Abstract

The Red Hat Software Collections 3.5 Release Notes document the major features and contain important information about known problems in Red Hat Software Collections 3.5. The Red Hat Developer Toolset collection is documented in the Red Hat Developer Toolset Release Notes and the Red Hat Developer Toolset User Guide.
# Table of Contents

## CHAPTER 1. RED HAT SOFTWARE COLLECTIONS 3.5

1.1. ABOUT RED HAT SOFTWARE COLLECTIONS ........................................ 4
  1.1.1. Red Hat Developer Toolset .................................................. 4
1.2. MAIN FEATURES .......................................................................... 4
1.3. CHANGES IN RED HAT SOFTWARE COLLECTIONS 3.5 .................. 16

1.6. DEPRECATED FUNCTIONALITY ................................................. 25

## CHAPTER 2. INSTALLATION ............................................................... 26

2.1. GETTING ACCESS TO RED HAT SOFTWARE COLLECTIONS ...... 26
  2.1.1. Using Red Hat Subscription Management .......................... 26
  2.1.2. Packages from the Optional Repository ............................... 27
2.2. INSTALLING RED HAT SOFTWARE COLLECTIONS ................. 29
  2.2.1. Installing Individual Software Collections .......................... 29
  2.2.2. Installing Optional Packages ............................................. 30
  2.2.3. Installing Debugging Information ....................................... 30
2.3. UNINSTALLING RED HAT SOFTWARE COLLECTIONS ............. 30
2.4. REBUILDING RED HAT SOFTWARE COLLECTIONS ................. 31

## CHAPTER 3. USAGE ......................................................................... 32

3.1. USING RED HAT SOFTWARE COLLECTIONS ............................... 32
  3.1.1. Running an Executable from a Software Collection ............... 32
  3.1.2. Running a Shell Session with a Software Collection as Default 32
  3.1.3. Running a System Service from a Software Collection ............ 33
    - Running a System Service from a Software Collection in Red Hat Enterprise Linux 6 33
    - Running a System Service from a Software Collection in Red Hat Enterprise Linux 7 33
  3.2. ACCESSING A MANUAL PAGE FROM A SOFTWARE COLLECTION 33
  3.3. DEPLOYING APPLICATIONS THAT USE RED HAT SOFTWARE COLLECTIONS 34
  3.4. RED HAT SOFTWARE COLLECTIONS CONTAINER IMAGES ........... 34

## CHAPTER 4. SPECIFICS OF INDIVIDUAL SOFTWARE COLLECTIONS ....... 37

4.1. RED HAT DEVELOPER TOOLSET .............................................. 37
4.2. MONGODB 3.6 ......................................................................... 37
4.3. MONGODB 3.4 ......................................................................... 38
  - MongoDB 3.4 on Red Hat Enterprise Linux 6 .......................... 38
  - MongoDB 3.4 on Red Hat Enterprise Linux 7 .......................... 38
4.4. MAVEN ..................................................................................... 39
CHAPTER 1. RED HAT SOFTWARE COLLECTIONS 3.5

This chapter serves as an overview of the Red Hat Software Collections 3.5 content set. It provides a list of components and their descriptions, sums up changes in this version, documents relevant compatibility information, and lists known issues.

1.1. ABOUT RED HAT SOFTWARE COLLECTIONS

For certain applications, more recent versions of some software components are often needed in order to use their latest new features. Red Hat Software Collections is a Red Hat offering that provides a set of dynamic programming languages, database servers, and various related packages that are either more recent than their equivalent versions included in the base Red Hat Enterprise Linux system, or are available for this system for the first time.

Red Hat Software Collections 3.5 is available for Red Hat Enterprise Linux 7; selected previously released components also for Red Hat Enterprise Linux 6. For a complete list of components that are distributed as part of Red Hat Software Collections and a brief summary of their features, see Section 1.2, “Main Features”.

Red Hat Software Collections does not replace the default system tools provided with Red Hat Enterprise Linux 6 or Red Hat Enterprise Linux 7. Instead, a parallel set of tools is installed in the /opt/ directory and can be optionally enabled per application by the user using the supplied scl utility. The default versions of Perl or PostgreSQL, for example, remain those provided by the base Red Hat Enterprise Linux system.

NOTE

In Red Hat Enterprise Linux 8, similar components are provided as Application Streams.

All Red Hat Software Collections components are fully supported under Red Hat Enterprise Linux Subscription Level Agreements, are functionally complete, and are intended for production use. Important bug fix and security errata are issued to Red Hat Software Collections subscribers in a similar manner to Red Hat Enterprise Linux for at least two years from the release of each major version. In each major release stream, each version of a selected component remains backward compatible. For detailed information about length of support for individual components, refer to the Red Hat Software Collections Product Life Cycle document.

1.1.1. Red Hat Developer Toolset

Red Hat Developer Toolset is a part of Red Hat Software Collections, included as a separate Software Collection. For more information about Red Hat Developer Toolset, refer to the Red Hat Developer Toolset Release Notes and the Red Hat Developer Toolset User Guide.

1.2. MAIN FEATURES

Table 1.1, “Red Hat Software Collections Components” lists components that are supported at the time of the Red Hat Software Collections 3.5 release.

Table 1.1. Red Hat Software Collections Components
<table>
<thead>
<tr>
<th>Component</th>
<th>Software Collection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red Hat Developer Toolset 9.1</td>
<td>devtoolset-9</td>
<td>Red Hat Developer Toolset is designed for developers working on the Red Hat Enterprise Linux platform. It provides current versions of the GNU Compiler Collection, GNU Debugger, and other development, debugging, and performance monitoring tools. For a complete list of components, see the Red Hat Developer Toolset Components table in the Red Hat Developer Toolset User Guide.</td>
</tr>
<tr>
<td>Perl 5.26.3[a]</td>
<td>rh-perl526</td>
<td>A release of Perl, a high-level programming language that is commonly used for system administration utilities and web programming. The rh-perl526 Software Collection provides additional utilities, scripts, and database connectors for MySQL and PostgreSQL. It includes the DateTime Perl module and the mod_perl Apache httpd module, which is supported only with the httpd24 Software Collection. Additionally, it provides the cpanm utility for easy installation of CPAN modules. The rh-perl526 packaging is aligned with upstream; theperl526-perl package installs also core modules, while the interpreter is provided by the perl-interpreter package.</td>
</tr>
<tr>
<td>Perl 5.30.1[a]</td>
<td>rh-perl530</td>
<td>A release of Perl, a high-level programming language that is commonly used for system administration utilities and web programming. The rh-perl530 Software Collection provides additional utilities, scripts, and database connectors for MySQL, PostgreSQL, and SQLite. It includes the DateTime Perl module and the mod_perl Apache httpd module, which is supported only with the httpd24 Software Collection. Additionally, it provides the cpanm utility for easy installation of CPAN modules, the LWP::UserAgent module for communicating with the HTTP servers, and the LWP::Protocol::https module for securing the communication. The rh-perl530 packaging is aligned with upstream; the perl530-perl package installs also core modules, while the interpreter is provided by the perl-interpreter package.</td>
</tr>
<tr>
<td>PHP 7.2.24[a]</td>
<td>rh-php72</td>
<td>A release of PHP 7.2 with PEAR 1.10.5, APCu 5.1.12, and enhanced language features.</td>
</tr>
<tr>
<td>PHP 7.3.11[a]</td>
<td>rh-php73</td>
<td>A release of PHP 7.3 with PEAR 1.10.9, APCu 5.1.17, and the Xdebug extension.</td>
</tr>
<tr>
<td>Component</td>
<td>Software Collection</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Python 2.7.17</td>
<td>python27</td>
<td>A release of Python 2.7 with a number of additional utilities. This Python version provides various features and enhancements, including an ordered dictionary type, faster I/O operations, and improved forward compatibility with Python 3. The python27 Software Collections contains the Python 2.7.13 interpreter, a set of extension libraries useful for programming web applications and mod_wsgi (only supported with the httpd24 Software Collection), MySQL and PostgreSQL database connectors, and numpy and scipy.</td>
</tr>
<tr>
<td>Python 3.6.9</td>
<td>rh-python36</td>
<td>The rh-python36 Software Collection contains Python 3.6.9, which introduces a number of new features, such as f-strings, syntax for variable annotations, and asynchronous generators and comprehensions. In addition, a set of extension libraries useful for programming web applications is included, with mod_wsgi (supported only together with the httpd24 Software Collection), PostgreSQL database connector, and numpy and scipy.</td>
</tr>
<tr>
<td>Python 3.8.0</td>
<td>rh-python38</td>
<td>The rh-python38 Software Collection contains Python 3.8, which introduces new Python modules, such as contextvars, dataclasses, or importlib.resources, new language features, improved developer experience, and performance improvements. In addition, a set of popular extension libraries is provided, including mod_wsgi (supported only together with the httpd24 Software Collection), numpy, scipy, and the psycopg2 PostgreSQL database connector.</td>
</tr>
<tr>
<td>Ruby 2.5.5</td>
<td>rh-ruby25</td>
<td>A release of Ruby 2.5. This version provides multiple performance improvements and new features, for example, simplified usage of blocks with the rescue else and ensure keywords, a new yield_self method, support for branch coverage and method coverage measurement, new Hash#slice and Hash#transform_keys methods. Ruby 2.5.0 maintains source-level backward compatibility with Ruby 2.4.</td>
</tr>
<tr>
<td>Ruby 2.6.2</td>
<td>rh-ruby26</td>
<td>A release of Ruby 2.6. This version provides multiple performance improvements and new features, such as endless ranges, the Binding#source_location method, and the $SAFE process global state. Ruby 2.6.0 maintains source-level backward compatibility with Ruby 2.5.</td>
</tr>
<tr>
<td>Ruby 2.7.1</td>
<td>rh-ruby27</td>
<td>A release of Ruby 2.7. This version provides multiple performance improvements and new features, such as Compaction GC or command-line interface for the LALR(1) parser generator, and an enhancement to REPL. Ruby 2.7 maintains source-level backward compatibility with Ruby 2.6.</td>
</tr>
<tr>
<td>Component</td>
<td>Software Collection</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MariaDB 10.2.22</td>
<td>rh-mariadb102</td>
<td>A release of MariaDB, an alternative to MySQL for users of Red Hat Enterprise Linux. For all practical purposes, MySQL is binary compatible with MariaDB and can be replaced with it without any data conversions. This version adds MariaDB Backup, Flashback, support for Recursive Common Table Expressions, window functions, and JSON functions.</td>
</tr>
<tr>
<td>MariaDB 10.3.13</td>
<td>rh-mariadb103</td>
<td>A release of MariaDB, an alternative to MySQL for users of Red Hat Enterprise Linux. For all practical purposes, MySQL is binary compatible with MariaDB and can be replaced with it without any data conversions. This version introduces system-versioned tables, invisible columns, a new instant <code>ADD COLUMN</code> operation for InnoDB, and a JDBC connector for MariaDB and MySQL.</td>
</tr>
<tr>
<td>MongoDB 3.4.9</td>
<td>rh-mongodb34</td>
<td>A release of MongoDB, a cross-platform document-oriented database system classified as a NoSQL database. This release introduces support for new architectures, adds message compression and support for the decimal128 type, enhances collation features and more.</td>
</tr>
<tr>
<td>MongoDB 3.6.3</td>
<td>rh-mongodb36</td>
<td>A release of MongoDB, a cross-platform document-oriented database system classified as a NoSQL database. This release introduces change streams, retryable writes, and JSON Schema, as well as other features.</td>
</tr>
<tr>
<td>MySQL 8.0.17</td>
<td>rh-mysql80</td>
<td>A release of the MySQL server, which introduces a number of new security and account management features and enhancements.</td>
</tr>
<tr>
<td>PostgreSQL 9.6.10</td>
<td>rh-postgresql96</td>
<td>A release of PostgreSQL, which introduces parallel execution of sequential scans, joins, and aggregates, and provides enhancements to synchronous replication, full-text search, deration driver, postgres_fdw, as well as performance improvements.</td>
</tr>
<tr>
<td>PostgreSQL 10.12</td>
<td>rh-postgresql10</td>
<td>A release of PostgreSQL, which includes a significant performance improvement and a number of new features, such as logical replication using the <code>publish</code> and <code>subscribe</code> keywords, or stronger password authentication based on the SCRAM-SHA-256 mechanism.</td>
</tr>
<tr>
<td>PostgreSQL 12.1</td>
<td>rh-postgresql12</td>
<td>A release of PostgreSQL, which provides the <code>pgaudit</code> extension, various enhancements to partitioning and parallelism, support for the SQL/JSON path language, and performance improvements.</td>
</tr>
<tr>
<td>Component</td>
<td>Software Collection</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Node.js 10.19.0[a]</td>
<td>rh-nodejs10</td>
<td>A release of Node.js, which provides multiple API enhancements and new features, including <em>V8 engine version 6.6, full N-API support</em>, and stability improvements.</td>
</tr>
<tr>
<td>Node.js 12.16.1[a]</td>
<td>rh-nodejs12</td>
<td>A release of Node.js, with <em>V8 engine version 7.6, support for ES6 modules</em>, and improved support for native modules.</td>
</tr>
<tr>
<td>nginx 1.14.1[a]</td>
<td>rh-nginx114</td>
<td>A release of nginx, a web and proxy server with a focus on high concurrency, performance, and low memory usage. This version provides a number of features, such as <em>mirror module, HTTP/2 server push, gRPC proxy module</em>, and numerous performance improvements.</td>
</tr>
<tr>
<td>nginx 1.16.1[a]</td>
<td>rh-nginx116</td>
<td>A release of nginx, a web and proxy server with a focus on high concurrency, performance, and low memory usage. This version introduces numerous <em>updates related to SSL, several new directives and parameters, and various enhancements</em>.</td>
</tr>
<tr>
<td>Apache httpd 2.4.34</td>
<td>httpd24</td>
<td>A release of the Apache HTTP Server (httpd), including a high performance <em>event-based processing model, enhanced SSL module and FastCGI support</em>. The <em>mod_auth_kerb, mod_auth_mellon</em>, and <em>ModSecurity</em> modules are also included.</td>
</tr>
<tr>
<td>Varnish Cache 5.2.1[a]</td>
<td>rh-varnish5</td>
<td>A release of Varnish Cache, a high-performance HTTP reverse proxy. This version includes the <em>shard director, experimental HTTP/2 support</em>, and improvements to Varnish configuration through separate VCL files and VCL labels.</td>
</tr>
<tr>
<td>Varnish Cache 6.0.6[a]</td>
<td>rh-varnish6</td>
<td>A release of Varnish Cache, a high-performance HTTP reverse proxy. This version includes <em>support for Unix Domain Sockets (both for clients and for back-end servers), new level of the VCL language (vcl 4.1), and improved HTTP/2 support</em>.</td>
</tr>
<tr>
<td>Maven 3.5.0[a]</td>
<td>rh-maven35</td>
<td>A release of Maven, a software project management and comprehension tool. This release introduces support for new architectures and a number of new features, including <em>colorized logging</em>.</td>
</tr>
<tr>
<td>Maven 3.6.1[a]</td>
<td>rh-maven36</td>
<td>A release of Maven, a software project management and comprehension tool. This release provides various enhancements and bug fixes.</td>
</tr>
</tbody>
</table>
Previously released Software Collections remain available in the same distribution channels. All Software Collections, including retired components, are listed in the Table 1.2, “All Available Software Collections”. Software Collections that are no longer supported are marked with an asterisk (*).

