is applicable to any of the filter types and respective values.

**Prerequisites**

You are logged in to the OpenShift Cluster Manager Hybrid Cloud Console.

**Procedure**

1. Go to Red Hat Hybrid Cloud Console → OpenShift → Advisor recommendations.
2. In the main, filter-type drop-down list, select the Category filter type.
3. Expand the filter-value drop-down list and select the checkbox next to each category of recommendation you want to view. Leave the checkboxes for unnecessary categories clear.
4. Optional: Add additional filters to further refine the list.

Only recommendations from the selected categories are shown in the list.

**Verification**

- After applying filters, you can view the updated recommendations list. The applied filters are added next to the default filters.

4.3.5.2. Removing filters from Insights Advisor recommendations

You can apply multiple filters to the list of recommendations. When ready, you can remove them individually or completely reset them.

**Removing filters individually**

- Click the X icon next to each filter, including the default filters, to remove them individually.

**Removing all non-default filters**

- Click Reset filters to remove only the filters that you applied, leaving the default filters in place.

4.3.6. Disabling Insights Advisor recommendations

You can disable specific recommendations that affect your clusters, so that they no longer appear in your reports. It is possible to disable a recommendation for a single cluster or all of your clusters.
NOTE

Disabling a recommendation for all of your clusters also applies to any future clusters.

Prerequisites

- Remote health reporting is enabled, which is the default.
- Your cluster is registered on OpenShift Cluster Manager Hybrid Cloud Console.
- You are logged in to OpenShift Cluster Manager Hybrid Cloud Console.

Procedure

1. Navigate to Advisor → Recommendations on OpenShift Cluster Manager Hybrid Cloud Console.
2. Optional: Use the Clusters Impacted and Status filters as needed.
3. Disable an alert by using one of the following methods:
   - To disable an alert:
     a. Click the Options menu for that alert, and then click Disable recommendation.
     b. Enter a justification note and click Save.
   - To view the clusters affected by this alert before disabling the alert:
     a. Click the name of the recommendation to disable. You are directed to the single recommendation page.
     b. Review the list of clusters in the Affected clusters section.
     c. Click Actions → Disable recommendation to disable the alert for all of your clusters.
     d. Enter a justification note and click Save.

4.3.7. Enabling a previously disabled Insights Advisor recommendation

When a recommendation is disabled for all clusters, you no longer see the recommendation in the Insights Advisor. You can change this behavior.

Prerequisites

- Remote health reporting is enabled, which is the default.
- Your cluster is registered on OpenShift Cluster Manager Hybrid Cloud Console.
- You are logged in to OpenShift Cluster Manager Hybrid Cloud Console.

Procedure

1. Navigate to Advisor → Recommendations on OpenShift Cluster Manager Hybrid Cloud Console.
2. Filter the recommendations to display on the disabled recommendations:
   a. From the Status drop-down menu, select Status.
   b. From the Filter by status drop-down menu, select Disabled.
   c. Optional: Clear the Clusters impacted filter.

3. Locate the recommendation to enable.

4. Click the Options menu, and then click Enable recommendation.

4.3.8. Displaying the Insights status in the web console

Insights repeatedly analyzes your cluster and you can display the status of identified potential issues of your cluster in the Red Hat OpenShift Service on AWS web console. This status shows the number of issues in the different categories and, for further details, links to the reports in OpenShift Cluster Manager Hybrid Cloud Console.

Prerequisites

- Your cluster is registered in OpenShift Cluster Manager Hybrid Cloud Console.
- Remote health reporting is enabled, which is the default.
- You are logged in to the Red Hat OpenShift Service on AWS web console.

Procedure

2. Click Insights on the Status card.
   The pop-up window lists potential issues grouped by risk. Click the individual categories or View all recommendations in Insights Advisor to display more details.

4.4. USING THE INSIGHTS OPERATOR

The Insights Operator periodically gathers configuration and component failure status and, by default, reports that data every two hours to Red Hat. This information enables Red Hat to assess configuration and deeper failure data than is reported through Telemetry. Users of Red Hat OpenShift Service on AWS can display the report in the Insights Advisor service on Red Hat Hybrid Cloud Console.

Additional resources

- For more information on using Insights Advisor to identify issues with your cluster, see Using Insights to identify issues with your cluster.

4.4.1. Understanding Insights Operator alerts

The Insights Operator declares alerts through the Prometheus monitoring system to the Alertmanager. You can view these alerts in the Alerting UI in the Red Hat OpenShift Service on AWS web console by using one of the following methods:
- In the **Administrator** perspective, click **Observe → Alerting**.
- In the **Developer** perspective, click **Observe → <project_name> → Alerts** tab.

Currently, Insights Operator sends the following alerts when the conditions are met:

**Table 4.1. Insights Operator alerts**

<table>
<thead>
<tr>
<th>Alert</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InsightsDisabled</td>
<td>Insights Operator is disabled.</td>
</tr>
<tr>
<td>SimpleContentAccessNotAvailable</td>
<td>Simple content access is not enabled in Red Hat Subscription Management.</td>
</tr>
<tr>
<td>InsightsRecommendationActive</td>
<td>Insights has an active recommendation for the cluster.</td>
</tr>
</tbody>
</table>
CHAPTER 5. SUMMARIZING CLUSTER SPECIFICATIONS

5.1. SUMMARIZING CLUSTER SPECIFICATIONS BY USING A CLUSTER VERSION OBJECT

You can obtain a summary of Red Hat OpenShift Service on AWS cluster specifications by querying the `clusterversion` resource.

Prerequisites

- You have access to the cluster as a user with the `dedicated-admin` role.
- You have installed the OpenShift CLI (`oc`).

Procedure

1. Query cluster version, availability, uptime, and general status:

   ```bash
   $ oc get clusterversion
   ```

   **Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>VERSION</th>
<th>AVAILABLE</th>
<th>PROGRESSING</th>
<th>SINCE</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>4.13.8</td>
<td>True</td>
<td>False</td>
<td>8h</td>
<td>Cluster version is 4.13.8</td>
</tr>
</tbody>
</table>

2. Obtain a detailed summary of cluster specifications, update availability, and update history:

   ```bash
   $ oc describe clusterversion
   ```

   **Example output**

   Name: version
   Namespace: 
   Labels: <none>
   Annotations: <none>
   API Version: config.openshift.io/v1
   Kind: ClusterVersion
   
   # ...

# ...
6.1. TROUBLESHOOTING RED HAT OPENSHIFT SERVICE ON AWS INSTALLATIONS

6.1.1. Installation troubleshooting

6.1.1.1. Inspect install or uninstall logs

To display install logs:

- Run the following command, replacing `<cluster_name>` with the name of your cluster:
  
  ```bash
  $ rosa logs install --cluster=<cluster_name>
  ```

- To watch the logs, include the `--watch` flag:
  
  ```bash
  $ rosa logs install --cluster=<cluster_name> --watch
  ```

To display uninstall logs:

- Run the following command, replacing `<cluster_name>` with the name of your cluster:
  
  ```bash
  $ rosa logs uninstall --cluster=<cluster_name>
  ```

- To watch the logs, include the `--watch` flag:
  
  ```bash
  $ rosa logs uninstall --cluster=<cluster_name> --watch
  ```

6.1.1.2. Verify your AWS account permissions for clusters without STS

Run the following command to verify if your AWS account has the correct permissions. This command verifies permissions only for clusters that do not use the AWS Security Token Service (STS):

```bash
$ rosa verify permissions
```

If you receive any errors, double check to ensure than an SCP is not applied to your AWS account. If you are required to use an SCP, see Red Hat Requirements for Customer Cloud Subscriptions for details on the minimum required SCP.

