1. FIREWALL RULES FOR RED HAT OPENSTACK PLATFORM

This article describes the firewall configuration created by the director for Red Hat OpenStack Platform. These ports are required for services running on the overcloud.

IMPORTANT

It is recommended that you test service connectivity before moving your deployment into production. As part of this process, consider checking for any dropped traffic on all intermediary firewalls.

NOTE

In the tables below, certain port numbers are formatted as variables, such as **IroniicIPXEPort**. These port numbers will be specific to your deployment and will have been defined in your environment files.

1.1. Reviewing firewall rules for Composable Roles

Red Hat OpenStack Platform director allows you to customize where certain OpenStack services are deployed. For example, you could deploy a standalone node that runs only the Identity Service (keystone). For more information, see the Composable Roles documentation:

https://access.redhat.com/documentation/en-us/red_hat_openstack_platform/12/html/advanced_overcloud_customization/roles

2. REVIEW THE FIREWALL RULES FOR EACH ROLE

Consider segmenting the network traffic that passes between standalone roles. For example, some deployments might want to use granular firewall rules to restrict traffic between standalone keystone nodes, or from one keystone node to a standalone Compute node. This approach would also be useful for spine-leaf networks, where the router can also be used to apply granular firewall rules.

To begin segmenting traffic for standalone roles, you will need to identify the firewall rules apply to each role. You can determine this by reviewing the services assigned to the role. Each service file in **tripleo-heat-templates/puppet/services/*** has an entry named **tripleo.<service>.firewall_rules** which describes the ports required for that service. You can extract this information from the templates using the following command:

```
find -L /usr/share/openstack-tripleo-heat-templates/ -type f | while read f;do if `grep -q firewall_rules $f`;then echo -e "\n $f " ; grep firewall_rules "$f" -A10;fi; done
```

NOTE

The following tables are formatted output from the above command, from a particular point in time. It would be good practice to confirm the settings in the YAML scripts, as they are subject to change.