See the Red Hat Software Collections Product Life Cycle document for information on the length of support for individual components. For detailed information regarding previously released components, refer to the Release Notes for earlier versions of Red Hat Software Collections.

- **ppc64le** – IBM POWER, little endian
- *** –** Retired component; this Software Collection is no longer supported

The tables above list the latest versions available through asynchronous updates.
Note that Software Collections released in Red Hat Software Collections 2.0 and later include a rh-
prefix in their names.

Eclipse is available as a part of the Red Hat Developer Tools offering.

1.3. CHANGES IN RED HAT SOFTWARE COLLECTIONS 3.5

1.3.1. Overview

Architectures
The Red Hat Software Collections offering contains packages for Red Hat Enterprise Linux 7 running on
AMD64 and Intel 64 architectures; certain earlier Software Collections are available also for Red Hat
Enterprise Linux 6.

In addition, Red Hat Software Collections 3.5 supports the following architectures on Red Hat
Enterprise Linux 7:

- The 64-bit ARM architecture
- IBM Z
- IBM POWER, little endian

For a full list of components and their availability, see Table 1.2, “All Available Software Collections”.

New Software Collections
Red Hat Software Collections 3.5 adds the following new Software Collections:

- rh-perl530 – see Section 1.3.3, “Changes in Perl”
- rh-python38 – see Section 1.3.4, “Changes in Python”
- rh-ruby27 – see Section 1.3.5, “Changes in Ruby”

All new Software Collections are available only for Red Hat Enterprise Linux 7.

Updated Software Collections
The following components has been updated in Red Hat Software Collections 3.5:

- devtoolset-9 – see Section 1.3.2, “Changes in Red Hat Developer Toolset”
- httpd24 – see Section 1.3.6, “Changes in Apache httpd”
- rh-varnish6 – see Section 1.3.7, “Changes in Varnish Cache”
- rh-jmc – see Section 1.3.8, “Changes in JDK Mission Control”
- rh-haproxy18 – see Section 1.3.9, “Changes in HAProxy”

Red Hat Software Collections Container Images
The following container images are new in Red Hat Software Collections 3.5:

- rhscl/perl-530-rhel7
- rhscl/python-38-rhel7
• rhscl/ruby-27-rhel7

The following container image has been updated in Red Hat Software Collections 3.5
• rhscl/httpd-24-rhel7
• rhscl/varnish-6-rhel7
• rhscl/devtoolset-9-toolchain-rhel7
• rhscl/devtoolset-9-perftools-rhel7

For detailed information regarding Red Hat Software Collections container images, see Section 3.4, “Red Hat Software Collections Container Images”.

1.3.2. Changes in Red Hat Developer Toolset

The following component has been upgraded in Red Hat Developer Toolset 9.1 compared to the previous release of Red Hat Developer Toolset:

• GCC to version 9.3.1

In addition, bug fix updates are available for the following components:
• binutils
• elfutils
• ltrace
• make
• strace
• SystemTap

For detailed information on changes in 9.1, see the Red Hat Developer Toolset User Guide.

1.3.3. Changes in Perl

The new rh-perl530 Software Collection includes Perl 5.30.1, which provides a number of bug fixes and enhancements over the previously released rh-perl526 Software Collection. The new version also deprecates or removes certain language features.

Notable changes with significant impact include:
• The Math::BigInt::CalcEmu, arybase, and B::Debug modules have been removed
• File descriptors are now opened with a close-on-exec flag
• Opening the same symbol as a file and as a directory handle is no longer allowed
• Subroutine attributes now must precede subroutine signatures
• The :locked and :uniq attributes have been removed
• Comma-less variable lists in formats are no longer allowed
• A bare << here-document operator is no longer allowed
• Certain formerly deprecated uses of an unescaped left brace ({}) character in regular expression patterns are no longer permitted
• The AUTOLOAD() subroutine can no longer be inherited to non-method functions
• The sort pragma no longer allows specifying a sort algorithm
• The B::OP::terse() subroutine has been replaced by the B::Concise::b_terse() subroutine
• The File::Glob::glob() function has been replaced by the File::Glob::bsd_glob() function
• The dump() function now must be invoked fully qualified as CORE::dump()
• The yada-yada operator (...) is a statement now, it cannot be used as an expression
• Assigning a non-zero value to the $[ variable now returns a fatal error
• The $* and $# variables are no longer allowed
• Declaring variables using the my() function in a false condition branch is no longer allowed
• Using the sysread() and syswrite() functions on the :utf8 handles now returns a fatal error
• The pack() function no longer returns malformed UTF-8 format
• Unicode code points with a value greater than IV_MAX are no longer allowed
• Unicode 12.1 is now supported

In addition, the rh-perl530 Software Collection now provides the Library for WWW in Perl (LWP) and other HTTP-related modules in the rh-perl530-perl-libwww-perl and rh-perl530-perl-LWP-Protocol-https RPM packages.

For detailed changes between Perl 5.26 and Perl 5.30.1, see the upstream change log for versions 5.28.0, 5.30.0, and 5.30.1.

1.3.4. Changes in Python

The new rh-python38 Software Collection introduces Python 3.8.0. Notable enhancements compared to Python 3.6 include:

• New Python modules, for example, contextvars, dataclasses, or importlib.resources
• New language features, such as assignment expressions (the so-called walrus operator, :=) or positional-only parameters
• Improved developer experience with the breakpoint() built-in function, the = format string specification, and compatibility between debug and non-debug builds of Python and extension modules
• Performance improvements
• Improved support for optional static type hints
• An addition of the = specifier to formatted string literals (f-strings) for easier debugging
• Updated versions of packages, such as pip, requests, or Cython

For detailed changes, see the upstream documentation.

Note that similarly to the previously released Python Software Collections, the rh-python38 Software Collection does not include the same binary bindings to system tools (RPM, DNF, SELinux, and others) that are provided for the base RHEL 7 version of Python.

1.3.5. Changes in Ruby

The new rh-ruby27 Software Collection provides Ruby 2.7.1, which introduces a number of performance improvements, bug and security fixes, and new features.

Notable enhancements include:

• A new Compaction Garbage Collector (GC) has been introduced, which can defragment a fragmented memory space.

• A new rubygem-racc package has been added. Ruby yet Another Compiler-Compiler (Racc) now provides a command-line interface for the one-token Look-Ahead Left-to-Right – LALR(1) – parser generator.

• Interactive Ruby Shell (irb), the bundled Read–Eval–Print Loop (REPL) environment, now supports multi-line editing.

• Pattern matching, frequently used in functional programming languages, has been introduced as an experimental feature.

• Numbered parameter as the default block parameter has been introduced as an experimental feature.

The following performance improvements have been implemented:

• Fiber cache strategy has been changed to accelerate fiber creation.

• Performance of the CGI.escapeHTML method has been improved.

• Performance of the Monitor class and MonitorMixin module has been improved.

In addition, automatic conversion of keyword arguments and positional arguments has been deprecated. In Ruby 3.0, positional arguments and keyword arguments will be separated. For more information, see the upstream documentation.

To suppress warnings against experimental features, use the -W:no-experimental command-line option. To disable a deprecation warning, use the -W:no-deprecated command-line option or add Warning[:deprecated] = false to your code.

For more information about changes in Ruby 2.7, see the upstream announcement for versions 2.7.0 and 2.7.1.

1.3.6. Changes in Apache httpd

The mod_md module of the httpd24 Software Collection has been updated to version 2.0.8. This update adds a number of features, notably support for version 2 of the Automatic Certificate Management Environment (ACME) certificate issuance and management protocol, which is the Internet
Engineering Task Force (IETF) standard (RFC 8555). The original ACMEv1 protocol remains supported but is deprecated by popular service providers.

In addition, a security fix for CVE-2019-10098 in the mod_rewrite module is now available.

1.3.7. Changes in Varnish Cache

The rh-varnish6 Software Collection has been updated to version 6.0.6. This release includes numerous bug and security fixes and various minor enhancements.

For detailed changes in Varnish Cache 6.0.6 since the previous Red Hat Software Collections release, see the upstream change log for versions 6.0.3, 6.0.4, 6.0.5, and 6.0.6.

1.3.8. Changes in JDK Mission Control

JDK Mission Control, provided by the rh-jmc Software Collection, has been updated to version 7.1.1. This update includes numerous bug fixes and enhancements, including:

- Multiple rule optimizations
- A new JOverflow view based on Standard Widget Toolkit (SWT)
- A new flame graph view
- A new way of latency visualization using the High Dynamic Range (HDR) Histogram

1.3.9. Changes in HAProxy

The rh-haproxy18 Software Collection has been updated to version 1.8.24 to provide multiple bug and security fixes.

1.4. COMPATIBILITY INFORMATION

Red Hat Software Collections 3.5 is available for all supported releases of Red Hat Enterprise Linux 7 on AMD64 and Intel 64 architectures, the 64-bit ARM architecture, IBM Z, and IBM POWER, little endian.

Certain components are available also for all supported releases of Red Hat Enterprise Linux 6 on AMD64 and Intel 64 architectures.

For a full list of available components, see Table 1.2, "All Available Software Collections".

1.5. KNOWN ISSUES

**rh-ruby27 component, BZ#1836201**

When a custom script requires the Psych YAML parser and afterwards uses the Gem.load_yaml method, running the script fails with the following error message:

```
superclass mismatch for class Mark (TypeError)
```

To work around this problem, add the gem 'psych' line to the script somewhere above the require 'psych' line:

```
...
```
multiple components, BZ#1716378

Certain files provided by the Software Collections debuginfo packages might conflict with the corresponding debuginfo package files from the base Red Hat Enterprise Linux system or from other versions of Red Hat Software Collections components. For example, the python27-python-debuginfo package files might conflict with the corresponding files from the python-debuginfo package installed on the core system. Similarly, files from the httpd24-mod_auth_mellon-debuginfo package might conflict with similar files provided by the base system mod_auth_mellon-debuginfo package. To work around this problem, uninstall the base system debuginfo package prior to installing the Software Collection debuginfo package.

rh-mysql80 component, BZ#1646363

The mysql-connector-java database connector does not work with the MySQL 8.0 server. To work around this problem, use the mariadb-java-client database connector from the rh-mariadb103 Software Collection.

rh-mysql80 component, BZ#1646158

The default character set has been changed to utf8mb4 in MySQL 8.0 but this character set is unsupported by the php-mysqlnd database connector. Consequently, php-mysqlnd fails to connect in the default configuration. To work around this problem, specify a known character set as a parameter of the MySQL server configuration. For example, modify the /etc/opt/rh/rh-mysql80/my.cnf.d/mysql-server.cnf file to read:

```
[mysqld]
character-set-server=utf8
```

httpd24 component, BZ#1429006

Since httpd 2.4.27, the mod_http2 module is no longer supported with the default prefork Multi-Processing Module (MPM). To enable HTTP/2 support, edit the configuration file at /opt/rh/httpd24/root/etc/httpd/conf.modules.d/00-mpm.conf and switch to the event or worker MPM.