6.1.1.3. Verify your AWS account and quota

Run the following command to verify you have the available quota on your AWS account:

```bash
$ rosa verify quota
```

AWS quotas change based on region. Be sure you are verifying your quota for the correct AWS region. If you need to increase your quota, navigate to your AWS console, and request a quota increase for the service that failed.
6.1.1.4. AWS notification emails

When creating a cluster, the Red Hat OpenShift Service on AWS service creates small instances in all supported regions. This check ensures the AWS account being used can deploy to each supported region.

For AWS accounts that are not using all supported regions, AWS may send one or more emails confirming that "Your Request For Accessing AWS Resources Has Been Validated". Typically the sender of this email is aws-verification@amazon.com.

This is expected behavior as the Red Hat OpenShift Service on AWS service is validating your AWS account configuration.

6.2. TROUBLESHOOTING NETWORKING

This document describes how to troubleshoot networking errors.

6.2.1. Connectivity issues on clusters with private Network Load Balancers

Red Hat OpenShift Service on AWS and ROSA with HCP clusters created with version 4.14 deploy AWS Network Load Balancers (NLB) by default for the default ingress controller. In the case of a private NLB, the NLB’s client IP address preservation might cause connections to be dropped where the source and destination are the same host. See the AWS’s documentation about how to Troubleshoot your Network Load Balancer. This IP address preservation has the implication that any customer workloads cohabitating on the same node with the router pods, may not be able send traffic to the private NLB fronting the ingress controller router.

To mitigate this impact, customer’s should reschedule their workloads onto nodes separate from those where the router pods are scheduled. Alternatively, customers should rely on the internal pod and service networks for accessing other workloads co-located within the same cluster.

6.3. VERIFYING NODE HEALTH

6.3.1. Reviewing node status, resource usage, and configuration

Review cluster node health status, resource consumption statistics, and node logs. Additionally, query kubelet status on individual nodes.

Prerequisites

- You have access to the cluster as a user with the dedicated-admin role.
- You have installed the OpenShift CLI (oc).

Procedure

- List the name, status, and role for all nodes in the cluster:

  ```
  $ oc get nodes
  ```

- Summarize CPU and memory usage for each node within the cluster:

  ```
  $ oc adm top nodes
  ```
6.4. TROUBLESHOOTING OPERATOR ISSUES

Operators are a method of packaging, deploying, and managing an Red Hat OpenShift Service on AWS application. They act like an extension of the software vendor’s engineering team, watching over an Red Hat OpenShift Service on AWS environment and using its current state to make decisions in real time. Operators are designed to handle upgrades seamlessly, react to failures automatically, and not take shortcuts, such as skipping a software backup process to save time.

Red Hat OpenShift Service on AWS 4 includes a default set of Operators that are required for proper functioning of the cluster. These default Operators are managed by the Cluster Version Operator (CVO).

As a cluster administrator, you can install application Operators from the OperatorHub using the Red Hat OpenShift Service on AWS web console or the CLI. You can then subscribe the Operator to one or more namespaces to make it available for developers on your cluster. Application Operators are managed by Operator Lifecycle Manager (OLM).

If you experience Operator issues, verify Operator subscription status. Check Operator pod health across the cluster and gather Operator logs for diagnosis.

6.4.1. Operator subscription condition types

Subscriptions can report the following condition types:

Table 6.1. Subscription condition types

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CatalogSourcesUnhealthy</td>
<td>Some or all of the catalog sources to be used in resolution are unhealthy.</td>
</tr>
<tr>
<td>InstallPlanMissing</td>
<td>An install plan for a subscription is missing.</td>
</tr>
<tr>
<td>InstallPlanPending</td>
<td>An install plan for a subscription is pending installation.</td>
</tr>
<tr>
<td>InstallPlanFailed</td>
<td>An install plan for a subscription has failed.</td>
</tr>
<tr>
<td>ResolutionFailed</td>
<td>The dependency resolution for a subscription has failed.</td>
</tr>
</tbody>
</table>

NOTE

Default Red Hat OpenShift Service on AWS cluster Operators are managed by the Cluster Version Operator (CVO) and they do not have a Subscription object. Application Operators are managed by Operator Lifecycle Manager (OLM) and they have a Subscription object.

Additional resources
6.4.2. Viewing Operator subscription status by using the CLI

You can view Operator subscription status by using the CLI.

Prerequisites

- You have access to the cluster as a user with the `dedicated-admin` role.
- You have installed the OpenShift CLI (oc).

Procedure

1. List Operator subscriptions:

   ```bash
   $ oc get subs -n <operator_namespace>
   ```

2. Use the `oc describe` command to inspect a `Subscription` resource:

   ```bash
   $ oc describe sub <subscription_name> -n <operator_namespace>
   ```

3. In the command output, find the **Conditions** section for the status of Operator subscription condition types. In the following example, the `CatalogSourcesUnhealthy` condition type has a status of `false` because all available catalog sources are healthy:

   **Example output**

   ```plaintext
   Name:         cluster-logging
   Namespace:    openshift-logging
   Labels:       operators.coreos.com/cluster-logging.openshift-logging=
   Annotations:  <none>
   API Version:  operators.coreos.com/v1alpha1
   Kind:         Subscription
   # ...
   Conditions:
   Message:               all available catalogsources are healthy
   Reason:                AllCatalogSourcesHealthy
   Status:                False
   Type:                  CatalogSourcesUnhealthy
   # ...
   ```

   **NOTE**

   Default Red Hat OpenShift Service on AWS cluster Operators are managed by the Cluster Version Operator (CVO) and they do not have a `Subscription` object. Application Operators are managed by Operator Lifecycle Manager (OLM) and they have a `Subscription` object.

6.4.3. Viewing Operator catalog source status by using the CLI

You can view the status of an Operator catalog source by using the CLI.

```bash
$ oc get subs -n <operator_namespace>
$ oc describe sub <subscription_name> -n <operator_namespace>
```
Prerequisites

- You have access to the cluster as a user with the dedicated-admin role.
- You have installed the OpenShift CLI (oc).

Procedure

1. List the catalog sources in a namespace. For example, you can check the openshift-marketplace namespace, which is used for cluster-wide catalog sources:

   ```
   $ oc get catalogsources -n openshift-marketplace
   ```

   **Example output**

<table>
<thead>
<tr>
<th>NAME</th>
<th>DISPLAY</th>
<th>TYPE</th>
<th>PUBLISHER</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>certified-operators</td>
<td>Certified Operators</td>
<td>grpc</td>
<td>Red Hat</td>
<td>55m</td>
</tr>
<tr>
<td>community-operators</td>
<td>Community Operators</td>
<td>grpc</td>
<td>Red Hat</td>
<td>55m</td>
</tr>
<tr>
<td>example-catalog</td>
<td>Example Catalog</td>
<td>grpc</td>
<td>Example Org</td>
<td>2m25s</td>
</tr>
<tr>
<td>redhat-marketplace</td>
<td>Red Hat Marketplace</td>
<td>grpc</td>
<td>Red Hat</td>
<td>55m</td>
</tr>
<tr>
<td>redhat-operators</td>
<td>Red Hat Operators</td>
<td>grpc</td>
<td>Red Hat</td>
<td>55m</td>
</tr>
</tbody>
</table>

2. Use the `oc describe` command to get more details and status about a catalog source:

   ```
   $ oc describe catalogsource example-catalog -n openshift-marketplace
   ```

   **Example output**

   Name:         example-catalog
   Namespace:    openshift-marketplace
   Labels:       <none>
   Annotations:  operatorframework.io/managed-by: marketplace-operator
                  target.workload.openshift.io/management: {"effect": "PreferredDuringScheduling"}
   API Version:  operators.coreos.com/v1alpha1
   Kind:         CatalogSource
   # ...
   Status:
   Connection State:
   Address:              example-catalog.openshift-marketplace.svc:50051
   Last Connect:         2021-09-09T17:07:35Z
   Last Observed State:  TRANSIENT_FAILURE
   Registry Service:
   Created At:         2021-09-09T17:07:35Z
   Port:               50051
   Protocol:           grpc
   Service Name:        example-catalog
   Service Namespace:   openshift-marketplace
   # ...

