CHAPTER 4. REVISING PROJECT VERSIONS .....	7
APPENDIX A. VERSIONING INFORMATION .....	8

# PREFACE

As a process administrator, you can use Business Central in Red Hat Process Automation Manager to import and revise existing projects.

## Prerequisites

- Red Hat JBoss Enterprise Application Platform 7.1.0 is installed. For installation information, see the [\*Red Hat JBoss EAP 7.1.0 Installation Guide\*](#).
- Red Hat Process Automation Manager is installed and configured with Process Server. For more information, see [\*Installing and configuring Red Hat Process Automation Manager on Red Hat JBoss EAP 7.1\*](#).
- Red Hat Process Automation Manager is running and you can log in to Business Central with the **process-admin** role. For more information, see [\*Planning a Red Hat Process Automation Manager installation\*](#).

## CHAPTER 1. PROJECTS

Projects contain the business assets that you develop in Red Hat Process Automation Manager and are assigned to a space (for example, **MyProject** within **MySpace**). Projects also contain configuration files such as a Maven project object model file (**pom.xml**), which contains build, environment, and other information about the project, and a KIE module descriptor file (**kmodule.xml**), which contains the KIE Base and KIE Session configurations for the assets in the project.

# CHAPTER 2. MODIFYING EXISTING PROJECTS IN BUSINESS CENTRAL

Business Central includes a number of sample projects that you can use to get familiar with the product and its features. The sample projects have been designed and created to demonstrate a variety of business scenarios. You can modify the sample projects to meet your specific business needs. For example, Red Hat Process Automation Manager 7.0 contains the **Mortgage Process** sample project, which consists of predefined data objects, guided decision tables, guided rules, forms, and a business process. You can edit the sample to refine your business process.

If none of the existing Business Central project samples align with your requirements, you can import a new project from a git repository. See [Chapter 3, Importing projects from Git repositories](#).

## 2.1. MODIFYING THE MORTGAGE PROCESS SAMPLE PROJECT

The **Mortgage Process** sample project consists of predefined data objects, guided decision tables, guided rules, forms, and a business process. Using the sample project provides a quick way to get acclimated with Red Hat Process Automation Manager. In a real business scenario, you would create all of the assets by providing data that is specific to your business requirements.

### Procedure

Navigate to the Mortgage Process sample project to view the predefined assets.

1. Log in to Business Central and click **Menu → Design → Projects**.
2. Click  in the upper-right corner of the screen and select **Try Samples**.
3. Select **Mortgage Process** and click **Ok**. The **Assets** view of the project opens.
4. Click on an asset that you want to modify. All of the assets can be edited to meet your project requirements.

## CHAPTER 3. IMPORTING PROJECTS FROM GIT REPOSITORIES

Git is a distributed version control system. It implements revisions as commit objects. When you save your changes to a repository, a new commit object in the Git repository is created.

Business Central uses Git to store project data, including assets such as rules and processes. When you create a project in Business Central, it is added to a Git repository that is connected to Business Central. If you have projects in Git repositories, you can import those projects into the Business Central Git repository through Business Central spaces.

### Prerequisites

- Red Hat Process Automation Manager projects exist in an external Git repository.
- Credentials required for read access to that external Git repository are available.

### Procedure

1. In Business Central, click **Menu** → **Design** → **Projects**.
2. Select or create the space into which you want to import the projects. The default space is **mySpace**.
3. Click  on the right side of the screen and select **Import Project**.
4. In the **Import Project** window, enter the URL and credentials for the Git repository that contains the project that you want to import and click **Import**. The project is added to the Business Central Git repository and is available in the created or default space.

# CHAPTER 4. REVISING PROJECT VERSIONS

You can revise the version number of a project in Red Hat Process Automation Manager before you build and deploy a new instance of the project. Creating a new version of a project preserves the old version in case there is a problem with the new one and you need to revert back.

## Prerequisites

The Process Server is deployed and connected to the Business Central.

## Procedure

1. Log in to Business Central and click **Menu → Design → Projects**.
2. Click on the project you want to deploy, for example **Mortgage Process**.
3. Click **Deploy**.
  - If there is no container with the project name, a container with default values is automatically created.
  - If an older version of the project is already deployed, go to the project settings and change the project version. When finished, save the change and click **Deploy**. This will deploy a new version of the same project with the latest changes in place, alongside the older version(s).
4. To verify the deployment, click **Menu → Manage → Process Definitions**, and click .
5. Click  in the **Actions** column and select **Start** to start a new instance of the process.

## APPENDIX A. VERSIONING INFORMATION

Documentation last updated on: Monday, October 1, 2018.