Note that the HTTP/2 server-push feature does not work on the 64-bit ARM architecture, IBM Z, and IBM POWER, little endian.

httpd24 component, BZ#1327548

The mod_ssl module does not support the ALPN protocol on Red Hat Enterprise Linux 6, or on Red Hat Enterprise Linux 7.3 and earlier. Consequently, clients that support upgrading TLS connections to HTTP/2 only using ALPN are limited to HTTP/1.1 support.

httpd24 component, BZ#1224763

When using the mod_proxy_fcgi module with FastCGI Process Manager (PHP-FPM), httpd uses port 8000 for the FastCGI protocol by default instead of the correct port 9000. To work around this problem, specify the correct port explicitly in configuration.

httpd24 component, BZ#1382706

When SELinux is enabled, the LD_LIBRARY_PATH environment variable is not passed through to
CGI scripts invoked by httpd. As a consequence, in some cases it is impossible to invoke executables from Software Collections enabled in the /opt/rh/httpd24/service-environment file from CGI scripts run by httpd. To work around this problem, set LD_LIBRARY_PATH as desired from within the CGI script.

httpd24 component

Compiling external applications against the Apache Portable Runtime (APR) and APR-util libraries from the httpd24 Software Collection is not supported. The LD_LIBRARY_PATH environment variable is not set in httpd24 because it is not required by any application in this Software Collection.

rh-python35, rh-python36 components, BZ#1499990

The pytz module, which is used by Babel for time zone support, is not included in the rh-python35, and rh-python36 Software Collections. Consequently, when the user tries to import the dates module from Babel, a traceback is returned. To work around this problem, install pytz through the pip package manager from the pypi public repository by using the pip install pytz command.

rh-python36 component

Certain complex trigonometric functions provided by numpy might return incorrect values on the 64-bit ARM architecture, IBM Z, and IBM POWER, little endian. The AMD64 and Intel 64 architectures are not affected by this problem.

python27 component, BZ#1330489

The python27-python-pymongo package has been updated to version 3.2.1. Note that this version is not fully compatible with the previously shipped version 2.5.2. For details, see https://api.mongodb.org/python/current/changelog.html.

scl-utils component

In Red Hat Enterprise Linux 7.5 and earlier, due to an architecture-specific macro bug in the scl-utils package, the <collection>/root/usr/lib64/ directory does not have the correct package ownership on the 64-bit ARM architecture and on IBM POWER, little endian. As a consequence, this directory is not removed when a Software Collection is uninstalled. To work around this problem, manually delete <collection>/root/usr/lib64/ when removing a Software Collection.

maven component

When the user has installed both the Red Hat Enterprise Linux system version of maven-local package and the rh-maven*-maven-local package, XMvn, a tool used for building Java RPM packages, run from the Maven Software Collection tries to read the configuration file from the base system and fails. To work around this problem, uninstall the maven-local package from the base Red Hat Enterprise Linux system.

perl component

It is impossible to install more than one mod_perl.so library. As a consequence, it is not possible to use the mod_perl module from more than one Perl Software Collection.

postgresql component

The rh-postgresql9* packages for Red Hat Enterprise Linux 6 do not provide the sepgsql module as this feature requires installation of libselinux version 2.0.99, which is not available in Red Hat Enterprise Linux 6.
When uninstalling the httpd24, rh-mariadb*, rh-mongodb*, rh-mysql*, rh-nodejs*, rh-perl*, rh-php*, python27, rh-python*, rh-ruby*, or rh-ror* packages, the order of uninstalling can be relevant due to ownership of dependent packages. As a consequence, some directories and files might not be removed properly and might remain on the system.

mariadb, mysql components, BZ#1194611

Since MariaDB 10 and MySQL 5.6, the rh-mariadb*-mariadb-server and rh-mysql*-mysql-server packages no longer provide the test database by default. Although this database is not created during initialization, the grant tables are prefilled with the same values as when test was created by default. As a consequence, upon a later creation of the test or test_* databases, these databases have less restricted access rights than is default for new databases.

Additionally, when running benchmarks, the run-all-tests script no longer works out of the box with example parameters. You need to create a test database before running the tests and specify the database name in the --database parameter. If the parameter is not specified, test is taken by default but you need to make sure the test database exist.

mariadb, mysql, postgresql, mongodb components

Red Hat Software Collections contains the MySQL 5.7, MySQL 8.0, MariaDB 10.2, MariaDB 10.3, PostgreSQL 9.6, PostgreSQL 10, PostgreSQL 12, MongoDB 3.4, and MongoDB 3.6 databases. The core Red Hat Enterprise Linux 6 provides earlier versions of the MySQL and PostgreSQL databases (client library and daemon). The core Red Hat Enterprise Linux 7 provides earlier versions of the MariaDB and PostgreSQL databases (client library and daemon). Client libraries are also used in database connectors for dynamic languages, libraries, and so on.

The client library packaged in the Red Hat Software Collections database packages in the PostgreSQL component is not supposed to be used, as it is included only for purposes of server utilities and the daemon. Users are instead expected to use the system library and the database connectors provided with the core system.

A protocol, which is used between the client library and the daemon, is stable across database versions, so, for example, using the PostgreSQL 9.2 client library with the PostgreSQL 9.4 or 9.5 daemon works as expected.

The core Red Hat Enterprise Linux 6 and Red Hat Enterprise Linux 7 do not include the client library for MongoDB. In order to use this client library for your application, you should use the client library from Red Hat Software Collections and always use the scl enable ... call every time you run an application linked against this MongoDB client library.

mariadb, mysql, mongodb components

MariaDB, MySQL, and MongoDB do not make use of the /opt/provider/collection/root prefix when creating log files. Note that log files are saved in the /var/opt/provider/collection/log/ directory, not in /opt/provider/collection/root/var/log/.

Other Notes

rh-ruby*, rh-python*, rh-php* components

Using Software Collections on a read-only NFS has several limitations.

- Ruby gems cannot be installed while the rh-ruby* Software Collection is on a read-only NFS. Consequently, for example, when the user tries to install the ab gem using the gem install ab command, an error message is displayed, for example:
The same problem occurs when the user tries to update or install gems from an external source by running the **bundle update** or **bundle install** commands.

- When installing Python packages on a read-only NFS using the Python Package Index (PyPI), running the **pip** command fails with an error message similar to this:

  ```bash
  Read-only file system: '/opt/rh/rh-python34/root/usr/lib/python3.4/site-packages/ipython-3.1.0.dist-info'
  ```

- Installing packages from PHP Extension and Application Repository (PEAR) on a read-only NFS using the **pear** command fails with the error message:

  ```bash
  Cannot install, php_dir for channel "pear.php.net" is not writeable by the current user
  ```

This is an expected behavior.

**httpd component**

Language modules for Apache are supported only with the Red Hat Software Collections version of **Apache httpd** and not with the Red Hat Enterprise Linux system versions of **httpd**. For example, the **mod_wsgi** module from the rh-python35 Collection can be used only with the httpd24 Collection.

**all components**

Since Red Hat Software Collections 2.0, configuration files, variable data, and runtime data of individual Collections are stored in different directories than in previous versions of Red Hat Software Collections.

**coreutils, util-linux, screen components**

Some utilities, for example, **su**, **login**, or **screen**, do not export environment settings in all cases, which can lead to unexpected results. It is therefore recommended to use **sudo** instead of **su** and set the **env_keep** environment variable in the **/etc/sudoers** file. Alternatively, you can run commands in a reverse order; for example:

```bash
su -l postgres -c "scl enable rh-postgresql94 psql"
```

instead of

```bash
scl enable rh-postgresql94 bash
su -l postgres -c psql
```

When using tools like **screen** or **login**, you can use the following command to preserve the environment settings:

```bash
source /opt/rh/<collection_name>/enable
```

**python component**

When the user tries to install more than one scldevel package from the python27 and rh-python* Software Collections, a transaction check error message is returned. This is an expected behavior because the user can install only one set of the macro files provided by the packages (**%scl_python**, **%scl_python27**, **%scl_python35**).
When the user tries to install more than one `scldevel` package from the `rh-php*` Software Collections, a transaction check error message is returned. This is an expected behavior because the user can install only one set of the macro files provided by the packages (`%scl_php`, `%scl_prefix_php`).

When the user tries to install more than one `scldevel` package from the `rh-ruby*` Software Collections, a transaction check error message is returned. This is an expected behavior because the user can install only one set of the macro files provided by the packages (`%scl_ruby`, `%scl_prefix_ruby`).

When the user tries to install more than one `scldevel` package from the `rh-perl*` Software Collections, a transaction check error message is returned. This is an expected behavior because the user can install only one set of the macro files provided by the packages (`%scl_perl`, `%scl_prefix_perl`).

When the user tries to install more than one `scldevel` package from the `rh-nginx*` Software Collections, a transaction check error message is returned. This is an expected behavior because the user can install only one set of the macro files provided by the packages (`%scl_nginx`, `%scl_prefix_nginx`).

### 1.6. DEPRECATED FUNCTIONALITY

**httpd24 component, BZ#1434053**

Previously, in an SSL/TLS configuration requiring name-based SSL virtual host selection, the `mod_ssl` module rejected requests with a **400 Bad Request** error, if the host name provided in the `Host:` header did not match the host name provided in a Server Name Indication (SNI) header. Such requests are no longer rejected if the configured SSL/TLS security parameters are identical between the selected virtual hosts, in-line with the behavior of upstream `mod_ssl`. 
CHAPTER 2. INSTALLATION

This chapter describes in detail how to get access to the content set, install Red Hat Software Collections 3.5 on the system, and rebuild Red Hat Software Collections.

2.1. GETTING ACCESS TO RED HAT SOFTWARE COLLECTIONS

The Red Hat Software Collections content set is available to customers with Red Hat Enterprise Linux 6 and Red Hat Enterprise Linux 7 subscriptions listed at https://access.redhat.com/solutions/472793. For information on how to register your system with Red Hat Subscription Management (RHSM), see Using and Configuring Red Hat Subscription Manager. For detailed instructions on how to enable Red Hat Software Collections using RHSM, see Section 2.1.1, “Using Red Hat Subscription Management”.

Since Red Hat Software Collections 2.2, the Red Hat Software Collections and Red Hat Developer Toolset content is available also in the ISO format at https://access.redhat.com/downloads, specifically for Server and Workstation. Note that packages that require the Optional repository, which are listed in Section 2.1.2, “Packages from the Optional Repository”, cannot be installed from the ISO image.

NOTE

Packages that require the Optional repository cannot be installed from the ISO image. A list of packages that require enabling of the Optional repository is provided in Section 2.1.2, “Packages from the Optional Repository”.

Beta content is unavailable in the ISO format.

2.1.1. Using Red Hat Subscription Management

If your system is registered with Red Hat Subscription Management, complete the following steps to attach the subscription that provides access to the repository for Red Hat Software Collections and enable the repository:

1. Display a list of all subscriptions that are available for your system and determine the pool ID of a subscription that provides Red Hat Software Collections. To do so, type the following at a shell prompt as root:

   subscription-manager list --available

   For each available subscription, this command displays its name, unique identifier, expiration date, and other details related to it. The pool ID is listed on a line beginning with Pool Id.

2. Attach the appropriate subscription to your system by running the following command as root:

   subscription-manager attach --pool=pool_id

   Replace pool_id with the pool ID you determined in the previous step. To verify the list of subscriptions your system has currently attached, type as root:

   subscription-manager list --consumed

3. Display the list of available Yum list repositories to retrieve repository metadata and determine the exact name of the Red Hat Software Collections repositories. As root, type:
subscription-manager repos --list

Or alternatively, run `yum repolist all` for a brief list.

The repository names depend on the specific version of Red Hat Enterprise Linux you are using and are in the following format:

```
rhel-variant-rhscl-6-rpms
rhel-variant-rhscl-6-debug-rpms
rhel-variant-rhscl-6-source-rpms
rhel-server-rhscl-6-eus-rpms
rhel-server-rhscl-6-eus-source-rpms
rhel-server-rhscl-6-eus-debug-rpms
rhel-variant-rhscl-7-rpms
rhel-variant-rhscl-7-debug-rpms
rhel-variant-rhscl-7-source-rpms
rhel-server-rhscl-7-eus-rpms
rhel-server-rhscl-7-eus-source-rpms
rhel-server-rhscl-7-eus-debug-rpms>
```

Replace `variant` with the Red Hat Enterprise Linux system variant, that is, `server` or `workstation`. Note that Red Hat Software Collections is supported neither on the `Client` nor on the `ComputeNode` variant.

4. Enable the appropriate repository by running the following command as `root`:

```
subscription-manager repos --enable repository
```

Once the subscription is attached to the system, you can install Red Hat Software Collections as described in Section 2.2, “Installing Red Hat Software Collections”. For more information on how to register your system using Red Hat Subscription Management and associate it with subscriptions, see Using and Configuring Red Hat Subscription Manager.

**NOTE**

Subscription through RHN is no longer available. For information how to migrate to RHSM, see [https://access.redhat.com/products/red-hat-subscription-management/#migration](https://access.redhat.com/products/red-hat-subscription-management/#migration).

### 2.1.2. Packages from the Optional Repository

Some of the Red Hat Software Collections packages require the **Optional** repository to be enabled in order to complete the full installation of these packages. For detailed instructions on how to subscribe your system to this repository, see the relevant Knowledgebase article at [https://access.redhat.com/solutions/392003](https://access.redhat.com/solutions/392003).

Packages from Software Collections for Red Hat Enterprise Linux that require the **Optional** repository to be enabled are listed in the tables below. Note that packages from the **Optional** repository are unsupported. For details, see the Knowledgebase article at [https://access.redhat.com/articles/1150793](https://access.redhat.com/articles/1150793).