   In the preceding example output, the last observed state is TRANSIENT_FAILURE. This state indicates that there is a problem establishing a connection for the catalog source.

3. List the pods in the namespace where your catalog source was created:
When a catalog source is created in a namespace, a pod for the catalog source is created in that namespace. In the preceding example output, the status for the `example-catalog-bwt8z` pod is `ImagePullBackOff`. This status indicates that there is an issue pulling the catalog source’s index image.

4. Use the `oc describe` command to inspect a pod for more detailed information:

```
$ oc describe pod example-catalog-bwt8z -n openshift-marketplace
```

**Example output**

```
Name:         example-catalog-bwt8z
Namespace:    openshift-marketplace
Priority:     0
Node:         ci-ln-jyryyg2-f76d1-ggdbq-worker-b-vsxjd/10.0.128.2

  Normal   Scheduled       48s                default-scheduler  Successfully assigned openshift-marketplace/example-catalog-bwt8z to ci-ln-jyryyg2-f76d1-ggdbq-worker-b-vsxjd
  Normal   AddedInterface  47s                multus             Add eth0 [10.131.0.40/23] from openshift-sdn
  Normal   BackOff         20s (x2 over 46s)  kubelet            Back-off pulling image "quay.io/example-org/example-catalog:v1"
  Warning  Failed          20s (x2 over 46s)  kubelet            Error: ImagePullBackOff
  Normal   Pulling         8s (x3 over 47s)   kubelet            Pulling image "quay.io/example-org/example-catalog:v1"
  Warning  Failed          8s (x3 over 47s)   kubelet            Failed to pull image "quay.io/example-org/example-catalog:v1": rpc error: code = Unknown desc = reading manifest v1 in quay.io/example-org/example-catalog: unauthorized: access to the requested resource is not authorized
  Warning  Failed          8s (x3 over 47s)   kubelet            Error: ErrImagePull
```

In the preceding example output, the error messages indicate that the catalog source’s index image is failing to pull successfully because of an authorization issue. For example, the index image might be stored in a registry that requires login credentials.

- gRPC documentation: States of Connectivity
6.4.4. Querying Operator pod status

You can list Operator pods within a cluster and their status. You can also collect a detailed Operator pod summary.

Prerequisites

- You have access to the cluster as a user with the dedicated-admin role.
- Your API service is still functional.
- You have installed the OpenShift CLI (oc).

Procedure

1. List Operators running in the cluster. The output includes Operator version, availability, and uptime information:
   
   ```bash
   $ oc get clusteroperators
   ```

2. List Operator pods running in the Operator’s namespace, plus pod status, restarts, and age:
   
   ```bash
   $ oc get pod -n <operator_namespace>
   ```

3. Output a detailed Operator pod summary:
   
   ```bash
   $ oc describe pod <operator_pod_name> -n <operator_namespace>
   ```

6.4.5. Gathering Operator logs

If you experience Operator issues, you can gather detailed diagnostic information from Operator pod logs.

Prerequisites

- You have access to the cluster as a user with the dedicated-admin role.
- Your API service is still functional.
- You have installed the OpenShift CLI (oc).
- You have the fully qualified domain names of the control plane or control plane machines.

Procedure

1. List the Operator pods that are running in the Operator’s namespace, plus the pod status, restarts, and age:
   
   ```bash
   $ oc get pods -n <operator_namespace>
   ```

2. Review logs for an Operator pod:
   
   ```bash
   $ oc logs pod/<pod_name> -n <operator_namespace>
   ```
If an Operator pod has multiple containers, the preceding command will produce an error that includes the name of each container. Query logs from an individual container:

$$\text{oc logs pod/}<\text{operator_pod_name}>\ -c\ <\text{container_name}>\ -n\ <\text{operator_namespace}>$$

3. If the API is not functional, review Operator pod and container logs on each control plane node by using SSH instead. Replace $<\text{master-node}.<\text{cluster_name}.<\text{base_domain}>$ with appropriate values.

a. List pods on each control plane node:

$$\text{ssh core@}<\text{master-node}.<\text{cluster_name}.<\text{base_domain}>\ \text{sudo crictl pods}$$

b. For any Operator pods not showing a Ready status, inspect the pod’s status in detail. Replace $<\text{operator_pod_id}>$ with the Operator pod’s ID listed in the output of the preceding command:

$$\text{ssh core@}<\text{master-node}.<\text{cluster_name}.<\text{base_domain}>\ \text{sudo crictl inspect}\ <\text{operator_pod_id}>$$

c. List containers related to an Operator pod:

$$\text{ssh core@}<\text{master-node}.<\text{cluster_name}.<\text{base_domain}>\ \text{sudo crictl ps --pod=}\ <\text{operator_pod_id}>$$

d. For any Operator container not showing a Ready status, inspect the container’s status in detail. Replace $<\text{container_id}>$ with a container ID listed in the output of the preceding command:

$$\text{ssh core@}<\text{master-node}.<\text{cluster_name}.<\text{base_domain}>\ \text{sudo crictl inspect}\ <\text{container_id}>$$

e. Review the logs for any Operator containers not showing a Ready status. Replace $<\text{container_id}>$ with a container ID listed in the output of the preceding command:

$$\text{ssh core@}<\text{master-node}.<\text{cluster_name}.<\text{base_domain}>\ \text{sudo crictl logs -f}\ <\text{container_id}>$$

**NOTE**

Red Hat OpenShift Service on AWS 4 cluster nodes running Red Hat Enterprise Linux CoreOS (RHCOS) are immutable and rely on Operators to apply cluster changes. Accessing cluster nodes by using SSH is not recommended. Before attempting to collect diagnostic data over SSH, review whether the data collected by running $\text{oc adm must gather}$ and other $\text{oc}$ commands is sufficient instead. However, if the Red Hat OpenShift Service on AWS API is not available, or the kubelet is not properly functioning on the target node, $\text{oc}$ operations will be impacted. In such situations, it is possible to access nodes using $\text{ssh core@}<\text{node}.<\text{cluster_name}.<\text{base_domain}>$.  

### 6.5. INVESTIGATING POD ISSUES
Red Hat OpenShift Service on AWS leverages the Kubernetes concept of a pod, which is one or more containers deployed together on one host. A pod is the smallest compute unit that can be defined, deployed, and managed on Red Hat OpenShift Service on AWS.

After a pod is defined, it is assigned to run on a node until its containers exit, or until it is removed. Depending on policy and exit code, Pods are either removed after exiting or retained so that their logs can be accessed.

The first thing to check when pod issues arise is the pod’s status. If an explicit pod failure has occurred, observe the pod’s error state to identify specific image, container, or pod network issues. Focus diagnostic data collection according to the error state. Review pod event messages, as well as pod and container log information. Diagnose issues dynamically by accessing running Pods on the command line, or start a debug pod with root access based on a problematic pod’s deployment configuration.

### 6.5.1. Understanding pod error states

Pod failures return explicit error states that can be observed in the `status` field in the output of `oc get pods`. Pod error states cover image, container, and container network related failures.

The following table provides a list of pod error states along with their descriptions.

**Table 6.2. Pod error states**

<table>
<thead>
<tr>
<th>Pod error state</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ErrImagePull</td>
<td>Generic image retrieval error.</td>
</tr>
<tr>
<td>ErrImagePullBackOff</td>
<td>Image retrieval failed and is backed off.</td>
</tr>
<tr>
<td>ErrInvalidImageName</td>
<td>The specified image name was invalid.</td>
</tr>
<tr>
<td>ErrImageInspect</td>
<td>Image inspection did not succeed.</td>
</tr>
<tr>
<td>ErrImageNeverPull</td>
<td>PullPolicy is set to <code>NeverPullImage</code> and the target image is not present locally on the host.</td>
</tr>
<tr>
<td>ErrRegistryUnavailable</td>
<td>When attempting to retrieve an image from a registry, an HTTP error was encountered.</td>
</tr>
<tr>
<td>ErrContainerNotFound</td>
<td>The specified container is either not present or not managed by the kubelet, within the declared pod.</td>
</tr>
<tr>
<td>ErrRunInitContainer</td>
<td>Container initialization failed.</td>
</tr>
<tr>
<td>ErrRunContainer</td>
<td>None of the pod’s containers started successfully.</td>
</tr>
<tr>
<td>ErrKillContainer</td>
<td>None of the pod’s containers were killed successfully.</td>
</tr>
<tr>
<td>Pod error state</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ErrCrashLoopBackOff</td>
<td>A container has terminated. The kubelet will not attempt to restart it.</td>
</tr>
<tr>
<td>ErrVerifyNonRoot</td>
<td>A container or image attempted to run with root privileges.</td>
</tr>
<tr>
<td>ErrCreatePodSandbox</td>
<td>Pod sandbox creation did not succeed.</td>
</tr>
<tr>
<td>ErrConfigPodSandbox</td>
<td>Pod sandbox configuration was not obtained.</td>
</tr>
<tr>
<td>ErrKillPodSandbox</td>
<td>A pod sandbox did not stop successfully.</td>
</tr>
<tr>
<td>ErrSetupNetwork</td>
<td>Network initialization failed.</td>
</tr>
<tr>
<td>ErrTeardownNetwork</td>
<td>Network termination failed.</td>
</tr>
</tbody>
</table>

### 6.5.2. Reviewing pod status

You can query pod status and error states. You can also query a pod’s associated deployment configuration and review base image availability.

**Prerequisites**

- You have access to the cluster as a user with the **dedicated-admin** role.
- You have installed the OpenShift CLI (**oc**).
- **skopeo** is installed.

**Procedure**

1. Switch into a project:
   ```
   $ oc project <project_name>
   ```

2. List pods running within the namespace, as well as pod status, error states, restarts, and age:
   ```
   $ oc get pods
   ```

3. Determine whether the namespace is managed by a deployment configuration:
   ```
   $ oc status
   ```
If the namespace is managed by a deployment configuration, the output includes the deployment configuration name and a base image reference.

4. Inspect the base image referenced in the preceding command’s output:
   
   ```
   $ skopeo inspect docker://<image_reference>
   ```

5. If the base image reference is not correct, update the reference in the deployment configuration:
   
   ```
   $ oc edit deployment/my-deployment
   ```

6. When deployment configuration changes on exit, the configuration will automatically redeploy. Watch pod status as the deployment progresses, to determine whether the issue has been resolved:
   
   ```
   $ oc get pods -w
   ```

7. Review events within the namespace for diagnostic information relating to pod failures:
   
   ```
   $ oc get events
   ```

### 6.5.3. Inspecting pod and container logs

You can inspect pod and container logs for warnings and error messages related to explicit pod failures. Depending on policy and exit code, pod and container logs remain available after pods have been terminated.

**Prerequisites**

- You have access to the cluster as a user with the `dedicated-admin` role.
- Your API service is still functional.
- You have installed the OpenShift CLI (`oc`).

**Procedure**

1. Query logs for a specific pod:
   
   ```
   $ oc logs <pod_name>
   ```

2. Query logs for a specific container within a pod:
   
   ```
   $ oc logs <pod_name> -c <container_name>
   ```

   Logs retrieved using the preceding `oc logs` commands are composed of messages sent to stdout within pods or containers.

3. Inspect logs contained in `/var/log` within a pod.
   
   a. List log files and subdirectories contained in `/var/log` within a pod:
$ oc exec <pod_name> -- ls -alh /var/log

**Example output**

```
total 124K
drwxr-xr-x. 1 root root   33 Aug 11 11:23 .
drwxr-xr-x. 1 root root   28 Sep  6  2022 ..
-rw-r--r--. 1 root utmp  0 Jul 10 10:31 btmp
-rw-r--r--. 1 root root  33K Jul 17 10:07 dnf.librepo.log
-rw-r--r--. 1 root root  69K Jul 17 10:07 dnf.log
-rw-r--r--. 1 root root  8.8K Jul 17 10:07 dnf.rpm.log
-rw-r--r--. 1 root root 480 Jul 17 10:07 hawkey.log
-rw-r--r--. 1 root utmp  0 Jul 10 10:31 lastlog
drw-------, 2 root root   23 Aug 11 11:14 openshift-apiserver
drw-------, 2 root root    6 Jul 10 10:31 private
drw-------, 1 root root   22 Mar  9 08:05 rhsm
-rw-rw-r--. 1 root utmp  0 Jul 10 10:31 wtmp
```

b. Query a specific log file contained in /var/log within a pod:

$ oc exec <pod_name> cat /var/log/<path_to_log>

**Example output**

```
2023-07-10T10:29:38+0000 INFO --- logging initialized ---
2023-07-10T10:29:38+0000 DDEBUG timer: config: 13 ms
2023-07-10T10:29:38+0000 DEBUG Loaded plugins: builddep, changelog, config-manager, copr, debug, debuginfo-install, download, generate_completion_cache, groups-manager, needs-restarting, playground, product-id, repoclosure, repodiff, repograph, repomanage, reposync, subscription-manager, uploadprofile
2023-07-10T10:29:38+0000 INFO Updating Subscription Management repositories.
2023-07-10T10:29:38+0000 INFO Unable to read consumer identity
2023-07-10T10:29:38+0000 INFO Subscription Manager is operating in container mode.
```

c. List log files and subdirectories contained in /var/log within a specific container:

$ oc exec <pod_name> -c <container_name> ls /var/log

d. Query a specific log file contained in /var/log within a specific container:

$ oc exec <pod_name> -c <container_name> cat /var/log/<path_to_log>

**6.5.4. Accessing running pods**

You can review running pods dynamically by opening a shell inside a pod or by gaining network access through port forwarding.

**Prerequisites**

- You have access to the cluster as a user with the `dedicated-admin` role.
• Your API service is still functional.
• You have installed the OpenShift CLI (oc).