**Table 2.1. Packages That Require Enabling of the Optional Repository in Red Hat Enterprise Linux 7**
<table>
<thead>
<tr>
<th>Package from a Software Collection</th>

Table 2.2. Packages That Require Enabling of the Optional Repository in Red Hat Enterprise Linux 6
## Package from a Software Collection | Required Package from the Optional Repository
--- | ---
devtoolset-8-build | scl-utils-build
devtoolset-8-dyninst-testsuite | glibc-static
devtoolset-8-elfutils-devel | xz-devel
devtoolset-8-gcc-plugin-devel | gmp-devel, mpfr-devel
devtoolset-8-libatomic-devel | libatomic
devtoolset-8-libgccjit | mpfr
rh-mariadb102-mariadb-bench | perl-GD
rh-mongodb34-boost-devel | libr-c-devel
rh-python36-python-devel | scl-utils-build

### 2.2. INSTALLING RED HAT SOFTWARE COLLECTIONS

Red Hat Software Collections is distributed as a collection of RPM packages that can be installed, updated, and uninstalled by using the standard package management tools included in Red Hat Enterprise Linux. Note that a valid subscription is required to install Red Hat Software Collections on your system. For detailed instructions on how to associate your system with an appropriate subscription and get access to Red Hat Software Collections, see Section 2.1, “Getting Access to Red Hat Software Collections”.

Use of Red Hat Software Collections 3.5 requires the removal of any earlier pre-release versions. If you have installed any previous version of Red Hat Software Collections 2.1 component, uninstall it from your system and install the new version as described in the Section 2.3, “Uninstalling Red Hat Software Collections” and Section 2.2.1, “Installing Individual Software Collections” sections.

The in-place upgrade from Red Hat Enterprise Linux 6 to Red Hat Enterprise Linux 7 is not supported by Red Hat Software Collections. As a consequence, the installed Software Collections might not work correctly after the upgrade. If you want to upgrade from Red Hat Enterprise Linux 6 to Red Hat Enterprise Linux 7, it is strongly recommended to remove all Red Hat Software Collections packages, perform the in-place upgrade, update the Red Hat Software Collections repository, and install the Software Collections packages again. It is advisable to back up all data before upgrading.

#### 2.2.1. Installing Individual Software Collections

To install any of the Software Collections that are listed in Table 1.1, “Red Hat Software Collections Components”, install the corresponding meta package by typing the following at a shell prompt as `root`:

```
yum install software_collection...
```
Replace `software_collection` with a space-separated list of Software Collections you want to install. For example, to install php54 and rh-mariadb100, type as `root`:

```
~]# yum install rh-php72 rh-mariadb102
```

This installs the main meta package for the selected Software Collection and a set of required packages as its dependencies. For information on how to install additional packages such as additional modules, see Section 2.2.2, “Installing Optional Packages”.

### 2.2.2. Installing Optional Packages

Each component of Red Hat Software Collections is distributed with a number of optional packages that are not installed by default. To list all packages that are part of a certain Software Collection but are not installed on your system, type the following at a shell prompt:

```
yum list available software_collection-
```

To install any of these optional packages, type as `root`:

```
yum install package_name...
```

Replace `package_name` with a space-separated list of packages that you want to install. For example, to install the rh-perl526-perl-CPAN and rh-perl526-perl-Archive-Tar, type:

```
~]# yum install rh-perl526-perl-CPAN rh-perl526-perl-Archive-Tar
```

### 2.2.3. Installing Debugging Information

To install debugging information for any of the Red Hat Software Collections packages, make sure that the `yum-utils` package is installed and type the following command as `root`:

```
debuginfo-install package_name
```

For example, to install debugging information for the rh-ruby25-ruby package, type:

```
~]# debuginfo-install rh-ruby25-ruby
```

Note that you need to have access to the repository with these packages. If your system is registered with Red Hat Subscription Management, enable the `rhel-variant-rhscl-6-debug-rpms` or `rhel-variant-rhscl-7-debug-rpms` repository as described in Section 2.1.1, “Using Red Hat Subscription Management”. For more information on how to get access to debuginfo packages, see https://access.redhat.com/solutions/9907.

### 2.3. UNINSTALLING RED HAT SOFTWARE COLLECTIONS

To uninstall any of the Software Collections components, type the following at a shell prompt as `root`:

```
yum remove software_collection-
```

Replace `software_collection` with the Software Collection component you want to uninstall.
Note that uninstallation of the packages provided by Red Hat Software Collections does not affect the Red Hat Enterprise Linux system versions of these tools.

2.4. REBUILDING RED HAT SOFTWARE COLLECTIONS

<collection>-build packages are not provided by default. If you wish to rebuild a collection and do not want or cannot use the `rpmbuild --define 'scl foo'` command, you first need to rebuild the metapackage, which provides the <collection>-build package.

Note that existing collections should not be rebuilt with different content. To add new packages into an existing collection, you need to create a new collection containing the new packages and make it dependent on packages from the original collection. The original collection has to be used without changes.

For detailed information on building Software Collections, refer to the Red Hat Software Collections Packaging Guide.
CHAPTER 3. USAGE

This chapter describes the necessary steps for using Red Hat Software Collections 3.5, and deploying applications that use Red Hat Software Collections.

3.1. USING RED HAT SOFTWARE COLLECTIONS

3.1.1. Running an Executable from a Software Collection

To run an executable from a particular Software Collection, type the following command at a shell prompt:

```
scl enable software_collection... 'command...'
```

Or, alternatively, use the following command:

```
scl enable software_collection... -- command...
```

Replace `software_collection` with a space-separated list of Software Collections you want to use and `command` with the command you want to run. For example, to execute a Perl program stored in a file named `hello.pl` with the Perl interpreter from the `perl526` Software Collection, type:

```
~]$ scl enable rh-perl526 'perl hello.pl'
Hello, World!
```

You can execute any command using the `scl` utility, causing it to be run with the executables from a selected Software Collection in preference to their possible Red Hat Enterprise Linux system equivalents. For a complete list of Software Collections that are distributed with Red Hat Software Collections, see Table 1.1, “Red Hat Software Collections Components”.

3.1.2. Running a Shell Session with a Software Collection as Default

To start a new shell session with executables from a selected Software Collection in preference to their Red Hat Enterprise Linux equivalents, type the following at a shell prompt:

```
scl enable software_collection... bash
```

Replace `software_collection` with a space-separated list of Software Collections you want to use. For example, to start a new shell session with the `python27` and `rh-postgresql10` Software Collections as default, type:

```
~]$ scl enable python27 rh-postgresql10 bash
```

The list of Software Collections that are enabled in the current session is stored in the `$X_SCLS` environment variable, for instance:

```
~]$ echo $X_SCLS
python27 rh-postgresql10
```

For a complete list of Software Collections that are distributed with Red Hat Software Collections, see Table 1.1, “Red Hat Software Collections Components”.

3.5 Release Notes
3.1.3. Running a System Service from a Software Collection

Running a System Service from a Software Collection in Red Hat Enterprise Linux 6
Software Collections that include system services install corresponding init scripts in the `/etc/rc.d/init.d/` directory. To start such a service in the current session, type the following at a shell prompt as `root`:

```
  service software_collection-service_name start
```

Replace `software_collection` with the name of the Software Collection and `service_name` with the name of the service you want to start.

To configure this service to start automatically at boot time, type the following command as `root`:

```
  chkconfig software_collection-service_name on
```

For example, to start the `postgresql` service from the `rh-postgresql96` Software Collection and enable it in runlevels 2, 3, 4, and 5, type as `root`:

```
  -]# service rh-postgresql96-postgresql start
  Starting rh-postgresql96-postgresql service: [ OK ]
  -]# chkconfig rh-postgresql96-postgresql on
```

For more information on how to manage system services in Red Hat Enterprise Linux 6, refer to the `Red Hat Enterprise Linux 6 Deployment Guide`. For a complete list of Software Collections that are distributed with Red Hat Software Collections, see `Table 1.1, “Red Hat Software Collections Components”`.

Running a System Service from a Software Collection in Red Hat Enterprise Linux 7
In Red Hat Enterprise Linux 7, init scripts have been replaced by `systemd` service unit files, which end with the `.service` file extension and serve a similar purpose as init scripts. To start a service in the current session, execute the following command as `root`:

```
  systemctl start software_collection-service_name.service
```

Replace `software_collection` with the name of the Software Collection and `service_name` with the name of the service you want to start.

To configure this service to start automatically at boot time, type the following command as `root`:

```
  systemctl enable software_collection-service_name.service
```

For example, to start the `postgresql` service from the `rh-postgresql10` Software Collection and enable it at boot time, type as `root`:

```
  -]# systemctl start rh-postgresql10-postgresql.service
  -]# systemctl enable rh-postgresql10-postgresql.service
```

For more information on how to manage system services in Red Hat Enterprise Linux 7, refer to the `Red Hat Enterprise Linux 7 System Administrator’s Guide`. For a complete list of Software Collections that are distributed with Red Hat Software Collections, see `Table 1.1, “Red Hat Software Collections Components”`.

3.2. ACCESSING A MANUAL PAGE FROM A SOFTWARE COLLECTION
Every Software Collection contains a general manual page that describes the content of this component. Each manual page has the same name as the component and it is located in the /opt/rh directory.

To read a manual page for a Software Collection, type the following command:

```
scl enable software_collection 'man software_collection'
```

Replace `software_collection` with the particular Red Hat Software Collections component. For example, to display the manual page for `rh-mariadb102`, type:

```
~]$ scl enable rh-mariadb102 "man rh-mariadb102"
```

### 3.3. DEPLOYING APPLICATIONS THAT USE RED HAT SOFTWARE COLLECTIONS

In general, you can use one of the following two approaches to deploy an application that depends on a component from Red Hat Software Collections in production:

- Install all required Software Collections and packages manually and then deploy your application, or
- Create a new Software Collection for your application and specify all required Software Collections and other packages as dependencies.

For more information on how to manually install individual Red Hat Software Collections components, see Section 2.2, “Installing Red Hat Software Collections”. For further details on how to use Red Hat Software Collections, see Section 3.1, “Using Red Hat Software Collections”. For a detailed explanation of how to create a custom Software Collection or extend an existing one, read the Red Hat Software Collections Packaging Guide.

### 3.4. RED HAT SOFTWARE COLLECTIONS CONTAINER IMAGES

Container images based on Red Hat Software Collections include applications, daemons, and databases. The images can be run on Red Hat Enterprise Linux 7 Server and Red Hat Enterprise Linux Atomic Host. For information about their usage, see Using Red Hat Software Collections 3 Container Images. For details regarding container images based on Red Hat Software Collections versions 2.4 and earlier, see Using Red Hat Software Collections 2 Container Images.

The following container images are available with Red Hat Software Collections 3.5:

- `rhscl/perl-530-rhel7`
- `rhscl/python-38-rhel7`
- `rhscl/ruby-26-rhel7`
- `rhscl/httpd-24-rhel7`
- `rhscl/varnish-6-rhel7`
- `rhscl/devtoolset-9-toolchain-rhel7`
- `rhscl/devtoolset-9-perftools-rhel7`
The following container images are based on Red Hat Software Collections 3.4:

- rhscl/nodejs-12-rhel7
- rhscl/php-73-rhel7
- rhscl/nginx-116-rhel7
- rhscl/postgresql-12-rhel7

The following container images are based on Red Hat Software Collections 3.3:

- rhscl/mariadb-103-rhel7
- rhscl/redis-5-rhel7
- rhscl/ruby-26-rhel7
- rhscl/devtoolset-8-toolchain-rhel7
- rhscl/devtoolset-8-perftools-rhel7

The following container images are based on Red Hat Software Collections 3.2:

- rhscl/mysql-80-rhel7
- rhscl/nginx-114-rhel7
- rhscl/php-72-rhel7
- rhscl/nodejs-10-rhel7

The following container images are based on Red Hat Software Collections 3.1:

- rhscl/mongodb-36-rhel7
- rhscl/perl-526-rhel7
- rhscl/postgresql-10-rhel7
- rhscl/ruby-25-rhel7
- rhscl/varnish-5-rhel7

The following container images are based on Red Hat Software Collections 3.0:

- rhscl/mariadb-102-rhel7
- rhscl/mongodb-34-rhel7
- rhscl/postgresql-96-rhel7
- rhscl/python-36-rhel7

The following container images are based on Red Hat Software Collections 2:

- rhscl/python-27-rhel7
- rhscl/s2i-base-rhel7
CHAPTER 4. SPECIFICS OF INDIVIDUAL SOFTWARE COLLECTIONS

This chapter is focused on the specifics of certain Software Collections and provides additional details concerning these components.

4.1. RED HAT DEVELOPER TOOLSET

Red Hat Developer Toolset is designed for developers working on the Red Hat Enterprise Linux platform. Red Hat Developer Toolset provides current versions of the GNU Compiler Collection, GNU Debugger, and other development, debugging, and performance monitoring tools. Similarly to other Software Collections, an additional set of tools is installed into the /opt/ directory. These tools are enabled by the user on demand using the supplied scl utility. Similarly to other Software Collections, these do not replace the Red Hat Enterprise Linux system versions of these tools, nor will they be used in preference to those system versions unless explicitly invoked using the scl utility.

For an overview of features, refer to the Features section of the Red Hat Developer Toolset Release Notes. For detailed information regarding usage and changes in 9.1, see the Red Hat Developer Toolset User Guide.

4.2. MONGODB 3.6

The rh-mongodb36 Software Collection is available only for Red Hat Enterprise Linux 7. See Section 4.3, “MongoDB 3.4” for instructions on how to use MongoDB 3.4 on Red Hat Enterprise Linux 6.

To install the rh-mongodb36 collection, type the following command as root:

```
yum install rh-mongodb36
```

To run the MongoDB shell utility, type the following command:

```
scl enable rh-mongodb36 'mongo'
```

NOTE

The rh-mongodb36-mongo-cxx-driver package has been built with the -std=gnu++14 option using GCC from Red Hat Developer Toolset 6. Binaries using the shared library for the MongoDB C++ Driver that use C++11 (or later) features have to be built also with Red Hat Developer Toolset 6 or later. See C++ compatibility details in the Red Hat Developer Toolset 6 User Guide.

To start the MongoDB daemon, type the following command as root:

```
systemctl start rh-mongodb36-mongod.service
```

To start the MongoDB daemon on boot, type this command as root:

```
systemctl enable rh-mongodb36-mongod.service
```

To start the MongoDB sharding server, type the following command as root:

```
systemctl start rh-mongodb36-shardedcluster.service
```
systemctl start rh-mongodb36-mongos.service

To start the MongoDB sharding server on boot, type this command as `root`:

systemctl enable rh-mongodb36-mongos.service

Note that the MongoDB sharding server does not work unless the user starts at least one configuration server and specifies it in the `mongos.conf` file.

4.3. MONGODB 3.4

To install the rh-mongodb34 collection, type the following command as `root`:

`yum install rh-mongodb34`

To run the MongoDB shell utility, type the following command:

`scl enable rh-mongodb34 'mongo'

NOTE

The rh-mongodb34-mongo-cxx-driver package has been built with the `-std=gnu++14` option using GCC from Red Hat Developer Toolset 6. Binaries using the shared library for the MongoDB C++ Driver that use C++11 (or later) features have to be built also with Red Hat Developer Toolset 6. See C++ compatibility details in the Red Hat Developer Toolset 6 User Guide.

MongoDB 3.4 on Red Hat Enterprise Linux 6

If you are using Red Hat Enterprise Linux 6, the following instructions apply to your system.

To start the MongoDB daemon, type the following command as `root`:

`service rh-mongodb34-mongod start`

To start the MongoDB daemon on boot, type this command as `root`:

`chkconfig rh-mongodb34-mongod on`

To start the MongoDB sharding server, type this command as `root`:

`service rh-mongodb34-mongos start`

To start the MongoDB sharding server on boot, type the following command as `root`:

`chkconfig rh-mongodb34-mongos on`

Note that the MongoDB sharding server does not work unless the user starts at least one configuration server and specifies it in the `mongos.conf` file.

MongoDB 3.4 on Red Hat Enterprise Linux 7

When using Red Hat Enterprise Linux 7, the following commands are applicable.
To start the MongoDB daemon, type the following command as `root`:

```
systemctl start rh-mongodb34-mongod.service
```

To start the MongoDB daemon on boot, type this command as `root`:

```
systemctl enable rh-mongodb34-mongod.service
```

To start the MongoDB sharding server, type the following command as `root`:

```
systemctl start rh-mongodb34-mongos.service
```

To start the MongoDB sharding server on boot, type this command as `root`:

```
systemctl enable rh-mongodb34-mongos.service
```

Note that the MongoDB sharding server does not work unless the user starts at least one configuration server and specifies it in the `mongos.conf` file.

4.4. MAVEN

The rh-maven36 Software Collection, available only for Red Hat Enterprise Linux 7, provides a software project management and comprehension tool. Based on the concept of a project object model (POM), Maven can manage a project's build, reporting, and documentation from a central piece of information.

To install the rh-maven36 Collection, type the following command as `root`:

```
yum install rh-maven36
```

To enable this collection, type the following command at a shell prompt:

```
scl enable rh-maven36 bash
```

Global Maven settings, such as remote repositories or mirrors, can be customized by editing the `/opt/rh/rh-maven36/root/etc/maven/settings.xml` file.

For more information about using Maven, refer to the [Maven documentation](#). Usage of plug-ins is described in [this section](#); to find documentation regarding individual plug-ins, see the [index of plug-ins](#).

4.5. DATABASE CONNECTORS

Database connector packages provide the database client functionality, which is necessary for local or remote connection to a database server. Table 4.1, “Interoperability Between Languages and Databases” lists Software Collections with language runtimes that include connectors for certain database servers.

Table 4.1. Interoperability Between Languages and Databases
<table>

CHAPTER 5. MIGRATION

This chapter provides information on migrating to versions of components included in Red Hat Software Collections 3.5.

5.1. MIGRATING TO MARIADB 10.3

The rh-mariadb103 Software Collection is available for Red Hat Enterprise Linux 7, which includes MariaDB 5.5 as the default MySQL implementation.

The rh-mariadb103 Software Collection does not conflict with the mysql or mariadb packages from the core systems. Unless the *-syspaths packages are installed (see below), it is possible to install the rh-mariadb103 Software Collection together with the mysql or mariadb packages. It is also possible to run both versions at the same time, however, the port number and the socket in the my.cnf files need to be changed to prevent these specific resources from conflicting. Additionally, it is possible to install the rh-mariadb103 Software Collection while the rh-mariadb102 Collection is still installed and even running.

The rh-mariadb103 Software Collection includes the rh-mariadb103-syspaths package, which installs packages that provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the rh-mariadb103*-syspaths packages, users are not required to use the scl enable command for correct functioning of the binaries and scripts provided by the rh-mariadb103* packages. Note that the *-syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system and from the rh-mariadb102 and rh-mysql80 Software Collections. To find out more about syspaths, see the Red Hat Software Collections Packaging Guide.

The recommended migration path from MariaDB 5.5 to MariaDB 10.3 is to upgrade to MariaDB 10.0 first, and then upgrade by one version successively. For details, see instructions in earlier Red Hat Software Collections Release Notes: Migrating to MariaDB 10.0, Migrating to MariaDB 10.1, and Migrating to MariaDB 10.2.

NOTE

The rh-mariadb103 Software Collection supports neither mounting over NFS nor dynamical registering using the scl register command.

5.1.1. Notable Differences Between the rh-mariadb102 and rh-mariadb103 Software Collections

- The mariadb-bench subpackage has been removed.
- The default allowed level of the plug-in maturity has been changed to one level less than the server maturity. As a result, plug-ins with a lower maturity level that were previously working, will no longer load.

For more information regarding MariaDB 10.3, see the upstream documentation about changes and about upgrading.

5.1.2. Upgrading from the rh-mariadb102 to the rh-mariadb103 Software Collection

IMPORTANT

Prior to upgrading, back up all your data, including any MariaDB databases.
1. Stop the rh-mariadb102 database server if it is still running.

   Before stopping the server, set the `innodb_fast_shutdown` option to 0, so that InnoDB performs a slow shutdown, including a full purge and insert buffer merge. Read more about this option in the upstream documentation. This operation can take a longer time than in case of a normal shutdown.

   ```
   mysql -uroot -p "SET GLOBAL innodb_fast_shutdown = 0"
   ```

   Stop the rh-mariadb102 server.

   ```
   systemctl stop rh-mariadb102-mariadb.service
   ```

2. Install the rh-mariadb103 Software Collection, including the subpackage providing the `mysql_upgrade` utility.

   ```
   yum install rh-mariadb103-mariadb-server rh-mariadb103-mariadb-server-utils
   ```

   Note that it is possible to install the rh-mariadb103 Software Collection while the rh-mariadb102 Software Collection is still installed because these Collections do not conflict.

4. All data of the rh-mariadb102 Software Collection is stored in the `/var/opt/rh/rh-mariadb102/lib/mysql/` directory unless configured differently. Copy the whole content of this directory to `/var/opt/rh/rh-mariadb103/lib/mysql/`. You can move the content but remember to back up your data before you continue to upgrade. Make sure the data are owned by the `mysql` user and SELinux context is correct.

5. Start the rh-mariadb103 database server.

   ```
   systemctl start rh-mariadb103-mariadb.service
   ```

6. Perform the data migration. Note that running the `mysql_upgrade` command is required due to upstream changes introduced in MDEV-14637.

   ```
   scl enable rh-mariadb103 mysql_upgrade
   ```

   If the `root` user has a non-empty password defined (it should have a password defined), it is necessary to call the `mysql_upgrade` utility with the `-p` option and specify the password.

   ```
   scl enable rh-mariadb103 -- mysql_upgrade -p
   ```

   Note that when the rh-mariadb103*-syspaths packages are installed, the `scl enable` command is not required. However, the `*-syspaths` packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system and from the rh-mariadb102 and rh-mysql80 Software Collections.

5.2. MIGRATING TO MARIADB 10.2
Red Hat Enterprise Linux 6 contains **MySQL 5.1** as the default MySQL implementation. Red Hat Enterprise Linux 7 includes **MariaDB 5.5** as the default MySQL implementation. MariaDB is a community-developed drop-in replacement for MySQL. MariaDB 10.1 has been available as a Software Collection since Red Hat Software Collections 2.2; Red Hat Software Collections 3.5 is distributed with MariaDB 10.2.

The rh-mariadb102 Software Collection, available for both Red Hat Enterprise Linux 6 and Red Hat Enterprise Linux 7, does not conflict with the mysql or mariadb packages from the core systems. Unless the *-syspaths packages are installed (see below), it is possible to install the rh-mariadb102 Software Collection together with the mysql or mariadb packages. It is also possible to run both versions at the same time, however, the port number and the socket in the **my.cnf** files need to be changed to prevent these specific resources from conflicting. Additionally, it is possible to install the rh-mariadb102 Software Collection while the rh-mariadb101 Collection is still installed and even running.

The recommended migration path from **MariaDB 5.5** to **MariaDB 10.3** is to upgrade to **MariaDB 10.0** first, and then upgrade by one version successively. For details, see instructions in earlier Red Hat Software Collections Release Notes: Migrating to MariaDB 10.0 and Migrating to MariaDB 10.1.

For more information about MariaDB 10.2, see the upstream documentation about changes in version 10.2 and about upgrading.

**NOTE**

The rh-mariadb102 Software Collection supports neither mounting over NFS nor dynamical registering using the **scl register** command.

### 5.2.1. Notable Differences Between the rh-mariadb101 and rh-mariadb102 Software Collections

Major changes in **MariaDB 10.2** are described in the Red Hat Software Collections 3.0 Release Notes.

Since **MariaDB 10.2**, behavior of the **SQL_MODE** variable has been changed; see the upstream documentation for details.

Multiple options have changed their default values or have been deprecated or removed. For details, see the Knowledgebase article Migrating from MariaDB 10.1 to the MariaDB 10.2 Software Collection.

The rh-mariadb102 Software Collection includes the rh-mariadb102*-syspaths package, which installs packages that provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the rh-mariadb102*-syspaths packages, users are not required to use the **scl enable** command for correct functioning of the binaries and scripts provided by the rh-mariadb102* packages. Note that the *-syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system and from the rh-mysql80 Software Collection. To find out more about syspaths, see the Red Hat Software Collections Packaging Guide.

### 5.2.2. Upgrading from the rh-mariadb101 to the rh-mariadb102 Software Collection

**IMPORTANT**

Prior to upgrading, back up all your data, including any MariaDB databases.

1. Stop the rh-mariadb101 database server if it is still running.

   Before stopping the server, set the **innodb_fast_shutdown** option to **0**, so that InnoDB
performs a slow shutdown, including a full purge and insert buffer merge. Read more about this option in the upstream documentation. This operation can take a longer time than in case of a normal shutdown.

```bash
mysql -uroot -p -e "SET GLOBAL innodb_fast_shutdown = 0"
```

Stop the rh-mariadb101 server.

```bash
service rh-mariadb101-mariadb stop
```

2. Install the rh-mariadb102 Software Collection.

```bash
yum install rh-mariadb102-mariadb-server
```

Note that it is possible to install the rh-mariadb102 Software Collection while the rh-mariadb101 Software Collection is still installed because these Collections do not conflict.

4. All data of the rh-mariadb101 Software Collection is stored in the `/var/opt/rh/rh-mariadb101/lib/mysql/` directory unless configured differently. Copy the whole content of this directory to `/var/opt/rh/rh-mariadb102/lib/mysql/`. You can move the content but remember to back up your data before you continue to upgrade. Make sure the data are owned by the `mysql` user and SELinux context is correct.

5. Start the rh-mariadb102 database server.

```bash
service rh-mariadb102-mariadb start
```

6. Perform the data migration.

```bash
scl enable rh-mariadb102 mysql_upgrade
```

If the root user has a non-empty password defined (it should have a password defined), it is necessary to call the `mysql_upgrade` utility with the `-p` option and specify the password.

```bash
scl enable rh-mariadb102 -- mysql_upgrade -p
```

Note that when the rh-mariadb102*-syspaths packages are installed, the `scl enable` command is not required. However, the *-syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system and from the rh-mysql80 Software Collection.

### 5.3. MIGRATING TO MYSQL 8.0

The rh-mysql80 Software Collection is available for Red Hat Enterprise Linux 7, which includes MariaDB 5.5 as the default MySQL implementation.

The rh-mysql80 Software Collection conflicts neither with the mysql or mariadb packages from the core systems nor with the rh-mysql* or rh-mariadb* Software Collections, unless the *-syspaths packages are installed (see below). It is also possible to run multiple versions at the same time; however,
the port number and the socket in the my.cnf files need to be changed to prevent these specific resources from conflicting.

Note that it is possible to upgrade to MySQL 8.0 only from MySQL 5.7. If you need to upgrade from an earlier version, upgrade to MySQL 5.7 first. For instructions, see Migration to MySQL 5.7.

5.3.1. Notable Differences Between MySQL 5.7 and MySQL 8.0

Differences Specific to the rh-mysql80 Software Collection

- The MySQL 8.0 server provided by the rh-mysql80 Software Collection is configured to use mysql_native_password as the default authentication plug-in because client tools and libraries in Red Hat Enterprise Linux 7 are incompatible with the caching_sha2_password method, which is used by default in the upstream MySQL 8.0 version.