Procedure

1. Switch into the project that contains the pod you would like to access. This is necessary because the oc rsh command does not accept the -n namespace option:

   $ oc project <namespace>

2. Start a remote shell into a pod:

   $ oc rsh <pod_name>  

   1 If a pod has multiple containers, oc rsh defaults to the first container unless -c <container_name> is specified.

3. Start a remote shell into a specific container within a pod:

   $ oc rsh -c <container_name> pod/<pod_name>

4. Create a port forwarding session to a port on a pod:

   $ oc port-forward <pod_name> <host_port>:<pod_port>  

   1 Enter Ctrl+C to cancel the port forwarding session.

6.5.5. Starting debug pods with root access

You can start a debug pod with root access, based on a problematic pod’s deployment or deployment configuration. Pod users typically run with non-root privileges, but running troubleshooting pods with temporary root privileges can be useful during issue investigation.

Prerequisites

• You have access to the cluster as a user with the dedicated-admin role.
• Your API service is still functional.
• You have installed the OpenShift CLI (oc).

Procedure

1. Start a debug pod with root access, based on a deployment.
   a. Obtain a project’s deployment name:

      $ oc get deployment -n <project_name>

   b. Start a debug pod with root privileges, based on the deployment:
2. Start a debug pod with root access, based on a deployment configuration.
   a. Obtain a project’s deployment configuration name:
      $ oc get deploymentconfigs -n <project_name>
   b. Start a debug pod with root privileges, based on the deployment configuration:
      $ oc debug deploymentconfig/my-deployment-configuration --as-root -n <project_name>

**NOTE**
You can append -- <command> to the preceding `oc debug` commands to run individual commands within a debug pod, instead of running an interactive shell.

### 6.5.6. Copying files to and from pods and containers

You can copy files to and from a pod to test configuration changes or gather diagnostic information.

**Prerequisites**
- You have access to the cluster as a user with the `dedicated-admin` role.
- Your API service is still functional.
- You have installed the OpenShift CLI (`oc`).

**Procedure**

1. Copy a file to a pod:

   ```
   $ oc cp <local_path> <pod_name>:/<path> -c <container_name> 1
   ```

   ![1]
   The first container in a pod is selected if the `-c` option is not specified.

2. Copy a file from a pod:

   ```
   $ oc cp <pod_name>:/<path> -c <container_name> <local_path> 1
   ```

   ![1]
   The first container in a pod is selected if the `-c` option is not specified.

**NOTE**
For `oc cp` to function, the `tar` binary must be available within the container.

### 6.6. TROUBLESHOOTING STORAGE ISSUES

#### 6.6.1. Resolving multi-attach errors
When a node crashes or shuts down abruptly, the attached ReadWriteOnce (RWO) volume is expected to be unmounted from the node so that it can be used by a pod scheduled on another node.

However, mounting on a new node is not possible because the failed node is unable to unmount the attached volume.

A multi-attach error is reported:

**Example output**

Unable to attach or mount volumes: unmounted volumes=[sso-mysql-pvol], unattached volumes=[sso-mysql-pvol default-token-x4rzc]: timed out waiting for the condition

Multi-Attach error for volume "pvc-8837384d-69d7-40b2-b2e6-5df86943eef9" Volume is already used by pod(s) sso-mysql-1-ns6b4

**Procedure**

To resolve the multi-attach issue, use one of the following solutions:

- Enable multiple attachments by using RWX volumes.
  For most storage solutions, you can use ReadWriteMany (RWX) volumes to prevent multi-attach errors.

- Recover or delete the failed node when using an RWO volume.
  For storage that does not support RWX, such as VMware vSphere, RWO volumes must be used instead. However, RWO volumes cannot be mounted on multiple nodes.

  If you encounter a multi-attach error message with an RWO volume, force delete the pod on a shutdown or crashed node to avoid data loss in critical workloads, such as when dynamic persistent volumes are attached.

    $ oc delete pod <old_pod> --force=true --grace-period=0

    This command deletes the volumes stuck on shutdown or crashed nodes after six minutes.

6.7. INVESTIGATING MONITORING ISSUES

Red Hat OpenShift Service on AWS includes a preconfigured, preinstalled, and self-updating monitoring stack that provides monitoring for core platform components. In Red Hat OpenShift Service on AWS 4, cluster administrators can optionally enable monitoring for user-defined projects.

You can follow these procedures if your own metrics are unavailable or if Prometheus is consuming a lot of disk space.

6.7.1. Investigating why user-defined project metrics are unavailable

**ServiceMonitor** resources enable you to determine how to use the metrics exposed by a service in user-defined projects. Follow the steps outlined in this procedure if you have created a **ServiceMonitor** resource but cannot see any corresponding metrics in the Metrics UI.

**Prerequisites**

- You have access to the cluster as a user with the **dedicated-admin** role.
- You have installed the OpenShift CLI (oc).
- You have enabled and configured monitoring for user-defined workloads.
- You have created the `user-workload-monitoring-config` ConfigMap object.
- You have created a `ServiceMonitor` resource.

**Procedure**

1. **Check that the corresponding labels match** in the service and `ServiceMonitor` resource configurations.
   a. Obtain the label defined in the service. The following example queries the `prometheus-example-app` service in the `ns1` project:
      
      ```bash
      $ oc -n ns1 get service prometheus-example-app -o yaml
      
      labels:
      app: prometheus-example-app
      
      **Example output**
      ```
   b. Check that the `matchLabels` app label in the `ServiceMonitor` resource configuration matches the label output in the preceding step:
      
      ```bash
      $ oc -n ns1 get servicemonitor prometheus-example-monitor -o yaml
      
      apiVersion: v1
      kind: Service
      # ...
      spec:
      endpoints:
      - interval: 30s
        port: web
        scheme: http
      selector:
      matchLabels:
      app: prometheus-example-app
      # ...
      
      **Example output**
      ```

      **NOTE**

      You can check service and `ServiceMonitor` resource labels as a developer with view permissions for the project.

2. **Inspect the logs for the Prometheus Operator** in the `openshift-user-workload-monitoring` project.
   a. List the pods in the `openshift-user-workload-monitoring` project:
      
      ```bash
      $ oc -n openshift-user-workload-monitoring get pods
      ```
Example output

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>prometheus-operator-776fcbbd56-2nbfd</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
<td>132m</td>
</tr>
<tr>
<td>prometheus-user-workload-0</td>
<td>5/5</td>
<td>Running</td>
<td>1</td>
<td>132m</td>
</tr>
<tr>
<td>prometheus-user-workload-1</td>
<td>5/5</td>
<td>Running</td>
<td>1</td>
<td>132m</td>
</tr>
<tr>
<td>thanos-ruler-user-workload-0</td>
<td>3/3</td>
<td>Running</td>
<td>0</td>
<td>132m</td>
</tr>
<tr>
<td>thanos-ruler-user-workload-1</td>
<td>3/3</td>
<td>Running</td>
<td>0</td>
<td>132m</td>
</tr>
</tbody>
</table>

b. Obtain the logs from the prometheus-operator container in the prometheus-operator pod. In the following example, the pod is called prometheus-operator-776fcbbd56-2nbfd:

```bash
$ oc -n openshift-user-workload-monitoring logs prometheus-operator-776fcbbd56-2nbfd -c prometheus-operator
```

If there is an issue with the service monitor, the logs might include an error similar to this example:

```plaintext
level=warn ts=2020-08-10T11:48:20.906739623Z caller=operator.go:1829 component=prometheusoperator msg="skipping servicemonitor" error="it accesses file system via bearer token file which Prometheus specification prohibits"
```

c. Configure debug level logging for the Prometheus Operator in the openshift-user-workload-monitoring project.

3. Review the target status for your endpoint on the Metrics targets page in the Red Hat OpenShift Service on AWS web console UI.

   a. Log in to the Red Hat OpenShift Service on AWS web console and navigate to Observe → Targets in the Administrator perspective.

   b. Locate the metrics endpoint in the list, and review the status of the target in the Status column.

   c. If the Status is Down, click the URL for the endpoint to view more information on the Target Details page for that metrics target.