To change the default authentication plug-in to caching_sha2_password, edit the /etc/opt/rh/rh-mysql80/my.cnf.d/mysql-default-authentication-plugin.cnf file as follows:

```
[mysqld]
default_authentication_plugin=caching_sha2_password
```

For more information about the caching_sha2_password authentication plug-in, see the upstream documentation.

- The rh-mysql80 Software Collection includes the rh-mysql80-syspaths package, which installs the rh-mysql80-mysql-config-syspaths, rh-mysql80-mysql-server-syspaths, and rh-mysql80-mysql-syspaths packages. These subpackages provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the rh-mysql80*-syspaths packages, users are not required to use the scl enable command for correct functioning of the binaries and scripts provided by the rh-mysql80* packages. Note that the *-syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system and from the rh-mariadb102 and rh-mariadb103 Software Collections. To find out more about syspaths, see the Red Hat Software Collections Packaging Guide.

General Changes in MySQL 8.0

- Binary logging is enabled by default during the server startup. The log_bin system variable is now set to ON by default even if the --log-bin option has not been specified. To disable binary logging, specify the --skip-log-bin or --disable-log-bin option at startup.

- For a CREATE FUNCTION statement to be accepted, at least one of the DETERMINISTIC, NO SQL, or READS SQL DATA keywords must be specified explicitly, otherwise an error occurs.

- Certain features related to account management have been removed. Namely, using the GRANT statement to modify account properties other than privilege assignments, such as authentication, SSL, and resource-limit, is no longer possible. To establish the mentioned properties at account-creation time, use the CREATE USER statement. To modify these properties, use the ALTER USER statement.

- Certain SSL-related options have been removed on the client-side. Use the --ssl-mode=REQUIRED option instead of --ssl=1 or --enable-ssl. Use the --ssl-mode=DISABLED option instead of --ssl=0, --skip-ssl, or --disable-ssl. Use the --ssl-mode=VERIFY_IDENTITY option instead of --ssl-verify-server-cert options. Note that these option remains unchanged on the server side.

- The default character set has been changed from latin1 to utf8mb4.
• The utf8 character set is currently an alias for utf8mb3 but in the future, it will become a reference to utf8mb4. To prevent ambiguity, specify utf8mb4 explicitly for character set references instead of utf8.

• Setting user variables in statements other than SET has been deprecated.

• The log_syslog variable, which previously configured error logging to the system logs, has been removed.

• Certain incompatible changes to spatial data support have been introduced.

• The deprecated ASC or DESC qualifiers for GROUP BY clauses have been removed. To produce a given sort order, provide an ORDER BY clause.

For detailed changes in MySQL 8.0 compared to earlier versions, see the upstream documentation: What Is New in MySQL 8.0 and Changes Affecting Upgrades to MySQL 8.0.

5.3.2. Upgrading to the rh-mysql80 Software Collection

IMPORTANT

Prior to upgrading, back-up all your data, including any MySQL databases.

1. Install the rh-mysql80 Software Collection.

   ```bash
   yum install rh-mysql80-mysql-server
   ```

2. Inspect the configuration of rh-mysql80, which is stored in the `/etc/opt/rh/rh-mysql80/my.cnf` file and the `/etc/opt/rh/rh-mysql80/my.cnf.d/` directory. Compare it with the configuration of rh-mysql57 stored in `/etc/opt/rh/rh-mysql57/my.cnf` and `/etc/opt/rh/rh-mysql57/my.cnf.d/` and adjust it if necessary.

3. Stop the rh-mysql57 database server, if it is still running.

   ```bash
   systemctl stop rh-mysql57-mysqld.service
   ```

4. All data of the rh-mysql57 Software Collection is stored in the `/var/opt/rh/rh-mysql57/lib/mysql/` directory. Copy the whole content of this directory to `/var/opt/rh/rh-mysql80/lib/mysql/`. You can also move the content but remember to back up your data before you continue to upgrade.

5. Start the rh-mysql80 database server.

   ```bash
   systemctl start rh-mysql80-mysqld.service
   ```

6. Perform the data migration.

   ```bash
   scl enable rh-mysql80 mysql_upgrade
   ```

   If the root user has a non-empty password defined (it should have a password defined), it is necessary to call the mysql_upgrade utility with the -p option and specify the password.

   ```bash
   scl enable rh-mysql80 -- mysql_upgrade -p
   ```
Note that when the rh-mysql80*-syspaths packages are installed, the `scl enable` command is not required. However, the -*syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system and from the rh-mariadb102 and rh-mariadb103 Software Collections.

5.4. MIGRATING TO MONGODB 3.6

Red Hat Software Collections 3.5 is released with MongoDB 3.6, provided by the rh-mongodb36 Software Collection and available only for Red Hat Enterprise Linux 7.

The rh-mongodb36 Software Collection includes the rh-mongodb36-syspaths package, which installs packages that provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the rh-mongodb36*-syspaths packages, users are not required to use the `scl enable` command for correct functioning of the binaries and scripts provided by the rh-mongodb36* packages. To find out more about syspaths, see the Red Hat Software Collections Packaging Guide.

5.4.1. Notable Differences Between MongoDB 3.4 and MongoDB 3.6

General Changes

The rh-mongodb36 Software Collection introduces the following significant general change:

- On Non-Uniform Access Memory (NUMA) hardware, it is possible to configure `systemd` services to be launched using the `numactl` command; see the [upstream recommendation](#). To use MongoDB with the `numactl` command, you need to install the `numactl` RPM package and change the `/etc/opt/rh/rh-mongodb36/sysconfig/mongod` and `/etc/opt/rh/rh-mongodb36/sysconfig/mongos` configuration files accordingly.

Compatibility Changes

MongoDB 3.6 includes various minor changes that can affect compatibility with previous versions of MongoDB:

- MongoDB binaries now bind to `localhost` by default, so listening on different IP addresses needs to be explicitly enabled. Note that this is already the default behavior for `systemd` services distributed with MongoDB Software Collections.

- The MONGODB-CR authentication mechanism has been deprecated. For databases with users created by MongoDB versions earlier than 3.0, upgrade authentication schema to SCRAM.

- The HTTP interface and REST API have been removed

- Arbiters in replica sets have priority 0

- Master-slave replication has been deprecated

For detailed compatibility changes in MongoDB 3.6, see the [upstream release notes](#).

Backwards Incompatible Features

The following MongoDB 3.6 features are backwards incompatible and require the version to be set to 3.6 using the `featureCompatibilityVersion` command:

- UUID for collections

- `$jsonSchema` document validation

- Change streams

48
- Chunk aware secondaries
- View definitions, document validators, and partial index filters that use version 3.6 query features
- Sessions and retryable writes
- Users and roles with `authenticationRestrictions`

For details regarding backward incompatible changes in MongoDB 3.6, see the upstream release notes.

### 5.4.2. Upgrading from the rh-mongodb34 to the rh-mongodb36 Software Collection

**IMPORTANT**

Before migrating from the rh-mongodb34 to the rh-mongodb36 Software Collection, back up all your data, including any MongoDB databases, which are by default stored in the `/var/opt/rh/rh-mongodb34/lib/mongodb/` directory. In addition, see the Compatibility Changes to ensure that your applications and deployments are compatible with MongoDB 3.6.

To upgrade to the rh-mongodb36 Software Collection, perform the following steps.

1. To be able to upgrade, the rh-mongodb34 instance must have `featureCompatibilityVersion` set to 3.4. Check `featureCompatibilityVersion`:

   ```bash
   ~]$ scl enable rh-mongodb34 'mongo --host localhost --port 27017 admin' --eval 'db.adminCommand({getParameter: 1, featureCompatibilityVersion: 1})'
   ```

   If the `mongod` server is configured with enabled access control, add the `--username` and `--password` options to the `mongo` command.

2. Install the MongoDB servers and shells from the rh-mongodb36 Software Collections:

   ```bash
   ~]# yum install rh-mongodb36
   ```

3. Stop the MongoDB 3.4 server:

   ```bash
   ~]# systemctl stop rh-mongodb34-mongod.service
   ```

4. Copy your data to the new location:

   ```bash
   ```

6. Start the MongoDB 3.6 server:

   ```bash
   ~]# systemctl start rh-mongodb36-mongod.service
   ```
7. Enable backwards incompatible features:

```bash
$ scl enable rh-mongodb36 'mongo --host localhost --port 27017 admin' --eval
   'db.adminCommand( { setFeatureCompatibilityVersion: "3.6" } )'
```

If the `mongod` server is configured with enabled access control, add the `--username` and `--password` options to the `mongo` command.

**NOTE**

After upgrading, it is recommended to run the deployment first without enabling the backwards incompatible features for a burn-in period of time, to minimize the likelihood of a downgrade.

For detailed information about upgrading, see the [upstream release notes](#).

For information about upgrading a Replica Set, see the upstream [MongoDB Manual](#).

For information about upgrading a Sharded Cluster, see the upstream [MongoDB Manual](#).

### 5.5. MIGRATING TO MONGODB 3.4

The `rh-mongodb34` Software Collection, available for both Red Hat Enterprise Linux 6 and Red Hat Enterprise Linux 7, provides [MongoDB 3.4](#).

#### 5.5.1. Notable Differences Between MongoDB 3.2 and MongoDB 3.4

**General Changes**

The `rh-mongodb34` Software Collection introduces various general changes. Major changes are listed in the Knowledgebase article [Migrating from MongoDB 3.2 to MongoDB 3.4](#). For detailed changes, see the [upstream release notes](#).

In addition, this Software Collection includes the `rh-mongodb34-syspaths` package, which installs packages that provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the `rh-mongodb34*-syspaths` packages, users are not required to use the `scl enable` command for correct functioning of the binaries and scripts provided by the `rh-mongodb34*` packages. To find out more about `syspaths`, see the [Red Hat Software Collections Packaging Guide](#).

**Compatibility Changes**

`MongoDB 3.4` includes various minor changes that can affect compatibility with previous versions of `MongoDB`. For details, see the Knowledgebase article [Migrating from MongoDB 3.2 to MongoDB 3.4](#) and the [upstream documentation](#).

Notably, the following `MongoDB 3.4` features are backwards incompatible and require that the version is set to `3.4` using the `featureCompatibilityVersion` command:

- Support for creating read-only views from existing collections or other views
- Index version `v: 2`, which adds support for collation, decimal data and case-insensitive indexes
- Support for the `decimal128` format with the new `decimal` data type

For details regarding backward incompatible changes in `MongoDB 3.4`, see the [upstream release notes](#).
5.5.2. Upgrading from the rh-mongodb32 to the rh-mongodb34 Software Collection

Note that once you have upgraded to MongoDB 3.4 and started using new features, cannot downgrade to version 3.2.7 or earlier. You can only downgrade to version 3.2.8 or later.

**IMPORTANT**

Before migrating from the rh-mongodb32 to the rh-mongodb34 Software Collection, back up all your data, including any MongoDB databases, which are by default stored in the `/var/opt/rh/rh-mongodb32/lib/mongodb/` directory. In addition, see the compatibility changes to ensure that your applications and deployments are compatible with MongoDB 3.4.

To upgrade to the rh-mongodb34 Software Collection, perform the following steps.

1. Install the MongoDB servers and shells from the rh-mongodb34 Software Collections:

   ```bash
   ~$ yum install rh-mongodb34
   ```

2. Stop the MongoDB 3.2 server:

   ```bash
   ~$ systemctl stop rh-mongodb32-mongod.service
   ```

   Use the `service rh-mongodb32-mongodb stop` command on a Red Hat Enterprise Linux 6 system.

3. Copy your data to the new location:

   ```bash
   ```

5. Start the MongoDB 3.4 server:

   ```bash
   ~$ systemctl start rh-mongodb34-mongod.service
   ```

   On Red Hat Enterprise Linux 6, use the `service rh-mongodb34-mongodb start` command instead.

6. Enable backwards-incompatible features:

   ```bash
   ~$ scl enable rh-mongodb34 'mongo --host localhost --port 27017 admin' --eval 'db.adminCommand( { setFeatureCompatibilityVersion: "3.4" } )'
   ```

   If the `mongod` server is configured with enabled access control, add the `--username` and `--password` options to `mongo` command.

   Note that it is recommended to run the deployment after the upgrade without enabling these features first.
For detailed information about upgrading, see the upstream release notes.

For information about upgrading a Replica Set, see the upstream MongoDB Manual.

For information about upgrading a Sharded Cluster, see the upstream MongoDB Manual.

5.6. MIGRATING TO POSTGRESQL 12

Red Hat Software Collections 3.5 is distributed with PostgreSQL 12, available only for Red Hat Enterprise Linux 7. The rh-postgresql12 Software Collection can be safely installed on the same machine in parallel with the base Red Hat Enterprise Linux system version of PostgreSQL or any PostgreSQL Software Collection. It is also possible to run more than one version of PostgreSQL on a machine at the same time, but you need to use different ports or IP addresses and adjust SELinux policy. See Section 5.7, “Migrating to PostgreSQL 9.6” for instructions how to migrate to an earlier version or when using Red Hat Enterprise Linux 6.

The rh-postgresql12 Software Collection includes the rh-postgresql12-syspaths package, which installs packages that provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the rh-postgresql12*-syspaths packages, users are not required to use the scl enable command for correct functioning of the binaries and scripts provided by the rh-postgresql12* packages. Note that the *-syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system. To find out more about syspaths, see the Red Hat Software Collections Packaging Guide.

**IMPORTANT**

Before migrating to PostgreSQL 12, see the upstream compatibility notes for PostgreSQL 11 and PostgreSQL 12.

In case of upgrading the PostgreSQL database in a container, see the container-specific instructions.