4. Configure debug level logging for the Prometheus Operator in the openshift-user-workload-monitoring project.

   a. Edit the user-workload-monitoring-config ConfigMap object in the openshift-user-workload-monitoring project:

```bash
$ oc -n openshift-user-workload-monitoring edit configmap user-workload-monitoring-config
```

   b. Add logLevel: debug for prometheusOperator under data/config.yaml to set the log level to debug:

```yaml
apiVersion: v1
kind: ConfigMap
metadata:
  name: user-workload-monitoring-config
namespace: openshift-user-workload-monitoring
data:
  config.yaml: |
```
c. Save the file to apply the changes.

NOTE

The prometheus-operator in the openshift-user-workload-monitoring project restarts automatically when you apply the log-level change.

d. Confirm that the debug log-level has been applied to the prometheus-operator deployment in the openshift-user-workload-monitoring project:

```bash
$ oc -n openshift-user-workload-monitoring get deploy prometheus-operator -o yaml | grep "log-level"
```

Example output

```
-apiVersion: apps/v1
kind: Deployment
metadata:
  name: prometheus-operator
  namespace: openshift-user-workload-monitoring
spec:
  selector:
    matchLabels:
      app.kubernetes.io/name: prometheus-operator
      app.kubernetes.io/part-of: prometheus
  template:
    metadata:
      labels:
        app.kubernetes.io/name: prometheus-operator
        app.kubernetes.io/part-of: prometheus
    spec:
      containers:
      - name: prometheus-operator
        image: "quay.io/prometheus/prometheus-operator:latest"
        env:
        - name: PROMETHEUS__LOGLEVEL
          value: debug
```

Check that the prometheus-operator pod is running:

```bash
$ oc -n openshift-user-workload-monitoring get pods
```

NOTE

If an unrecognized Prometheus Operator loglevel value is included in the config map, the prometheus-operator pod might not restart successfully.

e. Review the debug logs to see if the Prometheus Operator is using the ServiceMonitor resource. Review the logs for other related errors.

f. Review the debug logs to see if the Prometheus Operator is using the ServiceMonitor resource. Review the logs for other related errors.

Additional resources

- Creating a user-defined workload monitoring config map
- See Specifying how a service is monitored for details on how to create a service monitor or pod monitor
- See Getting detailed information about a metrics target

6.7.2. Determining why Prometheus is consuming a lot of disk space

Developers can create labels to define attributes for metrics in the form of key-value pairs. The number of potential key-value pairs corresponds to the number of possible values for an attribute. An attribute that has an unlimited number of potential values is called an unbound attribute. For example, a customer_id attribute is unbound because it has an infinite number of possible values.
Every assigned key-value pair has a unique time series. The use of many unbound attributes in labels can result in an exponential increase in the number of time series created. This can impact Prometheus performance and can consume a lot of disk space.

You can use the following measures when Prometheus consumes a lot of disk:

- **Check the number of scrape samples** that are being collected.
- **Check the time series database (TSDB) status using the Prometheus HTTP API** for more information about which labels are creating the most time series. Doing so requires cluster administrator privileges.
- **Reduce the number of unique time series that are created** by reducing the number of unbound attributes that are assigned to user-defined metrics.

**NOTE**

Using attributes that are bound to a limited set of possible values reduces the number of potential key-value pair combinations.

- **Enforce limits on the number of samples that can be scraped** across user-defined projects. This requires cluster administrator privileges.

### Prerequisites

- You have access to the cluster as a user with the **dedicated-admin** role.
- You have installed the OpenShift CLI (**oc**).

### Procedure

1. **In the Administrator perspective, navigate to Observe → Metrics.**

2. **Run the following Prometheus Query Language (PromQL) query in the Expression field.** This returns the ten metrics that have the highest number of scrape samples:

   ```
   topk(10,count by (job)({__name__=~".+."}))
   ```

3. **Investigate the number of unbound label values assigned to metrics with higher than expected scrape sample counts.**

   - **If the metrics relate to a user-defined project** review the metrics key-value pairs assigned to your workload. These are implemented through Prometheus client libraries at the application level. Try to limit the number of unbound attributes referenced in your labels.
   
   - **If the metrics relate to a core Red Hat OpenShift Service on AWS project** create a Red Hat support case on the Red Hat Customer Portal.

4. **Review the TSDB status using the Prometheus HTTP API by running the following commands as a dedicated-admin:**

   ```
   $ oc login -u <username> -p <password>
   $ host=$(oc -n openshift-monitoring get route prometheus-k8s -ojsonpath={.spec.host})
   ```
$ token=$(oc whoami -t)

$ curl -H "Authorization: Bearer $token" -k "https://$host/api/v1/status/tsdb"

Example output

"status": "success",

**Additional resources**

- See [Setting a scrape sample limit for user-defined projects](#) for details on how to set a scrape sample limit and create related alerting rules

## 6.8. DIAGNOSING OPENSHIFT CLI (oc) ISSUES

### 6.8.1. Understanding OpenShift CLI (oc) log levels

With the OpenShift CLI (oc), you can create applications and manage Red Hat OpenShift Service on AWS projects from a terminal.

If oc command-specific issues arise, increase the oc log level to output API request, API response, and curl request details generated by the command. This provides a granular view of a particular oc command’s underlying operation, which in turn might provide insight into the nature of a failure.

oc log levels range from 1 to 10. The following table provides a list of oc log levels, along with their descriptions.

**Table 6.3. OpenShift CLI (oc) log levels**

<table>
<thead>
<tr>
<th>Log level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 to 5</td>
<td>No additional logging to stderr.</td>
</tr>
<tr>
<td>6</td>
<td>Log API requests to stderr.</td>
</tr>
<tr>
<td>7</td>
<td>Log API requests and headers to stderr.</td>
</tr>
<tr>
<td>8</td>
<td>Log API requests, headers, and body, plus API response headers and body to stderr.</td>
</tr>
<tr>
<td>9</td>
<td>Log API requests, headers, and body, API response headers and body, plus curl requests to stderr.</td>
</tr>
<tr>
<td>10</td>
<td>Log API requests, headers, and body, API response headers and body, plus curl requests to stderr, in verbose detail.</td>
</tr>
</tbody>
</table>

### 6.8.2. Specifying OpenShift CLI (oc) log levels

You can investigate OpenShift CLI (oc) issues by increasing the command’s log level.
The Red Hat OpenShift Service on AWS user’s current session token is typically included in logged `curl` requests where required. You can also obtain the current user’s session token manually, for use when testing aspects of an `oc` command’s underlying process step-by-step.

**Prerequisites**

- Install the OpenShift CLI (`oc`).

**Procedure**

- Specify the `oc` log level when running an `oc` command:

```bash
$ oc <command> --loglevel <log_level>
```

where:

- `<command>`
  - Specifies the command you are running.
- `<log_level>`
  - Specifies the log level to apply to the command.

- To obtain the current user’s session token, run the following command:

```bash
$ oc whoami -t
```

**Example output**

```bash
sha256~RCV3Qcn7H-0EfqCGVI0CvnZ6...
```

### 6.9. TROUBLESHOOTING EXPIRED TOKENS

#### 6.9.1. Troubleshooting expired offline access tokens

If you use the Red Hat OpenShift Service on AWS (ROSA) CLI, `rosa`, and your `api.openshift.com` offline access token expires, an error message appears. This happens when `sso.redhat.com` invalidates the token.