The following table provides an overview of different paths in a Red Hat Enterprise Linux 7 system version of PostgreSQL provided by the postgresql package, and in the rh-postgresql10 and rh-postgresql12 Software Collections.

### Table 5.1. Differences in the PostgreSQL paths

<table>
<thead>
<tr>
<th>Content</th>
<th>postgresql</th>
<th>rh-postgresql10</th>
<th>rh-postgresql12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executables</td>
<td>/usr/bin/</td>
<td>/opt/rh/rh-postgresql10/root/usr/bin/</td>
<td>/opt/rh/rh-postgresql12/root/usr/bin/</td>
</tr>
</tbody>
</table>
## 5.6.1. Migrating from a Red Hat Enterprise Linux System Version of PostgreSQL to the PostgreSQL 12 Software Collection

Red Hat Enterprise Linux 7 is distributed with PostgreSQL 9.2. To migrate your data from a Red Hat Enterprise Linux system version of PostgreSQL to the rh-postgresql12 Software Collection, you can either perform a fast upgrade using the `pg_upgrade` tool (recommended), or dump the database data into a text file with SQL commands and import it in the new database. Note that the second method is usually significantly slower and may require manual fixes; see the PostgreSQL documentation for more information about this upgrade method.
IMPORTANT

Before migrating your data from a Red Hat Enterprise Linux system version of PostgreSQL to PostgreSQL 12, make sure that you back up all your data, including the PostgreSQL database files, which are by default located in the /var/lib/pgsql/data/ directory.

Procedure 5.1. Fast Upgrade Using the pg_upgrade Tool

To perform a fast upgrade of your PostgreSQL server, complete the following steps:

1. Stop the old PostgreSQL server to ensure that the data is not in an inconsistent state. To do so, type the following at a shell prompt as root:

   systemctl stop postgresql.service

   To verify that the server is not running, type:

   systemctl status postgresql.service

2. Verify that the old directory /var/lib/pgsql/data/ exists:

   file /var/lib/pgsql/data/

   and back up your data.

3. Verify that the new data directory /var/opt/rh/rh-postgresql12/lib/pgsql/data/ does not exist:

   file /var/opt/rh/rh-postgresql12/lib/pgsql/data/

   If you are running a fresh installation of PostgreSQL 12, this directory should not be present in your system. If it is, back it up by running the following command as root:

   mv /var/opt/rh/rh-postgresql12/lib/pgsql/data{,-scl-backup}

4. Upgrade the database data for the new server by running the following command as root:

   scl enable rh-postgresql12 -- postgresql-setup --upgrade

   Alternatively, you can use the /opt/rh/rh-postgresql12/root/usr/bin/postgresql-setup -- upgrade command.

   Note that you can use the --upgrade-from option for upgrade from different versions of PostgreSQL. The list of possible upgrade scenarios is available using the --upgrade-ids option.

   It is recommended that you read the resulting /var/lib/pgsql/upgrade_rh-postgresql12-postgresql.log log file to find out if any problems occurred during the upgrade.

5. Start the new server as root:

   systemctl start rh-postgresql12-postgresql.service

   It is also advised that you run the analyze_new_cluster.sh script as follows:
su - postgres -c 'scl enable rh-postgresql12 ~/analyze_new_cluster.sh'

6. Optionally, you can configure the PostgreSQL 12 server to start automatically at boot time. To disable the old system PostgreSQL server, type the following command as root:

    chkconfig postgresql off

To enable the PostgreSQL 12 server, type as root:

    chkconfig rh-postgresql12-postgresql on

7. If your configuration differs from the default one, make sure to update configuration files, especially the /var/opt/rh/rh-postgresql12/lib/pgsql/data/pg_hba.conf configuration file. Otherwise only the postgres user will be allowed to access the database.

**Procedure 5.2. Performing a Dump and Restore Upgrade**

To perform a dump and restore upgrade of your PostgreSQL server, complete the following steps:

1. Ensure that the old PostgreSQL server is running by typing the following at a shell prompt as root:

    systemctl start postgresql.service

2. Dump all data in the PostgreSQL database into a script file. As root, type:

    su - postgres -c 'pg_dumpall > ~/pgdump_file.sql'

3. Stop the old server by running the following command as root:

    systemctl stop postgresql.service

4. Initialize the data directory for the new server as root:

    scl enable rh-postgresql12 -- postgresql-setup initdb

5. Start the new server as root:

    systemctl start rh-postgresql12-postgresql.service

6. Import data from the previously created SQL file:

    su - postgres -c 'scl enable rh-postgresql12 "psql -f ~/pgdump_file.sql postgres"'

7. Optionally, you can configure the PostgreSQL 12 server to start automatically at boot time. To disable the old system PostgreSQL server, type the following command as root:

    chkconfig postgresql off

To enable the PostgreSQL 12 server, type as root:
chkconfig rh-postgresql12-postgresql on

8. If your configuration differs from the default one, make sure to update configuration files, especially the `/var/opt/rh/rh-postgresql12/lib/pgsql/data/pg_hba.conf` configuration file. Otherwise only the `postgres` user will be allowed to access the database.

5.6.2. Migrating from the PostgreSQL 10 Software Collection to the PostgreSQL 12 Software Collection

To migrate your data from the `rh-postgresql10` Software Collection to the `rh-postgresql12` Collection, you can either perform a fast upgrade using the `pg_upgrade` tool (recommended), or dump the database data into a text file with SQL commands and import it in the new database. Note that the second method is usually significantly slower and may require manual fixes; see the PostgreSQL documentation for more information about this upgrade method.

**IMPORTANT**

Before migrating your data from PostgreSQL 10 to PostgreSQL 12, make sure that you back up all your data, including the PostgreSQL database files, which are by default located in the `/var/opt/rh/rh-postgresql10/lib/pgsql/data/` directory.

Procedure 5.3. Fast Upgrade Using the `pg_upgrade` Tool

To perform a fast upgrade of your PostgreSQL server, complete the following steps:

1. Stop the old PostgreSQL server to ensure that the data is not in an inconsistent state. To do so, type the following at a shell prompt as `root`:

   ```bash
   systemctl stop rh-postgresql10-postgresql.service
   ```

   To verify that the server is not running, type:

   ```bash
   systemctl status rh-postgresql10-postgresql.service
   ```

2. Verify that the old directory `/var/opt/rh/rh-postgresql10/lib/pgsql/data/` exists:

   ```bash
   file /var/opt/rh/rh-postgresql10/lib/pgsql/data/
   ```

   and back up your data.

3. Verify that the new data directory `/var/opt/rh/rh-postgresql12/lib/pgsql/data/` does not exist:

   ```bash
   file /var/opt/rh/rh-postgresql12/lib/pgsql/data/
   ```

   If you are running a fresh installation of PostgreSQL 12, this directory should not be present in your system. If it is, back it up by running the following command as `root`:

   ```bash
   mv /var/opt/rh/rh-postgresql12/lib/pgsql/data/ -scl-backup
   ```

4. Upgrade the database data for the new server by running the following command as `root`:
scl enable rh-postgresql12 -- postgresql-setup --upgrade --upgrade-from=rh-postgresql10-postgresql

Alternatively, you can use the /opt/rh/rh-postgresql12/root/usr/bin/postgresql-setup --upgrade --upgrade-from=rh-postgresql10-postgresql command.

Note that you can use the --upgrade-from option for upgrading from different versions of PostgreSQL. The list of possible upgrade scenarios is available using the --upgrade-ids option.

It is recommended that you read the resulting /var/lib/pgsql/upgrade_rh-postgresql12-postgresql.log log file to find out if any problems occurred during the upgrade.

5. Start the new server as root:

```
systemctl start rh-postgresql12-postgresql.service
```

It is also advised that you run the analyze_new_cluster.sh script as follows:

```
su - postgres -c 'scl enable rh-postgresql12 ~/analyze_new_cluster.sh'
```

6. Optionally, you can configure the PostgreSQL 12 server to start automatically at boot time. To disable the old PostgreSQL 10 server, type the following command as root:

```
chkconfig rh-postgresql10-postgresql off
```

To enable the PostgreSQL 12 server, type as root:

```
chkconfig rh-postgresql12-postgresql on
```

7. If your configuration differs from the default one, make sure to update configuration files, especially the /var/opt/rh/rh-postgresql12/lib/pgsql/data/pg_hba.conf configuration file. Otherwise only the postgres user will be allowed to access the database.

Procedure 5.4. Performing a Dump and Restore Upgrade

To perform a dump and restore upgrade of your PostgreSQL server, complete the following steps:

1. Ensure that the old PostgreSQL server is running by typing the following at a shell prompt as root:

```
systemctl start rh-postgresql10-postgresql.service
```

2. Dump all data in the PostgreSQL database into a script file. As root, type:

```
su - postgres -c 'scl enable rh-postgresql10 "pg_dumpall > ~/pgdump_file.sql"'
```

3. Stop the old server by running the following command as root:

```
 systemctl stop rh-postgresql10-postgresql.service
```

4. Initialize the data directory for the new server as root:
5. Start the new server as root:

```
scl enable rh-postgresql12 -- postgresql-setup initdb
```

6. Import data from the previously created SQL file:

```
su - postgres -c 'scl enable rh-postgresql12 "psql -f ~/pgdump_file.sql postgres"'
```

7. Optionally, you can configure the PostgreSQL 12 server to start automatically at boot time. To disable the old PostgreSQL 10 server, type the following command as root:

```
chkconfig rh-postgresql10-postgresql off
```

To enable the PostgreSQL 12 server, type as root:

```
chkconfig rh-postgresql12-postgresql on
```

8. If your configuration differs from the default one, make sure to update configuration files, especially the `/var/opt/rh/rh-postgresql12/lib/pgsql/data/pg_hba.conf` configuration file. Otherwise only the `postgres` user will be allowed to access the database.

### 5.7. MIGRATING TO POSTGRESQL 9.6

PostgreSQL 9.6 is available for both Red Hat Enterprise Linux 6 and Red Hat Enterprise Linux 7 and it can be safely installed on the same machine in parallel with PostgreSQL 8.4 from Red Hat Enterprise Linux 6, PostgreSQL 9.2 from Red Hat Enterprise Linux 7, or any version of PostgreSQL released in previous versions of Red Hat Software Collections. It is also possible to run more than one version of PostgreSQL on a machine at the same time, but you need to use different ports or IP addresses and adjust SELinux policy.

**IMPORTANT**

In case of upgrading the PostgreSQL database in a container, see the container-specific instructions. Note that it is currently impossible to upgrade PostgreSQL from 9.5 to 9.6 in a container in an OpenShift environment that is configured with Gluster file volumes.

### 5.7.1. Notable Differences Between PostgreSQL 9.5 and PostgreSQL 9.6

The most notable changes between PostgreSQL 9.5 and PostgreSQL 9.6 are described in the [upstream release notes](#).

The rh-postgresql96 Software Collection includes the rh-postgresql96-syspaths package, which installs packages that provide system-wide wrappers for binaries, scripts, manual pages, and other. After installing the rh-postgresql96-syspaths packages, users are not required to use the `scl enable` command for correct functioning of the binaries and scripts provided by the rh-postgresql96* packages. Note that the *-syspaths packages conflict with the corresponding packages from the base Red Hat Enterprise Linux system. To find out more about syspaths, see the Red Hat Software Collections Packaging Guide.

The following table provides an overview of different paths in a Red Hat Enterprise Linux system version.
of PostgreSQL (postgresql) and in the postgresql92, rh-postgresql95, and rh-postgresql96 Software Collections. Note that the paths of PostgreSQL 8.4 distributed with Red Hat Enterprise Linux 6 and the system version of PostgreSQL 9.2 shipped with Red Hat Enterprise Linux 7 are the same; the paths for the rh-postgresql94 Software Collection are analogous to rh-postgresql95.

Table 5.2. Differences in the PostgreSQL paths

<table>
<thead>
<tr>
<th>Content</th>
<th>postgresql</th>
<th>postgresql92</th>
<th>rh-postgresql95</th>
<th>rh-postgresql96</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executables</td>
<td>/usr/bin/</td>
<td>/opt/rh/postgresql92/root/usr/bin/</td>
<td>/opt/rh/postgresql95/root/usr/bin/</td>
<td>/opt/rh/postgresql96/root/usr/bin/</td>
</tr>
<tr>
<td>Source</td>
<td>not installed</td>
<td>not installed</td>
<td>not installed</td>
<td>not installed</td>
</tr>
</tbody>
</table>
For changes between PostgreSQL 8.4 and PostgreSQL 9.2, refer to the Red Hat Software Collections 1.2 Release Notes. Notable changes between PostgreSQL 9.2 and PostgreSQL 9.4 are described in Red Hat Software Collections 2.0 Release Notes. For differences between PostgreSQL 9.4 and PostgreSQL 9.5, refer to Red Hat Software Collections 2.2 Release Notes.

5.7.2. Migrating from a Red Hat Enterprise Linux System Version of PostgreSQL to the PostgreSQL 9.6 Software Collection

Red Hat Enterprise Linux 6 includes PostgreSQL 8.4, Red Hat Enterprise Linux 7 is distributed with PostgreSQL 9.2. To migrate your data from a Red Hat Enterprise Linux system version of PostgreSQL to the rh-postgresql96 Software Collection, you can either perform a fast upgrade using the pg_upgrade tool (recommended), or dump the database data into a text file with SQL commands and import it in the new database. Note that the second method is usually significantly slower and may require manual fixes; see the PostgreSQL documentation for more information about this upgrade method. The following procedures are applicable for both Red Hat Enterprise Linux 6 and Red Hat Enterprise Linux 7 system versions of PostgreSQL.