**Example output**

```bash
Can't get tokens ....
Can't get access tokens ....
```

**Procedure**

- Generate a new offline access token at the following URL. A new offline access token is generated every time you visit the URL.

  - Red Hat OpenShift Service on AWS (ROSA):
    
    ```bash
    https://console.redhat.com/openshift/token/rosa
    ```

### 6.10. TROUBLESHOOTING IAM ROLES
6.10.1. Resolving issues with ocm-roles and user-role IAM resources

You may receive an error when trying to create a cluster using the Red Hat OpenShift Service on AWS (ROSA) CLI, rosa.

Sample output

E: Failed to create cluster: The sts_user_role is not linked to account '10Nl'. Please create a user role and link it to the account.

This error means that the user-role IAM role is not linked to your AWS account. The most likely cause of this error is that another user in your Red Hat organization created the ocm-role IAM role. Your user-role IAM role needs to be created.

NOTE

After any user sets up an ocm-role IAM resource linked to a Red Hat account, any subsequent users wishing to create a cluster in that Red Hat organization must have a user-role IAM role to provision a cluster.

Procedure

- Assess the status of your ocm-role and user-role IAM roles with the following commands:

  
  $ rosa list ocm-role

  **Sample output**

  I: Fetching ocm roles
  ROLE NAME                           ROLE ARN                                          LINKED  ADMIN
  ManagedOpenShift-OCM-Role-1158  arn:aws:iam::2066:role/ManagedOpenShift-OCM-Role-1158   No      No

  $ rosa list user-role

  **Sample output**

  I: Fetching user roles
  ROLE NAME                                   ROLE ARN                                        LINKED
  ManagedOpenShift-User.osdocs-Role  arn:aws:iam::2066:role/ManagedOpenShift-User.osdocs-Role  Yes

With the results of these commands, you can create and link the missing IAM resources.

6.10.1.1. Creating an ocm-role IAM role

You create your ocm-role IAM roles by using the command-line interface (CLI).

Prerequisites

- You have an AWS account.
You have Red Hat Organization Administrator privileges in the OpenShift Cluster Manager organization.

You have the permissions required to install AWS account-wide roles.

You have installed and configured the latest Red Hat OpenShift Service on AWS (ROSA) CLI, `rosa`, on your installation host.

Procedure

- To create an ocm-role IAM role with basic privileges, run the following command:

  ```bash
  $ rosa create ocm-role
  ```

- To create an ocm-role IAM role with admin privileges, run the following command:

  ```bash
  $ rosa create ocm-role --admin
  ```

This command allows you create the role by specifying specific attributes. The following example output shows the "auto mode" selected, which lets the ROSA CLI (`rosa`) create your Operator roles and policies. See "Methods of account-wide role creation" in the Additional resources for more information.

Example output

```
I: Creating ocm role
? Role prefix: ManagedOpenShift 1
? Enable admin capabilities for the OCM role (optional): No 2
? Permissions boundary ARN (optional): 3
? Role Path (optional): 4
? Role creation mode: auto 5
I: Creating role using 'arn:aws:iam::<ARN>:user/<UserName>'
? Create the 'ManagedOpenShift-OCM-Role-182' role? Yes 6
I: Created role 'ManagedOpenShift-OCM-Role-182' with ARN 'arn:aws:iam::<ARN>:role/ManagedOpenShift-OCM-Role-182'
I: Linking OCM role
? OCM Role ARN: arn:aws:iam::<ARN>:role/ManagedOpenShift-OCM-Role-182 7
? Link the 'arn:aws:iam::<ARN>:role/ManagedOpenShift-OCM-Role-182' role with organization '<AWS ARN>'? Yes 8
I: Successfully linked role-arn 'arn:aws:iam::<ARN>:role/ManagedOpenShift-OCM-Role-182' with organization account '<AWS ARN>'
```

1. A prefix value for all of the created AWS resources. In this example, `ManagedOpenShift` prepends all of the AWS resources.

2. Choose if you want this role to have the additional admin permissions.

3. The Amazon Resource Name (ARN) of the policy to set permission boundaries.

4. **NOTE**

   You do not see this prompt if you used the `--admin` option.
Specify an IAM path for the user name.

Choose the method to create your AWS roles. Using auto, the ROSA CLI generates and links the roles and policies. In the auto mode, you receive some different prompts to create the AWS roles.

The auto method asks if you want to create a specific ocm-role using your prefix.

Confirm that you want to associate your IAM role with your OpenShift Cluster Manager.

Links the created role with your AWS organization.

6.10.1.2. Creating a user-role IAM role

You can create your user-role IAM roles by using the command-line interface (CLI).

Prerequisites

- You have an AWS account.
- You have installed and configured the latest Red Hat OpenShift Service on AWS (ROSA) CLI, rosa, on your installation host.

Procedure

- To create a user-role IAM role with basic privileges, run the following command:

  $ rosa create user-role

  This command allows you create the role by specifying specific attributes. The following example output shows the "auto mode" selected, which lets the ROSA CLI (rosa) to create your Operator roles and policies. See "Understanding the auto and manual deployment modes" in the Additional resources for more information.

Example output

```
I: Creating User role
? Role prefix: ManagedOpenShift 1
? Permissions boundary ARN (optional): 2
? Role Path (optional): 3
? Role creation mode: auto 4
I: Creating ocm user role using 'arn:aws:iam::2066:user'
? Create the 'ManagedOpenShift-User.osdocs-Role' role? Yes 5
I: Created role 'ManagedOpenShift-User.osdocs-Role' with ARN 'arn:aws:iam::2066:role/ManagedOpenShift-User.osdocs-Role'
I: Linking User role
? User Role ARN: arn:aws:iam::2066:role/ManagedOpenShift-User.osdocs-Role
? Link the 'arn:aws:iam::2066:role/ManagedOpenShift-User.osdocs-Role' role with account '1AGE'? Yes 6
I: Successfully linked role ARN 'arn:aws:iam::2066:role/ManagedOpenShift-User.osdocs-Role' with account '1AGE'
```

1. A prefix value for all of the created AWS resources. In this example, ManagedOpenShift prepends all of the AWS resources.
2 The Amazon Resource Name (ARN) of the policy to set permission boundaries.

3 Specify an IAM path for the user name.

4 Choose the method to create your AWS roles. Using **auto**, the ROSA CLI generates and links the roles and policies. In the **auto** mode, you receive some different prompts to create the AWS roles.

5 The **auto** method asks if you want to create a specific **user-role** using your prefix.

6 Links the created role with your AWS organization.

### 6.10.1.3. Linking your AWS account

You can link your AWS account to existing IAM roles by using the Red Hat OpenShift Service on AWS (ROSA) CLI, **rosa**.

**Prerequisites**

- You have an AWS account.
- You are using **OpenShift Cluster Manager Hybrid Cloud Console** to create clusters.
- You have the permissions required to install AWS account-wide roles. See the "Additional resources" of this section for more information.
- You have installed and configured the latest AWS (**aws**) and ROSA (**rosa**) CLIs on your installation host.
- You have created your **ocm-role** and **user-role** IAM roles, but have not yet linked them to your AWS account. You can check whether your IAM roles are already linked by running the following commands:

```bash
$ rosa list ocm-role

$ rosa list user-role
```

If **Yes** is displayed in the **Linked** column for both roles, you have already linked the roles to an AWS account.