IMPORTANT

Before migrating your data from a Red Hat Enterprise Linux system version of PostgreSQL to PostgreSQL 9.6, make sure that you back up all your data, including the PostgreSQL database files, which are by default located in the /var/lib/pgsql/data/ directory.

Procedure 5.5. Fast Upgrade Using the pg_upgrade Tool

To perform a fast upgrade of your PostgreSQL server, complete the following steps:

1. Stop the old PostgreSQL server to ensure that the data is not in an inconsistent state. To do so, type the following at a shell prompt as root:

   service postgresql stop

To verify that the server is not running, type:
2. Verify that the old directory `/var/lib/pgsql/data/` exists:

```bash
file /var/lib/pgsql/data/
```

and back up your data.

3. Verify that the new data directory `/var/opt/rh/rh-postgresql96/lib/pgsql/data/` does not exist:

```bash
file /var/opt/rh/rh-postgresql96/lib/pgsql/data/
```

If you are running a fresh installation of PostgreSQL 9.6, this directory should not be present in your system. If it is, back it up by running the following command as `root`:

```bash
mv /var/opt/rh/rh-postgresql96/lib/pgsql/data{,-scl-backup}
```

4. Upgrade the database data for the new server by running the following command as `root`:

```bash
scl enable rh-postgresql96 -- postgresql-setup --upgrade
```

Alternatively, you can use the `/opt/rh/rh-postgresql96/root/usr/bin/postgresql-setup --upgrade` command.

Note that you can use the `--upgrade-from` option for upgrade from different versions of PostgreSQL. The list of possible upgrade scenarios is available using the `--upgrade-ids` option.

It is recommended that you read the resulting `/var/lib/pgsql/upgrade_rh-postgresql96-postgresql.log` log file to find out if any problems occurred during the upgrade.

5. Start the new server as `root`:

```bash
service rh-postgresql96-postgresql start
```

It is also advised that you run the `analyze_new_cluster.sh` script as follows:

```bash
su - postgres -c 'scl enable rh-postgresql96 ~/analyze_new_cluster.sh'
```

6. Optionally, you can configure the PostgreSQL 9.6 server to start automatically at boot time. To disable the old system PostgreSQL server, type the following command as `root`:

```bash
chkconfig postgresql off
```

To enable the PostgreSQL 9.6 server, type as `root`:

```bash
chkconfig rh-postgresql96-postgresql on
```

7. If your configuration differs from the default one, make sure to update configuration files, especially the `/var/opt/rh/rh-postgresql96/lib/pgsql/data/pg_hba.conf` configuration file. Otherwise only the `postgres` user will be allowed to access the database.

**Procedure 5.6. Performing a Dump and Restore Upgrade**
To perform a dump and restore upgrade of your PostgreSQL server, complete the following steps:

1. Ensure that the old PostgreSQL server is running by typing the following at a shell prompt as `root`:
   ```bash
   service postgresql start
   ```

2. Dump all data in the PostgreSQL database into a script file. As `root`, type:
   ```bash
   su - postgres -c 'pg_dumpall > ~/pgdump_file.sql'
   ```

3. Stop the old server by running the following command as `root`:
   ```bash
   service postgresql stop
   ```

4. Initialize the data directory for the new server as `root`:
   ```bash
   scl enable rh-postgresql96-postgresql -- postgresql-setup --initdb
   ```

5. Start the new server as `root`:
   ```bash
   service rh-postgresql96-postgresql start
   ```

6. Import data from the previously created SQL file:
   ```bash
   su - postgres -c 'scl enable rh-postgresql96 "psql -f ~/pgdump_file.sql postgres"'
   ```

7. Optionally, you can configure the PostgreSQL 9.6 server to start automatically at boot time. To disable the old system PostgreSQL server, type the following command as `root`:
   ```bash
   chkconfig postgresql off
   ```

   To enable the PostgreSQL 9.6 server, type as `root`:
   ```bash
   chkconfig rh-postgresql96-postgresql on
   ```

8. If your configuration differs from the default one, make sure to update configuration files, especially the `/var/opt/rh/rh-postgresql96/lib/pgsql/data/pg_hba.conf` configuration file. Otherwise only the `postgres` user will be allowed to access the database.

### 5.7.3. Migrating from the PostgreSQL 9.5 Software Collection to the PostgreSQL 9.6 Software Collection

To migrate your data from the rh-postgresql95 Software Collection to the rh-postgresql96 Collection, you can either perform a fast upgrade using the `pg_upgrade` tool (recommended), or dump the database data into a text file with SQL commands and import it in the new database. Note that the second method is usually significantly slower and may require manual fixes; see the PostgreSQL documentation for more information about this upgrade method.
IMPORTANT

Before migrating your data from PostgreSQL 9.5 to PostgreSQL 9.6, make sure that you back up all your data, including the PostgreSQL database files, which are by default located in the /var/opt/rh/rh-postgresql95/lib/pgsql/data/ directory.

Procedure 5.7. Fast Upgrade Using the `pg_upgrade` Tool

To perform a fast upgrade of your PostgreSQL server, complete the following steps:

1. Stop the old PostgreSQL server to ensure that the data is not in an inconsistent state. To do so, type the following at a shell prompt as root:

   ```bash
   service rh-postgresql95-postgresql stop
   ```

   To verify that the server is not running, type:

   ```bash
   service rh-postgresql95-postgresql status
   ```

2. Verify that the old directory /var/opt/rh/rh-postgresql95/lib/pgsql/data/ exists:

   ```bash
   file /var/opt/rh/rh-postgresql95/lib/pgsql/data/
   ```

   and back up your data.

3. Verify that the new data directory /var/opt/rh/rh-postgresql96/lib/pgsql/data/ does not exist:

   ```bash
   file /var/opt/rh/rh-postgresql96/lib/pgsql/data/
   ```

   If you are running a fresh installation of PostgreSQL 9.6, this directory should not be present in your system. If it is, back it up by running the following command as root:

   ```bash
   mv /var/opt/rh/rh-postgresql96/lib/pgsql/data{,-scl-backup}
   ```

4. Upgrade the database data for the new server by running the following command as root:

   ```bash
   scl enable rh-postgresql96 -- postgresql-setup --upgrade --upgrade-from=rh-postgresql95-postgresql
   ```

   Alternatively, you can use the `/opt/rh/rh-postgresql96/root/usr/bin/postgresql-setup -- upgrade --upgrade-from=rh-postgresql95-postgresql` command.

   Note that you can use the `--upgrade-from` option for upgrading from different versions of PostgreSQL. The list of possible upgrade scenarios is available using the `--upgrade-ids` option.

   It is recommended that you read the resulting /var/lib/pgsql/upgrade_rh-postgresql96-postgresql.log log file to find out if any problems occurred during the upgrade.

5. Start the new server as root:

   ```bash
   service rh-postgresql96-postgresql start
   ```

   It is also advised that you run the `analyze_new_cluster.sh` script as follows:
su - postgres -c 'scl enable rh-postgresql96 ~/analyze_new_cluster.sh'

6. Optionally, you can configure the PostgreSQL 9.6 server to start automatically at boot time. To disable the old PostgreSQL 9.5 server, type the following command as root:

    chkconfig rh-postgresql95-postgresql off

To enable the PostgreSQL 9.6 server, type as root:

    chkconfig rh-postgresql96-postgresql on

7. If your configuration differs from the default one, make sure to update configuration files, especially the /var/opt/rh/rh-postgresql96/lib/pgsql/data/pg_hba.conf configuration file. Otherwise only the postgres user will be allowed to access the database.

Procedure 5.8. Performing a Dump and Restore Upgrade

To perform a dump and restore upgrade of your PostgreSQL server, complete the following steps:

1. Ensure that the old PostgreSQL server is running by typing the following at a shell prompt as root:

    service rh-postgresql95-postgresql start

2. Dump all data in the PostgreSQL database into a script file. As root, type:

    su - postgres -c 'scl enable rh-postgresql95 "pg_dumpall > ~/pgdump_file.sql"'

3. Stop the old server by running the following command as root:

    service rh-postgresql95-postgresql stop

4. Initialize the data directory for the new server as root:

    scl enable rh-postgresql96-postgresql -- postgresql-setup --initdb

5. Start the new server as root:

    service rh-postgresql96-postgresql start

6. Import data from the previously created SQL file:

    su - postgres -c 'scl enable rh-postgresql96 "psql -f ~/pgdump_file.sql postgres"'

7. Optionally, you can configure the PostgreSQL 9.6 server to start automatically at boot time. To disable the old PostgreSQL 9.5 server, type the following command as root:

    chkconfig rh-postgresql95-postgresql off

To enable the PostgreSQL 9.6 server, type as root:
chkconfig rh-postgresql96-postgresql on

8. If your configuration differs from the default one, make sure to update configuration files, especially the `/var/opt/rh/rh-postgresql96/lib/pgsql/data/pg_hba.conf` configuration file. Otherwise only the `postgres` user will be allowed to access the database.

If you need to migrate from the postgresql92 Software Collection, refer to Red Hat Software Collections 2.0 Release Notes; the procedure is the same, you just need to adjust the version of the new Collection. The same applies to migration from the rh-postgresql94 Software Collection, which is described in Red Hat Software Collections 2.2 Release Notes.

5.8. MIGRATING TO NGINX 1.16

Configuration files are stored in the `/etc/opt/rh/rh-nginx116/nginx/` directory. Configuration files in nginx 1.16 have the same syntax and largely the same format as previous nginx Software Collections.

Configuration files (with a `.conf` extension) in the `/etc/opt/rh/rh-nginx116/nginx/default.d/` directory are included in the default server block configuration for port 80.

**IMPORTANT**

Before upgrading from nginx 1.14 to nginx 1.16, back up all your data, including web pages located in the `/opt/rh/nginx114/root/` tree and configuration files located in the `/etc/opt/rh/nginx114/nginx/` tree.

If you have made any specific changes, such as changing configuration files or setting up web applications, in the `/opt/rh/nginx114/root/` tree, replicate those changes in the new `/opt/rh/rh-nginx116/root/` and `/etc/opt/rh/rh-nginx116/nginx/` directories, too.

You can use this procedure to upgrade directly from nginx 1.8, nginx 1.10, nginx 1.12, or nginx 1.14 to nginx 1.16. Use the appropriate paths in this case.

For the official nginx documentation, refer to `http://nginx.org/en/docs/`.

5.9. MIGRATING TO REDIS 5

Redis 3.2, provided by the rh-redis32 Software Collection, is mostly a strict subset of Redis 4.0, which is mostly a strict subset of Redis 5.0. Therefore, no major issues should occur when upgrading from version 3.2 to version 5.0.

To upgrade a Redis Cluster to version 5.0, a mass restart of all the instances is needed.

Compatibility Notes

- The format of RDB files has been changed. Redis 5 is able to read formats of all the earlier versions, but earlier versions are incapable of reading the Redis 5 format.

- Since version 4.0, the Redis Cluster bus protocol is no longer compatible with Redis 3.2.

- For minor non-backward compatible changes, see the upstream release notes for version 4.0 and version 5.0.
CHAPTER 6. ADDITIONAL RESOURCES

This chapter provides references to other relevant sources of information about Red Hat Software Collections 3.5 and Red Hat Enterprise Linux.

6.1. RED HAT PRODUCT DOCUMENTATION

The following documents are directly or indirectly relevant to this book:

- **Red Hat Software Collections 3.5 Packaging Guide** — The *Packaging Guide* for Red Hat Software Collections explains the concept of Software Collections, documents the *scl* utility, and provides a detailed explanation of how to create a custom Software Collection or extend an existing one.

- **Using Red Hat Software Collections Container Images** — This book provides information on how to use container images based on Red Hat Software Collections. The available container images include applications, daemons, databases, as well as the Red Hat Developer Toolset container images. The images can be run on Red Hat Enterprise Linux 7 Server and Red Hat Enterprise Linux Atomic Host.

- **Getting Started with Containers** — This guide contains a comprehensive overview of information about building and using container images on Red Hat Enterprise Linux 7 and Red Hat Enterprise Linux Atomic Host.

- **Using and Configuring Red Hat Subscription Manager** — The *Using and Configuring Red Hat Subscription Manager* book provides detailed information on how to register Red Hat Enterprise Linux systems, manage subscriptions, and view notifications for the registered systems.

- **Red Hat Enterprise Linux 6 Deployment Guide** — The *Deployment Guide* for Red Hat Enterprise Linux 6 provides relevant information regarding the deployment, configuration, and administration of this system.

- **Red Hat Enterprise Linux 7 System Administrator’s Guide** — The *System Administrator’s Guide* for Red Hat Enterprise Linux 7 provides information on deployment, configuration, and administration of this system.

6.2. RED HAT DEVELOPERS

- **Red Hat Developer Program** — The *Red Hat Developers* community portal.

- **Overview of Red Hat Software Collections on Red Hat Developers** — The *Red Hat Developers* portal provides a number of tutorials to get you started with developing code using different development technologies. This includes the Node.js, Perl, PHP, Python, and Ruby Software Collections.

- **Red Hat Developer Blog** — The *Red Hat Developer Blog* contains up-to-date information, best practices, opinion, product and program announcements as well as pointers to sample code and...
other resources for those who are designing and developing applications based on Red Hat technologies.
APPENDIX A. REVISION HISTORY

Revision 3.5-1  
Tue May 26 2020  
Lenka Špačková

Release of Red Hat Software Collections 3.5 Release Notes.

Revision 3.5-0  
Tue Apr 21 2020  
Lenka Špačková

Release of Red Hat Software Collections 3.5 Beta Release Notes.