**Procedure**

1. From the CLI, link your **ocm-role** resource to your Red Hat organization by using your Amazon Resource Name (ARN):

   ```bash
   $ rosa link ocm-role --role-arn <arn>
   ```

   **NOTE**

   You must have Red Hat Organization Administrator privileges to run the **rosa link** command. After you link the **ocm-role** resource with your AWS account, it is visible for all users in the organization.

   ```bash
   $ rosa link ocm-role --role-arn <arn>
   ```

   **Example output**
2. From the CLI, link your user-role resource to your Red Hat user account by using your Amazon Resource Name (ARN):

    $ rosa link user-role --role-arn <arn>

Example output

    I: Linking OCM role
    [?] Link the '<AWS ACCOUNT ID>' role with organization '<ORG ID>'? Yes
    I: Successfully linked role-arn '<AWS ACCOUNT ID>' with organization account '<ORG ID>'

    I: Linking User role
    [?] Link the 'arn:aws:iam::<ARN>:role/ManagedOpenShift-User-Role-125' role with organization '<AWS ID>'? Yes
    I: Successfully linked role-arn 'arn:aws:iam::<ARN>:role/ManagedOpenShift-User-Role-125' with organization account '<AWS ID>'

6.10.1.4. Associating multiple AWS accounts with your Red Hat organization

You can associate multiple AWS accounts with your Red Hat organization. Associating multiple accounts lets you create Red Hat OpenShift Service on AWS (ROSA) clusters on any of the associated AWS accounts from your Red Hat organization.

With this feature, you can create clusters in different AWS regions by using multiple AWS profiles as region-bound environments.

Prerequisites

- You have an AWS account.
- You are using OpenShift Cluster Manager Hybrid Cloud Console to create clusters.
- You have the permissions required to install AWS account-wide roles.
- You have installed and configured the latest AWS (aws) and ROSA (rosa) CLIs on your installation host.
- You have created your ocm-role and user-role IAM roles.

Procedure

To associate an additional AWS account, first create a profile in your local AWS configuration. Then, associate the account with your Red Hat organization by creating the ocm-role, user, and account roles in the additional AWS account.

To create the roles in an additional region, specify the --profile <aws-profile> parameter when running the rosa create commands and replace <aws_profile> with the additional account profile name:

- To specify an AWS account profile when creating an OpenShift Cluster Manager role:

    $ rosa create --profile <aws_profile> ocm-role

- To specify an AWS account profile when creating a user role:
$ rosa create --profile <aws_profile> user-role

- To specify an AWS account profile when creating the account roles:
$ rosa create --profile <aws_profile> account-roles

**NOTE**

If you do not specify a profile, the default AWS profile is used.

### 6.11. TROUBLESHOOTING CLUSTER DEPLOYMENTS

This document describes how to troubleshoot cluster deployment errors.

### 6.11.1. Obtaining information on a failed cluster

If a cluster deployment fails, the cluster is put into an "error" state.

**Procedure**

Run the following command to get more information:

$ rosa describe cluster -c <my_cluster_name> --debug

### 6.11.2. Failing to create a cluster with an osdCcsAdmin error

If a cluster creation action fails, you can receive the following error message.

**Example output**

Failed to create cluster: Unable to create cluster spec: Failed to get access keys for user 'osdCcsAdmin': NoSuchEntity: The user with name osdCcsAdmin cannot be found.

**Procedure**

To fix this issue:

1. Delete the stack:

   $ rosa init --delete

2. Reinitialize your account:

   $ rosa init

### 6.11.3. Creating the Elastic Load Balancing (ELB) service-linked role

If you have not created a load balancer in your AWS account, it is possible that the service-linked role for Elastic Load Balancing (ELB) might not exist yet. You may receive the following error:

**Error**: Error creating network Load Balancer: AccessDenied: User:
Procedure

To resolve this issue, ensure that the role exists on your AWS account. If not, create this role with the following command:

```bash
aws iam get-role --role-name "AWSServiceRoleForElasticLoadBalancing" || aws iam create-service-linked-role --aws-service-name "elasticloadbalancing.amazonaws.com"
```

**NOTE**

This command only needs to be executed once per account.

6.11.4. Repairing a cluster that cannot be deleted

In specific cases, the following error appears in OpenShift Cluster Manager Hybrid Cloud Console if you attempt to delete your cluster.

If you try to delete your cluster from the CLI, the following error appears.

```
E: Failed to delete cluster <hash>: sts_user_role is not linked to your account. sts_ocm_role is linked to your organization <org number> which requires sts_user_role to be linked to your Red Hat account <account ID>. Please create a user role and link it to the account: User Account <account ID> is not authorized to perform STS cluster operations
```

This error occurs when the **user-role** is unlinked or deleted.

Procedure

1. Run the following command to create the **user-role** IAM resource:

   ```bash
   $ rosa create user-role
   ```

2. After you see that the role has been created, you can delete the cluster. The following confirms that the role was created and linked:

   ```bash
   I: Successfully linked role ARN <user role ARN> with account <account ID>
   ```
6.12.1. Overview

The following covers all resources managed or protected by the Service Reliability Engineering Platform (SRE-P) Team. Customers should not attempt to modify these resources because doing so can lead to cluster instability.

6.12.2. Hive managed resources

The following list displays the Red Hat OpenShift Service on AWS resources managed by OpenShift Hive, the centralized fleet configuration management system. These resources are in addition to the OpenShift Container Platform resources created during installation. OpenShift Hive continually attempts to maintain consistency across all Red Hat OpenShift Service on AWS clusters. Changes to Red Hat OpenShift Service on AWS resources should be made through OpenShift Cluster Manager so that OpenShift Cluster Manager and Hive are synchronized. Contact ocm-feedback@redhat.com if OpenShift Cluster Manager does not support modifying the resources in question.

Example 6.1. List of Hive managed resources

Schedule:
6.12.3. Red Hat OpenShift Service on AWS add-on namespaces

Red Hat OpenShift Service on AWS add-ons are services available for installation after cluster installation. These additional services include Red Hat OpenShift Dev Spaces, Red Hat OpenShift API Management, and Cluster Logging Operator. Any changes to resources within the following namespaces can be overridden by the add-on during upgrades, which can lead to unsupported configurations for the add-on functionality.

Example 6.2. List of add-on managed namespaces

```yaml
- namespace: openshift-velero
  name: daily-full-backup
- namespace: openshift-velero
  name: hourly-object-backup
- namespace: openshift-velero
  name: weekly-full-backup
```

6.12.4. Red Hat OpenShift Service on AWS validating webhooks

Red Hat OpenShift Service on AWS validating webhooks are a set of dynamic admission controls maintained by the OpenShift SRE team. These HTTP callbacks, also known as webhooks, are called for various types of requests to ensure cluster stability. The following list describes the various webhooks with rules containing the registered operations and resources that are controlled. Any attempt to circumvent these validating webhooks could affect the stability and supportability of the cluster.

Example 6.3. List of validating webhooks

```
- namespace: openshift-velero
  name: daily-full-backup
- namespace: openshift-velero
  name: hourly-object-backup
- namespace: openshift-velero
  name: weekly-full-backup
```

  "documentString": "Managed OpenShift Customers may not update or delete the Hive ownership settings under the managed namespaces: (^openshift-.*|kube-system)"
}]}
Managed OpenShift customers may not edit certain managed resources. A managed resource has a `hive.openshift.io/managed": "true"` label.

Managed OpenShift customers may not create ImageContentSourcePolicy,
ImageDigestMirrorSet, or ImageTagMirrorSet resources that configure mirrors for the entirety of quay.io, registry.redhat.io, nor registry.access.redhat.com. If needed, specific repositories can have mirrors configured, such as quay.io/example.
